Theſe herbes are mixed with compound medicines that mitigate the paine of the eyes, and by B
reaſon of his cold qualitie, being freſh and greene, it helpeth the inflammation or fierie heate of the eyes.

It is reported and affirmed, that it killeth Panthers, Swine, Wolues, and all kindes of wilde C
beaſts, being giuen them with fleſh. *Theophraſtus* ſaith, That it killeth Cattell, Sheepe, Oxen, and all foure-footed beaſts, within the compaſſe of one day, not by taking it inwardly onely, but if the herbe or root be tied vnto their priuy parts. Yet he writeth further, That the root being drunke is a remedie againſt the ſtinging of Scorpions; which ſheweth, that this herbe or the root thereof is not deadly to man, but to diuers beaſts onely: which thing alſo is found out by trial and manifeſt experience; for *Conrade Geſner* (a man in our time ſingularly learned, and a moſt diligent ſearcher of many things) in a certaine Epiſtle written to *Adolphus Occo*, ſheweth, That he himſelfe hath oftentimes inwardly taken the root hereof greene, dry, whole, preſerued with honey, and alſo beaten to pouder; and that euen the very ſame day in which hee wrote theſe things, hee had drunke with warme water two drams of the roots made into fine pouder, neither felt he any hurt thereby: and that he oftentimes alſo had giuen the ſame to his ſicke Patients, both by it ſelfe, and alſo mixed with other things, and that very luckily. Moreouer, the Apothecaries in ſtead of *Doronicum* doe vſe (though amiſſe) the roots thereof without any manifeſt danger.

That this *Aconite* killeth dogs, it is very certaine, and found out by triall: which thing *Matthio-* D
lus could hardly beleeue, but that at length he found it out to be true by a manifeſt example, as he confeſſeth in his Commentaries.

‡ I haue (ſaith *Geſner*) oft with very good ſucceſſe preſcribed it to my Patients, both alone, as E
alſo mixed with other medicines, eſpecially in the *Vertigo* and falling ſickneſſe: ſomtimes alſo I mix therewith Gentian, the pouder of Miſſe-toe, and *Aſtrantia*: thus it workes admirable effects in the Epilepſie, if the vſe thereof be continued for ſome time. ‡

† Formerly the figure that was in the firſt place ſhould haue beene in the ſecond, and the firſt and ſecond were confounded in the deſcription.

Chap. 265. *Of Sage.*

¶ *The Deſcription.*

1 THe great Sage is very full of ſtalkes, foure ſquare, of a wooddy ſubſtance, parted into branches, about the which grow broad leaues, long, wrinckled, rough, whitiſh, verie like to the leaues of wilde Mullein, but rougher, and not ſo white, like in roughneſſe to woollen cloath thread-bare: the floures ſtand forked in the tops of the branches like thoſe of dead Nettle, or of Clarie, of a purple blew colour, in the place of which doth grow little blackiſh ſeeds, in ſmall huskes. The root is hard and wooddy, ſending forth a number of little ſtrings.

2 The leſſer Sage is alſo a ſhrubby plant, ſpred into branches like to the former, but leſſer: the ſtalkes hereof are tenderer: the leaues be long, leſſer, narrower, but not leſſe rough; to which there do grow in the place wherein they are fixed to the ſtalke, two little leaues ſtanding on either ſide one right againſt another, ſomewhat after the manner of finnes or little eares: the floures are

cared blew like thoſe of the former: the root alſo is wooddy: both of them are of a certaine ſtrong ſmell, but nothing at all offenſiue; and that which is the leſſer is the better.

3 This Indian Sage hath diuers branches of a wooddy ſubſtance, whereon doe grow ſmall leaues, long, rough, and narrow, of an ouerworne colour, and of a moſt ſweet and fragrant ſmell. The floures grow alongſt the top of the branches, of a white colour, in forme like the precedent. The root is tough and wooddy.

1 *Saluia maior.*
Great Sage.

2 *Saluia minor.*
Small Sage.

4 The Mountaine Sage hath an vpright ſtalke ſmooth and plaine, whereupon do grow broad rough and rugged leaues, ſleightly nicked, and vneuenly indented about the edges, of an hoarie colour, ſharpe pointed, and of a ranke ſmell: the floures grow alongſt the top of the ſtalke, in ſhape like thoſe of Roſemarie, of a whitiſh red colour. The root is likewiſe wooddy.

5 We haue in our gardens a kinde of Sage, the leaues whereof are reddiſh, part of thoſe red leaues are ſtriped with white, others mixed with white, greene, and red, euen as Nature liſt to play with ſuch plants. This is an elegant varietie, and is called *Saluia variegata elegans*, Variegated or painted Sage.

6 We haue alſo another, the leaues whereof are for the moſt part white, ſomewhat mixed with greene, often one leafe white, and another greene, euen as Nature liſt, as we haue ſaid. This is not ſo rare as the former, nor neere ſo beautifull, wherefore it may be termed *Saluia variegata vulgaris*, Common painted Sage.

‡ 7 There is kept in ſome of our chiefe gardens a fine Sage, which in ſhape and manner of growing reſembles the ſmaller Sage, but in ſmell and taſte hath ſome affinity with Wormwood, whence it may be termed *Saluia Abſinthites*, or Wormewood Sage. *Bauhine* onely hath mentioned this, and that in the fourth place in his *Pinax*, *pag.* 237. by the name of *Saluia minor altera*: and hee addes, *Hæc odore & ſapore eſt Abſinthij, floreque rubente*: That is, This hath the ſmell and taſte of Wormewood, and a red floure: but ours (if my memorie faile me not) hath a whitiſh floure; it is a tender plant, and muſt be carefully preſerued from the extremitie of Winter. I firſt ſaw this Sage with M^r. *Cannon*, and by him it was communicated to ſome others.

8 This

3 *Saluia Indica.*
Indian Sage.

4 *Saluia Alpina.*
Mountaine Sage.

‡ 8 *Saluia Cretica pomifera.*
Apple-bearing Sage of Candy.

‡ 8 *Saluia Cretica non pomifera.*
Candy Sage without Apples.

8 This which we here giue you hath pretty large leaues, and thoſe alſo very hairy on the vnder ſide, but rough on the vpper ſide like as the ordinarie Sage. The ſtalkes are rough and hairie, foure ſquare below, and round at their tops. The floures in their growing and ſhape are like thoſe of the ordinarie, but of a whitiſh purple colour; and fading, they are each of them ſucceeded by three or foure ſeeds, which are larger than in other Sages, and ſo fill their ſeed-veſſels, that they ſhew like berries. The ſmell of the whole plant is ſomewhat more vehement than that of the ordinarie: the leaues alſo haue ſometimes little eares or appendices, as in the ſmaller or Pig-Sage: and in Candy (the naturall place of the growth) it beares excreſcences, or Apples (if we may ſo terme them) of the bigneſſe of large Gails, or Oke-Apples: whence *Cluſius* hath giuen you two figures by the ſame titles as I here preſent the ſame to your view. *Matthiolus*, *Dodonæus*, and others alſo haue made mention hereof. ‡

¶ *The Place.*

Theſe kindes of Sage grow not wilde in England: I haue them all in my garden: moſt of them are very common.

‡ The fine or elegant painted Sage was firſt found in a countrey garden, by Mr. *Iohn Tradeſcant*, and by him imparted to other louers of plants. ‡

¶ *The Time.*

Theſe Sages floure in Iune and Iuly, or later: they are fitly remoued and planted in March.

¶ *The Names.*

Sage is called in Greeke ἐλελίσφακος: the Apothecaries, the Italians, and the Spaniards keepe the Latine name *Saluia*: in high-Dutch, **Salben**: in French, *Sauge*: in low-Dutch, **Sauie**: in Engliſh, Sage.

¶ *The Temperature.*

Sage is manifeſtly hot and dry in the beginning of the third degree, or in the later end of the ſecond; it hath adioyned no little aſtriction or binding.

¶ *The Vertues.*

A *Agrippa* and likewiſe *Aetius* haue called it the Holy-herbe, becauſe women with childe if they be like to come before their time, and are troubled with abortments, do eate thereof to their great good; for it cloſeth the matrix, and maketh them fruitfull, it retaineth the birth, and giueth it life, and if the woman about the fourth day of her going abroad after her childing, ſhal drink nine ounces of the iuyce of Sage with a little ſalt, and then vſe the companie of her husband, ſhe ſhall without doubt conceiue and bring forth ſtore of children, which are the bleſſing of God. Thus far *Agrippa*.

B Sage is ſingular good for the head and braine; it quickneth the ſences and memory, ſtrengtheneth the ſinewes, reſtoreth health to thoſe that haue the palſie vpon a moiſt cauſe, takes away ſhaking or trembling of the members; and being put vp into the noſthrils, it draweth thin flegme out of the head.

C It is likewiſe commended againſt the ſpitting of bloud, the cough, and paines of the ſides, and bitings of Serpents.

D The iuyce of Sage drunke with honey is good for thoſe that ſpit and vomit bloud, and ſtoppeth the flux thereof incontinently, expelleth winde, drieth the dropſie, helpeth the palſie, ſtrengthneth the ſinewes, and cleanſeth the bloud.

E The leaues ſodden in water, with Wood-binde leaues, Plantaine, Roſemary, Honey, Allome, and ſome white wine, make an excellent water to waſh the ſecret parts of man or woman, and for cankers or other foreneſſe in the mouth, eſpecially if you boyle in the ſame a faire bright ſhining Sea-cole, which maketh it of greater efficacie.

F No man needs to doubt of the wholeſomneſſe of Sage Ale, being brewed as it ſhould be, with Sage, Scabious, Betony, Spikenard, Squinanth, and Fennell ſeeds.

G The leaues of red Sage put into a woodden diſh, wherein is put very quicke coles, with ſome aſhes in the bottome of the diſh to keepe the ſame from burning, and a little vineger ſprinkled vpon the leaues lying vpon the coles, and ſo wrapped in a linnen cloath, and holden very hot vnto the ſide of thoſe that are troubled with a grieuous ſtitch, taketh away the paine preſently: The ſame helpeth greatly the extremitie of the pleuriſie.

Chap.

Chap. 266. *Of French Sage or wooddie Mullein.*

1 *Verbaſcum Matthioli.*
French Sage.

‡ 2 *Verbaſcum angustis Saluiæ foliis.*
The leſſer French Sage.

‡ 3 *Phlomos Lychnites Syriaca.*
Syrian Sage-leaued Mullein.

¶ *The Deſcription.*

1 WIld Mullein, wooddie Mullein, *Matthiolus* his Mullein, or French Sage groweth vp like a ſmall wooddie ſhrub, hauing many wooddie branches of a woollie and hoarie colour, ſoft and downie: whereupon are placed thicke hoarie leaues, of a ſtrong ponticke ſauour, in ſhape like the leaues of Sage, whereupon the vulgar people call it French Sage: toward the top of the branches are placed roundles or crownets of yellow gaping floures like thoſe of dead Nettle, but much greater. The root is thicke, tough, and of a wooddie ſubſtance, as is all the reſt of the plant.

† 2 There is another ſort hereof that is very like the other, ſauing that the leaues & euery other part of this plant, hath a moſt ſweet and pleaſant ſmell, and the other more ſtrong and offenſiue: the leaues alſo are much leſſer and narrower, ſomewhat reſembling thoſe of the leſſer Sage.

‡ 3 I thinke it not amiſſe here to inſert this no leſſe rare than beautifull plant, which differs from the laſt deſcribed in the manner of growing & ſhape of the floures, which reſemble thoſe of the *Lychnis Chalcedonica*, or None-ſuch, but are of a yellow colour. The leaues are hairy, narrow, and ſharp pointed; the ſtalkes ſquare, and root wooddie. *Lobel*

(to

(to whom we are beholden for this figure and deſcription) calls this, *Phlomos Lychnites altera Syriaca.* ‡

¶ *The Place.*

Theſe wilde Mulleins do grow wilde in diuers Prouinces of Spaine, and alſo in Languedoc, vpon drie bankes, and ſtony places: I haue them both in my garden, and many others likewiſe.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

They are called of the learned men of our time, *Verbaſca Syluestria:* the firſt is called of the Grecians φλόμος, or φλογμος: in Latine, *Elychnium*, or after others, *Elychinium*, becauſe of the Cottonie ſubſtance thereof, matches, or weeks were made to keep light in lamps: *Verbaſcum Lychnitis*, as *Dioſcorides* himſelfe teſtifieth, is named alſo *Thryallis* or Roſe Campion; but the floure of *Thryallis* is red of colour, as *Nicander* in his Counterpoiſons doth ſhew, but the floures of theſe are yellow: therefore they are neither *Thryallis* nor *Lychnitis*, but *Syluestre Verbaſcum*, or wilde Mullein, as we haue already taught in the Chapter of Roſe Campion, that *Thryallis* is *Lychnitis ſatiua*, or Roſe Campion. There is nothing to the contrary, but that there may be many plants with ſoft downie leaues fit to make Candle weeke of: in Engliſh it is generally called French Sage: wee may call it Sage Mulleine.

¶ *The Temperature.*

As theſe be like in vertues to the others going before, ſo they be likewiſe drie in temperature.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that the leaues are ſtamped and laied in manner of a pultis vpon burnings and ſcaldings.

Chap. 267. *Of Clarie.*

1 *Gallitricum, ſiue Horminum.*
Common Clarie.

2 *Gallitricum alterum.*
Small Clarie.

¶ *The*

‡ 3. *Horminum ſylueſtre, Fuchſij.* *Fuchſius* his wilde Clarie.

¶ *The Deſcription.*

1 THe firſt kinde of Clarie which is the right, bringeth forth thick ſtalks foure ſquare, two foot long, diuided into branches: it hath many leaues growing both from the rootes, and along the ſtalkes and branches by diſtances, one againſt another by two and two, great, a handfull broad or broader, ſomewhat rough, vnequall, whitiſh and hairie, as be alſo the ſtalkes. The floures are like thoſe of Sage, or of dead Nettle, of colour white, out of a light blew: after which grow vp long toothed huskes in ſtead of cods, in which is blacke ſeed. The root is full of ſtrings: the whole herbe yeeldeth forth a rank and ſtrong ſmell that ſtuffeth the head: it periſheth after the ſeed is ripe, which is in the ſecond yeare after it is ſowne.

2 The ſecond kinde of Clarie hath likewiſe ſtalkes foure ſquare, a foot and a halfe high: the leaues alſo be rough and rugged, leſſer, and not ſo white. The floures be alike, of colour purple or blew: the rootes bee as thoſe of the former are. This hath not ſo ſtrong a ſent by a great deale.

3 There is a kinde of Clarie which *Fuchſius* pictureth for wilde Clarie, that hath ſhorter ſtalkes, hairie, and alſo foure ſquare: the leaues leſſer, long, deeper indented: the floures blew of colour, ſweet of ſmell, but not ſo ſweet as thoſe of

† 4 *Colus Iouis.* Iupiters diſtaffe.

the

the right Clarie: the husks or cods when they are ripe bend downwards: the seed is blackish; the roots in like manner are blacke and full of strings.

4 The fourth kind of *Horminum*, called *Iovis Colus*, representeth in the highest top of the stalke a distaffe, wrapped about with yellow flax, whereof it tooke his name, having knobbie roots, with certaine strings annexed thereto like *Galeopsis*, or like vnto the roots of Clarie, which doe yeeld forth sundry foure square rough stalks, two cubits high; whereon do grow leaues like those of the Nettle, rough, sharpe pointed, and of an ouerworne greene colour: the floures do grow alongst the top of the stalks, by certaine spaces, set round about in smal coronets, or wharles, like those of Sage in forme, but of a yellow colour.

¶ *The Place.*

These doe grow wilde in some places, notwithstanding they are manured and planted in Gardens, almost euery where, except Iupiters distaffe, beeing a kinde thereof, which I haue in my Garden.

¶ *The Time.*

They floure in Iune, Iuly, and August.

¶ *The Names.*

Clarie is called of the Apothecaries *Gallitricum*; it is likewise named *Orvala*: of some, *Tota bona*, but not properly: of others, *Scarlea*, *Sclarea*, *Centrum Galli*, and *Matrisaluia*: in Italian, *Sciaria*: in French, *Orvale*: in High Dutch, **Scharlach**: in Low Dutch, **Scharleye**: in English, Clarie, or Cleere eie.

Iupiters distaffe is called *Colus Iovis*: of some, *Galeopsis lutea*, but not properly: of diuers, *Horminum luteum*, or yellow Clarie, and *Horminum Tridentinum*, or Clarie of Trent.

¶ *The Temperature.*

Clarie is hot and drie in the third degree.

¶ *The Vertues.*

A The seed of Clarie poudered, finely searced and mixed with hony, taketh away the dimnesse of the eies, and cleereth the sight.

B The same stamped, infused, or laied to steepe in warme water, the mussilag or slimie substance taken and applied plaisterwise, draweth forth splinters of wood, thornes, or any other thing fixed in the bodie: it also scattereth and dissolueth all kindes of swellings, especially in the ioints.

C The seed poudered and drunke with wine, stirreth vp bodily lust.

D The leaues of Clarie taken any manner of way, helpeth the weaknesse of the backe proceeding of the ouermuch flowing of the whites, but most effectually if they be fried with egges in manner of a Tansie, either the leaues whole or stamped.

† The figure which formerly was vnder the title of *Colus Iouis*, was of the *Horminum syluestre* of *Fuchsius*, which is described immediatly before it.

Chap. 268. *Of wilde Clarie, or* Oculus Christi.

¶ *The Description.*

1 *Oculus Christi* is also a kinde of Clarie, but lesser: the stalkes are many, a cubite high, squared, and somewhat hairie: the leaues be broad, rough, and of a blackish green colour. The floures grow alongst the stalkes, of a blewish colour. The seed is round and blackish, the root is thicke and tough, with some threds annexed thereto. ‡ This is *Hormini syluestris* 4. *quinta species* of *Clusius*. ‡

2 The purple Clarie hath leaues somewhat round, layd ouer with a hoarie cottony substance, not much vnlike Horehound: among which rise vp small hairie square stalks, set toward the top with little leaues of a purple colour, which appeare at the first view to be floures, and yet are nothing else but leaues, turned into an excellent purple colour: and among these beautifull leaues come forth small floures of a blewish or watchet colour, in fashion like vnto the floures of Rosemarie; which being withered, the husks wherein they did grow containe certaine blacke seed, that falleth forth vpon the ground very quickely, because that euery such huske doth turne and hang downe his head toward the ground. The root dieth at the first approch of Winter.

‡ 3 Broad leaued Clarie hath a square stalke some cubite high, hairy, firme, and iointed; the leaues are large, rough, and sharpe pointed, snipt about the edges, wrinckled, and standing by couples at each ioint: vpon the branches in roundles grow purple floures, lesse than those of Clarie, and scarce any bigger than those of Lauander: the seed is smal and blacke: the root is large, hard, black,

† 1 *Horminum ſylueſtre.*
Wilde Clarie, or *Oculus Chriſti.*

2 *Horminum ſylueſtre foliis purpureis.*
Clarie with purple leaues.

‡ 3 *Horminum ſylueſtre latifolium.*
Broad leaued wilde Clarie.

‡ 4 *Horminum ſylueſtre flore albo.*
White floured wilde Clarie.

‡ 5. *Horminum ſylueſtre flore rubro.*
Red floured wilde Clarie.

blacke, and liues many yeares. It floures in Iune and Iuly, and growes wilde in many mountainous places of Germany. *Cluſius* calls it *Horminum ſylueſtre tertium.*

4 This hath long leaues next vnto the ground, growing vpon prettie long ſtalkes, broad at their ſetting on, and ſo ending by little and little in ſharpe points, they are not deeply cut in, but onely lightly ſnipt about the edges: they are alſo wrinckled on the vpper ſide, and whitiſh, but hairie on the vnder ſide. The ſquare ſtalkes are ſome cubite high, iointed, and ſet with two leaues at each ioint. The floures grow alongſt the tops of the branches, and are of a ſnow white colour. There is a varietie of this with the leaues greener, and the floures of an elegant deepe purple colour. This is the *Horminum ſylueſtris quarti ſpecies prima* of *Cluſius*, and the varietie with the white floures is his *Hormini ſylueſtris quarti ſpecies prima*; and the figure that our Authour gaue in the firſt place was of theſe.

5 There is another variety of the laſt deſcribed, which alſo hath ſquare ſtalks ſet with rough ſnipt leaues, which end in ſharp points, but are narrower at the lower end than the former, and they are greene of colour: vpon the tops of the ſtalkes grow red hooded floures, and thoſe not very large: the ſeed is ſmall and blacke, and the root liues many yeares. This floures in Iuly. *Cluſius* makes this his *Hormini ſylueſtris quarti ſpecies quarta.* ‡

¶ *The Place.*

The firſt groweth wilde in diuers barren places, almoſt in euery Country, eſpecially in the fields of Holborne neere vnto Grayes Inne, in the high way by the end of a bricke wall: at the end of Chelſey next to London, in the high way as you go from the Queenes pallace of Richmond to the waters ſide, and in diuers other places.

The other is a ſtranger in England: it groweth in my garden.

¶ *The Time.*

They floure and flouriſh from Iune to the end of Auguſt.

¶ *The Names.*

Wilde Clarie is called after the Latine name *Oculus Chriſti*, of his effect in helping the diſeaſes of the eies: in Greeke ὀφθαλμὸς and likewiſe in Latine, *Horminum*: of ſome, *Geminalis*: in Engliſh, wild Clarie, and *Oculus Chriſti*.

The ſecond is thought of ſome to be the right Clarie, and they haue called it *Horminum verum*, but with greater errour: it may be called in Latine *Horminum ſylueſtre foliis & floribus purpureis*, Clarie with leaues and floures of a purple colour.

‡ Our Authour ſhould haue ſhewn his reaſons why this is not the *Horminum verum*, to haue conuinced the errour of *Anguillara*, *Matthiolus*, *Geſner*, *Dodonæus*, *Lobel* and others, who haue accounted it ſo, as I my ſelfe muſt needs do, vntill ſome reaſon be ſhewne to the contrarie, the which I thinke cannot be done. ‡

¶ *The Temperature and Vertues.*

A The temperature and faculties are referred vnto the garden Claries: yet *Paulus Ægineta* ſaith it is hot and moderately drie, and it alſo clenſeth.

B The ſeed of wilde Clarie, as *Dioſcorides* writeth, being drunke with wine, ſtirreth vp luſt, it clenſeth the eies from filmes and other imperfections, being mixed with honie.

C The ſeede put whole into the eies, clenſeth and purgeth them exceedingly from wateriſh humours, redneſſe, inflammation, and diuers other maladies, or all that happen vnto the eies, and takes away the paine and ſmarting thereof, eſpecially being put into the eies one ſeed at one time, and

no

no more,which is a generall medicine in Cheſhire and other Countries thereabout, knowne of all, and vſed with good ſucceſſe.

The leaues are good to be put into pottage or brothes among other potherbes; for they ſcatter congealed bloud,warme the ſtomacke,and helpe the dimneſſe of the eies. D

† The figure that formerly was in the firſt place,was of that which you may here finde figured and deſcribed in the fourth.

CHAP. 269. *Of Mullein.*

¶ *The Deſcription.*

1 THe male Mullein or Higtaper hath broad leaues, very ſoft,whitiſh and downie; in the midſt of which riſeth vp a ſtalke,ſtraight,ſingle,and the ſame alſo whitiſh all ouer,with a hoarie downe,and couered with the like leaues,but leſſer and leſſer euen to the top: among which taperwiſe are ſet a multitude of yellow floures, conſiſting of fiue leaues apeece: in the places whereof come vp little round veſſels, in which is contained very ſmall ſeed. The root is long,a finger thicke,blacke without,and full of ſtrings.

1 *Tapſus Barbatus.*
Mullein or Higtaper.

2 *Tapſus Barbatus flore albo.*
White floured Mullein.

2 The female Mullein hath likewiſe many white woolley leaues, ſet vpon an hoarie cottonie vpright ſtalke,of the height of foure or fiue cubits: the top of the ſtalks reſembleth a torch decked with infinite white floures,which is the ſpeciall marke to know it from the male kinde,being like in euery other reſpect.

¶ *The Place.*

Theſe plants do grow of themſelues neere the borders of paſtures, and plowed fields,or cauſies, and drie ſandie ditch banks,and in other vntilled places. They grow in great plentie neere vnto a lyme kill vpon the end of black Heath next to London,as alſo about the Queens houſe at Eltham neere vnto Dartford in Kent: in the high waies about Highgate neere London,and in moſt countries of England that are of a ſandie ſoile.

¶ *The Time.*

They are found with their floure from Iuly to September, and bring forth their ſeed the ſecond yeare after the ſeed is ſowne.

¶ *The Names.*

Mullein is called in Greeke φλόμος in ſhops, *Tapſus Barbatus:* of diuers, *Candela Regia, Candelaria,* and *Lanaria: Dioſcorides, Pliny,* and *Galen,* do call it *Verbaſcum:* in Italian, *Verbaſco,* and *Taſſo Barbaſſo:* in Spaniſh, *Gordolobo:* in High Dutch, **wollkraut:** in French, *Bouillon:* in Engliſh, Mullein, or rather Woollen, Higtaper, Torches, Long-woort, and Bullockes Long-woort; and of ſome Haresbeard.

¶ *The Temperature.*

Mullein is of temperature drie: the leaues haue alſo a digeſting and clenſing qualitie, as *Galen* affirmeth.

¶ *The Vertues.*

A The leaues of Mullein being boiled in water, and laid vpon hard ſwellings and inflammations of the eies, cureth and ceaſeth the paine.

B The root boiled in red wine and drunke, ſtoppeth the laske and bloudy flix.

C The ſame boiled in water and drunke, is good for them that are broken and hurt inwardly, and preuaileth much againſt the old cough.

D A little fine treacle ſpred vpon a leafe of Mullein, and laied to the piles or Hemorhoides, cureth the ſame: an ointment alſo made with the leaues thereof and old hogs greaſe worketh the ſame effect.

E The leaues worne vnder the feet day and night, in manner of a ſhooe ſole or ſock, bringeth down in yong maidens their deſired ſickneſſe, being kept vnder their feet with ſome ſocks or other thing for falling away.

F The Countrey people, eſpecially the husbandmen in Kent, doe giue their cattell the leaues to drinke againſt the cough of the lungs, being an excellent approued medicine for the ſame, whereupon they doe call it Bullocks Lung-woort.

G Frankenſence and Maſticke burned in a chafing diſh of coles, and ſet within a cloſe ſtoole, and the fume thereof taken vnderneath, doth perfectly cure the piles, hemorrhoids, and all diſeaſes happening in thoſe lower parts, if alſo there be at euery ſuch fuming (which muſt bee twice euerie day) a leafe of the herbe bound to the place, and there kept vntill the next dreſſing.

H There be ſome who thinke that this herbe being but carried about one, doth helpe the falling ſickneſſe, eſpecially the leaues of that plant which hath not as yet borne floures, and that is gathered when the Sun is in Virgo, and the Moone in Aries; which thing notwithſtanding is vaine and ſuperſtitious.

I The later Phyſitions commend the yellow floures, beeing ſteeped in Oile and ſet in warme doung vntill they bee waſted into the Oile and conſumed away, to bee a remedie againſt the piles.

K The report goeth, ſaith *Pliny,* that figges do not putrifie at all that are wrapped in the leaues of Mullein: which thing *Dioſcorides* alſo maketh mention of.

Chap. 270. *Of baſe Mullein.*

¶ *The Deſcription.*

1 The baſe white Mullein hath a thicke wooddie root, from which riſeth vp a ſtiffe and hairie ſtalke, of the height of foure cubites, garniſhed with faire grayiſh leaues like thoſe of Elecampane, but leſſer: the floures grow round about the ſtalks taper or torch faſhion, of a white colour, with certaine golden thrums in the middle: the ſeed followeth, ſmal, and of the colour of duſt.

2 Blacke Mullein hath long leaues, not downie at all, large and ſharp pointed, of an ouerworne blackiſh green colour, ſomewhat rough, and ſtrongly ſmelling: the floures grow at the top of the ſtalks, of a golden yellow colour, with certaine threds in the middle thereof. The root differeth not from the precedent.

3 Candleweeke Mullein hath large, broad, and woollie leaues, like vnto thoſe of the common Mullein: among which riſeth vp a ſtalke couered with the like leaues, euen to the branches whereon the floures do grow, but leſſer and leſſer by degrees. The ſtalke diuideth it ſelfe toward the top into diuerſe branches, whereon is ſet round about many yellow floures, which oftentimes doe change into white, varying according vnto the ſoile and clymate. The root is thick and wooddy.

4 The

1 *Verbaſcum album.*
Baſe white Mullein.

2 *Verbaſcum nigrum.*
Baſe blacke Mullein.

3 *Verbaſcum Lychnite Matthioli.*
Candle-weeke Mullein.

4 *Verbaſcum Lychnite minus.*
Small Candle-weeke Mullein.

4 The ſmall Candle-weeke Mullein differeth little from the laſt rehearſed, ſauing that the whole plant of this is of a better ſauour, wherein eſpecially conſiſteth the difference. ‡ The floure alſo is much larger, and of a ſtraw, or pale yellow colour. ‡

¶ *The Place.*

Theſe plants do grow where the other Mulleins do, and in the like ſoile.

¶ *The Time.*

The time likewiſe anſwereth their flouring and ſeeding.

¶ *The Names.*

Their capitall names expreſſed in the titles ſhal ſerue for theſe baſe Mulleins, conſidering they are all and euery of them kindes of Mulleins.

¶ *The Temperature.*

Theſe Mulleins are drie without any manifeſt heat, yet doubtleſſe hotter and drier than the common Mullein or Hygtaper.

¶ *The Vertues.*

A The blacke Mullein, with his pleaſant yellow floures, boiled in water or wine and drunken, is good againſt the diſeaſes of the breſt and lungs, and againſt all ſpitting of corrupt rotten matter.

B The leaues boiled in water, ſtamped and applied pultis wiſe vpon cold ſwellings (called *Oedemata*) and alſo vpon the vlcers and inflammations of the eies, cureth the ſame.

C The floures of blacke Mullein are put into lie, which cauſeth the haire of the head to wax yellow, if it be waſhed and combed therewith.

D The leaues are put into cold ointments with good ſucceſſe, againſt ſcaldings and burnings with fire or water.

E *Apuleius* reporteth a tale of *Vlyſſes*, *Mercurie*, and the inchantreſſe *Circe*, and their vſe of theſe herbes in their incantations and witchcrafts.

Chap. 271. *Of Moth Mullein.*

1 *Blattaria Plinÿ.*
Plinies Moth Mullein.

2 *Blattaria flore purpureo.*
Purple Moth Mullein.

¶ *The*

¶ *The Deſcription.*

1 PLinie hath ſet forth a kinde of *Blattaria*, which hath long and ſmooth leaues, ſomewhat iagged or ſnipt about the edges: the ſtalke riſeth vp to the height of three cubits, diuiding it ſelfe toward the top into ſundry armes or branches, beſet with yellow floures like vnto blacke Mullein.

2 *Blattaria* with purple floures hath broad blacke leaues, without any manifeſt ſnips or notches by the ſides, growing flat vpon the ground: among which riſeth vp a ſtalke two cubits high, garniſhed with floures like vnto the common *Blattaria*, but that they are of a purple colour, and thoſe few threds or chiues in the middle of a golden colour: the root is as thick as a mans thumb, with ſome threds hanging thereat, and it indureth from yeare to yeare.

3 There is another kinde like vnto the blacke Mullein, in ſtalks, roots, and leaues, and other reſpects, ſauing that his ſmall floures are of a greene colour.

4 There is another like vnto the laſt before written, ſauing that his leaues are not ſo deepely cut about the edges, and that the ſmall floures haue ſome purple colour mixed with the greenneſſe.

‡ 3 *Blattaria flore viridi.*
Greene Moth Mullein.

‡ 4 *Blattaria flore ex viridi purpuraſcente.*
Moth Mullein with the greeniſh purple coloured floure.

‡ 5 This is ſomewhat like the firſt deſcribed in leaues and ſtalks, but much leſſe, the floures alſo are of a whitiſh or grayiſh colour, and therein conſiſts the chiefeſt difference.

6 There is alſo another varietie of this kinde, which hath very faire and large floures, and theſe either of a bright yellow, or elſe of a purple colour.

7 This hath long narrow leaues like thoſe of the ſecond, ſnipt about the edges, and of a darke greene colour: the ſtalkes grow ſome two cubits high, and ſeldome ſend forth any branches; the floures are large and yellow, with rough threddes in their middles tipt with red, and theſe grow in ſuch an order that they ſomewhat reſemble a flie: the ſeed is ſmall, and contained in round buttons. This is an annuall, and periſheth when the ſeed is ripe. ‡

‡ 5 *Blattaria flore albo.*
White floured Moth Mullein.

‡ 6 *Blattaria flore amplo.*
Moth Mullein with the great floure.

‡ 7 *Blattaria flore Luteo.*
Yellow Moth Mullein.

¶ *The Place.*

† The firſt and fift of theſe grow wilde in ſundrie places, and the reſt onely in gardens with vs.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The later Herbariſts call Moth Mullein by the name of *Blattaria*, and doe truly take it to bee that which *Plinie* deſcribeth in his 22. booke, *cap.* 9. in theſe words. [There is an herbe like Mullein, or *Verbaſcum nigrum*, which oftentimes deceiueth, being taken for the ſame, with leaues not ſo white, moe ſtalks, and with yellow floures (as wee haue written) which do agree with blacke Mullein, but we haue not as yet learned by obſeruation that they do gather mothes and flies vnto them, as wee haue ſaid.] *Valerius Cordus* names it *Verbaſcum Leptophyllon*, or narrow leafed Mullein: their ſeueral titles ſufficiently ſet forth their Engliſh names.

¶ *The Nature and Vertues.*

Concerning the plants comprehended vnder the titles of *Blattaria*, or Moth Mulleins, I find nothing written of them, ſauing that moths, butterflies, and all manner of ſmall flies and bats do reſort to the place where theſe herbs are laied or ſtrewed.

‡ The decoctiõ of the floures or leaues of the firſt deſcribed opens the obſtructions of the bowels, as alſo of the Meſeraicke veins, as *Camerar.* affirmes. ‡

A

B

CHAP.

CHAP. 272. *Of Mullein of Æthiopia.*

Æthiopis.
Æthiopian Mullein.

¶ *The Deſcription.*

MVllein of Æthiopia hath many very broad hoary leaues ſpred vpon the ground, very ſoft and downy, or rather woolly, like to thoſe of Hygtaper, but farre whiter, ſofter, thicker, and fuller of woollineſſe; which wooll is ſo long, that one may with his fingers pull the ſame from the leaues, euen as wooll is pulled from a Sheeps skinne: among which leaues riſeth vp a foure ſquare downy ſtalke, ſet with the like leaues, but ſmaller; which ſtalke is diuided at the top into other branches, ſet about and orderly placed by certaine diſtances, hauing many floures like thoſe of Archangell, of a white colour tending to blewneſſe: which being paſt, there ſucceedeth a three ſquare browne ſeed: the root is blacke, hard, and of a wooddy ſubſtance.

¶ *The Place.*

It groweth naturally in Ethiopia, and in Ida, a hill hard by Troy, and in Meſſenia a prouince of Morea, as *Pliny* ſheweth in his twenty ſeuenth booke, chap. 4. it alſo groweth in Meroe, an Iſland in the riuer Nilus: it likewiſe groweth in my garden.

¶ *The Time.*

It floureth and flouriſheth in Iune, and perfecteth his ſeed toward the end of Auguſt.

¶ *The Names.*

It is called in Greek Αἰθιοπὶς: and in Latine *Æthiopis*, of the countrey; and for that cauſe it is likewiſe called *Meroides*, of *Meroë*, as *Pliny* writeth: of ſome becauſe the Greeke word Αἰθω. ſignifieth in Latine *Fauilla aduſta*, or *Cinere aſperſa*, or couered with aſhes: in Engliſh we may cal it Mullein of Æthiopia, or woolly Mullein.

¶ *The Nature.*

Æthiopis is dry without any manifeſt heate.

¶ *The Vertues.*

Æthiopis is good for thoſe that haue the Pleuriſie, and for thoſe that haue their breſts charged A with corrupt and rotten matter, and for ſuch as are grieued with the aſperitie and roughneſſe in the throat, and againſt the Sciatica, if one drinke the decoction of the root thereof.

For the diſeaſes of the breſt and lungs it is good to licke oftentimes of a confection made with B the root hereof and honey, and ſo are the roots condited with ſugar, in ſuch manner as they condite the roots of Eringos.

CHAP. 273. *Of Cowſlips.*

¶ *The Deſcription.*

1 THoſe herbes which at this day are called Primroſes, Cowſlips, and Oxlips, are reckoned among the kindes of Mulleins; notwithſtanding for diſtinctions ſake I haue marſhalled them in a chapter, comming in the rereward as next neighbors to the Mullens, for that the Antients haue named them *Verbaſculi*, that is to ſay, Small Mullens. The firſt, which is called in Engliſh the field Cowſlip, is as common as the reſt, therefore I ſhall not need to ſpend much time about the deſcription.

2 The ſecond is likewiſe well knowne by the name of Oxlip, and differeth not from the other, ſaue

ſaue that the floures are not ſo thicke thruſt together as the former, and they are fairer, and fewer in number, and do not ſmell ſo pleaſantly as the other: of which kinde wee haue one lately come into our gardens, whoſe floures are curled and wrinkled after a moſt ſtrange manner, which our women haue named Iack-an-apes on horſebacke.

1 *Primula veris maior.*
Field Cowſlips.

2 *Primula pratenſis inodora lutea.*
Field Oxlips.

3 Double Paigle, called of *Pena*, *Primula hortenſis Anglica omnium maxima, & ſerotina floribus plenis*; that is, The greateſt Engliſh garden Cowſlip with double yellow floures, is ſo commonly knowne that it needeth no deſcription.

4 The fourth is likewiſe known by the name of double Cowſlips, hauing but one floure within another, which maketh the ſame once double, where the other is many times double, called by *Pena*, *Geminata*, for the likeneſſe of the floures, which are brought forth as things againſt nature, or twinnes.

5 The fifth being the common white field Primroſe, needeth no deſcription.

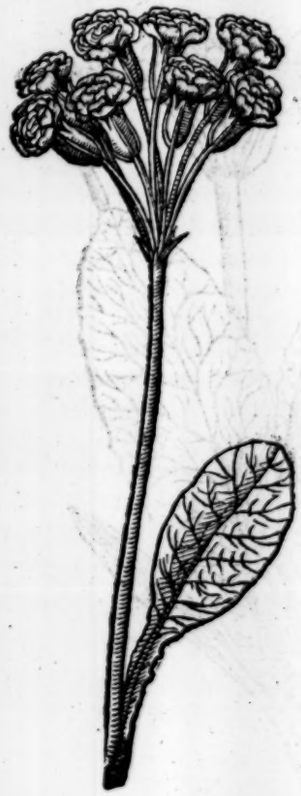
6 The ſixth, which is our garden double Primroſe, of all the reſt is of greateſt beauty, the deſcription whereof I refer vnto your owne conſideration.

7 The ſeuenth kinde is alſo very well knowne, being a Primroſe with greeniſh floures ſomewhat welted about the edges: for which cauſe *Pena* hath called it *Siluarum primula, floribus obſcure virentibus fimbriatis*.

8 There is a ſtrange Primroſe found in a wood in Yorkſhire growing wilde, by the trauell and induſtrie of a learned gentleman of Lancaſhire called M^r. *Thomas Hesketh*, a diligent ſearcher of Simples, who hath not onely brought to light this amiable and pleaſant kinde of Primroſe, but many others likewiſe, neuer before his time remembred or found out. This kinde of Primroſe hath leaues and roots like the wilde field Primroſe in each reſpect: it bringeth forth amongſt the leaues a naked ſtalke of a grayiſh or ouerworne greeniſh colour: at the top whereof doth grow in the Winter time one floure and no more, like vnto that ſingle one of the field: but in the Sommer time it bringeth forth a ſoft ruſſet huske or hoſe, wherein are contained many ſmall floures, ſometimes foure or fiue, and oftentimes more, very thicke thruſt together, which maketh one entire floure, ſeeming to be one of the common double Primroſes, whereas indeed it is one double floure made of a number of ſmall ſingle floures, neuer ceaſing to beare floures Winter nor Sommer, as before is ſpecified.

‡ Beſides

3 *Primula hortenſis Anglica.*
Double Paigles.



4 *Primula veris flore geminato.*
Cowſlips two in a hoſe.

6 *Primula veris flore pleno.*
Double white Primroſe.

5 *Primula veris minor.*
Field Primroſe.

‡ Beſides theſe, there are kept in our gardens, and ſet forth by M^r. *Parkinſon* (to whoſe Worke I referre the curious Reader) two or three more varieties; one a double Cowſlip hoſe in hoſe, naked, without any huske: the other two beare many greene leaues on the tops of the ſtalkes, the one of them hauing yellowiſh floures amongſt the leaues, and the other onely longiſh narrow greene leaues. The firſt of theſe he calls *Paralyſis inodora flore geminato*, Double Oxlips hoſe in hoſe. The ſecond, *Paralyſis fatua*, The fooliſh Cowſlip. And the laſt, *Paralyſis flore viridi roſeo calamiſtrato*, The double greene feathered Cowſlip. ‡

¶ *The*

7 *Primula flore viridi.*
Greene Primroſe.

‡ 8 *Primula veris Heskethi.*
Mr. *Hesketh* Primroſe.

¶ *The Place.*

Cowſlips and Primroſes ioy in moiſt and dankiſh places, but not altogether couered with water; they are found in woods and the borders of fields: the Primroſe found by Mr. *Hesketh* growes in a wood called Clap-dale, three miles from a towne in Yorkeſhire called Settle.

¶ *The Time.*

They flouriſh from Aprill to the end of May, and ſome one or other of them do floure all the Winter long.

¶ *The Names.*

They are commonly called *Primula veris*, becauſe they are the firſt among thoſe plants that doe floure in the Spring, or becauſe they do floure with the firſt. They are alſo named *Arthritica*, and *Herba paralyſis*, for they are thought to be good againſt the paines of the ioynts and ſinewes. They are called in Italian, *Brache cuculi*: in Engliſh, Petty Mulleins, or Palſie-worts: of moſt, Cowſlips.

The greater ſort, called for the moſt part Oxlips or Paigles, are named of diuers *Herba S. Petri*. In Engliſh, Oxlip, and Paigle.

The common Primroſe is vſually called *Primula veris*: moſt Herbariſts do refer the Primroſes to the φλομίδες, called in Latine *Verbaſcula*, or Petty Mulleins; but ſeeing the leaues be neither woollie nor round, they are hardly drawn vnto them: for *Phlomides* are deſcribed by leaues, as *Pliny* hath interpreted it, *Hirſutis & Rotundis*, Hairy and round; which *Pliny*, *lib.* 25. *cap.* 10. tranſlateth thus: *Sunt & Phlomides duæ Hirſutæ, rotundis foliis, humiles*: which is as much to ſay in Engliſh as, There be alſo two pretty Mulleins, hairy, round leafed, low, or ſhort. ‡ *Fabius Columna* refers theſe to the *Aliſma* of *Dioſcor.* and calls the Cowſlip *Aliſma pratorum*: and the Primroſe, *Aliſma ſyluarum*. ‡

¶ *The Temperature.*

The Cowſlips and Primroſes are in temperature dry, and a little hot.

¶ *The Vertues.*

A The Cowſlips are commended againſt the paine of the ioynts called the Gout, and ſlackeneſſe of the ſinewes, which is the palſie. The decoction of the roots is thought to be profitably giuen againſt the ſtone in the kidneyes and bladder; and the iuyce of the leaues for members that are looſe and out of ioynt, or inward parts that are hurt, rent, or broken.

B A dramme and a halfe of the pouder of the dried roots of field Primroſe gathered in Autumne,

giuen

giuen to drinke in Ale or Wine purgeth by vomit very forcibly (but ſafely) wateriſh humours, choler, and flegme, in ſuch manner as *Azarum* doth, experimented by a learned and skilfull Apothecarie of Colcheſter Mr. *Thomas Buckſtone*, a man ſingular in the knowledge of Simples.

A conſerue made with the floures of Cowſlips and ſugar preuaileth wonderfully againſt the palſie, convulſions, cramps, and all the diſeaſes of the ſinewes. C

Cowſlips or Paigles do greatly reſtraine or ſtop the belly in the time of a great laske or bloudy flix, if the decoction thereof be drunke warme. D

A practitioner in London, who was famous for curing the frenſie, after that hee had performed his cure by the due obſeruation of phyſicke, accuſtomed euery yeare in the moneth of May to diet his patients after this manner: Take the leaues and floures of Primroſe, boyle them a little in fountaine water, and in ſome Roſe and Betony waters, adding thereto ſugar, pepper, ſalt, and butter, which being ſtrained, he gaue them to drinke thereof firſt and laſt. E

The roots of Primroſe ſtamped and ſtrained, and the iuyce ſniffed into the noſe with a quill or ſuch like, purgeth the braine, and qualifieth the paine of the megrim. F

An vnguent made with the iuyce of Cowſlips and oyle of Linſeed cureth all ſcaldings or burnings with fire, water, or otherwiſe. G

The floures of Primroſes ſodden in vineger and applied, do heale the Kings Euill, as alſo the almonds of the throat and uvula, if you gargariſe the part with the decoction thereof. H

The leaues and floures of Primroſes boyled in wine and drunke, is good againſt all diſeaſes of the breſt and lungs, and draweth forth of the fleſh any thorne or ſplinter, or bone fixed therein. I

Chap. 274. *Of Birds-eine.*

1 *Primula veris flore rubro.*
Red Bird-eyne.

2 *Primula veris flore albo.*
White Bird-eyne.

¶ *The Deſcription.*

1 SOme Herbariſts call this plant by the name of *Sanicula anguſtifolia*, making thereof two kinds, and diſtinguiſhing them by theſe termes, *maior & minor, ſiue media*: others cal them *Paralytica alpina*, which without controuerſie are kindes of Cowſlips, agreeing with them as well in ſhape, as in their nature and vertues, hauing leaues much like vnto Cowſlips, but ſmaller, growing

growing flat vpon the ground, of a faint greeniſh colour on the vpper ſide, & vnderneath of a white or mealy colour: among which riſe vp ſmall and tender ſtalkes of a foot high, hauing at the top of euery ſtalke a buſh of ſmall floures in ſhape like the common Oxlip, ſauing that they are of a faire ſtammell colour tending to purple: in the middle of euery ſmall floure appeareth a little yellow ſpot, reſembling the eye of a bird; which hath moued the people of the North parts (where it aboundeth) to call it Birds eyne. The ſeed is ſmall like duſt, and the root white and threddy.

2 The ſecond is like the firſt, ſauing that the whole plant is greater in each reſpect, and that the floures are of a whitiſh colour.

¶ *The Place.*

Theſe plants grow very plentifully in moiſt and ſqually grounds in the North parts of England, as in Harwood neere to Blackburne in Lancaſhire, and ten miles from Preſton in Aunderneſſe; alſo at Crosby, Rauenſwaith, and Crag-Cloſe in Weſtmerland.

They likewiſe grow in the medowes belonging to a village in Lancaſhire neere Maudſley, called Harwood, and at Hesketh not far from thence, and in many other places of Lancaſhire, but not on this ſide Trent, that I could euer haue any certaine knowledge of. *Lobel* reporteth, That doctor *Penny* (a famous Phyſition of our London Colledge) did finde them in theſe Southerne parts.

¶ *The Time.*

They floure and flouriſh from Aprill to the end of May.

¶ *The Names.*

The firſt is called Primroſe with the red floure: the ſecond, Primroſe with the white floure, and Birds eyne.

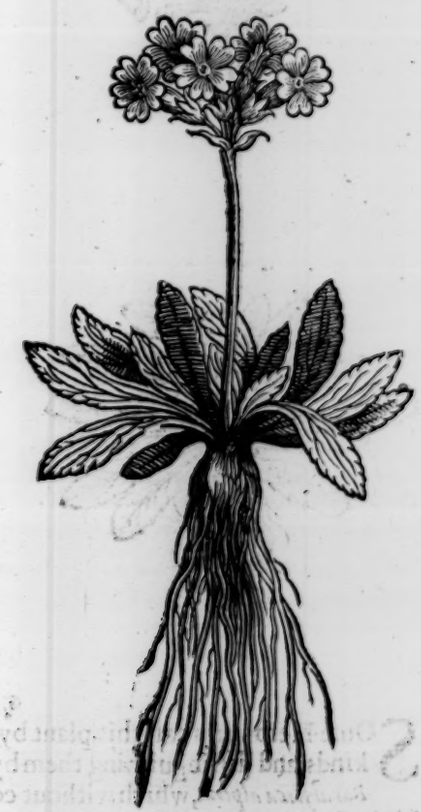
¶ *The Nature and Vertues.*

The nature and vertues of theſe red and white Primroſes muſt be ſought out amongſt thoſe aboue named.

Chap. 275. *Of Beares eares, or Mountaine Cowſlips.*

1 *Auricula vrſi flore luteo.*
Yellow Beares-eare.

2 *Auricula vrſi flore purpureo.*
Purple Beares-eare.



¶ Th

¶ *The Kindes.*

THere be diuers ſorts of Mountaine Cowſlips, or Beares-eares, differing eſpecially in the colour of their floures, as ſhall be declared, notwithſtanding it may appeare to the curious, that there is great difference in the roots alſo, conſidering ſome of them haue knobby roots, and others threddy: notwithſtanding there is no difference in the roots at all.

‡ There are diuers varieties of theſe floures, and the chiefe differences ariſe, either from the leaues or floures; from their leaues, which are either ſmooth and greene, or elſe gray and hoary, againe they are ſmooth about the edges, or ſnipt more or leſſe; The floures ſome are fairer then otherſome, and their colours are ſo various, that it is hard to finde words to expreſſe them, but they may be refer'd to whites, reds, yellowes, and purples; for of all the varieties and mixtures of theſe they chiefely conſiſt. The gardens of M^r. *Tradeſcant* and M^r. *Tuggie* are at this preſent furniſhed with very great varieties of theſe floures. ‡

3 *Auricula Vrſi ij. Cluſij.*
Red Beares eare.

4 *Auricula Vrſi iiij. Cluſij.*
Scarlet Beares eare.

¶ *The Deſcription.*

1 *AVricula Vrſi* was called of *Matthiolus*, *Pena*, and other Herbariſts, *Sanicula Alpina*, by reaſon of his ſingular facultie in healing of wounds, both inward and outward. They do all call it *Paralityca*, becauſe of his vertues in curing the palſies, cramps, and conuulſions, and is numbred among the kindes of Cowſlips, whereof no doubt they are kinds, as others are which do hereafter follow vnder the ſame title, although there be ſome difference in the colour of the floures. This beautifull and braue plant hath thicke, greene, and fat leaues, ſomewhat finely ſnipt about the edges, not altogether vnlike thoſe of Cowſlips, but ſmoother, greener, and nothing rough or crumpled: among which riſeth vp a ſlender round ſtem a handfull high, bearing a tuft of floures at the top, of a faire yellow colour, not much vnlike to the floures of Oxe-lips, but more open and conſiſting of one only leafe like Cotiledon: the root is very threddy, and like vnto the Oxe-lip.

2 The leaues of this kinde which beareth the purple floures are not ſo much ſnipt about the edges: theſe ſaid purple floures haue alſo ſome yellowneſſe in the middle, but the floures are not ſo much laid open as the former, otherwiſe in all reſpects they are like.

3 *Carolus Cluſius* ſetteth forth in the booke of his Pannonicke trauels two kindes more, which he hath found in his trauell ouer the Alpes and other mountaines of Germanie and Heluetia, being the third in number, according to my computation: it hath leaues like the former, but longer, ſmaller, and narrower toward the bottome, greene aboue, and of a pale colour vnderneath. The floures are in faſhion like to the former, but of a moſt ſhining red colour within, and on the outſide of the colour of a mulberry: the middle or eye of the floure is of a whitiſh pale colour: the root is like the former.

4 The fourth is a ſmaller plant than any of the foreſaid, whoſe leaues are thicke and fat, nothing at all ſnipt about the edges, greene aboue, and grayiſh vnderneath. The floures are like the former, ſhining about the edges, of an ouerworne colour toward the middle, and in the middle commeth a forke couered with an hairineſſe: the root is blacke and threddy.

5 *Auricula Vrſi erubeſcens.*
Bluſh coloured Beares eare.

6 *Auricula Vrſi ſuaue rubens.*
Bright red Beares eare.

7 *Auricula Vrſi minima.*
Stamell Beares eare.

5 The bluſh-coloured Beares eare hath diuers thicke fat leaues ſpred vpon the ground, of a whitiſh green colour, ſleightly or not at all indented in the edges: among which riſeth vp a naked ſtalke likewiſe hairy or whitiſh, on the top whereof ſtand very faire floures, in ſhape like thoſe of the common Cowſlip, but of a whitiſh colour tending to purple, which wee terme bluſh-colour. The root is tough and threddy, as are all the reſt.

6 The bright ſhining red Beares eare of *Matthiolus* deſcription ſeemes to late Herbariſts to be rather a figure made by conceit or imagination, than by the ſight of the plant it ſelf; for doubtleſſe we are perſuaded that there is no ſuch plant, but onely a figure foiſted for oſtentations ſake, the deſcription whereof we leaue to a further conſideration, becauſe we haue not ſeene any ſuch plant, neither do we beleeue there is any ſuch. ‡ Our Author is here without cauſe iniurious to *Matthiolus*; for he figures and deſcribes onely the common firſt deſcribed yellow Beares eare: yet if he had ſaid the floures were of a light ſhining red, he had not erred; for I haue ſeen theſe floures of all the reds both bright and darke that one may imagine. ‡

7 *Pena* ſetteth forth a kinde of Beares eare vnder the name of *Sanicula Alpina*, hauing his vppermoſt leaues an inch long, ſomewhat iagged and hem'd at the ends, and broad before like a ſhouel; the lower leaues next the ground are ſomewhat ſhorter, but of the ſame forme; among which riſeth a ſmall ſlender foot-ſtalke of an inch long, whereon doth ſtand a ſmall floure, conſiſting of fiue little leaues of a bright red or ſtammell colour.

8 The ſnow white Beares eare differeth not from the laſt deſcribed but in the colour of the floure, for as the others are red; contrarie theſe are very white, and the whole plant is leſſer, wherein conſiſteth the difference. The root is long, tough, with ſome fibres thereto belonging. Neither of theſe two laſt deſcribed will be content to grow in gardens.

¶ *The Place.*

They grow naturally vpon the Alpiſh and Heluetian mountaines: moſt of them do grow in our London gardens.

¶ *The Time.*

Theſe herbes do floure in Aprill and May.

¶ *The Names.*

Either the antient writers knew not theſe plants, or elſe the names of them were not by them or their ſucceſſors diligently committed vnto poſteritie. *Matthiolus* and other later writers haue giuen names according to the ſimilitude, or of the ſhape that they beare vnto other plants, according to the likeneſſe of the qualities and operations: you may call it in Engliſh, Beares eare: they that dwell about the Alps doe call it **Ziaſtkrawt**, and **Schwindlekrawt**, by reaſon of the effects thereof; for the root is amongſt them in great requeſt for the ſtrengthning of the head, that when they are on the tops of places that are high, giddineſſe and the ſwimming of the braine may not afflict them: it is there called the Rocke-roſe, for that it groweth vpon the rockes, and reſembleth the braue colour of the Roſe. ‡ *Fabius Columna* proues this to be the *Aliſma* or *Damaſonium* of *Dioſcorides* and the Antients.

¶ *The Nature.*

Theſe herbes are dry and very aſtringent.

¶ *The Vertues.*

It healeth all outward and inward wounds of the breſt, and the enterocele alſo, if for ſome reaſonable ſpace of time it be put in drinkes, or boyled by it ſelfe. A

Theſe plants are of the nature and temperature of *Primula veris*, and are reckoned amongſt the Sanicles by reaſon of their vertue. B

Thoſe that hunt in the Alps and high mountaines after Goats and Bucks, do as highly eſteeme hereof as of *Doronicum*, by reaſon of the ſingular effects that it hath, but (as I ſaid before) one eſpecially, euen in that it preuenteth the loſſe of their beſt ioynts (I meane their neckes) if they take the roots hereof before they aſcend the rocks or other high places. C

‡ The root of *Damaſonium* (according to *Dioſcorides*) taken in the weight of one or two drams, helpeth ſuch as haue deuoured the *Lepus marinus* or ſea Hare, or haue been bitten by a Toad, or taken too great a quantitie of *Opium*. D

It is alſo profitably drunke, either by it ſelfe, or with the like quantitie of *Daucus* ſeeds, againſt gripings in the belly, and the bloudy flux. E

Alſo it is good againſt conuulſions and the affects of the wombe. F

The herbe ſtayes the fluxes of the belly, moues the courſes, and applied in forme of a pultis aſſwageth œdematous tumors. ‡ G

CHAP. 276. *Of Mountaine Sanicle.*

¶ *The Kindes.*

THere be ſundry ſorts of herbes contained vnder the name of Sanicle, and yet not one of them agreeing with our common Sanicle, called *Diapenſia*, in any one reſpect, except in the vertues, whereof no doubt they tooke that name; which number doth dayly increaſe, by reaſon that the later writers haue put downe more new plants, not written of before by the Antients, which ſhall be diſtinguiſhed in this chapter by ſeuerall titles.

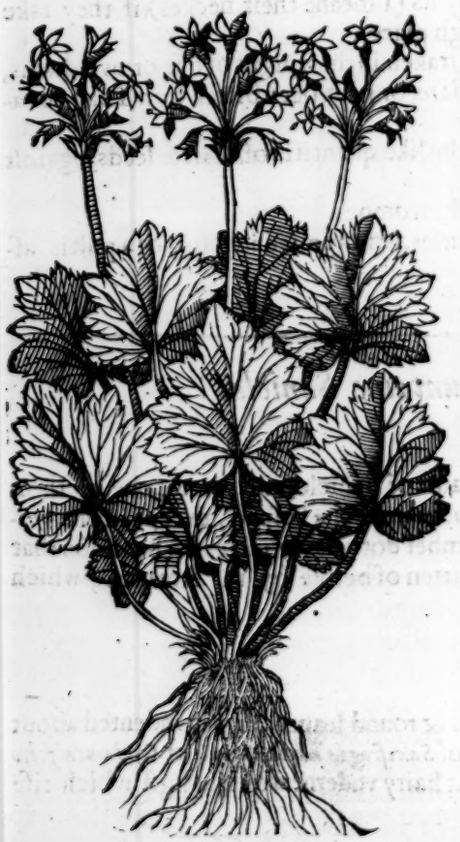
¶ *The Deſcription.*

1 SPotted Sanicle of the mountaine hath ſmall fat & round leaues, bluntly indented about the edges, and faſhioned like vnto the leaues of *Saxifragia aurea*, or rather *Cyclamen folio hedera*, of a darke greene colour, and ſomewhat hairy vnderneath: amongſt which riſe

1 *Sanicula guttata.*
Spotted Sanicle.

2 *Pinguicula ſiue Sanicula Eboracenſis.*
Butterwort, or Yorkſhire Sanicle.

3 *Sanicula Alpina Cluſij, ſiue Cortuſa Matthioli.*
Beares eare Sanicle.



vp ſundry ſtalkes, beſet with like leaues, but ſmaller, and of a cubit high, diuiding themſelues into many ſmall armes or branches, bearing diuers little white floures, ſpotted moſt curiouſly with bloudy ſpecks or prickes, inſomuch that if you marke the admirable workemanſhip of the ſame wrought in ſuch glorious manner, it muſt needs put euery creature in minde of his Creator: the floures are in ſmell like the May floures or Hawthorne: the ſeed is ſmall and blacke, contained in ſmall pointals like vnto white Saxifrage: the root is ſcaly and full of ſtrings.

2 The ſecond kind of Sanicle, which *Cluſius* calleth *Pinguicula*, not before his time remembred, hath ſmall thicke leaues, fat and ful of iuyce, being broad towards the root, and ſharpe towards the point, of a faint greene colour, and bitter in taſte: out of the middeſt wherof ſprouteth or ſhooteth vp a naked ſlender ſtalke, nine inches long, euery ſtalke bearing one floure and no more, ſometimes white, and commonly of a blewiſh purple colour, faſhioned like vnto the common *Conſolida regalis*, hauing the like ſpur or Larks heele anexed thereto.

3 The third kinde of mountaine Sanicle ſome

ſome Herbariſts haue called *Sanicula alpina flore rubro*: the leaues ſhoot forth in the beginning of the Spring, very thicke and fat, and are like a purſe or round lumpe at their firſt comming out of the ground; and when it is ſpred abroad, the vpper part thereof is full of veines or ſinewes, and houen vp or curled like *Ranunculus Luſitanicus*, or like the crumpling of a cabbage leafe; and are not onely indented about the edges, but each leafe is diuided into ſix or more iagges or cuts, deepely hacked, greeniſh aboue, and of an ouerworne greene colour vnderneath, hot in taſte; from the middle whereof ſhooteth forth a bar or naked ſtalke, ſix inches long, ſomewhat purple in colour, bearing at the top a tuft of ſmall hollow floures, looking or hanging downewards like little bells, not vnlike in forme to the common Cowſlips, but of a fine deepe red colour tending to purple, hauing in the middle a certaine ring or circle of white, and alſo certaine pointals or ſtrings, which turne into an head wherein is contained ſeed. The whole plant is couered as it were with a rough woollineſſe: the root is fibrous and threddy.

¶ *The Place.*

Theſe plants are ſtrangers in England; their naturall countrey is the Alpiſh mountains of Heluetia: they grow in my garden, where they flouriſh exceedingly, except Butterwort, which groweth in our Engliſh ſqually wet grounds, and will not yeeld to any culturing or tranſplanting: it groweth eſpecially in a field called Crag-Cloſe, and at Crosby, Rauenſwaith, in Weſtmerland, vpon Ingleborow fels twelue miles from Lancaſter, and in Harwood in the ſame countie neere to Blackburne, ten miles from Preſton in Aunderneſſe vpon the bogs and mariſh grounds, and in the boggie medowes about Biſhops Hatfield; and alſo in the fens in the way to Wittles meare from London, in Huntingdonſhire. ‡ It groweth alſo in Hampſhire, and aboundantly in many places of Wales. ‡

¶ *The Time.*

They floureand flouriſh from May to the end of Iuly.

¶ *The Names.*

The firſt is called *Sanicula guttata*, taken from the ſpots wherewith the floures are marked: of *Lobel*, *Geum Alpinum*, making it a kind of Auens: in Engliſh, ſpotted Sanicle: of our London dames, Pratling Parnell.

The ſecond is called *Pinguicula*, of the fatneſſe or fulneſſe of the leafe, or of fatning: in Yorkeſhire, where it doth eſpecially grow, and in greateſt aboundance, it is called Butterworts, Butterroot, and white root; but the laſt name belongeth more properly to Solomons Seale.

¶ *The Temperature and Vertues.*

They are hot and dry in the third degree.

The husbandmens wiues of Yorkſhire do vſe to anoint the dugs of their kine with the fat and oilous iuyce of the herbe Butterwort, when they are bitten with any venomous worme, or chapped, rifted, and hurt by any other meanes. A

They ſay it rots their ſheepe, when for want of other food they eat thereof. B

Chap. 277. *Of Fox-Gloues.*

¶ *The Deſcription.*

1 FOx-gloue with the purple floure is moſt common; the leaues whereof are long, nicked in the edges, of a light greene, in manner like thoſe of Mullein, but leſſer, and not ſo downie: the ſtalke is ſtraight, from the middle whereof to the top ſtand the floures, ſet in a courſe one by another vpon one ſide of the ſtalke, hanging downwards with the bottome vpward, in forme long, like almoſt to finger ſtalks, whereof it tooke his name *Digitalis*, of a red purple colour, with certaine white ſpots daſht within the floure; after which come vp round heads, in which lies the ſeed, ſomewhat browne, and as ſmall as that of Time. The roots are many ſlender ſtrings.

2 The Fox-gloue with white floures differs not from the precedent but in the colour of the floures; for as the others were purple, theſe contrariwiſe are of a milke-white colour.

3 We haue in our gardens another ſort hereof, which bringeth forth moſt pleaſant yellow floures, and ſomewhat leſſe than the common kinde, wherein they differ. ‡ This alſo differs from the common kind in that the leaues are much ſmoother, narrower, and greener, hauing the nerues or vrines running alongſt it, neither are the nerues ſnipt, nor ſinuated on their edges. ‡

4 We haue alſo another ſort, which we call *Digitalis ferruginea*, whoſe floures are of the colour of ruſty iron; whereof it tooke his name, and likewiſe maketh the difference. ‡ Of this ſort there is a bigger and a leſſer; the bigger hath the lower leaues ſome foot long, of a darke green colour, with veines running along them; the ſtalks are ſome yard and halfe high: the floures large,

1 *Digitalis purpurea.*
Purple Fox-gloues.

2 *Digitalis alba.*
White Fox-gloues.

‡ 3 *Digitalis lutea.*
Yellow Fox-gloues.

‡ 4 *Digitalis ferruginea.*
Dusky Fox-gloues.

and ending in a ſharpe turned vp end as you ſee in the figure, and they are of a ruſtie colour, mixed of a yellow and red.

5 The leſſer duskie Fox-gloue hath much leſſe leaues and thoſe narrow, ſmooth, and exceeding greene: amongſt which comes vp a ſtalke ſome foot high, hauing ſmall floures of the colour of the laſt deſcribed. This I obſerued the laſt yeare 1632, in floure with M^r. *Iohn Tradeſcant* in the middle of Iuly. It may fitly be called *Digitalis ferruginea minor*, Small duskie Fox-gloues. ‡

¶ *The Place.*

Fox-gloue groweth in barren ſandie grounds, and vnder hedges almoſt euery where.

Thoſe with white floures do grow naturally in Landeſdale, and Crauen, in a field called Cragge cloſe, in the North of England: likewiſe by Colcheſter in Eſſex; neere Exceſter in the Weſt parts, and in ſome few other places. The other two are ſtrangers in England, neuertheleſſe they do grow with the others in my garden.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Fox-gloues ſome call in Greeke [illegible], and make it to be *Verbaſci ſpeciem*, or a kinde of Mullein: in Latine, *Digitalis*: in High Dutch, **Fingerhut**, and **Fingher kraut**: in Low Dutch, **Vinger hoet**: in French, *Gantes noſtre dame*: in Engliſh, Fox-gloues. ‡ *Fabius Columna* thinks it to be that *Ephemerum* of *Dioſcorides* deſcribed in his fourth booke, and *cap.* 75. ‡

¶ *The Temperature.*

The Fox-gloues in that they are bitter, are hot and drie, with a certaine kinde of clenſing qualitie ioined therewith; yet are they of no vſe, neither haue they any place amongſt medicines, according to the Antients.

¶ *The Vertues.*

Fox-gloue boiled in water or wine, and drunken, doth cut and conſume the thicke toughneſſe of groſſe and ſlimie flegme and naughtie humours; it openeth alſo the ſtopping of the liuer, ſpleene, and milt, and of other inward parts. A

The ſame taken in like manner, or boiled with honied water or ſugar, doth ſcoure and clenſe the breſt, ripeneth and bringeth forth tough and clammie flegme. B

They ſerue for the ſame purpoſes whereunto Gentian doth tend, and hath beene vſed in ſtead thereof, as *Galen* ſaith. C

‡ Where or by what name *Galen* either mentions, or affirmes this which our Authour cites him for, I muſt confeſſe I am ignorant. But I probably coniecture that our Authour would haue ſaid *Fuchſius*: for I onely finde him to haue theſe words ſet downe by our Authour, in the end of his Chapter of *Digitalis*. ‡ D

Chap. 278. *Of Baccharis out of* Dioſcorides.

¶ *The Deſcription.*

1 About this plant *Baccharis* there hath beene great contention amongſt the old and new writers; *Matthiolus* and *Dodonæus* haue miſtaken this plant, for *Coniza maior*, or *Coniza Helenitis Cordi*; *Virgil* and *Athenæus* haue confounded *Baccharis*, and *Aſarum* together: but following the antient writers, it hath many blackiſh rough leaues, ſomewhat bigger than the leaues of Primroſe: amongſt which riſeth vp a ſtalke two cubits high, bearing at the top little chaffie or ſcalie floures in ſmall bunches, of a darke yellowiſh or purple colour, which turne into downe, and are carried away with the winde, like vnto the kindes of thiſtles: the root is thick, groſſe, and fat, ſpreading about in the earth, full of ſtrings: the fragrant ſmell that the root of this plant yeeldeth, may well be compared vnto the ſauour of Cinnamon, *Helenium*, or *Enula Campana*, beeing a plant knowne vnto very many or moſt ſorts of people, I meane in moſt parts of England.

¶ *The Place.*

Baccharis delighteth to grow in rough and craggy places, and in a leane ſoile where no moiſture

is:

Baccharis Monſpelienſium.
Plowmans Spikenard.

is: it groweth very plentifully about Montpellier in France, and diuers places in the Weſt parts of England.

¶ *The Time.*

It ſpringeth vp in April, it floureth in Iune, and perfecteth his ſeed in Auguſt.

¶ *The Names.*

The learned Herbariſts of Montpellier haue called this plant *Baccharis*: the Grecians, βάκχεις, or after others, νάρδος, by reaſon of that ſweet and aromaticall ſauour which his root containeth and yeeldeth: in Engliſh it may be called the Cinamom root, or Plowmans Spiknard: *Virgill* in his ſeuenth Ecloge of his Bucolicks maketh mention of *Baccharus*, and doth not onely ſhew that it is a Garland plant, but alſo ſuch a one as preuaileth againſt inchantments, ſaying,

——Bacchare frontem
Cingite, ne vati noceat mala lingua futuro.

With Plowmans Nard my forehead girt,
Leſt euill tongue thy Poet hurt.

Baccharis is likewiſe an ointment in *Athenæus*, in his 15 booke, which may take his name of the ſweet herbe *Baccharis*: for as *Pliny* writeth, *Ariſtophanes* of old, being an antient comical Poet witneſſeth, that ointments were wont to bee made of the root thereof: to bee briefe, *Crateuas* his *Aſarum* is the ſame that *Dioſcorides* his *Baccharis* is. ‡ This plant here deſcribed is the *Coniza maior* of *Matthiolus*, *Tragus*, and others. ‡

¶ *The Temperature.*

Baccharis or Plowmans Spiknard is of temperature very aſtringent or binding.

¶ *The Vertues.*

A *Baccharis*, or the decoction of the root, as *Paulus Ægineta* briefely ſetteth downe, doth open the pipes and paſſages that are ſtopped, prouoketh vrine, and bringeth downe the deſired ſickneſſe: the leaues thereof for that they are aſtringent or binding, ſtop the courſe of fluxes and rheumes.

B *Baccharis* is a ſingular remedie to heale inflammations and Saint Anthonies fire, called *Ignis ſacer*, and the ſmell thereof prouoketh ſleepe.

C The decoction of the roots of *Baccharis* helpeth ruptures and conuulſions, thoſe alſo that haue falne from an high place, and thoſe that are troubled with the ſhortneſſe of breath.

D It helpeth alſo the old cough, and difficultie to make water.

E When it is boiled in wine it is giuen with great profit againſt the bitings of Scorpions, or any venomous beaſt, being implaiſtered and applied thereto.

F A bath made thereof and put into a cloſe ſtoole, and receiued hot, mightily voideth the birth, and further thereth thoſe that haue extreame labour in their childing, cauſing them to haue eaſie deliuerance.

Chap. 279: *Of Elecampane.*

¶ *The Deſcription.*

Elecampane bringeth forth preſently from the root great white leaues, ſharpe pointed, almoſt like thoſe of great Comfrey, but ſoft, and couered with a hairie downe, of a whitiſh greene co-

[lour,

Helenium:
Elecampane.

lour, and are more white vnderneath, ſleightly nicked in the edges: the ſtalke is a yard and a halfe long, about a finger thicke, not without downe, diuided at the top into diuers branches, vpon the top of euery ſprig ſtand great floures broad and round, of which not only the long ſmal leaues that compaſſe round about are yellow, but alſo the middle ball or circle, which is filled vp with an infinit number of threds, and at length is turned into fine downe; vnder which is ſlender and long ſeed: the root is vneuen, thicke, and as much as a man may gripe, not long, oftentimes blackiſh without, white within, and full of ſubſtance, ſweet of ſmell, and bitter of taſte.

¶ *The Place.*

It groweth in medowes that are fat and fruitfull: it is alſo oftentimes found vpon mountains, ſhadowie places, that be not altogether drie: it groweth plentifully in the fields on the left hand as you go from Dunſtable to Puddle hill: alſo in an orchard as you go from Colbrook to Ditton ferry, which is the way to Windſor, and in ſundry other places, as at Lidde, and Folkeſtone, neere to Douer by the ſea ſide.

¶ *The Time.*

The floures are in their brauerie in Iune & Iuly: the roots be gathered in Autumne, and oftentimes in Aprill and May.

¶ *The Names.*

That which the Græcians name *Ἑλένιον*, the Latines call *Inula* and *Enula*: in ſhops *Enula campana*: in high Dutch, **Alantwurtz**: in low Dutch, **Alandt woztele**: in Italian, *Enoa*, and *Enola*: in Spaniſh, *Raiz del alla*: in French, *Enula Campane*: in Engliſh, Elecampane, and Scab-woort, and Horſe-heale: ſome report that this plant tooke the name *Helenium* of *Helena* wife to *Menelaus*, who had her hands ful of it when *Paris* ſtole her away into Phrygia.

¶ *The Temperature.*

The root of this Elecampane, is maruellous good for many things, being of nature hot and drie in the third degree, eſpecially when it is drie: for beeing greene and as yet full of iuice, it is full of ſuperfluous moiſture, which ſomewhat abateth the hot and drie qualitie thereof.

¶ *The Vertues.*

It is good for ſhortneſſe of breath, and an old cough, and for ſuch as cannot breathe vnleſſe they hold their necks vpright. A

It is of great vertue both giuen in a looch, which is a medicine to be licked on, and likewiſe preſerued, as alſo otherwiſe giuen to purge and void out thicke, tough, and clammie humours, which ſticke in the cheſt and lungs. B

The root preſerued is good and wholeſome for the ſtomack: being taken after ſupper it doth not onely helpe digeſtion, but alſo keepeth the belly ſoluble. C

The iuice of the ſame boiled, driueth forth all kinde of wormes of the belly, as *Pliny* teacheth: who alſo writeth in his twentie booke, and fift chapter, the ſame being chewed faſting, doth faſten the teeth.

The root of Elecampane is with good ſucceſſe mixed with counterpoiſons: it is a remedie againſt the bitings of ſerpents, it reſiſteth poiſon: it is good for them that are burſten, and troubled with cramps and conuulſions. D

Some alſo affirme, that the decoction thereof, and likewiſe the ſame beaten into powder and mixed with honie in manner of an ointment, doth clenſe and heale vp old vlcers. E

Galen ſaith, that herewith the parts are to be made red, which be vexed with long & cold griefs: as are diuers paſſions of the huckle bones, called the Sciatica, and little and continual bunnies and looſeneſſe of certaine ioints, by reaſon of ouermuch moiſture. F

The

H The decoction of *Enula* drunken, prouoketh vrine, and is good for them that are grieued with inward burſtings, or haue any member out of ioint.

I The root taken with honie or ſugar, made in an electuarie, clenſeth the breſt, ripeneth tough flegme, and maketh it eaſie to be ſpet forth, and preuaileth mightily againſt the cough and ſhortneſſe of breath, comforteth the ſtomacke alſo, and helpeth digeſtion.

K The roots condited after the manner of *Eringos* ſerueth for the purpoſes aforeſaid.

L The root of *Enula* boiled very ſoft, and mixed in a morter with freſh butter and the powder of Ginger, maketh an excellent oinrment againſt the itch, ſcabs, mangineſſe, and ſuch like.

M The roots are to be gathered in the end of September, and kept for ſundrie vſes, but it is eſpecially preſerued by thoſe that make Succade and ſuch like.

Chap. 280. *Of Sauce alone, or Jacke by the hedge.*

Alliaria.
Sauce alone.

¶ *The Deſcription.*

Sauce alone hath affinitie with Garlicke in name, not becauſe it is like it in forme, but in ſmell: for if it be bruiſed or ſtamped it ſmelleth altogether like Garlicke: the leaues hereof are broad, of a light green colour, nicked round about, and ſharpe pointed: the ſtalke is ſlender, about a cubit high, about the branches whereof grow little white floures; after which come vp ſlender ſmal and long cods, & in theſe black ſeed: the root is long, ſlender, and ſomething hard.

¶ *The Place.*

It groweth of it ſelfe by garden hedges, by old wals, by highwaies ſides, or oftentimes in the borders of fields.

¶ *The Time.*

It floureth chiefely in Iune and Iuly, the ſeed waxeth ripe in the meane ſeaſon. The leaues are vſed for a ſauce in March or Aprill.

¶ *The Names.*

The later writers call it *Alliaria*, and *Alliaris*: of ſome, *Rima Maria*: it is not *Scordium*, or water Germander, which the apothecaries in times paſt miſtooke for this herbe: neither is it *Scordij ſpecies*, or a kinde of water Germander, whereof wee haue written: it is named of ſome, *Pes Aſininus*: it is called in High Dutch, Knoblauch kraut Leuchel, and Salzkraut: and in Low Dutch, Looks ſonder Looch: you may name it in Latine, *Allium non bulboſum*: in French, *Alliayre*: in Engliſh, Sauce alone, and Iacke of the hedge.

¶ *The Temperature.*

Iacke of the hedge is hot and drie, but much leſſe than Garlicke, that is to ſay, in the end of the ſecond degree, or in the beginning of the third.

¶ *The Vertues.*

A We know not what vſe it hath in medicine: diuers eat the ſtamped leaues hereof with Salt-fiſh, for a ſauce, as they do thoſe of Ramſons.

B Some alſo boile the leaues in cliſters which are vſed againſt the paine of the collicke and ſtone, in which not only winde is notably waſted, but the pain alſo of the ſtone mitigated and very much eaſed.

Chap.

CHAP. 281. *Of Dittany.*

¶ *The Deſcription.*

DIttanie of Crete now called Candie (as *Dioſcorides* ſaith) is a hot and ſharpe hearbe, much like vnto Penni-roiall, ſauing that his leaues be greater and ſomewhat hoary, couered ouer with a ſoft downe or white woollie cotton: at the top of the branches grow ſmall ſpikie eares or ſcaly aglets, hanging by little ſmall ſtemmes, reſembling the ſpiky tufts of Marierome, of a white colour: amongſt which ſcales there doe come forth ſmall floures like the flouring of wheat, of a red purple colour; which being paſt, the knop is found full of ſmall ſeed, contrarie to the ſaying of *Dioſcorides*, who ſaith, it neither beareth floure nor ſeed, but my ſelfe haue ſeene it beare both in my Garden: the whole plant periſhed in the next VVinter following.

1 *Dictamnum Creticum.*
Dittanie of Candie.

2 *Pſeudodictamnum.*
Baſtard Dittanie.

2 The ſecond kind called *Pſeudodictamnum*, that is, Baſtard Dittanie, is much like vnto the firſt ſauing that it is not ſweet of ſmell, neither doth it bite the tongue, hauing round ſoft woolly ſtalks with knots and ioints, and at euery knot two leaues ſomewhat round, ſoft, woolly, and ſomewhat bitter: the floures be of a light purple color, compaſſing the ſtalks by certain ſpaces like garlands or wharles, and like the floures of Peni-roiall. The root is of a wooddie ſubſtance: the whole plant groweth to the height of a cubite and an halfe, and laſteth long.

¶ *The Place.*

The firſt Dittanie commeth from Crete, an Iland which we call Candie, where it growes naturally: I haue ſowne it in my garden, where it hath floured and borne ſeed; but it periſhed by reaſon of the iniurie of our extraordinarie cold winter that then happened: neuertheleſſe *Dioſcorides* writeth

writeth againſt all truth, that it neither beareth floures nor ſeed: after *Theophraſtus*, *Virgil* witneſſeth that it doth beare floures in the twelfth of his Æneidos.

Dictamnum genitrix Cretæa carpit ab Ida,
Puberibus caulem foliis, & flore comantem
Purpureo.———

In Engliſh thus:

His mother from the Cretæan Ida crops
Dictamnus hauing ſoft and tender leaues,
And purple floures vpon the bending tops, &c.

¶ *The Time.*

They floure and flouriſh in the Sommer moneths, their ſeed is ripe in September.

¶ *The Names.*

It is called in Greeke δίκταμνον: in Latine, *Dictamnus* and *Dictamnum*: of ſome, *Pulegium ſylueſtre*, or wilde Pennie-roiall: the Apothecaries of Germanie for *Dictamnum* with *c*, in the firſt ſyllable, doe read *Diptamnum* with *p*: but (ſaith *Dodonæus*) this errour might haue beene of ſmall importance, if in ſtead of the leaues of Dittanie, they did not vſe the rootes of *Fraxinella* for Dittany, which they falſely call *Dictamnum*: in Engliſh, Dittanie, and Dittanie of Candie.

The other is called *Pſeudodictamnum*, or baſtard Dittanie, of the likeneſſe it hath with Dittanie, it skilleth not, though the ſhoppes know it not: the reaſon why let the Reader gueſſe.

¶ *The Temperature.*

Theſe plants are hot and drie of nature.

¶ *The Vertues.*

A Dittanie beeing taken in drinke, or put vp in a peſſarie, or vſed in a fume, bringeth away dead children: it procureth the monethly termes, and driueth foorth the ſecondine or the after-birth.

B The iuice taken with wine is a remedie againſt the ſtinging of ſerpents.

C The ſame is thought to be of ſo ſtrong an operation, that with the very ſmell alſo it driueth away venomous beaſts, and doth aſtoniſh them.

D It is reported likewiſe that the wilde Goats and Deere in Candie when they be wounded with arrowes, do ſhake them out by eating of this plant, and heale their wounds.

E It preuaileth much againſt all wounds, and eſpecially thoſe made with invenomed weapons, arrowes ſhot out of guns, or ſuch like, and is very profitable for Chirurgians that vſe the ſea and land wars, to carry with them and haue in readineſſe: it draweth forth alſo ſplinters of wood, bones, or ſuch like.

F The baſtard Dittanie, or *Pſeudodictamnum*, is ſomewhat like in vertues to the firſt, but not of ſo great force, yet it ſerueth exceeding well for the purpoſes aforeſaid.

Chap. 282. *Of Borage.*

¶ *The Deſcription.*

1 Borage hath broad leaues, rough, lying flat vpon the ground, of a blacke or ſwart green colour: among which riſeth vp a ſtalke two cubits high, diuided into diuers branches, whereupon do grow gallant blew floures, compoſed of fiue leaues apiece; out of the middle of which grow forth blacke threds ioined in the top, and pointed like a broch or pyramide: the root is threddie, and cannot away with the cold of winter.

2 Borage with white floures is like vnto the precedent, but differeth in the floures, for thoſe of this plant are white, and the others of a perfect blew colour, wherein is the difference.

† 3 Neuer dying Borage hath manie verie broad leaues, rough and hairie, of a blacke darke greene colour: among which riſe vp ſtiffe hairie ſtalkes, whereupon doe grow faire blew floures, ſomewhat rounder pointed than the former: the root is blacke and laſting, hauing leaues both winter and Sommer, and hereupon it was called *Semper virens*, and that very properly, to diſtinguiſh it from the reſt of this kinde, which are but annuall. ‡

4 There

1 *Borago hortenſis.*
Garden Borage.

2 *Borago flore albo.*
White floured Borage.

3 *Borago ſemper virens.*
Neuer dying Borage.

4 There is a fourth ſort of Borage that hath leaues like the precedent, but thinner and leſſer, rough and hairy, diuiding it ſelfe into branches at the bottom of the plant, whereupon are placed faire red floures, wherein is the chiefeſt difference between this and the laſt deſcribed. ‡ The figure which belonged to this deſcription was put hereafter for *Lycopſis Anglica.* ‡

¶ *The Place.*

Theſe grow in my garden, and in others alſo.

¶ *The Time.*

Borage floures and flouriſhes moſt part of all Sommer, and till Autumne be far ſpent.

¶ *The Names.*

Borage is called in ſhops *Borago*: of the old Writers, Euphrasion, which is called in Latine *Lingua Bubula*: *Pliny* calleth it *Euphroſinum*, becauſe it maketh a man merry and ioyfull: which thing alſo the old verſe concerning Borage doth teſtifie:

Ego Borago gaudia ſemper ago.

I Borage bring alwaies courage.

It is called in high Dutch **Burretſch**: in Italian, *Boragine*: in Spaniſh, *Boraces*: in low Dutch, **Beruagie**: in Engliſh, Borage.

¶ *The Temperature.*

It is euidently moiſt, and not in like ſort hot, but ſeemes to be in a meane betwixt hot and cold.

¶ *The Vertues.*

Thoſe of our time do vſe the floures in ſallads, to exhilerate and make the mind glad. There be alſo many things made of them, vſed euery where for the comfort of the heart, for the driuing away of ſorrow, and encreaſing the ioy of the minde. A

B The leaues boyled among other pot-herbes do much preuaile in making the belly ſoluble, they being boyled in honied water be alſo good againſt the roughneſſe of the throat, and hoarſeneſſe, as *Galen* teacheth.

C The leaues and floures of Borage put into Wine make men and women glad and merry, and driue away all ſadneſſe, dulneſſe, and melancholy, as *Dioſcorides* and *Pliny* affirme.

D Syrrup made of the floures of Borage comforteth the heart, purgeth melancholy, and quieteth the phrenticke or lunaticke perſon.

E The floures of Borage made vp with ſugar do all the aforeſaid with greater force and effect.

F Syrrup made of the iuyce of Borage with ſugar, adding thereto pouder of the bone of a Stags heart, is good againſt ſwouning, the cardiacke paſſion of the heart, againſt melancholy and the falling ſickneſſe.

G The root is not vſed in medicine: the leaues eaten raw ingender good bloud, eſpecially in thoſe that haue been lately ſicke.

Chap. 283. *Of Bugloſſe.*

¶ *The Kindes.*

Like as there be diuers ſorts of Borage, ſo are there ſundry of the Bugloſſes; notwithſtanding after *Dioſcorides*, Borage is the true Bugloſſe: many are of opinion, and that rightly, that they may be both referred to one kinde; yet will we diuide them according to the cuſtome of our time, and their vſuall denominations.

1 *Bugloſſa vulgaris.*
Common Bugloſſe, or Garden Bugloſſe.

2 *Bugloſſum luteum.*
Lang de beefe.

¶ *The Deſcription.*

1 THat which the Apothecaries call Bugloſſe bringeth forth leaues longer than thoſe of Borage, ſharpe pointed, longer than the leaues of Beets, rough and hairy. The ſtalke groweth vp to the height of two cubits, parted aboue into ſundry branches, whereon are orderly placed blewiſh floures, tending to a purple colour before they be opened, and afterward more blew. The root is long, thicke, and groſſe, and of long continuance.

2 Lang

‡ 3 *Bugloſſa ſylueſtris minor.*
Small wilde Bugloſſe.

2 *Lang de Beefe* is a kinde hereof, altogether leſſer, but the leaues hereof are rougher, like the rough tongue of an oxe or cow, whereof it tooke his name. ‡ The leaues of *Lang-de-Beefe* are very rough, the ſtalke ſome cubit and halfe high, commonly red of colour: the tops of the branches carry floures in ſcaly rough heads: theſe floures are compoſed of many ſmall yellow leaues in manner of thoſe of Dandelion, and flie away in down like as they do: the floures are of a verie bitter taſte, whence *Lobel* calls it *Bugloſſum echioides luteum Hieracio cognatum. Tabernamontanus* hath fitly called it *Hieracium echioides.*

3 There is another wilde Bugloſſe which *Dodonæus* hath by the name of *Bugloſſa ſylueſtris:* it hath a ſmall white root, from which ariſes a ſlender ſtalke ſome foot and halfe high ſet with ſmal rough leaues ſinuated or cut in on the edges: the ſtalkes at the top are diuided into three or foure ſmall branches, bearing ſmall blew floures in rough huskes. ‡

¶ *The Place.*

Theſe do grow in gardens euery where. ‡ The *Lang-de-Beefe* growes wilde in many places; as betweene Redriffe and Deptford by the waterie ditch ſides. The little wilde Bugloſſe growes vpon the drie ditch bankes about Pickadilla, and almoſt eueſty where. ‡

¶ *The Time.*

They floure from May, or Iune, euen to the end of Sommer. The leaues periſh in Winter, and new come vp in the Spring.

¶ *The Names.*

Garden Bugloſſe is called of the later Herbariſts *Bugloſſa*, and *Bugloſſa Domeſtica:* or garden Bugloſſe.

Lang-de Beefe is called in Latine *Lingua bouis*, and *Bugloſſum Luteum Hieracio cognatum*, and alſo *Bugloſſa ſylueſtris*, or wilde Bugloſſe.

‡ Small wilde Bugloſſe is called *Borago ſylueſtris* by *Tragus*; *Echium Germanicum Spinoſum* by *Fuchſius*; and *Bugloſſa ſylueſtris* by *Dodonæus.* ‡

¶ *The Temperature and Vertues.*

The root, ſaith *Dioſcorides*, mixed with oile, cureth greene wounds, and adding thereto a little barley meale, it is a remedie againſt Saint Anthonies fire. A

It cauſeth ſweat in agues, as *Plinie* ſaith, if the iuice be mixed with a little *Aquavitæ*, and the body rubbed therewith. B

The Phyſitions of the later time vſe the leaues, floures, and roots in ſtead of Borage, and put them both into all kindes of medicines indifferently, which are of force and vertue to driue away ſorrow and penſiueneſſe of the minde, and to comfort and ſtrengthen the heart. The leaues are of like operation with thoſe of Borage, and are vſed as potherbes for the purpoſes aforeſaid, as wel Bugloſſe as *Lang-de-Beefe*, and alſo to keepe the belly ſoluble. C

Chap. 284. *Of Alkanet or wilde Bugloſſe.*

¶ *The Deſcription.*

Theſe herbes comprehended vnder the name of *Anchuſa*, were ſo called of the Greeke word ἀγχόυειν (i) *Illinere ſucco, vel pigmentis*, that is, to colour or paint any thing: whereupon theſe

† 1 *Anchuſa Alcibiadion.*
Red Alkanet.

† 2 *Anchuſa lutea.*
Yellow Alkanet.

‡ 3 *Anchuſa minor.*
Small Alkanet.

plants were called *Anchuſa* of that flouriſhing and bright red colour which is in the root, euen as red as pure and cleere bloud: for that is the onely marke or note whereby to diſtinguiſh theſe herbes from thoſe which be called *Echum*, *Lycopſis*, and *Bugloſſa*, whereto they haue a great reſemblance: I haue therefore expreſſed foure differences of this plant *Anchuſa* or Alkanet from the other kindes, by the leaues, floures, and bigneſſe.

1 The firſt kinde of Alkanet hath many leaues like *Echium*, or ſmall Bugloſſe, couered ouer with a prickie hoarineſſe, hauing commonly but one ſtalke, which is round, rough, and a cubite high. The cups of the floures are of a skie colour tending to purple, not vnlike the floures of *Echium*; the ſeed is ſmall, ſomewhat long, and of a pale colour: the root is a finger thicke, the pith or inner part thereof is of a wooddie ſubſtance, dying the hands or whatſoeuer toucheth the ſame, of a bloudie colour, or of the colour of ſaunders.

2 The ſecond kinde of *Anchuſa* or Alkanet is of greater beautie and eſtimation than the firſt; the branches are leſſe and more buſhie in the toppe: it hath alſo greater plentie of leaues, and thoſe more woollie or hairie: the ſtalke groweth to the height of two cubites: at the top grow floures of a yellow colour, far different from the other: the root is more ſhining, of an excellent delicate purpliſh colour, and more full of iuice than the firſt.

3 There

3 There is a ſmall kinde of Alkanet, whoſe root is greater and more ful of iuice and ſubſtance than the roots of the other kindes: in all other reſpects it is leſſe, for the leaues are narrower, ſmaller, tenderer, and in number more, very greene like vnto Borage, yeelding forth many little tender ſtalks: the floures are leſſe than of the ſmall Bugloſſe, and red of colour: the ſeed is of an aſhe colour, ſomewhat long and ſlender, hauing the taſte of Bugloſſe.

4 There is alſo another kinde of Alkanet, which is as the others before mentioned, a kinde of wilde Bugloſſe, notwithſtanding for diſtinctions ſake I haue ſeparated and ſeuered them. This laſt *Anchuſa* hath narrow leaues, much like vnto our common Sommer Sauorie. The ſtalkes are two handfuls high, bearing very ſmal floures, and of a blewiſh or skie colour: the root is of a dark browniſh red colour, dying the hands little or nothing at all, and of a wooddie ſubſtance.

¶ *The Time.*

Theſe plants do grow in the fields of Narbone, and about Montpellier and many other parts of France: I found theſe plants growing in the Iſle of Thanet neere vnto the ſea, betwixt the houſe ſometime belonging to Sir *Henrie Criſpe*, and Margate; where I found ſome in their naturall ripeneſſe, yet ſcarcely any that were come to that beautifull colour of Alkanet: but ſuch as is ſold for very good in our Apothecaries ſhops I found there in great plentie.

‡ I doubt whether our Authour found any of theſe in the place heere ſet downe, for I haue ſought it but failed of finding; yet if he found any it was onely the firſt deſcribed, for I think the other three are ſtrangers. ‡

¶ *The Time.*

The Alkanets floure and flouriſh in the Sommer moneths: the roots doe yeeld their bloudie iuice in harueſt time, as *Dioſcorides* writeth.

¶ *The Names.*

Alkanet is called in Greeke ἄνχουσα in Latine alſo *Anchuſa*: of diuers, *Fucus herba*, and *Onocleia*, *Bugloſſa Hiſpanica*, or Spaniſh Bugloſſe: in Spaniſh, *Soagem*: in French, *Orchanet*: and in Engliſh likewiſe Orchanet and Alkanet.

¶ *The Temperature.*

The roots of Alkanet are cold and drie, as *Galen* writeth, and binding, and becauſe it is bitter it clenſeth away cholericke humours: the leaues bee not ſo forceable, yet doe they likewiſe binde and drie.

¶ *The Vertues.*

Dioſcorides ſaith, that the root being made vp in a cerote, or ſearecloth with oile, is very good for A
old vlcers; that with parched barley meale it is good for the leprey, and for tetters and ring-worms.
That being vſed as a peſſarie it bringeth forth the dead birth. B
The decoction being inwardly taken with Mead or honied water, cureth the yellow iaundiſe, C
diſeaſes of the kidneies, the ſpleene and agues.
It is vſed in ointments for womens paintings: and the leaues drunke in wine is good againſt the D
laske.
Diuers of the later Phyſitions do boile with the root of Alkanet and wine, ſweet butter, ſuch as E
hath in it no ſalt at all, vntill ſuch time as it becommeth red, which they call red butter, and giue it not onely to thoſe that haue falne from ſome high place, but alſo report it to be good to driue forth the meaſels and ſmall pox, if it be drunke in the beginning with hot beere.
The roots of theſe are vſed to color ſirrups, waters, gellies, & ſuch like confections as Turnſole is. F
Iohn of *Ardern* hath ſet down a compoſition called *Sanguis Veneris*, which is moſt ſingular in deep G
punctures or wounds made with thruſts, as follows: take of oile oliue a pint, the root of Alkanet two ounces, earth worms purged, in number twenty, boile them together & keep it to the vſe aforeſaid.
The Gentlewomen of France do paint their faces with theſe roots, as it is ſaid. H

† The two figures that were formerly here were both of the ordinary Bugloſſe, whereof the firſt might well enough ſerue, but the 2. was much different from that it ſhould haue been.

Chap. 285. *Of Wall and Vipers Bugloſſe.*

¶ *The Deſcription.*

1 *Lycopſis Anglica*, or wilde Bugloſſe, ſo called for that it doth not grow ſo commonly elſewhere, hath rough and hairie leaues, ſomewhat leſſer than the garden Bugloſſe: the floures grow for the moſt part vpon the ſide of the ſlender ſtalke, in faſhion hollow like a little bell, whereof ſome be blew, and others of a purple colour.

2 There is another kinde of *Echium* that hath rough and hairy leaues likewiſe, much like vnto the former; the ſtalke is rough, charged full of little branches, which are laden on euery ſide with diuers ſmall narrow leaues, ſharp pointed, and of a brown colour: among which leaues grow floures, each floure being compoſed of one leafe diuided into fiue parts at the top, leſſe, and not ſo wide open as that of *Lycopſis*; yet of a ſad blew or purple colour at the firſt, but when they are open they ſhew to be of an azure colour, long and hollow, hauing certaine ſmal blew threds in the middle: the ſeed is ſmall and black, faſhioned like the head of a ſnake or viper: the root is long, and red without.

† 1 *Lycopſis Anglica.*
Wall Bugloſſe.

‡ 2 *Echium vulgare.*
Vipers Bugloſſe.

‡ 3 *Echium pullo flore.*
Rough Vipers Bugloſſe.

‡ 4 *Echium rubro flore.*
Red floured Vipers Bugloſſe.

‡ 3 This hath a creſted very rough and hairy ſtalke ſome foot high; the leaues are like thoſe of Vipers Bugloſſe, and couered ouer with a ſoft downineſſe, and grow diſorderly vpon the ſtalke, which towards the top is parted into ſundry branches, which are diuided into diuers foot-ſtalkes carrying ſmall hollow floures diuided by fiue little gaſhes at their tops; and they are of a darke purple colour, and contained in rough cups lying hid vnder the leaues. The ſeed, as in other plants of this kinde, reſembles a Vipers head: the root is long, as thicke as ones little finger, of a dusky colour on the outſide, and it liues diuers yeares. This floures in May, and growes in the dry medowes and hilly grounds of Auſtria. *Cluſius* calls it *Echium pullo flore*.

4 This other being alſo of *Cluſius* his deſcription hath long and narrow leaues like thoſe of the common Vipers Bugloſſe, yet a little broader: the ſtalkes riſe vp ſome cubit high, firme, creſted, and hairy; vpon which grow aboundance of leaues, ſhorter and narrower than thoſe below; and amongſt theſe towards the top grow many floures vpon ſhort foot-ſtalks, which twine themſelues round like a Scorpions taile: theſe floures are of an elegant red colour, and in ſhape ſomwhat like thoſe of the common kinde; and ſuch alſo is the ſeed, but ſomewhat leſſe: the root is laſting, long alſo, hard, wooddy, and blacke on the outſide, and it ſometimes ſends vp many, but moſt vſually but one ſtalke. It floures in May, and was found in Hungary by *Cluſius*, who firſt ſet it forth by the name of *Echium rubro flore*. ‡

¶ *The Place.*

Lycopſis groweth vpon ſtone walls, and vpon dry barren ſtony grounds.
Echium groweth where Alkanet doth grow, in great aboundance.

¶ *The Time.*

They flouriſh when the other kindes of Bugloſſes do floure.

¶ *The Names.*

It is called in Greeke *Echium*, and Ἀλκιβιάδιον, of *Alcibiades* the finder of the vertues thereof: of ſome it is thought to be *Anchuſa ſpecies*, or a kinde of Alkanet: in high-Dutch, wilde **Ochſenzungen**: in Spaniſh, *Yerua de la Biuora*, or *Chupamel*: in Italian, *Bugloſſa ſaluatica*: in French, *Bugloſſe ſauuage*: in Engliſh, Vipers Bugloſſe, Snakes Bugloſſe; and of ſome, Vipers herbe, and wilde Bugloſſe the leſſer.

¶ *The Temperature.*

Theſe herbes are cold and dry of complexion.

¶ *The Vertues.*

The root drunke with wine is good for thoſe that be bitten with Serpents, and it keepeth ſuch A
from being ſtung as haue drunk of it before: the leaues and ſeeds do the ſame, as *Dioſcorides* writes. *Nicander* in his booke of Treacles makes Vipers Bugloſſe to be one of thoſe plants which cure the biting of ſerpents, and eſpecially of the Viper, and that driue ſerpents away.

If it be drunke in wine or otherwiſe it cauſeth plenty of milke in womens breſts. B

The herbe chewed, and the iuyce ſwallowed downe, is a moſt ſingular remedie againſt poyſon C
and the bitings of any venomous beaſt; and the root ſo chewed and layd vpon the ſore workes the ſame effect.

† That figure which formerly ſtood in the ſecond place, vnder the title of *Onoſma*, and whereof there was no more mention made by our Author, neither in deſcription, name, nor otherwiſe, I take to be nothing elſe than the *Lycopſis* which liues with long leaues ſpred vpon the ground before it comes to ſend vp the ſtalke; as you may ſee it expreſt apart by it ſelfe in the figure we giue you; which is the true figure of that plant our Author deſcribed and meant: for the figure which he gaue was nothing but of the common Borage with narrower leaues, which he deſcribed in the fourth place of the chapter of Borage, as I haue formerly noted.

Chap. 286. *Of Hounds-tongue.*

¶ *The Deſcription.*

1 THe common Hounds tongue hath long leaues much like the garden Bugloſſe, but broader, and not rough at all, yet hauing ſome fine hoarineſſe or ſoftneſſe like veluet. Theſe leaues ſtinke very filthily, much like to the piſſe of dogs; wherefore the Dutch men haue called it **Hounds piſſe**, and not Hounds tongue. The ſtalkes are rough, hard, two cubits high, and of a browne colour, bearing at the top many floures of a darke purple colour: the ſeed is rough, cleauing to garments like Agrimonie ſeed: the root is blacke and thicke. ‡ Theſe plants for one yeare after they come vp of ſeed bring forth onely leaues, and thoſe pretty large; and the ſecond yere they ſend vp their ſtalks, bearing both floures and ſeed, and then vſually the root periſheth. I haue therefore preſented you with the figures of it, both when it floures, and when it ſendeth forth onely leaues. ‡

2 We

1 *Cynogloſſum maius vulgare ſine flore.*
Hounds-tongue without the floure.

1 *Cynogloſſum maius cum flore & ſemine.*
Hounds-tongue with the floure and ſeed.

‡ 2 *Cynogloſſum Creticum* 1.
The firſt Candy Dogs-tongue.

‡ 2 *Cynogloſſum Creticum alterum.*
The other Candy Dogs-tongue.

2 We haue receiued another ſort hereof from the parts of Italy, hauing leaues like Woade, ſomewhat rough, and without any manifeſt ſmell, wherein it differeth from the common kinde; the ſeed hereof came vnder the title *Cynogloſſum Creticum*, Hounds-tongue of Candy. ‡ The floures are leſſer and of a lighter colour than thoſe of the former; the ſeeds alſo are rough, and grow foure together, with a point comming out of the middle of them as in the common kind, but yet leſſer; the root is long and whitiſh. *Cluſius* hath this by the name of *Cynogloſſum Creticum* 1.

3 This ſecond *Cynogloſſum Creticum* of *Cluſius* hath leaues ſome handfull long, and ſome inch and better broad: among which, the next yeare after the ſowing, comes vp a ſtalke ſome cubit or more high, creſted, ſtiffe, and ſtraight, and ſomewhat downy as are alſo the leaues, which grow vpon the ſame, being ſomwhat broad at their ſetting on, and of a yellowiſh greene colour. The top of the ſtalke is diuided into ſundry branches, which twine or turne in their tops like as the Scorpion graſſe, and carry ſhorter yet larger floures than the ordinarie kinde, and thoſe of a whitiſh colour at the firſt, with many ſmall purpliſh veines, which after a few dayes become blew. The ſeeds are like the former in their growing, ſhape, and roughneſſe. ‡

4 We haue another ſort of Hounds-tongue like vnto the common kinde, ſauing it is altogether leſſer: the leaues are of a ſhining greene colour.

‡ 4 *Cynogloſſum minus folio virente.*
Small greene leaued Houndſ-tongue.

¶ *The Place.*

The great Hounds-tongue growes almoſt euery where by high-wayes and vntoiled ground: the ſmall Hounds-tongue groweth very plentifully by the waies ſide as you ride Colcheſter highway from Londonward, betweene Eſterford and Wittam in Eſſex.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Hounds-tongue is called in Greeke, Κυνόγλωσσον: in Latine, *Lingua canis:* of *Pliny*, *Cynogloſſos*; and he ſheweth two kinds thereof: in Engliſh, Hounds-tongue, or Dogs-tongue, but rather Hounds-piſſe, for in the world there is not any thing ſmelleth ſo like vnto Dogs-piſſe as the leaues of this Plant doe.

¶ *The Nature.*

Hounds-tongue, but eſpecially his root, is cold and dry.

¶ *The Vertues.*

The roots of Hounds-tongue roſted in the embers and layd to the fundament, healeth the hemorrhoides, and the diſeaſe called *Ignis ſacer*, or wilde-fire. A

The iuyce boiled with honey of roſes and Turpentine, to the forme of an vnguent, is moſt ſingular in wounds and deepe vlcers. B

Dioſcorides ſaith, That the leaues boyled in wine and drunk, do mollifie the belly, and that the leaues ſtamped with old ſwines greaſe are good againſt the falling away of the haire of the head, which proceedeth of hot ſharpe humors. C

Likewiſe they are a remedie againſt ſcaldings or burnings, and againſt the biting of dogs, as the ſame Author addeth. D

Chap. 287. *Of Comfrey, or great Conſound.*

¶ *The Deſcription.*

1 THe ſtalke of this Comfrey is cornered, thicke, and hollow like that of Sow-thiſtle: it groweth two cubits or a yard high: the leaues that ſpring from the root, and thoſe that grow

1 *Conſolida maior flore purpureo.*
Comfrey with purple floures.

3 ‡ *Symphytum tuberoſum.*
Comfrey with the knobby root.

‡ 4 *Simphytum parvum Boraginis facie.*
Borage-floured Comfrey.

grow vpon the ſtalkes are long, broad, rough, and pricking withall, ſomething hairie, and being handled make the hands itch; very like in colour and roughnes to thoſe of Borage, but longer, and ſharpe pointed, as be the leaues of Elecampane: from out the wings of the ſtalkes appeare the floures orderly placed, long, hollow within, of a light red colour: after them groweth the ſeed, which is blacke. The root is long and thick, blacke without, white within, hauing in it a clammy juice, in which root conſiſteth the vertue.

2 The great Comfrey hath rough hairy ſtalks, and long rough leaues much like the garden Bugloſſe, but greater and blacker: the floures be round and hollow like little bells, of a white colour: the root is blacke without, and white within, and very ſlimy. ‡ This differeth no way from the former but onely in the colour of the floure, which is yellowiſh or white, when as the other is reddiſh or purple. ‡

3 There is another kinde of Comfrey which hath leaues like the former, ſauing that they be leſſer: the ſtalks are rough and tender: the floures be like the former, but that they be of an ouerworn yellow colour: the roots are thicke, ſhort, blacke without, and tuberous, ‡ which in the figure are not expreſſed ſo large and knobby as they ought to haue been. ‡

4 This

‡ 4 This pretty plant hath fibrous and blackiſh roots, from which riſe vp many leaues like thoſe of Borage, or Comfrey, but much ſmaller and greener, the ſtalkes are ſome eight inches high, and on their tops carry pretty floures like thoſe of Borage, but not ſo ſharpe pointed, but of a more pleaſing blew colour. This floures in the ſpring and is kept in ſome choice Gardens. *Lobell* calls it *Symphytum pumilum repens Borraginis facie, ſiue Borrago minima Herbariorum.* ‡

¶ *The Place.*

Comfrey joyeth in watery ditches, in fat and fruitfull medowes; they grow all in my Garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

It is called in Greeke συμφυτον: in Latine *Symphytum*, and *Solidago*: in ſhops, *Conſolida maior*, and *Symphytum maius*: of *Scribonius Largus*, *Inula ruſtica*, and *Alus Gallica*: of others, *Oſteocollon*: in high Dutch, **Wealwurtz**: in low Dutch, **Waelwortele**: in Italian, *Conſolida maggiore*: in Spaniſh, *Suelda maiore*, and *Conſuelda maior*: in French, *Conſire*, and *Oreille d'aſne*: in Engliſh, Comfrey, Comfrey Conſound; of ſome, Knit backe, and Blackewoort.

¶ *The Temperature.*

The root of Comfrey hath a cold quality, but yet not much: it is alſo of a clammie and gluing moiſture, it cauſeth no itch at all, neither is it of a ſharpe or biting taſte, vnſauory, and without any qualitie that may be taſted; ſo far is the tough and gluing moiſture from the ſharpe clammineſſe of the ſea Onion, as that there is no compariſon betweene them. The leaues may cauſe itching not through heate or ſharpeneſſe, but through their ruggedneſſe, as we haue already written, yet leſſe than thoſe of the Nettle.

¶ *The Vertues.*

The rootes of Comfrey ſtamped, and the juice drunke with wine, helpeth thoſe that ſpit bloud, and healeth all inward wounds and burſtings. A

The ſame bruiſed and laid to in manner of a plaiſter, doth heale all freſh and greene woundes, and are ſo glutenatiue, that it will ſodder or glew together meate that is chopt in peeces ſeething in a pot, and make it in one lumpe. B

The rootes boiled and drunke, doe clenſe the breſt from flegme, and cure the griefes of the lungs, eſpecially if they be confect with ſugar and ſyrrup; it preuaileth much againſt ruptures or burſtings. C

The ſlimie ſubſtance of the root made in a poſſet of ale, and giuen to drinke againſt the paine in the backe, gotten by any violent motion, as wraſtling, or ouermuch vſe of women, doth in foure or fiue daies perfectly cure the ſame: although the inuoluntary flowing of the ſeed in men be gotten thereby. D

The roots of Comfrey in number foure, Knotgraſſe and the leaues of Clarie of each an handfull, being ſtamped all together, and ſtrained, and a quart of Muſcadell put thereto, the yolkes of three egges, and the powder of three Nutmegs, drunke firſt and laſt, is a moſt excellent medicine againſt a Gonorrhæa or running of the reines, and all paines and conſumptions of the backe. E

There is likewiſe a ſyrrup made hereof to be vſed in this caſe, which ſtaieth voiding of bloud: tempereth the heate of agues: allaieth the ſharpeneſſe of flowing humors: healeth vp vlcers of the lungs, and helpeth the cough: the receit whereof is this: Take two ounces of the roots of great Comfrey, one ounce of Liquorice; two handfulls of Folefoot, roots and all; one ounce and an halfe of Pine-apple kernells; twenty iuiubes; two drams or a quarter of an ounce of Mallow ſeed; one dram of the heads of Poppy; boile all in a ſufficient quantitie of water, till one pinte remaine, ſtraine it, and and adde to the liquor ſtrained ſix ounces of very white ſugar, and as much of the beſt hony, and make thereof a ſyrrup that muſt be throughly boiled. F

The ſame ſyrrup cureth the vlcers of the kidnies, though they haue been of long continuance; and ſtoppeth the bloud that commeth from thence. G

Moreouer, it ſtaieth the ouermuch flowing of the monethly ſickneſſe, taken euery day for certaine daies together. H

It is highly commended for woundes or hurts of all the reſt alſo of the intrailes and inward parts, and for burſtings or ruptures. I

The root ſtamped and applied vnto them, taketh away the inflammation of the fundament, and ouermuch flowing of the hemorrhoides. K

CHAP.

Chap. 288. *Of Cowſlips of Ieruſalem.*

1 *Pulmonaria maculoſa.*
Spotted Cowſlips of Ieruſalem.

2 *Pulmonaria folijs Echij.*
Bugloſſe Cowſlips.

3 *Pulmoria anguſtifolia ij. Cluſij.*
Narrow leafed Cowſlips of Ieruſalem.

¶ *The Deſcription.*

1 Cowſlips of Ieruſalem, or the true and right Lungwort, hath rough, hairy, and large leaues of a brown green color, confuſedly ſpotted with diuers ſpots, or drops of white: amongſt which ſpring vp certaine ſtalkes, a ſpan long, bearing at the top many fine floures, growing together in bunches like the floures of cowſlips, ſauing that they be at the firſt red, or purple, and ſometimes blew, and oftentimes al theſe colours at once. The floures being fallen, there come ſmall buttons full of ſeed. The root is blacke and threddy. ‡ This is ſometimes found with white floures. ‡

2 The ſecond kinde of Lungwort is like vnto the former, but greater in each reſpect: the leaues bigger than the former, reſembling wilde Bugloſſe, yet ſpotted with white ſpots like the former: the floures are like the other, but of an exceeding ſhining red colour.

3 *Carolus Cluſius* ſetteth forth a third kinde of Lungwoort, which hath rough and hairie leaues, like vnto wilde Bugloſſe, but narrower: among which riſes vp a ſtalke a foot high, bearing at the top a bundle of blew floures, in faſhion like vnto thoſe of Bugloſſe or the laſt deſcribed.

¶ *The*

¶ *The Place.*

Theſe plants do grow in moiſt ſhadowie woods, and are planted almoſt euery where in gardens. ‡ Mr. *Goodyer* found the *Pulmonaria folijs Echij*, being the ſecond, May 25. *Anno* 1620. flouring in a wood by Holbury houſe in the New Forreſt in Hampſhire. ‡

¶ *The Time.*

They floure for the moſt part in March and Aprill.

¶ *The Names.*

Cowſlips of Ieruſalem, or Sage of Ieruſalem, is called of the Herbariſts of our time, *Pulmonaria*, and *Pulmonalis*; of *Cordus*, *Symphitum ſylueſtre*, or wilde Comfrey: but ſeeing the other is alſo of nature wilde, it may aptly be called *Symphytum maculoſum*, or *Maculatum*: in high Dutch, **Lungenkraut:** in low Dutch, **Onſer vrouwen melcruit:** in Engliſh, ſpotted Comfrey, Sage of Ieruſalem, Cowſlip of Ieruſalem, Sage of Bethlem, and of ſome Lungwort; notwithſtanding there is another Lungwort, of which we will intreat among the kindes of Moſſes.

¶ *The Temperature.*

Pulmonaria ſhould be of like temperature with the great Comfrey, if the roote of this were clammie: but ſeeing that it is hard and woody, it is of a more drying quality, and more binding.

¶ *The Vertues.*

The leaues are vſed among pot-herbes. The roots are alſo thought to be good againſt the infirmities and vlcers of the lungs, and to be of like force with the great Comfrey.

† The figure which formerly was in the fourth place of this Chapter, was onely of the firſt deſcribed with white floures. But the Title *Pulmonaria Gallorum*, and the deſcription fitted to it (though little to the purpoſe, and therefore omitted) were intended for the *Pulmonaria Gallorum flore aurea*, whereof I haue in the due place largely treated, as you may ſee in this booke, *pag.* 304. *chap.* 36.

Chap. 289. *Of Clote Burre, or Burre Docke.*

1 *Bardana maior.*
The great Burre Docke.

2 *Bardana minor.*
The leſſe Burre Docke.

¶ *The Deſcription.*

1 CLot Burre bringeth forth broad leaues and hairie, far bigger than the leaues of Gourds, and of greater compaſſe, thicker alſo, and blacker, which on the vpper ſide are of a darke greene colour, and on the nether ſide ſomewhat white: the ſtalke is cornered, thicke, beſet with like leaues, but far leſſe, diuided into very many wings and branches, bringing forth great Burres round like bullets or balls, which are rough all ouer, and full of ſharpe crooking prickles, taking hold on mens garments as they paſſe by; out of the tops whereof groweth a floure thrummed, or all of threds, of colour purple: the ſeed is perfected within the round ball or bullet, and this ſeed when the burres open, and the winde bloweth, is caried away with the winde: the root is long, white within, and blacke without.

‡ There is another kinde hereof which hath leſſer and ſofter heads, with weaker prickles; theſe heads are alſo hairy or downy, and the leaues and whole plant ſomewhat leſſe, yet otherwiſe like the fore deſcribed; *Lobell* calls this *Arction montanum*, and *Lappa minor Galeni*: it is alſo the *Lappa minor altera* of *Matthiolus*. *Lobell* found this growing in Somerſetſhire three miles from Bath, neere the houſe of one M^r. *Iohn Colt*.

2 The leſſer Burre hath leaues farre ſmaller than the former, of a grayiſh ouerworne colour like to thoſe of Orach, nicked round about the edges: the ſtalke is a foot and a halfe high, full of little blacke ſpots, diuiding it ſelfe into many branches: the floures before the Burres come forth do compaſſe the ſmall ſtalkes round about; they are but little, and quickly vade away: then follow the Burres or the fruit out of the boſome of the leaues, in forme long, on the tops of the branches as big as an Oliue or a Cornell berry, rough like the balles of the Plane tree, and being touched cleaue faſt vnto mens garments: they do not open at all, but being kept cloſe ſhut bring forth long ſeeds. The root is faſtened with very many ſtrings, and groweth not deepe.

¶ *The Place.*

The firſt groweth euery where: the ſecond I found in the high way leading from Draiton to Iuer, two miles from Colbrooke, ſince which time I haue found it in the high way betweene Stanes and Egham ‡ It alſo groweth plentifully in Southwickſheet in Hampſhire, as I haue been enformed by M^r. *Goodyer*. ‡

¶ *The Time.*

Their ſeaſon is in Iuly and Auguſt.

¶ *The Names.*

The great Burre is called in Greeke ἀρκτίον: in Latine, *Perſonata*, *perſonatia*, and *Arcium*: in ſhops, *Bardana*, and *Lappa maior*: in high Dutch, **Groſskletten**: in low Dutch, **Groote cliſſen**: in French, *Glouteron*: in Engliſh, Great Burre, Burre Docke, or Clot Burre: *Apuleius* beſides theſe doth alſo ſet downe certaine other names belonging to Clot Burre, as *Dardana*, *Bacchion*, *Elephantoſis*, *Nepheli-on*, *Manifolium*.

The leſſer Burre Docke is called of the Græcians ξάνθιον: in Latine, *Xanthium*: in ſhops, *Lappa minor*, *Lappa inuerſa*, and of diuers, *Strumaria*: *Galen* ſaith it is alſo called, *Phaſganion*, and *Phaſganon*, or herbe victory, being but baſtard names, and therefore not properly ſo called: in Engliſh, Louſe Burre, Ditch Burre, and leſſer Burre Docke: it ſeemeth to be called *Xanthium* of the effect, for the Burre or fruite before it be fully withered, being ſtamped and put into an earthen veſſell, and afterwards when need requireth the weight of two ounces thereof and ſomewhat more, being ſteeped in warme water and rubbed on, maketh the haires of the head red; yet the head is firſt to be dreſſed or rubbed with niter, as *Dioſcorides* writeth.

¶ *The Temperature.*

The leaues of Clot Burre are of temperature moderately dry and waſting; the root is ſomething hot.

The ſeed of the leſſer Burre, as *Galen* ſaith, hath power to digeſt, therefore it is hot and dry.

¶ *The Vertues.*

A The roots being taken with the kernels of Pine Apples, as *Dioſcorides* witneſſeth, are good for them that ſpit bloud and corrupt matter.

B *Apeleius* ſaith that the ſame being ſtamped with a little ſalt, and applied to the biting of a mad dog, cureth the ſame, and ſo ſpeedily ſetteth free the ſicke man.

C He alſo teacheth that the juice of the leaues giuen to drinke with hony, procureth vrine, and taketh away the paines of the bladder; and that the ſame drunke with old wine doth wonderfully helpe againſt the bitings of ſerpents.

D *Columella* declareth, that the herbe beaten with ſalt and laid vpon the ſcarifying, which is made with the launcet or raſer, draweth out the poiſon of the viper: and that alſo the root being ſtamped is more auaileable againſt ſerpents, and that the root in like maner is good againſt the Kings euill.

The

The ſtalke of Clot-burre before the burres come forth, the rinde pilled off, being eaten raw with E
ſalt and pepper, or boyled in the broth of fat meate, is pleaſant to be eaten: being taken in that
manner it increaſeth ſeed and ſtirreth vp luſt.

Alſo it is a good nouriſhment, eſpecially boyled: if the kernell of the Pine Apple be likewiſe F
added it is the better, and is no leſſe auailable againſt the vlcer of the lungs, and ſpitting of bloud,
than the root is.

The root ſtamped and ſtrained with a good draught of Ale is a moſt approued medicine for a G
windie or cold ſtomacke.

Treacle of Andromachus, and the whites of egges, of each a like quantitie, laboured in a leaden H
mortar, and ſpred vpon the Burre leafe, and ſo applied to the gout, haue been proued many times
moſt miraculouſly to appeaſe the paine thereof.

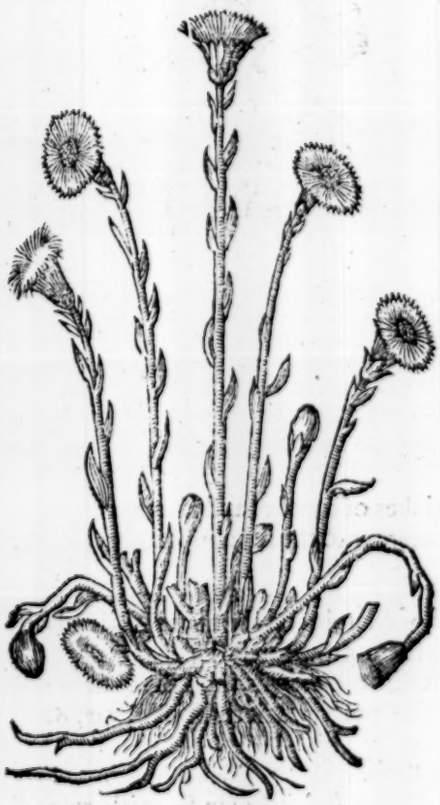
Dioſcorides commendeth the decoction of the root of *Arcion*, together with the ſeed, againſt the I
tooth-ache, if it be holden a while in the mouth: alſo that it is good to foment therewith both
burnings and kibed heeles; and affirmeth that it may be drunke in wine againſt the ſtrangury and
paine in the hip.

Dioſcorides reporteth that the fruit is very good to be laid vnto hard ſwellings. K

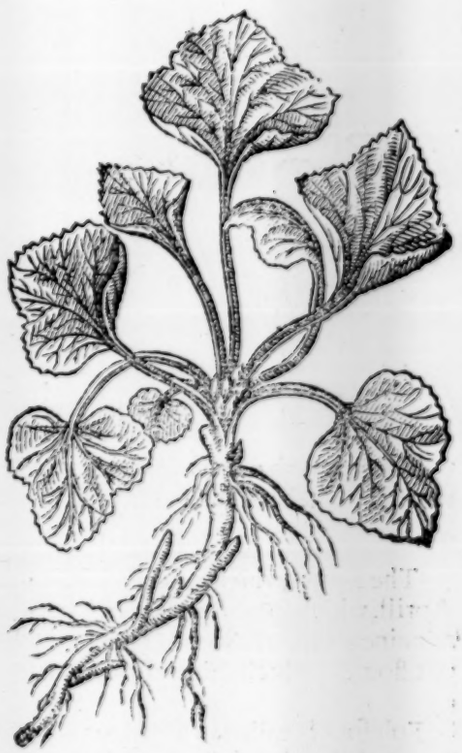
The root cleane picked, waſhed, ſtamped and ſtrained with Malmeſey, helpeth the running of L
the reines, the whites in women, and ſtrengthneth the backe, if there be added thereto the yelks of
egges, the pouder of acornes and nutmegs brued or mixed together, and drunke firſt and laſt.

Chap. 290. *Of Colts-foot, or Horſe-foot.*

1 *Tuſsilago florens.*
Colts-foot in floure.



1 *Tuſsilaginis folia.*
The leaues of Colts-foot.



¶ *The Deſcription.*

1 *Tuſsilago* or Fole-foot hath many white and long creeping roots, ſomewhat fat; from which riſe vp naked ſtalkes (in the beginning of March and Aprill) about a ſpanne long, bearing at the top yellow floures, which change into down, and are caried away with the winde: when the ſtalke and ſeed is periſhed, there appeare ſpringing out of the earth

many broad leaues, green aboue, and next the ground of a white hoarie or grayiſh colour, faſhioned like an horſe foot; for which cauſe it was called Fole-foot, and Horſe-hooſe: ſeldome or neuer ſhall you find leaues and floures at once, but the floures are paſt before the leaues come out of the ground; as may appeare by the firſt picture, which ſetteth forth the naked ſtalkes and floures; and by the ſecond, which pourtraiteth the leaues onely.

‡ 2 Beſides the commonly growing and deſcribed Colts-foot, there are other two ſmall mountaine Colts-feet deſcribed by *Cluſius*; the firſt whereof I will here preſent you with, but the ſecond you ſhall finde hereafter in the chapter of *Aſarum*, by the name of *Aſarina Matthioli*. This here delineated hath fiue or ſix leaues not much vnlike thoſe of Alehoofe, of a darke ſhining green colour aboue, and very white and downy below: the ſtalke is naked ſome handfull high, hollow and downy, bearing one floure at the top compoſed of purpliſh threds, and flying away in downe: after which the ſtalke falls away, and ſo the leaues onely remaine during the reſt of the yeare: the root is ſmall and creeping. It growes on the tops of the Auſtrian and Stirian mountaines, where it floures in Iune or Auguſt. Brought into gardens it floures in Aprill. *Cluſius* calls it *Tuſſilago Alpina* 1. and he hath giuen two figures thereof, both which I here giue you by the ſame titles as he hath them. ‡

‡ 2 *Tuſſilago Alpina flore aperto.*
Mountaine Colts-foot full in floure.

‡ 2 *Tuſſilago Alpina flore evanido.*
Mountaine Colts-foot with the floure fading.

¶ *The Place.*

This groweth of it ſelfe neere vnto Springs, and on the brinkes of brookes and riuers, in wet furrowes, by ditches ſides, and in other moiſt and watery places neere vnto the ſea, almoſt euery where.

¶ *The Time.*

The floures, which quickly fade, are to be ſeene in the end of March, and about the Calends of Aprill, which ſpeedily wither together with the ſtems: after them grow forth the leaues, which remaine greene all Sommer long: and hereupon it came that Colts-foot was thought to be without floures; which thing alſo *Pliny* hath mentioned in his ſixe and twentieth booke, *cap. 6.*

¶ *The Names.*

Folefoot is called in Greeke Βήχιον: of the Latines likewiſe *Bechion*, and *Tuſſilago*: in ſhops, *Farfara*, and *Vngula Caballana*: of diuers, *Pata equina*: in Italian, *Vnghia di Cauallo*: in Spaniſh, *vnha d' aſno*: in French, *Pas d' aſne*: in Engliſh, Fole-foot, Colts-foot, Horſe-hooſe, and Bull-foot. The ſame is alſo *Chamæleuce*, which *Pliny* in his twenty eighth booke, and fifteenth chapter reporteth to be likewiſe called *Farfugium*, and *Farranum*, if there be not an error in the copy: which thing alſo *Aëtius* in his firſt booke affirmeth, pretermitting the name of *Bechium*, and attributing vnto it all the vertues and faculties of *Bechium* or Colts-foot. Whoſe opinion *Orabaſius* ſeemeth to be of, in his fifteenth booke of his medicinable Collections, making mention of *Chamæleuce*: only *Pliny* alſo

alſo agreeth with them; ſhewing that ſome thinke, that *Bechium* is called by another name *Chamæleuce*, in his twenty ſixth booke, *cap. 6.* and it may be that *Dioſcorides* hath written of one and the ſelfe ſame herbe in ſundry places, and by diuers names. *Bechium* and *Tuſſilago*, which may alſo be Engliſhed Coughwort, ſo called of the effect, and *Farfara*, of the white Poplar tree, to whoſe leaues it is like; which was named of the Antients *Farfarus*, as *Plautus* writeth in his Comedie called *Pœnulus*:

——— *viſcum legioni dedi.*
fundaſque eos proſternebam vt folia Farfari.

To the company I gaue both lime buſh and ſling.
That to the ground as Poplar leaues I might them ſling.

‡ *Dodonæus* (from whom our Author tooke this) ſets downe this place in *Plautus* as you finde it here, but not well; for the laſt verſe ſhould be *Fundaſque, eo præſternebant folia Farfari*. Thus it is in moſt editions of *Plautus*, and that rightly, as the enſuing words in that place declare. ‡

The white Poplar tree is called in Greeke Λεύκη, and hereupon *Bechion* or Colts-foot was alſo called *Chamæleuce*.

¶ *The Temperature and Vertues.*

The leaues of Colts-foot being freſh and greene are ſomething cold, and haue withall a drying A
qualitie; they are good for vlcers and inflammations: but the dried leaues are hot and drie, and
ſomewhat biting.

A decoction made of the greene leaues and roots, or elſe a ſyrrup thereof, is good for the cough B
that proceedeth of a thin rheume.

The green leaues of Fole-foot pound with hony, do cure and heale the hot inflammation called C
Saint Anthonies fire, and all other inflammations.

The fume of the dried leaues taken through a funnell or tunnell, burned vpon coles, effectually D
helpeth thoſe that are troubled with the ſhortneſſe of breath, and fetch their winde thicke and often, and breaketh without perill the impoſtumes of the breſt.

Being taken in manner as they take Tobaco, it mightily preuaileth againſt the diſeaſes afore- E
ſaid.

Chap. 291. *Of Butter-Burre.*

¶ *The Deſcription.*

1 Butter-Burre doth in like manner bring forth floures before the leaues, as doth Colts-foot, but they are ſmall, moſſie, tending to a purple colour; which being made vp into a big eare as it were, do quickly (together with the ſtem, which is thicke, full of ſubſtance, and brittle) wither and fall away: the leaues are very great like to a round cap or hat, called in Latine *Petaſus*, of ſuch a wideneſſe, as that of it ſelfe it is big and large enough to keepe a mans head from raine, and from the heate of the Sunne: and therefore they be greater than the leaues of the Clot-burre, of colour ſomewhat white, yet whiter vnderneath: euery ſtem beareth his leafe; the ſtem is oftentimes a cubit long, thicke, full of ſubſtance; vpon which ſtandeth the leafe in the centre or middlemoſt part of the circumference, or very neere, like to one of the greateſt Muſhroms, but that it hath a cleft that ſtandeth about the ſtem, eſpecially when they are in periſhing and withering away: at the firſt the vpper ſuperficiall or outſide of the Muſhroms ſtandeth out, and when they are in withering ſtandeth more in; and euen ſo the leafe of Butter-bur hath on the outſide a certaine ſhallow hollowneſſe: the root is thicke, long, blacke without, white within, of taſte ſomewhat bitter, and is oftentimes worme-eaten.

¶ *The Place.*

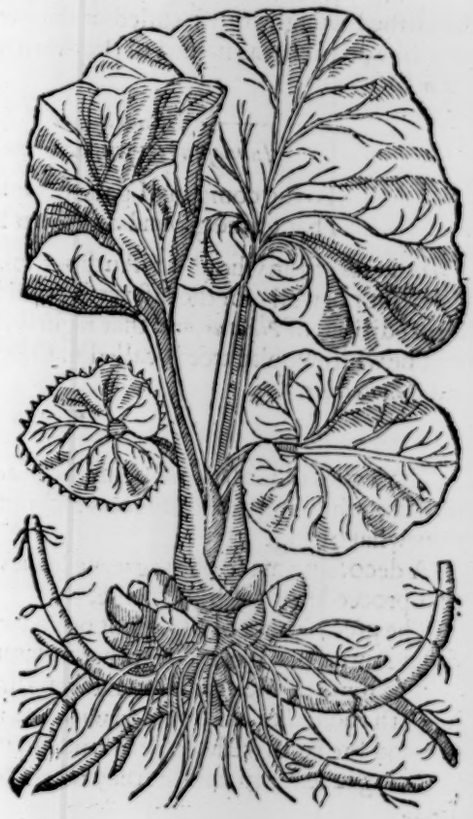
2 This groweth in moiſt places neere vnto riuers ſides, and vpon the brinks and banks of lakes and ponds, almoſt euery where.

¶ *The Time.*

The eare with the floures flouriſh in Aprill or ſooner: then come vp the leaues, which continue till Winter, with new ones ſtill growing vp.

1 *Petaſites florens.*
Butter-Burre in floure.

1. *Petaſitis folia.*
The leaues of Butter-burre.



¶ *The Names.*

Butter-bur is called in Greeke πετασίτης, of the hugeneſſe of the leafe that is like to πέτασος or a hat: the Latines call it *Petaſites*: in high-Dutch, **Peſtilentzwurts**: in low-Dutch, **Dockbladeren**: in Engliſh it is named Butter-Burre: it is very manifeſt that this is like to Colts-foot, and of the ſame kinde.

¶ *The Temperature.*

Butter-Burre is hot and dry in the ſecond degree, and of thinne parts.

¶ *The Vertues.*

A The roots of Butter-burre ſtamped with ale, and giuen to drinke in peſtilent and burning Feuers, mightily cooleth and abateth the heate thereof.

B The roots dried and beaten to pouder, and drunke in wine, is a ſoueraigne medicine againſt the plague and peſtilent feuers, becauſe it prouoketh ſweat, and driueth from the heart all venome and ill heate: it killeth wormes, and is of great force againſt the ſuffocation of the mother.

C The ſame cureth all naughty filthy vlcers, if the pouder be ſtrewed therein.

D The ſame kills wormes in the belly: it prouokes vrine, and brings downe the monthly termes.

‡ Chap. 292. *Of Mountaine Horſe-foot.*

¶ *The Deſcription.*

‡ 1 THis plant (which the moderne Writers haue referred to the *Cacalia* of the Antients, and to the kindes of Colts-foot) I haue thought good to name in Engliſh, Horſe-foot, for that the leaues exceed Colts-foot in bigneſſe, yet are like them in ſhape: and of this plant *Cluſius* (whom I here chiefely follow) hath deſcribed two ſorts: the firſt of theſe hath many leaues almoſt like vnto thoſe of Colts-foot, but larger, very round, and ſnipt about the edges, of a light greene colour aboue, and hoarie vnderneath, hauing alſo many veines or nerues running vp and downe them; and theſe leaues are of an vngrateful taſte, and grow vpon long purpliſh creſted ſtalkes: The ſtemme is ſome two cubits high, creſted likewiſe, and of a purpliſh colour, ſet alſo at certaine ſpaces with leaues very like vnto the other, but leſſer than thoſe

next

‡ 1 *Cacalia incano folio.*
Hoarie leaued Horſe-foot.

‡ 2 *Cacalia folio glabro.*
Smooth leaued Horſe-foot.

next the ground, and more cornered and ſharper pointed; the tops of the ſtalkes and branches carrie bunches of purple floures, as in an vmbell: and commonly in each bunch there are three little floures conſiſting of foure leaues a peece, and a forked peſtell, and theſe are of a purple colour, and a weake, but not vnpleaſant ſmell, and they at length turne into downe, amongſt which lies hid a longiſh ſeed: the root, if old, ſends forth diuers heads, as alſo ſtore of long whitiſh fibres.

2 The leaues of this are more thin, tough and hard, and of a deeper greene on the vpper ſides, neither are they whitiſh below, nor come ſo round or cloſe whereas they are faſtened to their ſtalks (which are not creſted as thoſe of the other, but round and ſmooth) they are alſo full of veines, and nickt about the edges, and of ſomewhat an vngratefull hot and bitter taſte. The ſtalkes are alſo ſmoother, and the floures of a lighter colour.

¶ *The Place.*

Both theſe grow in the Auſtrian and Stirian Alpes vnder the ſides of woods, among buſhes and ſuch ſhadowie places: but not in England, that I haue yet heard of.

¶ *The Time.*

I find it not ſet downe when theſe floure and ſeed, but iudge it about the ſame time that Coltſfoot doth.

¶ *The Names.*

This by *Cluſius*, *Lobel* and others, hath beene called *Cacalia*, and referred to that deſcribed by *Dioſcorides*, *lib. 4. cap. 123.* which is thought to be that ſet forth by *Galen* by the name of *Cancanus*. In the *Hiſtoria Lugd. pag. 1052.* The later of theſe two here deſcribed is figured by the name of *Tuſſilago Alpina ſive montana*, and the former is there, page 1308, by the name of *Cacalia*, but the floures are not rightly expreſt: and if my iudgement faile me not, the figure which is in the ſeuenteenth page of the *Appendix* of the ſame Authour, by the title of *Aconitum Pardalianches primum*, is of no other than this very plant. But becauſe I haue not as yet ſeene the plant, I will not poſitiuely affirme it: but referre this my opinion to thoſe that are iudicious and curious, to know the plant that raiſed ſuch controuerſie between *Matthiolus* and *Geſner*, and whereof neither *Camerarius* nor *Bauhine*, who haue ſet forth *Matthiolus* his Commentaries, haue giuen vs any certain or probable knowledge.

¶ *The*

¶ *The Temperature and Vertues, out of the Antients.*

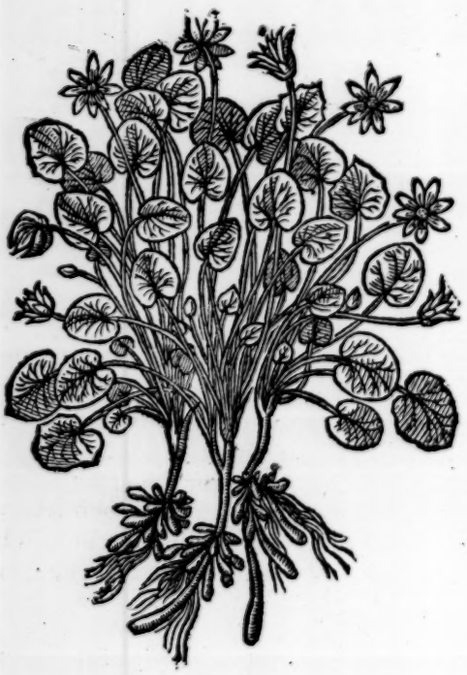
A The root of *Cacalia* is void of any biting qualitie, and moderately dries, and it is of a groſſe and emplaiſticke ſubſtance; wherefore ſteeped in wine and ſo taken it helpes the cough, the roughneſſe of the Arterie or hoarſnes, like as *Tragacanth:* neither if you chew it and ſwallow downe the iuice doth it leſſe auaile againſt thoſe effects than the iuice of Liquorice. ‡

Chap. 293. *Of ſmall Celandine or Pile-woort.*

¶ *The Kindes.*

THere be two kindes of Celandine, according to the old writers, much differing in forme and figure: the one greater, the other leſſer, which I intende to diuide into two diſtinct chapters, marſhalling them as neere as may be with their like, in forme and figure, and firſt of the ſmall Celandine.

Chelidonium minus.
Pile-woort.



¶ *The Deſcription.*

THe leſſer Celandine hath greene round leaues, ſmooth, ſlipperie, and ſhining, leſſe than the leaues of the Iuie: the ſtalks are ſlender, ſhort, and for the moſt part creeping vpon the ground: they bring forth little yellow flours like] thoſe of Crow-foot; and after the floures there ſpringeth vp a little fine knop or head full of ſeede: the root conſiſteth of ſlender ſtrings, on which doe hang as it were certaine graines, of the bignes of wheat cornes, or bigger.

¶ *The Place.*

It groweth in medows, by common waies, by ditches and trenches, and it is common euery where, in moiſt and dankiſh places.

¶ *The Time.*

It commeth forth about the Calends of March, and floureth a little after: it beginneth to fade away in Aprill, it is quite gone in May, afterwards it is hard to be found, yea ſcarcely the root.

¶ *The Names.*

It is called in Greeke χελιδόνιον: of the Latines *Chelidonium minus*, and *Hirundinaria minor*: of diuers, *Scrophularia minor*, *Ficaria minor*: of *Serapio*, *Memiren*: in Italian, *Fauoſcello*: in High Dutch, **Feigwurtzenkraut**: in French, *Eſclere*, and *Petit Baſſinet*: in Engliſh, little Celandine, Fig-woort, and Pile-woort.

¶ *The Temperature.*

It is hot and drie, alſo more biting and hotter than the greater: it commeth neereſt in facultie to the Crowfoot.

‡ This which is here, and by moſt Authours ſet forth for *Chelidonium minus*, hath no ſuch great heat and Acrimonie as *Dioſcorides* and *Galen* affirme to be in theirs; making it hot in the fourth degree, when as this of ours ſcarce exceedes the firſt, as farre as wee may coniecture by the taſte. ‡

¶ *The Vertues.*

B It preſently, as *Galen* and *Dioſcorides* affirme, exulcerateth or bliſtereth the skin: it maketh rough and corrupt nailes to fall away.

B The iuice of the roots mixed with honie, and drawne vp into the noſthrils, purgeth the head of foule and filthie humours.

The

The later age vſe the roots and graines for the piles, which being often bathed with the iuice C
mixed with wine, or with the ſickmans vrine, are drawne together and dried vp, and the paine quite
taken away.

There be alſo who thinke, that if the herbe be but carried about one that hath the piles, the pain D
forthwith ceaſeth.

CHAP. 294. *Of Marſh Marigold.*

¶ *The Deſcription.*

1 MArſh Marigold hath great broad leaues ſomewhat round, ſmooth, of a gallant greene colour, ſleightly indented or purld about the edges: among which riſe vp thicke fat ſtalkes, likewiſe greene; whereupon doe grow goodly yellow floures, glittering like gold, and like to thoſe of Crow-foot, but greater: the root is ſmall, compoſed of verie manie ſtrings.

1 *Caltha paluſtris maior.*
The great Marſh Marigold.

2 *Caltha paluſtris minor.*
The ſmall Marſh Marigold.

2 The ſmaller Marſh Marigold hath many round leaues ſpred vpon the ground, of a darke greene colour: amongſt which riſe vp diuers branches, charged with the like leaues: the floures grow at the toppes of the branches, of a moſt ſhining yellow colour: the root is alſo like the former.

3 The great Marſh Marigold with double floures is a ſtranger in England, his natiue Countrey ſhould ſeeme to be in the furtheſt part of Germanie, by the relation of a man of thoſe Countries that I haue had conference withall the which hee thus deſcribed: it hath (ſaith hee) leaues, roots, and ſtalkes like thoſe of our common ſort, and hath double floures like thoſe of the garden Marigold, wherein conſiſteth the difference.

‡ *Camerarius* writes iuſt contrarie to that which our Authour here affirmes; for hee ſaith, *In Anglia ſua ſponte non ſolum plenis, ſed oderatis etiam floribus paſſim ſeſe offert.* But I feare that both our Authour

3 *Caltha paluſtris multiplex.*
Double floured Marſh Marigold.

Authour and *Camerarius* were deceiued by truſting the report of ſome lying, or elſe ignorant perſons, for I could neuer finde it growing wilde with double floures here, nor *Camerarius* there: yet I do not denie but by chance ſome one with double floures may be found both here & there, but this is not euery where. ‡

The Place.

They ioy in moiſt and mariſh grounds, and in watery medowes. ‡ I haue not found the double one wilde, but ſeene it preſerued in diuers gardens for the beautie of the floure. ‡

¶ *The Time.*

They floure in the Spring when the Crowfoots doe, and oftentimes in Sommer: the leaues keepe their greeneneſſe all the Winter long.

¶ *The Names.*

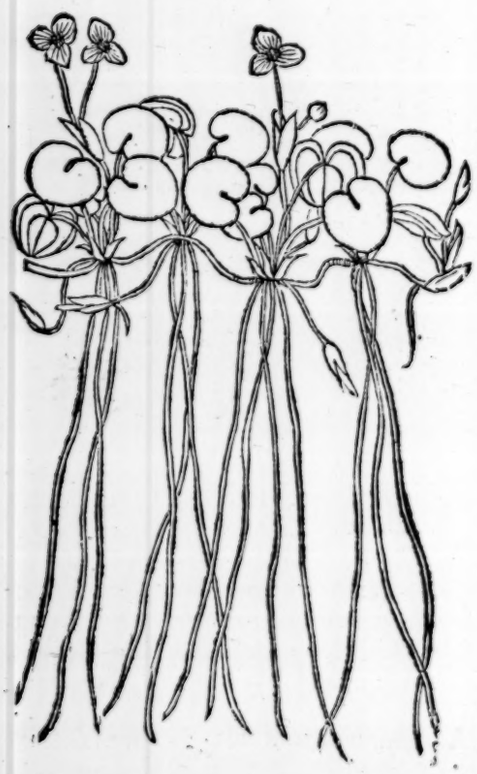
Marſh Marigold is called of *Valerius Cordus*, *Caltha paluſtris*: of *Tabernamontanus*, *Populago*: but not properly: in Engliſh, Marſh Marigolds: in Cheſhire and thoſe parts it is called Bootes.

¶ *The Temperature and Vertues.*

Touching the faculties of theſe plants, wee haue nothing to ſay, either out of other mens writings, or our owne experiences

Chap. 295. *Of Frogge-bit.*

Morſus Rana.
Frogge-bit.



¶ *The Deſcription.*

THere floteth or ſwimmeth vpon the vpper parts of the water a ſmall plant, which wee vſually call Frog-bit, hauing little round leaues, thicke and full of iuice, very like to the leaues of wall Peniwoort: the floures grow vpon long ſtems among the leaues, of a white colour, with a certaine yellow thrum in the middle, conſiſting of three leaues: in ſtead of roots it hath ſlender ſtrings, which grow out of a ſhort and ſmall head, as it were, from whence the leaues ſpring, in the bottom of the water: from which head alſo come forth ſlopewiſe certaine ſtrings, by which growing forth it multiplieth it ſelfe.

¶ *The Place.*

It is found ſwimming or floting almoſt in euery ditch, pond, poole, or ſtanding water, in all the ditches about Saint George his fields, and in the ditches by the Thames ſide neere to Lambeth Marſh, where any that is diſpoſed may ſee it.

¶ *The Time.*

It flouriſheth and floureth moſt part of all the yeare.

¶ *The Names.*

It is called of ſome *Ranæ morſus*, and *Morſus Ranæ*, and *Nymphæa parua*.

¶ *The*

¶ *The Temperature and Vertues.*

It is thought to be a kinde of Pond-weed (or rather of Water Lillie) and to haue the ſame faculties that belong vnto it. A

CHAP. 296. *Of Water Lillie.*

¶ *The Deſcription.*

1 THe white water Lillie or *Nenuphar* hath great round leaues, in ſhape of a Buckler, thick, fat, and full of iuice, ſtanding vpon long round and ſmooth foot-ſtalkes, ful of a ſpungious ſubſtance, which leaues do ſwim or flote vpon the top of the water: vpon the end of each ſtalk groweth one floure onely, of colour white, conſiſting of many little long ſharpe pointed leaues, in the middeſt whereof bee many yellow threds: after the floure it bringeth forth a round head, in which lieth blackiſh glittering ſeed. The roots be thicke, full of knots, blacke without, white and ſpungie within, out of which groweth a multitude of ſtrings, by which it is faſtened in the bottome.

1 *Nymphæa alba.*
White Water Lillie.

2 *Nymphæa lutea.*
Yellow Water Lillie.

2 The leaues of the yellow water Lillie be like to the other, yet are they a little longer. The ſtalkes of the floures and leaues be like: the floures be yellow, conſiſting onely of fiue little ſhort leaues ſomething round; in the midſt of which groweth a ſmall round head, or button, ſharpe towards the point, compaſſed about with many yellow threds, in which, when it is ripe, lie alſo glittering ſeeds, greater than thoſe of the other, and leſſer than wheat cornes. The roots be thick, long, ſet with certaine dents, as it were white both within and without, of a ſpungious ſubſtance.

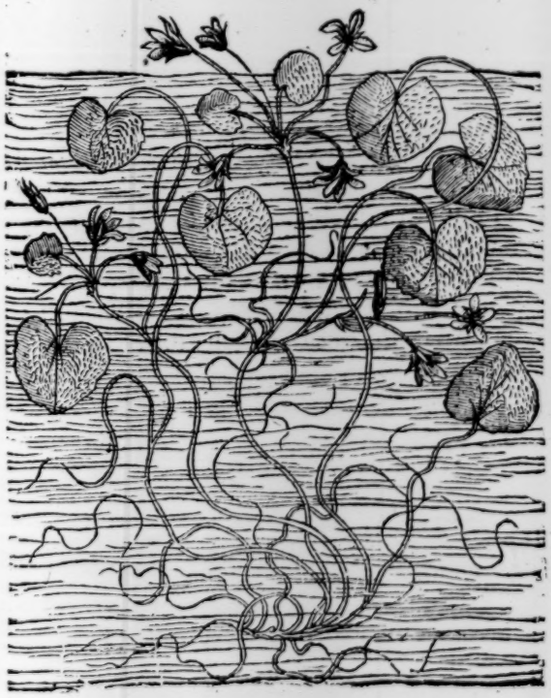
3 The ſmal white water Lillie floteth likewiſe vpon the water, hauing a ſingle root, with ſome few fibres faſtened thereto: from which riſeth vp many long, round, ſmooth, and ſoft foot-ſtalkes, ſome of which doe bring forth at the end faire broad round buckler leaues like vnto the prece-

dent,

dent,but leſſer: on the other foot-ſtalkes ſtand prettie white floures,conſiſting of fiue ſmall leaues apeece,hauing a little yellow in the middle thereof.

3 *Nymphæa alba minor.*
The ſmall white Water Lillie.

5 *Nymphæa lutea minima.*
Dwarfe Water Lillie.



4 The ſmall yellow water Lillie hath a little threddie root,creeping in the bottome of the water, and diſperſing it ſelfe far abroad: from which riſe ſmall tender ſtalkes, ſmooth and ſoft, whereon do grow little buckler leaues like the laſt deſcribed: likewiſe on the other ſmall ſtalke ſtandeth a tuft of many floures likewiſe floting vpon the water as the others do. ‡ This hath the floures larger than thoſe of the next deſcribed, wherefore it may be fitly named *Nymphæa lutea minor flore amplo.* ‡

5 This dwarfe water Lillie differeth not from the other ſmall yellow water Lillie,ſauing that, that this kinde hath ſharper pointed leaues, and the whole plant is altogether leſſer, wherein lieth the difference. ‡ This hath the floures much leſſe than thoſe of the laſt deſcribed, wherefore it is fitly for diſtinction ſake named *Nymphæa lutea minor flore paruo.* ‡

¶ *The Place.*

Theſe herbes do grow in fennes,ſtanding waters,broad ditches, and in brookes that run ſlowly, and ſometimes in great riuers.

¶ *The Time.*

They floure and flouriſh moſt of the Sommer moneths.

¶ *The Names.*

Water Lillie is called in Greeke Νυμφαια: and in Latine alſo *Nymphæa*, ſo named becauſe it loues to grow in waterie places,as *Dioſcorides* ſaith: the Apothecaries call it *Nenuphar:* of *Apuleius*, *Mater Herculania*, *Alga paluſtris*, *Papauer paluſtre*, *Clavus veneris*, and *Digitus veneris*: *Marcellus* a very old writer reporteth, that it is called in Latine *Claua Herculis:* in French, *Baditin*: in high Dutch, **Waſſer Mahem**: in low Dutch, **Plompen**: in Engliſh, Water Lillie, water Roſe.

¶ *The Temperature.*

Both the root and ſeed of water Lillie haue a drying force without biting.

¶ *The Vertues.*

A Water Lillie with yellow floures ſtoppeth laskes, the ouerflowing of ſeed which commeth away by dreames or otherwiſe,and is good for them that haue the bloudie flix.

But

But water Lillie which hath the white floures is of greater force, inſomuch as it ſtaieth the whites: but both this and the other that hath the black root muſt be drunke in red wine: they haue alſo a ſcouring quality, therfore they both clenſe away the morphew, and be alſo good againſt the pilling away of the haire of the head; againſt the morphew they are ſteeped in water, and for the pilling away of the haire in Tarre: but for theſe things that is fitter which hath the black root, and for the other, that which hath the white root. B

Theophraſtus ſaith, that being ſtamped and laid vpon the wound, it is reported to ſtay the bleeding. C

The Phyſitions of our age do commend the floures of white *Nymphæa* againſt the infirmities of the head which come of a hot cauſe: and do certainely affirme, that the root of the yellow cureth hot diſeaſes of the kidnies and bladder, and is ſingular good againſt the running of the reines. D

The root and ſeed of the great water Lillie is very good againſt venery or fleſhly deſire, if one do drinke the decoction thereof, or vſe the ſeed or root in powder in his meates, for it dryeth vp the ſeed of generation, and ſo cauſeth a man to be chaſt, eſpecially vſed in broth with fleſh. E

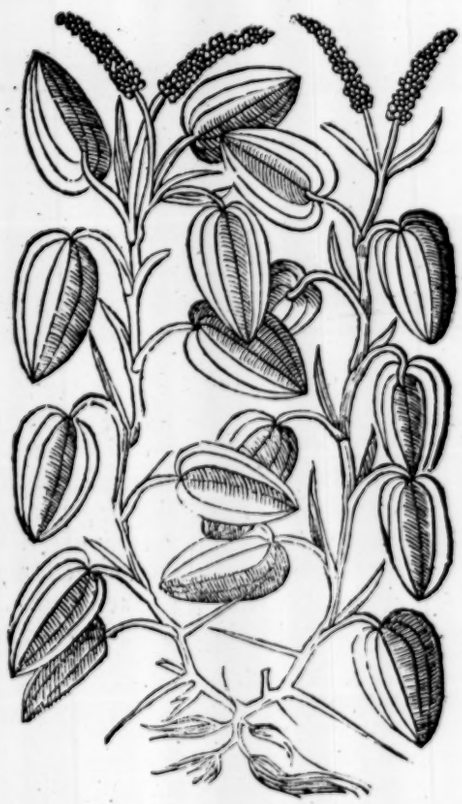
The conſerue of the floures is good for the diſeaſes aforeſaid, and is good alſo againſt hot burning feuers. F

The floures being made into oile, as yee do make oile of roſes, doth coole and refrigerate, cauſing ſweate and quiet ſleepe, and putteth away all venereous dreames: the temples of the head and palmes of the hands and feet, and the breſt being annointed for the one, and the genitors vpon and about them for the other. G

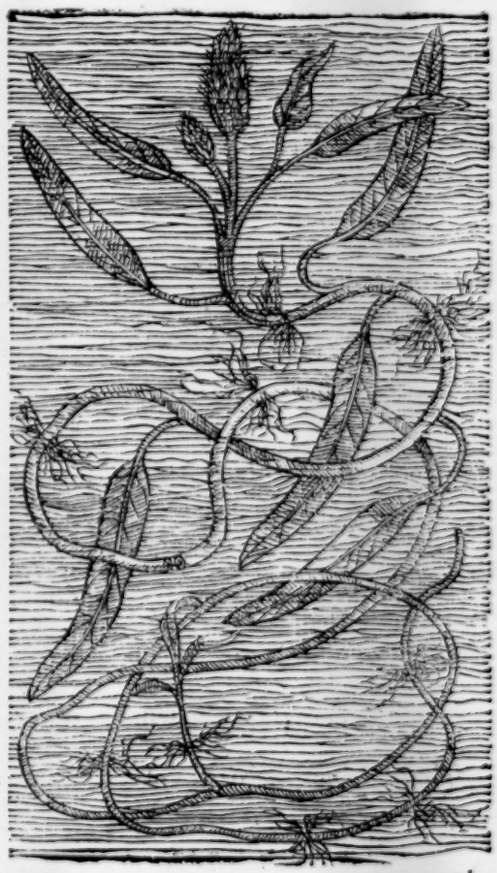
The greene leaues of the great water Lillie, either the white or the yellow laid vpon the region of the backe in the ſmall, mightily ceaſe the inuoluntary flowing away of the ſeed called *Gonorrhæa*, or running of the raines, being two or three times a day remooued, and freſh applied thereto. H

CHAP. 297. *Of Pond-weed, or water Spike.*

1 *Potamogeiton latifolium.*
Broad leafed Pondweed.



2 *Potamogeiton anguſtifolium.*
Narrow leafed Pondweed.



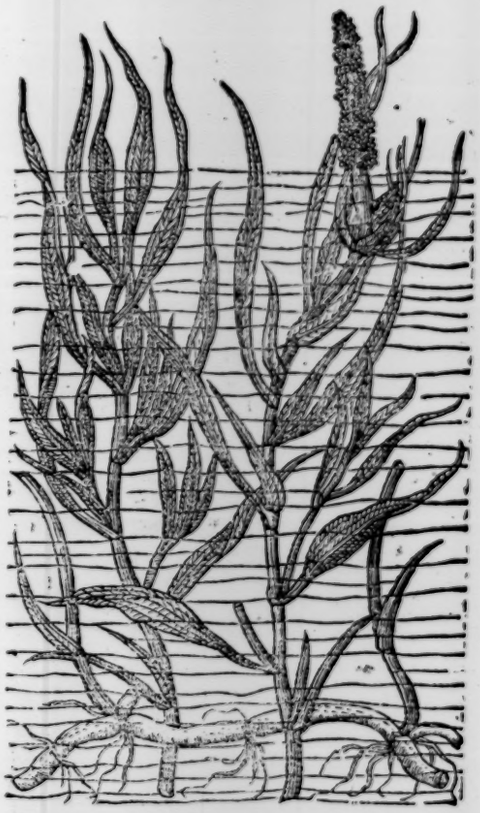
¶ *The Deſcription.*

1 POnd-weed hath little ſtalkes, ſlender, ſpreading like thoſe of the vine, and jointed: the leaues be long, ſmaller than the leaues of Plantaine, and harder, with manifeſt veines running alongſt them as in Plantains, which ſtanding vpon ſlender and long ſtems or foot-ſtalkes, ſhew themſelues aboue the water, and lie flat along vpon the ſuperficiall or vpper part thereof, as do the leaues of the water Lillie: the floures grow in ſhort eares, and are of a light red purple colour, like thoſe of Red-ſhankes or Biſtort: the ſeed is hard.

‡ 2 This (whoſe figure was formerly vnfitly put by our Authour to the following deſcription) hath longer, narrower, and ſharper pointed leaues than thoſe of the laſt deſcribed, hauing the veines running from the middle rib to the ſides of the leaues, as in a willow leafe, which they ſomewhat reſemble; at the tops of the ſtalkes grow reddiſh ſpikes or eares like thoſe of the laſt deſcribed: the root is long, jointed, and fibrous. ‡

‡ 3 *Potamogeiton 3 Dodonæi.*
Small Pondweed.

‡ 4 *Potamogeiton longis acutis foliis.*
Long ſharpe leaued Pondweed.



3 There is another Pondweed deſcribed thus; it ſhooteth forth into many ſlender and round ſtems, which are diſtributed into ſundry branches: his leaues are broad, long, and ſharpe pointed, yet much leſſe than the firſt kinde: out of the boſomes of the branches and leaues there ſpring certaine little ſtalkes which beare ſundry ſmall white moſſie floures, which doe turne into plaine and round ſeeds, like the common Tare or Vetch: his root is fibrous, throughly faſtened in the ground.

‡ 4 There is alſo another Pondweed, which hath whitiſh and jointed roots creeping in the bottome of the water, and ſending downe ſome fibres, but ſending vp ſlender jointed and long ſtalkes, ſmall below, and bigger aboue, hauing long narrow and very ſtiffe ſharpe pointed leaues. The floures grow in a reddiſh ſpike like thoſe of the firſt deſcribed. This is the *Potamogeiton altera* of *Dodonæus*. ‡

¶ *The Place.*

Theſe herbes do grow in ſtanding waters, pooles, ponds, and ditches, almoſt euery where.

¶ *The Time.*

They do floure in Iune and Iuly.

¶ *The Names.*

It is called of the Grecians, πομαγειτον: in Latine, *Fontalis*, and *Spicata*: in high Dutch, Zamkraut: in low Dutch, Fonteyncruyt: in French, *Eſpi d'eaue*: in Engliſh, Pondweed, and water Spike.

¶ *The*

¶ *The Temperature.*

Pondweed, ſaith *Galen*, doth binde and coole, like as doth Knot-graſſe, but his eſſence is thicker than that of Knot-graſſe.

¶ *The Vertues.*

It is good againſt the itch, and conſuming or eating Vlcers, as *Dioſcorides* writeth. A
Alſo it is good being applied to the inflammation of the legges, wherein *Ignis ſacer* hath gotten B the ſuperioritie.

Chap. 298. *Of Water Saligot, water Caltrops, or water Nuts.*

¶ *The Deſcription.*

1 WAter Caltrops haue long ſlender ſtalkes, growing vp, and riſing from the bottome of the water, and mounting aboue the ſame: the root is long, hauing here and there vnder the water certaine taſſels full of ſmall ſtrings and threddie haires: the ſtem towards the top of the water, is very great in reſpect of that which is lower, the leaues are large and ſomewhat round, not vnlike thoſe of the Poplar or Elme tree leaues, a little creuiſed or notched about the edges: amongſt and vnder the leaues groweth the fruit, which is triangled, hard, ſharpe pointed, and prickly: in ſhape like thoſe hurtfull engines in the warres, caſt in the paſſage of the enemie to annoy the feet of their horſes, called Caltrops, whereof this tooke its name: within theſe heads or Nuts is contained a white kernell, in taſte almoſt like the Cheſ-nut, which is reported to be eaten greene, and being dried and ground to ſerue in ſtead of bread.

‡ There are two other plants which are found growing in many ponds and ditches of this kingdome, both about London and elſe-where, and I will here giue you the figures out of *Lobel* and *Cluſius*, and their deſcriptions as they were ſent me by M^r. *Goodyer*, who hath ſaued me the labour of deſcribing them.

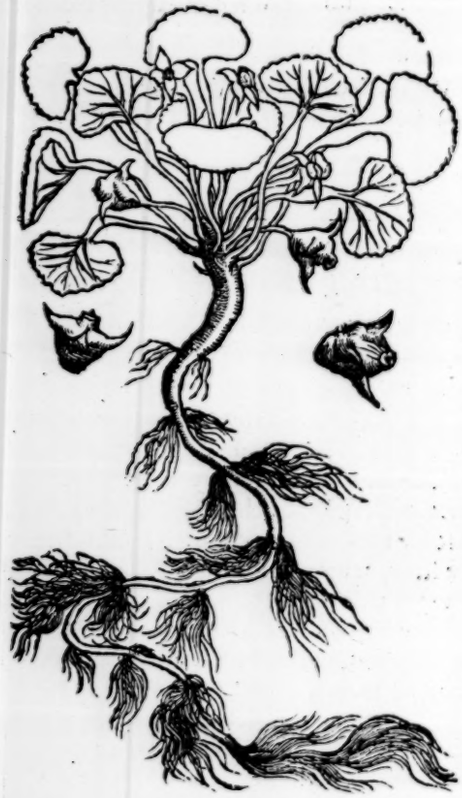
Tribulus aquaticus minor quercus floribus, Cluſ. p. 252.
Puſillum fontila pathum, Lobelij.

2 This water herbe bringeth forth from the root, thin, flat, knottie ſtalkes, of a reddiſh colour, two or three cubits long, or longer, according to the depth of the water (which when they are drie, are pliant and bowing) diuided towards the top into many parts or branches, bearing but one leafe at euery ioint, ſometimes two inches long, and halfe an inch broad, thin, and as it were ſhining, ſo wrinckled and crompled by the ſides that it ſeemeth to be torne, of a reddiſh greene colour: the foot-ſtalkes are ſomething long and thicke, and riſe vp from amongſt thoſe leaues, which alwaies grow two one oppoſit againſt another, in a contrarie manner to thoſe that grow below on the ſtalk: neere the top of which foot-ſtalke groweth ſmall grape-like huskes, out of which ſpring very ſmall reddiſh floures, like thoſe of the Oke, euery floure hauing foure very ſmall round topped leaues: after euery floure commeth commonly foure ſharpe pointed graines growing together, containing within them a little white kernell. The lower part of the ſtalke hath at euery ioint ſmall white threddie roots, ſomewhat long, whereby it taketh hold in the mudde, and draweth nouriſhment vnto it. The whole plant is commonly couered ouer with water. It floureth in Iune and the beginning of Iuly. I found it in the ſtanding pooles or fiſh-ponds adioyning to a diſſolued Abbey called Durford, which ponds diuide Hampſhire and Suſſex, and in other ſtanding waters elſwhere. This deſcription was made vpon ſight of the plant the 2. of Iune, 1632.

Tribulus aquaticus minor, muſcatellæ floribus.

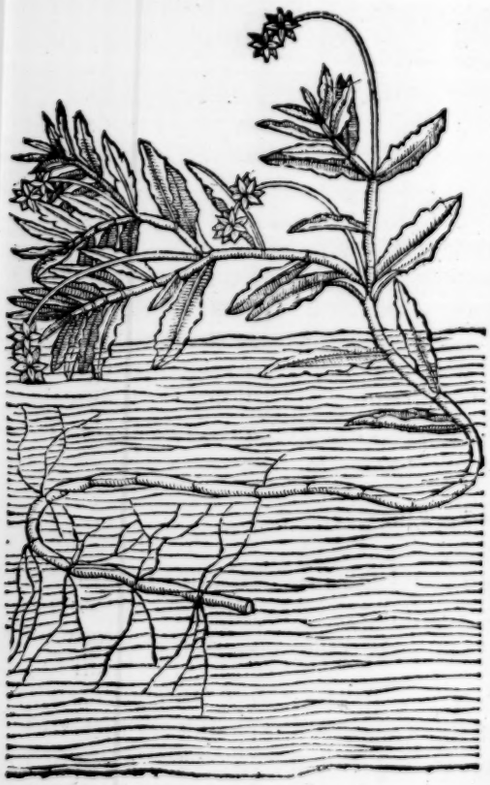
3 This hath not flat ſtalkes like the other, but round, kneed, and alwaies bearing two leaues at euery ioint, one oppoſite againſt another, greener, ſhorter and leſſer than the other, ſharpe pointed, not much wrinckled and crumpled by the edges. *Cluſius* ſaith, that they are not at all crumpled. I neuer obſerued any without crumples and wrinckles: the floures grow on ſhort ſmall foot-ſtalkes, of a whitiſh green colour, like thoſe of *Muſcatella Cordi*, called by *Gerard*, *Radix caua minima viridi flore: viz.* two floures at the top of euery foot-ſtalke, one oppoſite againſt another, euery floure containing foure ſmall leaues: which two floures beeing paſt there come vp eight ſmall

1 *Tribulus aquaticus.*
Water Caltrops.



‡ 2 *Tribulus aquaticus minor quercus floribus.*
Small water Caltrops, or Frogs-lettuce.

‡ 3 *Tribulus aquaticus minor, Muſcatellæ floribus.*
Small Frogs-Lettuce.



husks making ſix ſeueral waies a ſquare of flours. The roots are like the former. This groweth abundantly in the riuer by Droxford in Hampſhire. It floureth in Iune and Iuly when the other doth, and continueth couered ouer with water, greene, both winter and Sommer. *Iohn Goodyer.* ‡

¶ *The Place.*

Cordus ſaith that it groweth in Germany in myrie lakes, and in citie ditches that haue mud in them: in Brabant and in other places of the Low-countries, it is found oftentimes in ſtanding waters, and ſprings: *Matthiolus* writeth, that it groweth not only in lakes of ſweet water, but alſo in certaine ditches by the ſea neere vnto Venice.

¶ *The Time.*

It flouriſheth in Iune, Iuly, and Auguſt.

¶ *The Names.*

The Grecians call it τριβολος ὑδατιος: the Latins, *Tribulus aquatilis*, and *aquaticus*, and *Tribulus lacuſtris*: the Apothecaries, *Tribulus marinus*: in High Dutch, **Waſſer nuſz:** the Brabanders, **Water noten:** and of the likeneſſe of yron nailes, **Winckiſſers:**

the

the French men, *Macres*: in Engliſh it is named water Caltrops, Saligot, and Water-nuts: moſt do call the fruit of this Caltrops, *Caſtaneæ aquatiles*, or water Cheſ-nuts.

¶ *The Temperature.*

Water Caltrop is of a cold nature, it conſiſteth of a moiſt eſſence, which in this is more watery than in the land Caltrops, wherein an earthie cold is predominant, as *Galen* ſaith.

¶ *The Vertues.*

The herbe vſed in manner of a pultis, as *Dioſcorides* teacheth, is good againſt all inflammations or hot ſwellings: boiled with honie and water, it perfectly healeth cankers in the mouth, ſore gums, and the Almonds of the throat. A

The Thracians, ſaith *Plinie*, that dwell in Strymona, do fatten their horſes with the leaues of Saligot, and they themſelues do feed of the kernels, making very ſweet bread thereof, which bindeth the belly. B

The green nuts or fruit of *Tribulus aquaticus*, or Saligot, being drunke in wine, is good for them which are troubled with the ſtone and grauell. C

The ſame drunke in like manner, or laied outwardly to the place, helpeth thoſe that are bitten with any venomous beaſt, and reſiſteth all venome and poiſon. D

The leaues of Saligot be giuen againſt all inflammations and vlcers of the mouth, the putrifaction and corruption of the iawes, and againſt the Kings euill. E

A pouder made of the nuts is giuen to ſuch as piſſe bloud, and are troubled with grauell, and it doth bind the belly very much. F

‡ The two leſſer water Caltrops here deſcribed are in my opinion much agreeable in temper to the great one, and are much fitter *Succidanea* for it then Aron, which ſome in the compoſition of *Vnguentum Agrippæ* haue appointed for it. ‡ G

Chap. 299. *Of water Sengreene, or freſh water Soldier.*

Militaris Aizoides.
Freſh water Soldier.

¶ *The Deſcription.*

FReſh water Soldier or water Houſleeke, hath leaues like thoſe of the herbe Aloe, or *Semper viuum*, but ſhorter and leſſer, ſet round about the edges with certaine ſtiffe and ſhort prickles: amongſt which commeth forth diuers caſes or huskes, verie like vnto crabbes clawes: out of which when they open grow white floures, conſiſting of three leaues, altogether like thoſe of Frogs-bit, hauing in the middle little yellowiſh threds: in ſtead of roots there be long ſtrings, round, white, verie like to great Harp-ſtrings, or to long wormes, which falling downe from a ſhort head that brought forth the leaues, go to the bottom of the water, and yet be they ſeldome there faſtened: there alſo grow from the ſame other ſtrings aſlope, by which the plant is multiplied after the manner of Frogs-bit.

¶ *The Place.*

‡ I found this growing plentifully in the ditches about Rotſey a ſmal village in Holderneſſe. And my friend Mr. *William Broad* obſerued it in the Fennes in Lincolne-ſhire. ‡ The leaues and floures grow vpon the top of the water, and the roots are ſent downe through the water to the mud.

¶ *The Time.*

It floures in Iune, and ſometimes in Auguſt.

¶ *The Names.*

It may be called *Sedum aquatile*, or water Sengreen, that is to ſay, of the likeneſſe of herbe Aloe, which is alſo called in Latine *Sedum*: of ſome, *Cancri chela*, or *Cancri forficula*: in Engliſh, VVater Houſleeke, Knights Pondwoort; and of ſome, Knights water Sengreene, freſh water Soldier, or wading Pondweed: it ſeemeth to be *Stratiotes aquatilis*, or *Stratiotes potamios*, or Knights water Woundwoort, which may alſo be named in Latine *Militaris aquatica*, and *Militaris Aizoides*, or Soldiers Yarrow; for it groweth in the water, and floteth vpon it, and if thoſe ſtrings which it ſendeth to the bottome of the water be no roots, it alſo liueth without roots.

¶ *The Temperature.*

This herbe is of a cooling nature and temperament.

¶ *The Vertues.*

A This Houſleeke ſtaieth the bloud which commeth from the kidneies, it keepeth green wounds from being inflamed, and it is good againſt S. Anthonies fire and hot ſwellings, being applied vnto them: and is equall in the vertues aforeſaid with the former.

Chap. 300. *Of Water Yarrow, and water Gilloflоure.*

1 *Viola paluſtris.*
Water Violet.

‡ *Viola Paluſtris tenuifolia.*
The ſmaller leaued water violet.

¶ *The Deſcription.*

1 WAter Violet hath long and great iagged leaues, very finely cut or rent like Yarrow, but ſmaller: among which come vp ſmall ſtalkes a cubit and a halfe high, bearing at the top ſmall white floures like vnto ſtocke Gilloflоures, with ſome yellownes in the middle. The roots are long and ſmall like blacke threds, and at the end whereby they are faſtened to the ground they are white, and ſhining like Chryſtall.

‡ There is another varietie of this plant, which differs from it only in that the leaues are much ſmaller, as you may ſee them expreſt in the figure. ‡

2 VVater

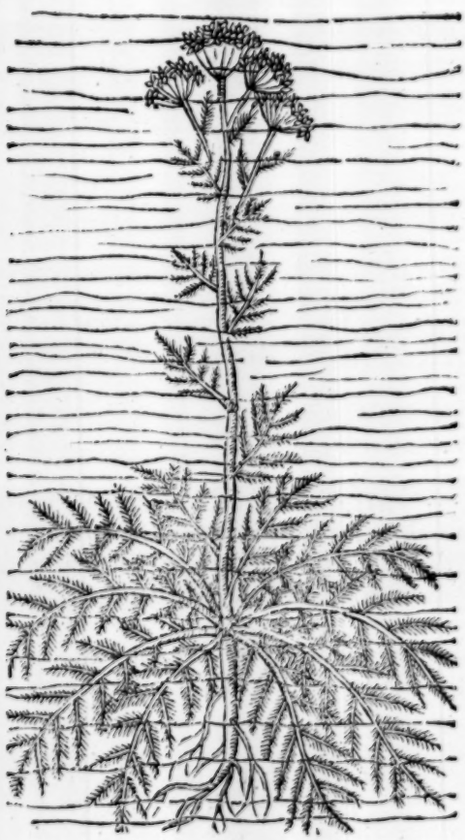
2 Water Milfoile, or water Yarrow hath long and large leaues deepely cut with many diuiſions like Fennell, but finelier iagged, ſwimming vpon the water. The root is ſingle, long, and round, which brings vp a right ſtraight and ſlender ſtalke, ſet in ſundry places with the like leaues, but ſmaller. The floures grow at the top of the ſtalke tuft faſhion, and like vnto the land Yarrow.

3 This water Milfoile differeth from all the kindes aforeſaid, hauing a root in the bottom of the water, made of many hairy ſtrings, which yeeldeth vp a naked ſlender ſtalke within the water, and the reſt of the ſtalke which floteth vpon the water diuideth it ſelfe into ſundry other branches and wings, which are bedaſht with fine ſmall iagged leaues like vnto Cammomill, or rather reſembling hairy taſſels or fringe, than leaues. From the boſomes whereof come forth ſmall and tender branches, euery branch bearing one floure like vnto water Crow-foot, white of colour, with a little yellow in the midſt: the whole plant reſembleth water Crow-foot in all things ſaue in the broad leaues.

† 4 There is another kinde of water violet very like the former, ſauing that his leaues are much longer, ſomewhat reſembling the leaues of Fennell, faſhioned like vnto wings, and the floures are ſomewhat ſmaller, yet white, with yellowneſſe in their middles, and ſhaped like thoſe of the laſt deſcribed. And the ſeed alſo growes like vnto that of the Water *Ranunculus*, laſt deſcribed.

5 There is alſo another kinde of water Milfoile, which hath leaues very like vnto water Violet, ſmaller, and not ſo many in number: the ſtalke is ſmall and tender, bearing yellow gaping floures faſhioned like a hood or the ſmall Snapdragon; which cauſed *Pena* to put vnto his name this additament *Galericulatum*, that is, hooded. The roots are ſmall and threddy, with ſome few knobs hanging thereat like the ſounds of fiſh.

2 *Milleſolium aquaticum.*
Water Yarrow.

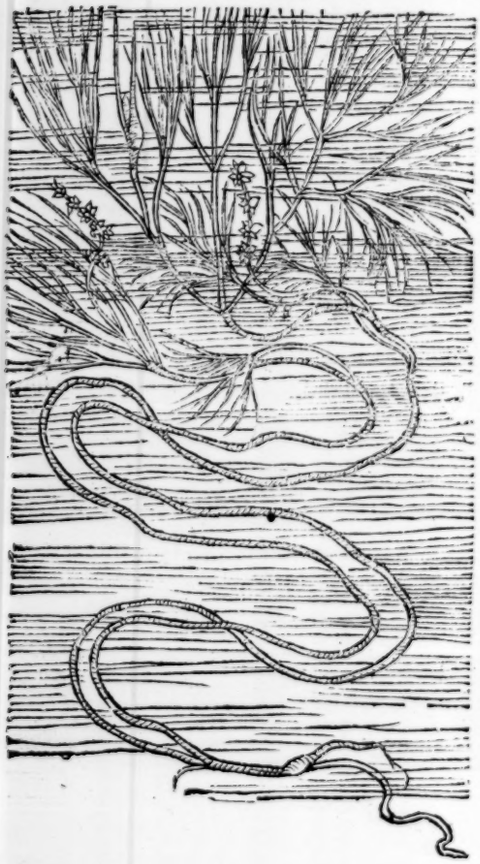


3 *Milleſolium, ſiue maratriphyllon, flore & ſemine Ranunculi aquatici, Hepaticæ facie.*
Crow-foot, or water Milfoile.

‡ 6 To theſe may we adde a ſmall water Milfoile, ſet forth by *Cluſius*. It hath round greene ſtalkes ſet with many ioynts, whereout come at their lower ends many hairy fibres, whereby it taketh hold of the mud: the tops of theſe ſtems ſtand ſome handfull aboue the water, and at each ioynt ſtand fiue long finely winged leaues, very greene, and ſome inch long; which wax leſſe and leſſe,

leſſe, as they ſtand higher or neerer the top of the ſtalke: and at each of theſe leaues about the top of the ſtem growes one ſmall white floure conſiſting of ſix little leaues ioyned together, and not opening themſelues: and theſe at length turne into little knobs, with foure little pointals ſtanding out of them. *Cluſius* calls this *Myriophyllon aquaticum minus.* ‡

‡ 4 *Millefolium tenuifolium.*
Fennell leaued water Milfoile.



‡ 5 *Millefolium paluſtre galericulatum.*
Hooded water Milfoile.

¶ *The Place.*

They be found in lakes and ſtanding waters, or in waters that run ſlowly: I haue not found ſuch plenty of it in any one place, as in the water ditches adioyning to Saint George his field neere London.

¶ *The Time.*

They floure for the moſt part in May and Iune.

¶ *The Names.*

The firſt is called in Dutch water **Violetten**, that is to ſay, *Viola aquatilis*: in Engliſh, Water Gilloſloure, or water Violet: in French, *Gyroflees d' eaue*: *Matthiolus* makes this to be alſo *Myrophylli ſpecies*, or a kinde of Yarrow, although it doth not agree with the deſcription thereof; for neither hath it one ſtalke onely, nor one ſingle root, as *Myriophyllon* or Yarrow is deſcribed to haue; for the roots are full of ſtrings, and it bringeth forth many ſtalkes.

The ſecond is called in Greeke Μυριόφυλλον: in Latine, *Millefolium*, and *Myriophyllon*, and alſo *Supercilium Veneris*: in ſhops it is vnknowne. This Yarrow differeth from that of the land: the reſt are ſufficiently ſpoken of in their titles.

¶ *The Nature and Vertues.*

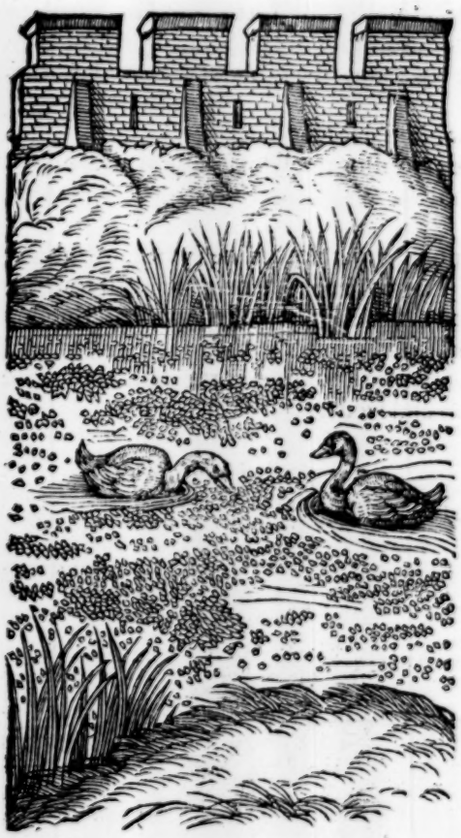
A Water Yarrow, as *Dioſcorides* ſaith, is of a dry facultie; and by reaſon that it taketh away hot inflammations and ſwellings, it ſeemeth to be of a cold nature; for *Dioſcorides* affirmeth, that water Yarrow is a remedie againſt inflammations in greene wounds, if with vineger it be applied greene or dry: and it is giuen inwardly with vineger and ſalt, to thoſe that haue fallen from a high place.

B Water Gilloſloure or water Violet is thought to be cold and dry, yet hath it no vſe in phyſicke at all.

Chap.

Chap. 301. *Of Ducks meate.*

Lens paluſtris.
Ducks meate.



¶ *The Deſcription.*

Dvckes meate is as it were a certaine greene moſſe, with very little round leaues of the bigneſſe of Lentils: out of the midſt whereof on the nether ſide grow downe very fine threds like haires, which are to them in ſtead of roots: it hath neither ſtalke, floure, nor fruit.

¶ *The Place.*

It is found in pounds, lakes, city ditches, and in other ſtanding waters euery where.

¶ *The Time.*

The time of Ducks meate is knowne to all.

¶ *The Names.*

Duckes meate is called in Latine *Lens lacuſtris*, *Lens aquatilis*, and *Lens paluſtris*: of the Apothecaries it is named *Aquæ Lenticula*: in high-Dutch, **Meerlinſen**: in low-Dutch, **Waterlinſen**, and more vſually **Enden gruen**, that is to ſay, *Anatum herba*, Ducks herbe, becauſe Ducks doe feed thereon; whereupon alſo in Engliſh it is called Ducks meate: ſome terme it after the Greeke water Lentils; and of others it is named Graines. The Italians call it *Lent di palude*: in French, *Lentille d'eaue*: in Spaniſh, *Lenteias de agua*.

¶ *The Temperature.*

Galen ſheweth that it is cold and moiſt after a ſort in the ſecond degree.

¶ *The Vertues.*

Dioſcorides ſaith that it is a remedie againſt all manner of inflammations, Saint Anthonies fire, and hot Agues, if they be either applied alone, or elſe vſed with partched barley meale. It alſo knitteth ruptures in young children. A

Ducks meate mingled with fine wheaten floure and applied, preuaileth much againſt hot ſwellings, as Phlegmons, Eriſipelas, and the paines of the ioynts. B

The ſame doth helpe the fundament fallen downe in yong children. C

Chap. 302. *Of Water Crow-foot.*

1 *Ranunculus aquatilis.*
Water Crow-foot.

¶ *The Deſcription.*

1 WAter Crow-foot hath ſlender branches trailing far abroad, whereupon grow leaues vnder the water moſt finely cut and iagged like thoſe of Cammomill. Thoſe aboue the water are ſomwhat round, indented about the edges, in forme not vnlike the ſmal tender leaues of the mallow, but leſſer: among which do grow the floures, ſmall, and white of colour, made of fine little leaues, with ſome yellowneſſe in the middle like the floures of the Straw-berry, and of a ſweet ſmell: after which there come round rough and prickly knaps like thoſe of the field Crow-foot. The roots be very ſmall hairy ſtrings.

‡ There is ſometimes to be found a varietie of this, with the leaues leſſe, and diuided into three parts after the manner of an Iuy leafe; and the floures are alſo much leſſer, but white of colour, with a yellow bottome. I queſtion whether this be not the *Ranunculus hederaceus Daleſchampij*, *pag.* 1031. of the *hiſt. Lugd.* ‡

2 There is another plant growing in the water, of ſmal moment, yet not amiſſe to be remembred, called *Hederula aquatica*, or water Iuie: the which is very rare to finde; neuertheleſſe I found it once in a ditch by Bermondſey houſe neere to London, and neuer elſewhere: it hath ſmall threddy ſtrings in ſtead of roots and ſtalkes, riſing from the bottome of the water to the top; wherunto are faſtned ſmall leaues ſwimming or floting vpon the water, triangled or three cornered like to thoſe of barren Iuie, or rather noble Liuerwort: barren of floures and ſeeds.

2 *Hederula aquatica.*
Water Iuie.

‡ 3 *Stellaria aquatica.*
Water Starwort.

3 There is likewiſe another herbe of ſmall reckoning that floteth vpon the water, called *Stellaria aquatica*, or water Star-wort, which hath many ſmall graſſie ſtems like threds, comming from the bottome of the water vnto the vpper face of the ſame: whereupon do grow ſmal double floures of a greeniſh or herby colour. ‡ I take this *Stellaria* to be nothing elſe but a water Chickeweed, which growes almoſt in euery ditch, with two long narrow leaues at each ioynt, and halfe a dozen or more lying cloſe together at the top of the water, in faſhion of a ſtarre: it may be ſeene in this ſhape in the end of Aprill and beginning of May: I haue not yet obſerued either the floure or ſeed thereof. ‡

¶ *The*

¶ *The Place.*

Water Crow-foot groweth by ditches and ſhallow Springs, and in other moiſt and plaſhie places.

¶ *The Time.*

It floureth in Aprill and May, and ſometimes in Iune.

¶ *The Names.*

Water Crow-foot is called in Latine *Ranunculus aquatilis*, and *Polyanthemum aquatile*: in Engliſh, Water Crow-foot, and white water Crow-foot: moſt Apothecaries and Herbariſts do erroneouſly name it *Hepatica aquatica*, and *Hepatica alba*; and with greater error they mix it in medicines in ſtead of *Hepatica alba*, or graſſe of Parnaſſus. ‡ I know none that commit this great error here mentioned, neither haue I knowne either the one or the other euer vſed or appointed in medicine with vs in England, though *Dodonæus* (from whom our Author had this and moſt elſe) doe blame his countreymen for this miſtake and error. ‡

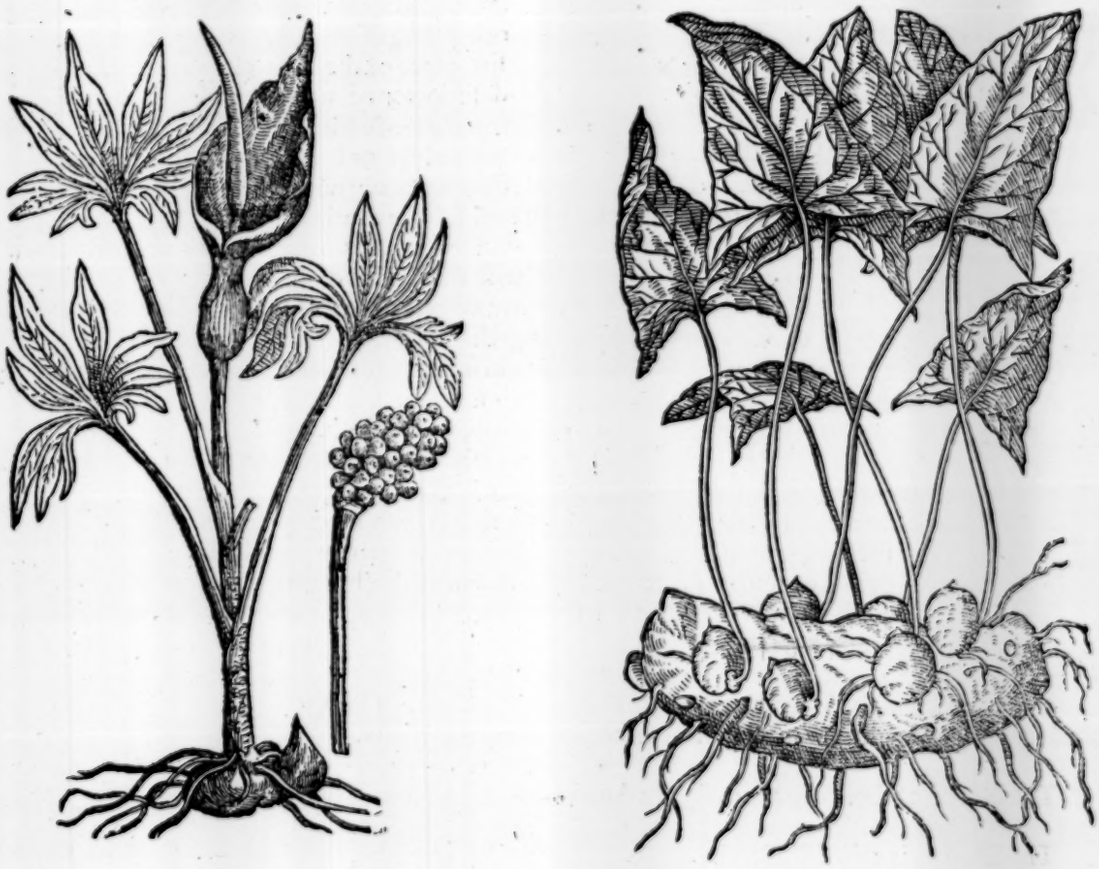
¶ *The Temperature and Vertues.*

Water Crow-foot is hot, and like to common Crow-foot.

Chap. 303. *Of Dragons.*

1 *Dracontium maius.*
Great Dragons.

† 2 *Dracontium minus.*
Small Dragons.



¶ *The Deſcription.*

1 THe great Dragon riſeth vp with a ſtraight ſtalke a cubit and a halfe high or higher, thicke, round, ſmooth, ſprinkled with ſpots of diuers colours, like thoſe of the adder or ſnake: the leaues are great and wide, conſiſting of ſeuen or more ioynēd together in order; euery one of which is long and narrow, much like to the leaues of Docke, ſmooth and ſlipperie: out of the top of the ſtalke groweth a long hoſe or huske greater than that of the Cuckow pintle, of a greeniſh colour without, and within crimſon, with his peſtell which is blackiſh, long, thicke, and pointed like a horne; the skin or filme whereof when the ſeed waxeth big, being ſtretched

1 *Dracunculus aquaticus.*
Water Dragons.

ſtretched or broken aſunder, there appeareth the fruit, like to a bunch or cluſter of grapes: the berries whereof at the firſt be greene, afterwards red and full of iuyce; in which is contained ſeed that is ſomewhat hard: The root continueth freſh, thicke, like to a knob, white, couered with a thin pilling, oftentimes of the bigneſſe of a meane apple, full of white little threds appendant thereunto.

2 The leſſer Dragon is like *Aron* or wake Robin, in leaues, hoſe, or huske, peſtell, and berries, yet are not the leaues ſprinkled with blacke but with whitiſh ſpots, which periſh not ſo ſoone as thoſe of wake-Robin, but endure together with the berries euen vntil winter: theſe berries alſo be not of a deepe red, but of a colour enclining to Saffron. The root is not vnlike to the Cuckow-pint, hauing the forme of a bulbe, full of ſtrings, with diuers rude ſhapes of new plants, whereby it greatly encreaſeth.

‡ The figure which our Authour heere gaue by the title of *Dracuntium minus*, was no other than of *Aron*, which is deſcribed in the firſt place of the next chapter: neither is the deſcription of any other plant, than of that ſort thereof which hath leaues ſpotted either with white or blacke ſpots, though our Author ſay onely with white. I haue giuen you *Cluſius* his figure of *Arum Byzantinum*, in ſtead of that which our Author gaue. ‡

3 The root of water Dragon is not round like a bulbe, but very long, creeping, and ioynted, and of meane bigneſſe; out of the ioynts whereof ariſe the ſtalkes of the leaues, which are round, ſmooth, and ſpongie within, and there grow downewards certaine white and ſlender ſtrings. The fruit ſprings forth at the top vpon a ſhort ſtalke, together with one of the leaues, being at the beginning couered with little white threds, which are in ſtead of the floures: after that it groweth into a bunch or cluſter, at the firſt greene, and when it is ripe, red, leſſer than that of Cuckow-pint, but not leſſe biting: the leaues are broad, greeniſh, glib, and ſmooth, in faſhion like thoſe of Iuy, yet leſſer than thoſe of Cuckow-pint; and that thing whereunto the cluſtered fruit growes is alſo leſſer, and in that part which is towards the fruit (that is to ſay the vpper part) is white.

4 The great Dragon of *Matthiolus* his deſcription is a ſtranger not onely in England, but elſewhere for any thing that we can learne: my ſelfe haue diligently enquired of moſt ſtrangers skilfull in plants, that haue reſorted vnto me for conference ſake, but no man can giue me any certaintie thereof; and therefore I thinke it amiſſe to giue you his figure or any deſcription, for that I take it for a feigned picture.

¶ *The Place.*

The greater and the leſſer Dragons are planted in gardens. The water Dragons grow in watery and mariſh places, for the moſt part in fenny and ſtanding waters.

¶ *The Time.*

The berries of theſe plants are ripe in Autumne.

¶ *The Names.*

The Dragon is called in Greeke Δρακόντιον: in Latine, *Dracunculus*. The greater is named *Serpentaria maior*: of ſome, *Biſaria*, and *Colubrina*: *Cordus* calleth it *Dracunculus Polyphyllos*, and *Luph Criſpum*: in high-Dutch, **Schlangenkraut**: in low-Dutch, **Speerwortele**: in French, *Serpentaire*: in Italian, *Dragontea*: in Spaniſh, *Taragontia*: in Engliſh, Dragons, and Dragon-wort. *Apuleius* calleth Dragon *Dracontea*, and ſetteth downe many ſtrange names thereof, which whether they agree with the greater or the leſſer, or both of them, he doth not expound; as *Pythonion*, *Anchomanes*, *Sauchromaton*, *Therion*, *Schœnos*, *Dorcadion*, *Typhonion*, *Theriophonon*, and *Eminion*. *Athenæus* ſheweth, that Dragon is called *Aronia*, becauſe it is like to *Aron*.

¶ *The Temperature.*

Dragon, as *Galen* ſaith, hath a certaine likeneſſe with *Aron* or wake-Robin, both in leaues, and alſo in root, yet more biting and more bitter than it, and therefore hotter, and of thinner parts: it is

alſo

alſo ſomething binding, which by reaſon that it is adjoined with the two former qualities, that is to ſay, biting and bitter, is is made in like manner a ſingular medicine of very great efficacy.

¶ *The Vertues.*

The root of Dragons doth clenſe and ſcoure all the entrailes, making thinne, eſpecially thicke and tough humours; and it is a ſingular remedy for vlcers that are hard to be cured, named in Greeke καυσῶν. A

It ſcoureth and clenſeth mightely, aſwell ſuch things as haue need of ſcouring, as alſo white and blacke morphew, being tempered with vineger. B

The leaues alſo by reaſon that they are of like qualitie are good for vlcers and greene wounds: and the leſſe dry they are, the fitter they be to heale; for the dryer ones are of a more ſharpe or biting quality than is conuenient for wounds.

The fruit is of greater operation than either the leaues or the root: and therefore it is thought to be of force to conſume and take away cankers and proud fleſh growing in the noſtrils, called in Greeke *Polypus*: alſo the juice doth clenſe away webs and ſpots in the eies. C

Furthermore, *Dioſcorides* writeth, that it is reported that they who haue rubbed the leaues or root vpon their hands, are not bitten of the viper. D

Pliny ſaith, that ſerpents will not come neere vnto him that beareth Dragons about him, and theſe things are read concerning both the Dragons, in the two chapters of *Dioſcorides*. E

Galen alſo hath made mention of Dragon in his booke of the faculties of nouriſhments, where he ſaith, that the root of Dragon being twice or thrice ſod, to the end it may loſe all his acrimony or ſharpeneſſe, is ſometimes giuen as Aron, or wake-Robin is, when it is needfull to expell the more forceable thicke and clammy humours that are troubleſome to the cheſt and lungs. F

And *Dioſcorides* writeth, that the root of the leſſer Dragon being both ſodde and roſt with honie, or taken of it ſelfe in meate, cauſeth the humours which ſticke faſt in the cheſt to be eaſily voided. G

The juice of the garden Dragons, as ſaith *Dioſcorides*, being dropped into the eies, doth clenſe them, and greatly amend the dimneſſe of the ſight. H

The diſtilled water hath vertue againſt the peſtilence or any peſtilentiall feuer or poiſon, being drunke bloud-warme with the beſt treacle or mithridate. I

The ſmell of the floures is hurtfull to women newly conceiued with child. K

Chap. 304. *Of Cockow pint, or wake-Robin.*

¶ *The Deſcription.*

1 *Arum* or Cockow pint hath great, large, ſmooth, ſhining, ſharpe pointed leaues, beſpotted here and there with blackiſh ſpots, mixed with ſome blewneſſe: among which riſeth vp a ſtalke nine inches long, beſpeckled in many places with certaine purple ſpots. It beareth alſo a certaine long hoſe or hood, in proportion like the eare of an hare: in the middle of which hood commeth forth a peſtle or clapper of a darke murrie or pale purple colour: which being paſt, there ſucceedeth in place thereof a bunch or cluſter of berries in manner of a bunch of grapes, greene at the firſt, but after they be ripe of a yellowiſh red like corall, and full of pith, with ſome threddy additaments annexed thereto.

2 There is in Ægypt a kinde of *Arum* which alſo is to be ſeene in Africa, and in certaine places of Luſitania, about riuers and floods, which differeth from that which groweth in England and other parts of Europe. This plant is large and great, and the leaues thereof are greater than thoſe of the water Lillie: the root is thicke and tuberous, and toward the lower end thicker and broader, and may be eaten. It is reported to be without floure and ſeed, but the increaſe that it hath is by the fibres which runne and ſpread from the roots. ‡ This plant hath alſo peſtells and cluſters, of berryes as the common Aron, but ſomewhat different, the leaues are not cut into the ſtalke, but joined before the ſetting thereto: the root alſo is very large. Thoſe that deſire to ſee more of this plant, and the queſtion which ſome haue moued, whither this be the *Colocaſia*, or *Faba Ægyptia* of the Antients? let them haue recourſe to the firſt chapter of *Fabius Columna* his *Minus cognitarum ſtirpium pars altera*, and there they ſhall finde ſatisfaction. ‡

1 *Arum vulgare.*
Cockow pint.

‡ 2 *Arum Ægyptiacum.*
Ægyptian Cockow pint.

¶ *The Place.*

Cockow pint groweth in woods neere vnto ditches vnder hedges, euery where in ſhadowie places.

¶ *The Time.*

The leaues appeare preſently after winter: the peſtell ſheweth it ſelfe out of his huske or ſheath in Iune, whileſt the leaues are in withering: and when they are gone, the bunch or cluſter of berries becommeth ripe, which is in Iuly and Auguſt.

¶ *The Names.*

There groweth in Ægypt a kinde of Aron or Cuckow pint which is found alſo in Africa, and likewiſe in certaine places of Portingale neere vnto riuers and ſtreames, that differeth from thoſe of our countries growing, which the people of Caſtile call *Manta de nueſtra ſenora:* moſt would haue it to be called *Colocaſia*; but *Dioſcorides* ſaith that *Colocaſia* is the root of *Faba Ægyptia*, or the Beane of Egypt. ‡ *Fabius Columna* (in the place formerly alledged) prooues this not to be the true *Colocaſia*, and yet *Proſper Alpinus* ſince in his ſecond booke *de plantis exoticis, cap.* 17. and 18. labours to proue the contrary: let the curious haue recourſe to theſe, for it is too tedious for me in this place to inſiſt vpon it, being ſo large a point of controuerſie, which hath ſo much troubled all the late writers. ‡

The common Cuckow pint is called in Latine, *Arum:* in Greeke, ἄρον: in ſhops, *Iarus*, and *Barba-Aron:* of others, *Pes vituli:* of the Syrians, *Lupha:* of the men of Cyprus, *Colocaſia*, as we finde among the baſtard names. *Pliny* in his 24. booke, 16. chapter, doth witneſſe, that there is great difference betweene *Aron* and *Dracontium*, although there hath been ſome controuerſie about the ſame among the old writers, affirming them to be all one: in high Dutch it is called, **Paffen pint:** in Italian, *Gigora:* in Spaniſh, *Yaro:* in low Dutch, **Calfsuoet:** in French, *Pied d'veau:* in Engliſh, Cuckow pint, and Cuckow pintle, wake-Robin, Prieſts pintle, Aron; Calfes foot, and Rampe; and of ſome Stratchwoort.

¶ *The Temperature.*

The faculties of Cuckow pint doe differ according to the varietie of countries: for the root hereof, as *Galen* in his booke of the faculties of nouriſhments doth affirme, is ſharper and more biting in ſome countries than in others, almoſt as much as Dragons; contrariwiſe in Cyren a city in Africke, it is generally in all places hot and dry, at the leaſt in the firſt degree.

¶ *The*

¶ *The Vertues.*

If any man would haue thicke and tough humours which are gathered in the cheſt and lungs to be clenſed and voided out by coughing, then that Cuckowpint is beſt that biteth moſt.

It is eaten being ſodden in two or three waters, and freſh put to, whereby it may loſe his acrimonie; and being ſo eaten, they cut thicke humors meanely, but Dragons is better for the ſame purpoſe.

Dioſcorides ſheweth, that the leaues alſo are preſerued to be eaten, and that they muſt be eaten after they be dried and boyled; and writeth alſo, that the root hath a peculiar vertue againſt the gout, being laid on ſtamped with Cowes dung.

Beares after they haue lien in their dens forty dayes without any manner of ſuſtenance, but what they get with licking and ſucking their owne feet, do as ſoone as they come forth eate the herbe Cuckowpint, through the windie nature whereof the hungry gut is opened and made fit againe to receiue ſuſtenance: for by abſtaining from food ſo long a time, the gut is ſhrunke or drawne ſo cloſe together, that in a manner it is quite ſhut vp, as *Ariſtotle*, *Ælianus*, *Plutarch*, *Pliny*, and others do write.

The moſt pure and white ſtarch is made of the roots of Cuckowpint; but moſt hurtfull to the hands of the Laundreſſe that hath the handling of it, for it choppeth, bliſtereth, and maketh the hands rough and rugged, and withall ſmarting.

CHAP. 305. *Of Friers Cowle, or hooded Cuckowpint.*

1 *Ariſarum latifolium.*
Broad leaued Friers Cowle.

2 *Ariſarum anguſtifolium.*
Narrow leaued Friers Cowle.

¶ *The Deſcription.*

1 BRoad leaued Friers hood hath a leafe like Iuy, broad and ſharpe pointed, but far leſſe, approching neere to the forme of thoſe of Cuckowpint: the ſtalke thereof is ſmall and ſlender: the huske or hoſe is little; the peſtel ſmall, and of a blacke purpliſh colour; the cluſter when it is ripe is red; the kernels ſmall; the root white, hauing the forme of Aron or Cuckowpint, but leſſer, whereof doubtleſſe it is a kinde.

2 The ſecond Friers hood hath many leaues, long and narrow, ſmooth and glittering: The huske or hoſe is narrow and long; the peſtell that commeth forth of it is ſlender, in forme like a great earth worme, of a blackiſh purple colour, as hath alſo the inſide of the hoſe, vpon which, hard to the ground, and ſometimes a little within the ground, groweth a certaine bunch or cluſter of berries, greene at the firſt, and afterwards red: the root is round and white like the others.

¶ *The Place.*

Theſe plants are ſtrangers in England, but common in Italy, and eſpecially in Tuſcane about Rome, and in Dalmatia, as *Aloiſius Anguillara* witneſſeth: notwithſtanding I haue them in my Garden.

¶ *The Time.*

The floures and fruit of theſe come to perfection with thoſe of Cuckowpint and Dragons.

¶ *The Names.*

Friers hood is called of *Dioſcorides*, Ἄρισαρον: in Latine, *Ariſarum*: but *Pliny* calleth it Ἄρεως, or *Aris*; for in his twenty fourth booke, *cap.* 16. he ſaith, That *Aris* which groweth in Egypt is like Aron or Cuckowpint: it may be called in Engliſh after the Latine name *Ariſarum*; but in my opinion it may be more fitly called Friers hood, or Friers cowle, to which the floures ſeeme to be like; whereupon the Spaniards name it *Frailillos*, as *Daleſchampius* noteth.

¶ *The Temperature.*

Friers-Cowle is like in power and facultie to the Cuckow-pint, yet is it more biting, as *Galen* ſaith.

¶ *The Vertues.*

A There is no great vſe of theſe plants in phyſicke; but it is reported that they ſtay running or eating ſores or vlcers: and likewiſe that there is made of the roots certaine compoſitions called in Greeke *Collyria*, good againſt fiſtula's: and being put into the ſecret part of any liuing thing, it rotteth the ſame, as *Dioſcorides* writeth.

† That which was formerly figured and deſcribed in the third place, vnder the title of *Ariſarum latifolium Matthioli*, was the ſame with that deſcribed by the name of *Dracontium minus*, in the precedent chapter, and therefore here omitted.

Chap. 306. *Of Aſtrabacca.*

1 *Aſarum.*
Aſarabacca.

2 *Aſarina Matthioli.*
Italian Aſarabacca.

¶ *The*

¶ *The Deſcription.*

1 THe leaues of Aſarabacca are ſmooth, of a deepe greene colour, rounder, broader, and tenderer than thoſe of Iuy, and not cornered at all, not vnlike to thoſe of Sow-bread: the floures lie cloſe to the roots, hid vnder the leaues, ſtanding vpon ſlender foot-ſtalkes, of an ill fauoured purple colour, like to the floures and husks of Henbane, but leſſe, wherein are contained ſmall ſeeds, cornered, and ſomewhat rough: the roots are many, ſmall and ſlender, growing aſlope vnder the vpper cruſt of the earth, one folded within another, of an vnpleaſant taſte, but of a moſt ſweet and pleaſing ſmell, hauing withall a kinde of biting qualitie.

2 This ſtrange kinde of Aſarabacca, which *Matthiolus* hath ſet forth creeping on the ground, in manner of our common Aſtrabacca, hath leaues ſomwhat rounder and rougher, ſleightly indented about the edges, and ſet vpon long ſlender foot-ſtalkes: the floures grow hard vnto the ground like vnto thoſe of Cammomill, but much leſſer, of a mealy or duſty colour, and not without ſmel. The roots are long and ſlender, creeping vnder the vpper cruſt of the earth, of a ſharpe taſte, and bitter withall. ‡ This *Aſarina* of *Matthiolus*, *Cluſius* (whoſe opinion I here follow) hath iudged to be the *Tuſsilago Alpina* 2. of his deſcription; wherefore I giue you his figure in ſtead of that of our Author, which had the floures expreſt, which this wants. ‡

¶ *The Place.*

It delighteth to grow in ſhadowie places, and is very common in moſt gardens.

¶ *The Time.*

The herbe is alwaies greene; yet doth it in the Spring bring forth new leaues and floures.

¶ *The Names.*

It is called in Greeke Ἄσαρον, *Aſarum*: in Latine, *Nardus ruſtica*: and of diuers, *Perpenſa*: *Perpenſa* is alſo *Baccharis* in *Pliny*, *lib.* 21. *cap.* 21. *Macer* ſaith, That *Aſarum* is called *Vulgago*, in theſe words:

Eſt Aſaron Græcè, Vulgago dicta Latinè.

This herbe, *Aſaron* do the Grecians name;
Whereas the Latines *Vulgago* clepe the ſame.

It is found alſo amongſt the baſtard names, that it was called of the great learned Philoſophers Ἄρεως ἅιμα: that is, *Martis ſanguis*, or the bloud of *Mars*: and of the French men *Baccar*; and thereupon it ſeemeth that the word *Aſarabacca* came, which the Apothecaries vſe, and likewiſe the common people: but there is another *Baccharis* differing from *Aſarum*, yet notwithſtanding *Crateuas* doth alſo call *Baccharis*, *Aſarum*.

This confuſion of both the names hath been the cauſe, that moſt could not ſufficiently expound themſelues concerning *Aſarum* and *Baccharis*; and that many things haue beene written amiſſe in many copies of *Dioſcorides*, in the chapter of *Aſarum*: for when it is ſet downe in the Greek copies a ſweet ſmelling garden herbe, it belongeth not to the deſcription of this *Aſarum*, but to that of *Baccharis*: for *Aſarum* (as *Pliny* ſaith) is ſo called, becauſe it is not put into garlands: and ſo by that meanes it came to paſſe, that oftentimes the deſcriptions of the old Writers were found corrupted and confuſed: which thing, as it is in this place manifeſt, ſo oftentimes it cannot ſo eaſily be marked in other places. Furthermore, *Aſarum* is called in French *Cabaret*: in high-Dutch, **Haſelwurtz**: in low-Dutch, **Wans oozen**: in Engliſh, Aſarabacca, Fole-foot, and Hazel-wort.

¶ *The Temperature.*

The leaues of Aſarabacca are hot and dry, with a purging qualitie adioyned thereunto, yet not without a certaine kinde of aſtriction or binding. The roots are alſo hot and dry, yet more than the leaues; they are of thin and ſubtill parts: they procure vrine, bring downe the deſired ſicknes, and are like in facultie, as *Galen* ſaith, to the roots of *Acorus*, but yet more forceable; and the roots of *Acorus* are alſo of a thinne eſſence, heating, attenuating, drying, and prouoking vrine, as he affirmeth: which things are happily performed by taking the roots of Aſarabacca, either by themſelues, or mixed with other things.

¶ *The Vertues.*

The leaues draw forth by vomit, thicke phlegmaticke and cholericke humours, and withall A
moue the belly; and in this they are more forceable and of greater effect than the roots themſelues.

They are thought to keepe in hard ſwelling cankers that they encreaſe not, or come to exulce- B
ration, or creeping any farther, if they be outwardly applied vpon the ſame.

The roots are good againſt the ſtoppings of the liuer, gall, and ſpleene, againſt wens and hard C
ſwellings, and agues of long continuance: but being taken in the greater quantitie, they purge flegme and choler not much leſſe than the leaues (though *Galen* ſay no) by vomit eſpecially, and alſo by ſiege.

D One dram of the pouder of the roots giuen to drinke in ale or wine, groſſely beaten, prouoketh vomit for the purpoſes aforeſaid; but being beaten into fine pouder, and ſo giuen, it purgeth very little by vomit, but worketh moſt by procuring much vrine; therefore the groſſer the pouder is, ſo much the better.

E But if the roots be infuſed or boyled, then muſt two, three, or foure drams be put to the infuſion; and of the leaues eight or nine be ſufficient: the iuyce of which ſtamped with ſome liquid thing, is to be giuen. The roots may be ſteeped in wine, but more effectually in whay or honied water, as *Meſues* teacheth.

F The ſame is good for them that are tormented with the Sciatica or gout in the huckle bones, for thoſe that haue the dropſie, and for ſuch alſo as are vexed with a quartaine ague, who are cured and made whole by vomiting.

Chap. 307. *Of Sea Binde-weed.*

1 *Soldanella marina.*
Sea Binde-weed.

‡ 2 *Soldanella Alpina maior.*
Mountaine Binde-weed.

¶ *The Deſcription.*

1 *Soldanella* or Sea Binde-weed hath many ſmall branches, ſomwhat red, trailing vpon the ground, beſet with ſmall and round leaues, not much vnlike Aſarabacca, or the leaues of Ariſtolochia, but ſmaller; betwixt which leaues and the ſtalkes come forth floures formed like a bell, of a bright red incarnate colour, in euery reſpect anſwering the ſmall Binde-weed, whereof it is a kinde, albeit I haue here placed the ſame, for the reaſons rendred in my Proeme. The ſeed is blacke, and groweth in round huskes: the root is long and ſmall, thruſting it ſelfe far abroad, and into the earth like the other Binde-weeds.

2 *Soldanella* or mountaine Binde-weed hath many round leaues ſpred vpon the ground, not much vnlike the former, but rounder, and more full of veines, greener, of a bitter taſte like ſea Binde-weed: among which commeth forth a ſmall and tender ſtalke a handfull high, bearing at the top little floures like the ſmall Bell-floure, of a ſky colour. The root is ſmall and threddy.

‡ 3 There

‡ 3 *Soldanella Alpina minor.*
Small Mountaine Bindweed.

‡ 3 There is of this kinde another hauing all the parts ſmaller, and the leaues redder and rounder: the floures alſo blew, and compoſed of one leafe diuided into fiue parts, and ſucceeded by a longiſh cod, round and ſharp pointed. ‡

¶ *The Place.*

The firſt grows plentifully by the Sea ſhore in moſt places of England, eſpecially neere to Lee in Eſſex, at Merſey in the ſame countie, in moſt places of the Iſle of Thanet, and Shepey, and in many places along the Northern coaſt.

The ſecond groweth vpon the mountains of Germanie, and the Alpes; it groweth vpon the mountains of VVales, not far from Cowmers Meare in North-Wales.

¶ *The Time.*

Theſe herbes do floure in Iune, and are gathered in Auguſt to be kept for medicine.

¶ *The Names.*

The firſt called *Soldanella* is of the Apothecaries and the Antients called *Marina Braſſica*, that is to ſay, Sea Co'ewoort: but what reaſon hath moued them ſo to doe I cannot conceiue, vnleſſe it be penurie and ſcarſitie of names, and becauſe they know not otherwiſe how to terme it: of this I am ſure, that this plant and *Braſſica* are no more like than things which are moſt vnlike; for *Braſſica Marina* is the Sea Colewoort, which doth much reſemble the garden Cabbage or Cole, both in ſhape and in nature, as I haue in his due place expreſſed. A great fault and ouerſight therefore it hath been of the old writers and their ſucceſſors which haue continued the cuſtome of this error, not taking the paines to diſtinguiſh a Bindeweed from a Cole-woort. But to auoid controuerſies, the truth is, as I haue before ſhewed, that this *Soldanella* is a Bindeweed, and cannot be eſteemed for a *Braſſica*, that is a Colewoort. The later Herbariſts call it *Soldana*, and *Soldanella*: in Dutch, **Zeewind**, that is to ſay, *Conuoluulus Marinus*: of *Dioſcorides* θαλάσσιος, (i) *Braſſica Marina*: in Engliſh, Sea VVithwinde, Sea Bindweed, Sea-bels, Sea-coale, of ſome, Sea Fole-foot, and Scottiſh Scuruie-graſſe.

The ſecond is called *Soldanella montana*: in Engliſh, Mountaine Bindweed.

¶ *The Nature.*

Sea Bindeweed is hot and drie in the ſecond degree: the ſecond is bitter and very aſtringent.

¶ *The Vertues.*

Soldanella purgeth downe mightily all kinde of watriſh humours, and openeth the ſtoppings of the liuer, and is giuen with great profit againſt the dropſie: but it muſt be boiled with the broth of ſome fat meat or fleſh, and the broth drunke, or elſe the herbe taken in pouder worketh the like effect. A

Soldanella hurteth the ſtomack, and troubleth the weake and delicate bodies which doe receiue it in pouder, wherefore aduice muſt be taken to mix the ſaid pouder with Anniſe ſeeds, Cinnamon, ginger, and ſugar, which ſpices do correct his malignitie. B

Practitioners about Auſpurge and Rauiſpurge (cities of Germanie) do greatly boaſt that they haue done wonders with this herbe *Soldanella montana*; ſaying, that the leaues taken and emplaiſtred vpon the nauell and ſomewhat lower, draw forth water from their bellies that are hydroptike, that is, troubled with water or the dropſie: this effect it worketh in other parts without heating. C

It doth alſo wonderfully bring fleſh in wounds, and healeth them. D

Dioſcorides witneſſeth, that the whole herbe is an enemie to the ſtomacke, biting and extremely purging (both ſodden, and taken with meat) and bringeth troubleſome gripings thereunto, and doth oftentimes more hurt than good. E

‡ My friend Mr. *Goodyer* hath told me, that in Hampſhire at Chicheſter and thereabout they make vſe of this for Scuruie-graſſe, and that not without great errour, as any that know the qualities may eaſily perceiue. F

CHAP.

Chap. 308. *Of the Graſſe of Parnaſſus.*

† 1 *Gramen Parnaſſi.*
Graſſe of Parnaſſus.

‡ 2 *Gramen Parnaſſi flore duplici.*
Graſſe of Parnaſſus with double floures.

¶ *The Deſcription.*

1 THe Graſſe of Parnaſſus hath ſmall round leaues, very much differing from any kind of Graſſe, much reſembling the leaues of Iuie, or Aſarabacca, but ſmaller, and not of ſo darke a colour: among theſe leaues ſpring vp ſmall ſtalkes a foot high, bearing little white floures conſiſting of fiue round pointed leaues; which beeing falne and paſt, there come vp round knops or heads, wherein is contained a reddiſh ſeed. The root is ſomewhat thicke, with many ſtrings annexed thereto.

2 The ſecond kinde of *Gramen Parnaſſi* doth anſwer the former in each reſpect, ſauing that the leaues are ſomewhat larger, and the floures double, otherwiſe verie like.

¶ *The Place.*

The firſt groweth very plentifully in Lanſdall and Crauen, in the North parts of England; at Doncaſter, and in Thornton fields in the ſame countrie: moreouer in the Moore neere to Linton, by Cambridge, at Heſſet alſo in Suffolke, at a place named Drinkſtone, in the medow called Butchers mead. ‡ Mr. *Goodyer* found it in the boggy ground below the red well of Wellingborough in Northampton ſhire: and Mr. *William Broad* obſerued it to grow plentifully in the Caſtle fields of Berwicke vpon Tweed. ‡

The ſecond is a ſtranger in England.

¶ *The Time.*

Theſe herbes do floure in the end of Iuly, and their ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Valerius Cordus hath among many that haue written of theſe herbes ſaid ſomething of them to good purpoſe, calling them by the name of *Hepatica alba* (whereof without controuerſie they are kindes) in Engliſh, white Liuerwoort: although there is another plant called *Hepatica alba*, which for

for diſtinction ſake I haue thought good to Engliſh, Noble white Liuerwoort.

The ſecond may be called Noble white Liuerwoort with the double floure.

¶ *The Nature.*

The ſeed of Parnaſſus Graſſe, or white Liuer-woort, is drie, and of ſubtill parts.

¶ *The Vertues.*

The decoction of the leaues of Parnaſſus Graſſe drunken, doth drie and ſtrengthen the feeble and moiſt ſtomacke, ſtoppeth the bellie, and taketh away the deſire to vomite. A

The ſame boiled in wine or water, and drunken, eſpecially the ſeed thereof, prouoketh vrine, breaketh the ſtone, and driueth it forth. B

† The figure that was formerly in the firſt place of this Chapter was of *Vnifolium*, deſcribed before, *cap.* 90. *p.* 409. that which was in the ſecond place belonged to the firſt deſcription.

Chap. 309. *Of white Saxifrage, or Golden Saxifrage.*

¶ *The Deſcription.*

THe white Saxifrage hath round leaues ſpred vpon the ground, and ſomewhat iagged about the edges, not much vnlike the leaues of ground Iuie, but ſofter and ſmaller, and of a more faint yellowiſh greene: among which riſeth vp a round hairie ſtalke a cubit high, bearing at the top ſmall white floures, almoſt like Stockgillo floures: the root is compact of a number of blacke ſtrings, whereunto are faſtened very many ſmall reddiſh graines or round roots as bigge as pepper cornes, which are vſed in medicine, and are called *Semen Saxifragæ albæ*; that is, the ſeede of white Saxifrage, or Stone-breake, although (beſide theſe foreſaid round knobbes) it hath alſo ſmall ſeed contained in little huskes, following his floure as other herbes haue.

1 *Saxifraga alba.*
White Saxifrage.

2 *Saxifraga aurea.*
Golden Saxifrage.

2 Golden

‡ 3 *Saxifraga alba petræa.*
White Rocke Saxifrage.

2 Golden Saxifrage hath round compaſſed leaues, bluntly indented about the borders like the former, among which riſe vp ſtalkes a handfull high, at the top whereof grow two or three little leaues together: out of the middle of them ſpring ſmall floures of a golden color, after which come little husks, wherein is contained the red ſeed, not vnlike the former: the roote is tender, creeping in the ground with long threds or haires.

‡ 3 *Pona* hath ſet forth this plant by the name of *Saxifraga alba petræa*, and therefore I haue placed it here; though I thinke I might more fitly haue ranked him with *Paronychia rutaceo folio* formerly deſcribed. It hath a ſmall ſingle root from which ariſe diuers fat longiſh leaues, ſomewhat hairy, and diuided into three parts: amongſt thoſe riſes vp a round knottie ſtalke, roughiſh, and of a purpliſh colour, ſome halfe foot high, diuided into ſundry branches, which carry white floures, conſiſting of fiue leaues apiece, with ſome yellowiſh threds in their middles: theſe falling, there remaines a cup containing a very ſmall ſeed. It floures at the end of Iune in the ſhadowie places of the Alpes, whereas *Pona* firſt obſerued it. ‡

¶ *The Place.*

The white Saxifrage groweth plentifully in ſundrie places of England, and eſpecially in a field on the left hand of the high way, as you goe from the place of execution called Saint Thomas Waterings vnto Dedford by London. It groweth alſo in the great field by Iſlington called the Mantles: alſo in the greene places by the ſea ſide at Lee in Eſſex, among the ruſhes, and in ſundrie other places thereabout, and elſe where. ‡ It alſo growes in Saint Georges fields behinde Southwarke. ‡

The golden Saxifrage groweth in the moiſt and mariſh grounds about Bathe and Wels, alſo in the Moores by Boſton and Wisbich in Lincolnſhire: ‡ and Mr. *George Bowles* hath found it growing in diuers woods at Chiſſelhurſt in Kent: Mr. *Goodyer* alſo hath obſerued it abundantly on the ſhadowie moiſt rockes by Mapledurham in Hampſhire: and I haue found it in the like places in Yorkſhire. ‡

¶ *The Time.*

The white Saxifrage floureth in May and Iune: the herbe with his floure are no more ſeen vntill the next yeare.

The golden Saxifrage floureth in March and Aprill.

¶ *The Names.*

The firſt is called in Latine *Saxifraga Alba*: in Engliſh, white Saxifrage, or white Stone-breake: The ſecond is called Golden Saxifrage, or golden Stone-breake.

¶ *The Nature.*

The firſt of theſe, eſpecially the root and ſeed thereof, is of a warme or hot complexion.

Golden Saxifrage is of a cold nature, as the taſte doth manifeſtly declare.

¶ *The Vertues.*

A The root of white Saxifrage boiled in wine and drunken, prouoketh vrine, clenſeth the kidneis and bladder, breaketh the ſtone, and driueth it forth, and is ſingular good againſt the ſtrangurie, and all other griefes and imperfections in the reines.

B The vertues of golden Saxifrage are yet vnto vs vnknowne, notwithſtanding I am of this minde, that it is a ſingular wound herbe, equall with Sanicle.

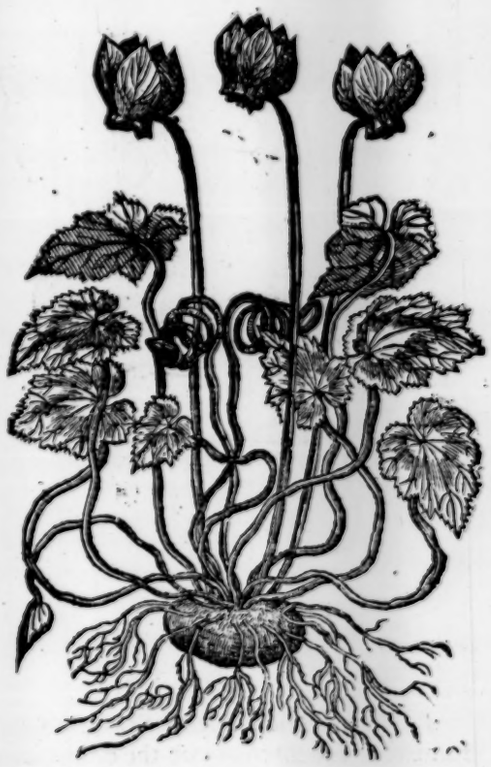
CHAP. 310 *Of Sow-bread.*

¶ *The Deſcription.*

1 THe firſt being the common kinde of Sowbread, called in ſhops *Panis porcinus*, and *Arthanita*, hath many greene and round leaues like vnto Aſarabacca, ſauing that the vpper part of the leaues are mixed here and there confuſedly with white ſpots, and vnder the leaues next the ground of a purple colour: among which riſe vp little ſtemmes like vnto the ſtalks of violets, bearing at the top ſmall purple floures, which turne themſelues backward (beeing full blowne) like a Turks cap, or Tulepan, of a ſmall ſent or ſauour, or none at all: which being paſt there ſucceed little round knops or heads which containe ſlender browne ſeedes: theſe knoppes

1 *Cyclamen orbiculato folio.* Round Sowbread.

2 *Cyclamen folio Hederæ.* Iuie Sowbread.



‡ 3 *Cyclamen Vernum.* Spring Sowbread.

arc

are wrapped after a few daies in the ſmall ſtalkes,as thred about a bottome,where it remaineth ſo defended from the iniurie of Winter cloſe vpon the ground,couered alſo with the greene leaues aforeſaid,by which meanes it is kept from the froſt,euen from the time of his ſeeding,which is in September vntill Iune: at which time the leaues do fade away,the ſtalkes and ſeed remaining bare and naked, whereby it inioyeth the Sun(whereof it was long depriued) the ſooner to bring them vnto maturitie: the root is round like a Turnep,blacke without and white within,with many ſmal ſtrings annexed thereto.

‡ 4 *Cyclamen Vernum album.* White floured Sowbread.

‡ 5 *An Cyclaminos altera, hederaceis foliis planta?*

2 The ſecond kinde of Sowbread, hath broad leaues ſpred vpon the ground, ſharpe pointed, ſomewhat indented about the edges, of a darke greene colour,with ſome little lines or ſtrakes of white on the vpper ſide,and of a darke reddiſh colour on that ſide next the ground: among which riſe vp ſlender foot-ſtalks of two or three inches long: at the tops whereof ſtand ſuch floures as the precedent,but of a ſweeter ſmell,and more pleaſant colour. The ſeed is alſo wrapped vp in the ſtalk for his further defence againſt the iniurie of winter. The root is ſomewhat greater,and of more vertue,as ſhall be declared.

3 There is a third kinde of Sowbread that hath round leaues without peaked corners,as the laſt before mentioned, yet ſomewhat ſnipt about the edges,and ſpeckled with white about the brims of the leaues,and of a blackiſh colour in the middle:the floures are like to the reſt, but of a deeper purple:the root alſo like,but ſmaller,and this commonly floures in the Spring.

‡ 4 This in leaues and roots is much like the laſt deſcribed, but the floures are ſmaller,ſnow white,and ſweet ſmelling. There are diuers other varieties of theſe plants, which I thinke it not neceſſarie for me to inſiſt vpon: wherefore I referre the curious to the Garden of floures ſet forth by M^r. *Iohn Parkinſon*,where they ſhall finde ſatisfaction. ‡

5 There is a plant which I haue ſet forth in this place that may very well be called into queſtion,and his place alſo,conſidering that there hath been great contention about the ſame, and not fully determined on either part,which hath moued me to place him with thoſe plants that moſt do reſemble one another,both in ſhape and name:this plant hath greene cornered leaues like to Iuie,

long

long and ſmall gaping floures like the ſmall Snapdragon : more hath not been ſaid of this plant, either of ſtalke or root, but is left vnto the conſideration of the learned.

‡ The plant which our Author here would acquaint you with, is that which *Lobel* figures with this title which I here giue, and ſaith it was gathered amongſt other plants on the hils of Italy, but in what part or place, or how growing he knew not; and he onely queſtions whether it may not be the *Cyclaminos altera* of *Dioſcorides*, *lib.* 2. *cap.* 195. ‡

¶ *The Place.*

Sow-bread groweth plentifully about Artoies and Vermandois in France, and in the Foreſt of Arden, and in Brabant: but the ſecond groweth plentifully in many places of Italie.

It is reported vnto mee by men of good credit, that *Cyclamen* or Sow-bread groweth vpon the mountaines of Wales; on the hils of Lincolnſhire, and in Somerſetſhire by the houſe of a gentleman called M^r. *Hales*; vpon a Fox-borough alſo not far from M^r. *Bamfields*, neere to a towne called Hardington. The firſt two kindes do grow in my garden, where they proſper well. ‡ I cannot learne that this growes wilde in England. ‡

¶ *The Time.*

Sow-bread floureth in September when the plant is without leafe, which doth afterwards ſpring vp, continuing greene all the Winter, couering and keeping warme the ſeede vntill Midſommer next, at what time the ſeed is ripe as aforeſaid. The third floureth in the ſpring, for which cauſe it was called *Cyclamen vernum*: and ſo doth alſo the fourth.

¶ *The Names.*

Sow-bread is called in Greeke κυκλάμινος: in Latine, *Tuber terræ*, and *Terræ rapum*: of *Marcellus*, *Orbicularis*: of *Apuleius*, *Palalia*, *Rapum Porcinum*, and *Terræ malum*. in ſhops, *Cyclamen*, *Panis porcinus*, and *Arthanita*: in Italian, *Pan Porcino*: in Spaniſh, *Mazan de Puerco*: in High Dutch, **Schweinbzot**: in Low Dutch, **Uetckins bzoot**: in French, *Pain de Porceau*: in Engliſh, Sow-bread. *Pliny* calleth the colour of this floure in Latine, *Coloſſinus color*: in Engliſh, Murrey colour.

¶ *The Nature.*

Sow-bread is hot and drie in the third degree.

¶ *The Vertues.*

The root of Sow-bread dried into pouder and taken inwardly in the quantitie of a dram and a halfe, with mead or honied water, purgeth downeward tough and groſſe flegme, and other ſharpe humours. A

The ſame taken in wine as aforeſaid, is very profitable againſt all poiſon, and the bitings of venomous beaſts, and to be outwardly applied to the hurt place. B

The pouder taken as aforeſaid, cureth the iaundiſe and the ſtoppings of the liuer, taketh away the yellow colour of the bodie, if the patient after the taking hereof be cauſed to ſweat. C

The leaues ſtamped with honie, and the iuice put into the eies, cleereth the ſight, taketh away al ſpots and webs, pearle or haw, and all impediments of the ſight, and is put into that excellent ointment called *Vnguentum Arthanitæ*. D

The root hanged about women in their extreame trauell with childe, cauſeth them to be deliuered incontinent, and taketh away much of their paine. E

The leaues put into the place hath the like effect, as my wife hath prooued ſundrie times vpon diuers women, by my aduiſe and commandement, with good ſucceſſe. F

The iuice of Sow-bread doth open the Hemorrhoids, and cauſeth them to flow beeing applied with wooll or flocks. G

It is mixed with medicines that conſume or waſte away knots, the Kings euill, and other hard ſwellings: moreouer it clenſeth the head by the noſtrils, it purgeth the belly being annointed therwith, and killeth the childe. It is a ſtrong medicine to deſtroy the birth, being put vp as a peſſarie. H

It ſcoureth the skin, and taketh away Sun-burning, and all blemiſhes of the face, pilling of the haire, and marks alſo that remaine after the ſmall pocks and meſels: and giuen in wine to drinke, it maketh a man drunke. I

The decoction thereof ſerueth as a good and effectuall bath for members out of ioint, the gout, aud kibed heeles. K

The root being made hollow and filled with oile, cloſed with a little wax, and roſted in the hot embers, maketh an excellent ointment for the griefes laſt rehearſed. L

Being beaten and made vp into trochiſches, or little flat cakes, it is reported to be a good amorous medicine to make one in loue if it be inwardly taken. M

¶ *The Danger.*

It is not good for women with childe to touch or take this herbe, or to come neere vnto it, or ſtride ouer the ſame where it groweth; for the naturall attractiue vertue therein contained is ſuch, that without controuerſie they that attempt it in maner aboueſaid, ſhall be deliuered before their

time: which danger and inconuenience to auoid, I haue (about the place where it groweth in my garden) faſtened ſticks in the ground, and ſome other ſtickes I haue faſtened alſo croſſe-waies ouer them, leſt any woman ſhould by lamentable experiment finde my words to bee true, by their ſtepping ouer the ſame.

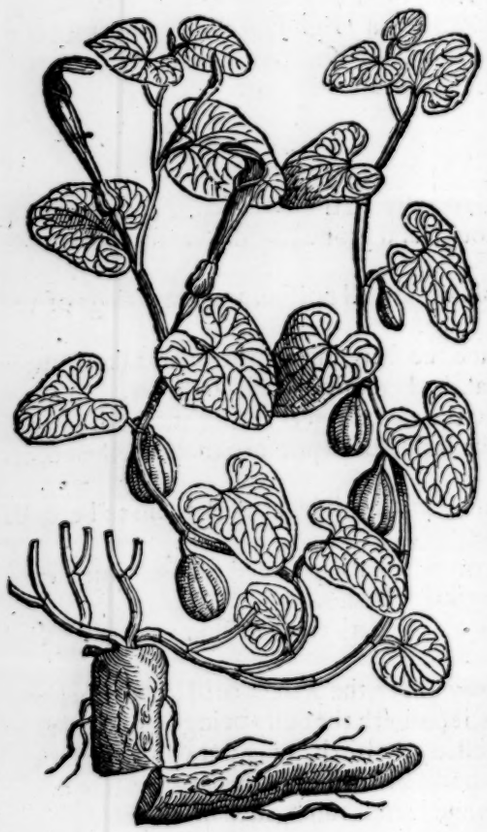
‡ I iudge our Author ſomething too womaniſh in this, that is, led more by vain opinion than by any reaſon or experience, to confirme this his aſſertion, which frequent experience ſhews to be vaine and friuolous, eſpecially for the touching, ſtriding ouer, or comming neere to this herbe. ‡

Chap. 311. *Of Birthwoorts.*

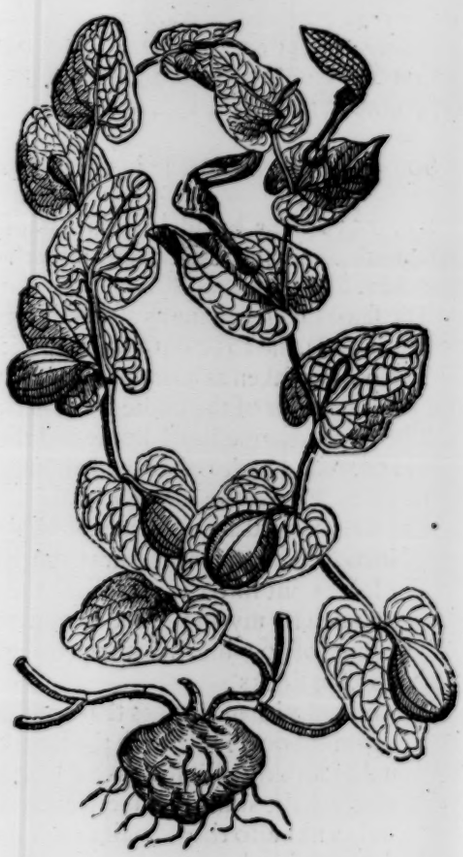
¶ *The Kindes.*

Birthwoort, as *Dioſcorides* writeth, is of three ſorts, long, round, and winding: *Plinie* hath added a fourth kinde called *Piſtolochia*, or little Birthwoort. The later writers haue ioined vnto them a fifth, named Saracens Birthwoort.

1 *Ariſtolochia longa.*
Long Birthwoort.



2 *Ariſtolochia rotunda.*
Round Birthwoort.



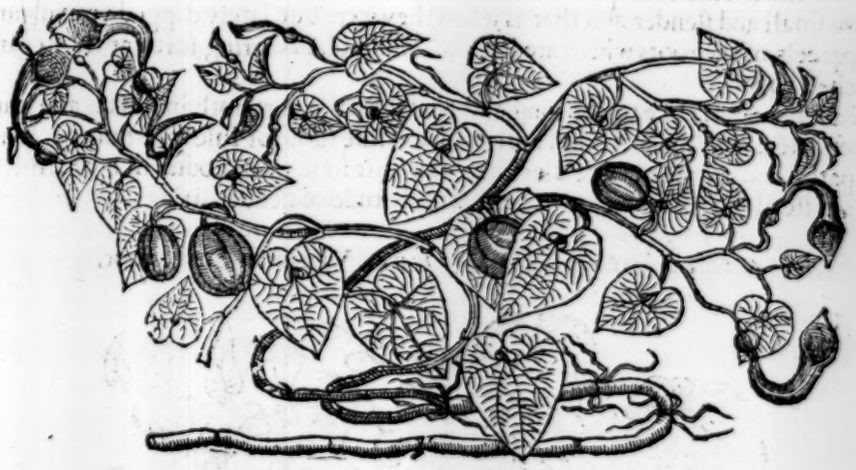
¶ *The Deſcription.*

1 Long Birthwoort hath many ſmall long ſlender ſtalkes creeping vpon the ground, tangling one with another very intricately, beſet with round leaues not much vnlike Sowbread or Iuie, but larger, of a light or ouerworne greene colour, and of a grieuous or lothſome ſmell and ſauour: among which come forth long hollow floures, not much vnlike the floures of Aron, but without any peſtell or clapper in the ſame; of a dark purple colour: after which do follow ſmall fruit like vnto little peares, containing triangled ſeeds of a blackiſh colour. The root is long, thicke, of the colour of box, of a ſtrong ſauour and bitter taſte.

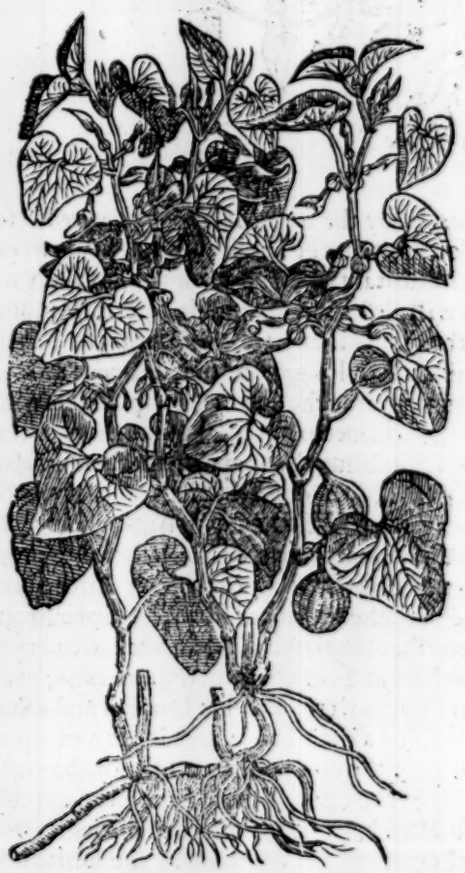
2 The round Birthwoort in ſtalkes and leaues is like the firſt, but his leaues are rounder: the floures differ onely in this, that they be ſomewhat longer and narrower, and of a faint yellowiſh colour, but the ſmall flap or point of the floure that turneth backe againe, is of a darke or blacke purple

ple colour. The fruit is formed like a peare, ſharpe toward the top, more ribbed and fuller than the former: the root is round like vnto Sow-bread, in taſte and ſauour like the former.

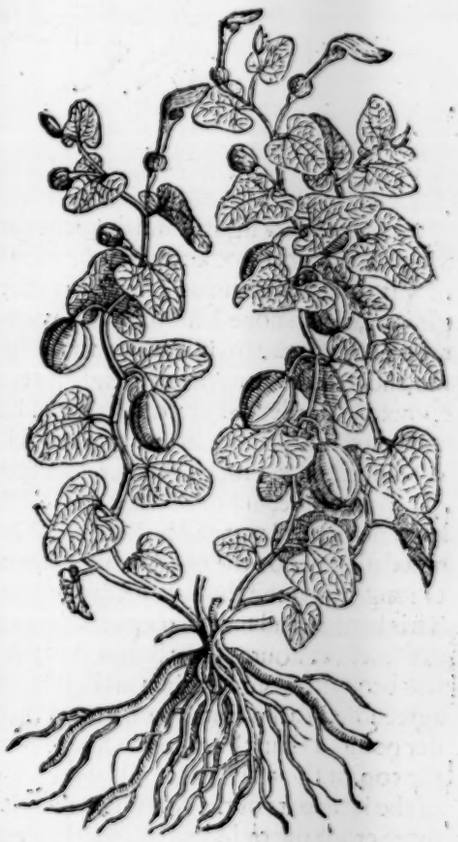
3 *Ariſtolochia clematitis.* Climing Birthwoort.



‡ 4 *Ariſtolochia Saracenica.*
Saracens Birthwoort,



‡ 5 *Piſtolochia.*
Small Birthwoort.



3 Climing Birthwoort taketh hold of any thing that is next vnto it, with his long and claſping ſtalks, which be oftentimes branched, and windeth it ſelfe like Bindweed: the ſtalks of the leaues are longer, whoſe leaues be ſmooth, broad, ſharpe pointed, as be thoſe of the others: the floures likewiſe hollow, long, yellow, or of a blackiſh purple colour: the fruit differeth not from that of the others: but the roots be ſlender and very long, ſometimes creeping on the top of the earth, and ſometimes growing deeper, being of like colour with the former ones.

4 There is a fourth kinde of Birthwoort reſembling the reſt in leaues and branched ſtalkes, yet higher

higher,and longer than either the long or the round:the leaues thereof be greater than thoſe of *Aſarabacca*;the floures hollow,long,and in one ſide hanging ouer,of a yellowiſh colour:the fruit is long and round like a peare,in which the ſeeds lie ſeuered,of forme three ſquare, of an ill fauored blackiſh colour:the root is ſomewhat long,oftentimes of a mean thickneſſe,yellow like to the colour of Box,not inferior in bitterneſſe either to the long or to the round Birthwoort: and ſometimes theſe are found to be ſmall and ſlender,and that is when they were but lately digged vp and gathered:for by the little parcels of the roots which are left,the young plants bring forth at the beginning tender and branched roots.

5 Small Birthwoort is like to the long and round Birthwoort both in ſtalkes and leaues, yet is it leſſer and tenderer: the leaues thereof are broad,and like thoſe of Iuie: the floure is long, hollow in the vpper part, and on the outſide blackiſh: the fruit ſomething round like the fruit of round Birthwoort: in ſtead of roots there grow forth a multitude of ſlender ſtrings.

‡ 6 *Piſtolochia Cretica ſiue Virginiana.* Virginian Snake-root.

‡ 6 *Cluſius* figures and deſcribes another ſmal *Piſtolochia* by the name of *Piſtolochia Cretica*,to which I thought good to adde the Epithite *Virginia* alſo, for that the much admired Snakeweed of Virginia ſeems no otherwiſe to differ from it than an inhabitant of Candy from one of the Virginians,which none I thinke will ſay to differ in *ſpecie*. I will firſt giue *Cluſius* his deſcription, and then expreſſe the little varietie that I haue obſerued in the plants that were brought from Virginia,and grew here with vs: it ſends forth many ſlender ſtalks a foot long,more or leſſe,and theſe are cornered or indented,creſted,branched, tough,and bending towards the ground, or ſpred thereon, and of a darke green colour: vpon which without order grow leaues,neruous,and like thoſe of the laſt deſcribed,yet much ſharper pointed, and after a ſort reſembling the ſhape of thoſe of *Smilax aſpera*; but leſſe,and of a darke and laſting greene colour, faſtened to longiſh ſtalkes: out of whoſe boſomes grow long and hollow crooked floures,in ſhape like thoſe of the long Birthwoort, but of a darker red on the outſide,but ſomewhat yellowiſh within: and theſe are alſo faſtened to pretty long ſtalks;and they are ſucceeded by fruit,not vnlike,yet leſſe than that of the long Birthwort. This hath abundance of roots,like as the former,but much ſmaller,and more fibrous,and of a ſtronger ſmell. It floures in Iuly and Auguſt. Thus *Cluſius* deſcribes his,to which that Snakeweed that was brought from Virginia,and grew with M^r. *Iohn Tradeſcant* at South-Lambeth, *An.* 1632. was agreeable in all points,but here and there one of the lower leaues were ſomwhat broader and rounder pointed than the reſt: the floure was long,red, crooked,and a little hairie,and it did not open the top,or ſhew the inner ſide,which I iudge was by reaſon of the coldneſſe and vnſeaſonableneſſe of the later part of the Sommer when it floured: the ſtalks in the figure ſhould haue been expreſt more crooking or indenting,for they commonly grow ſo. How hard it is to iudge of plants by one particle or facultie may very well appeare by this herbe I now treat of: for ſome by the ſimilitude the root had with *Aſarum*,and a vomiting qualitie which they attributed to it (which certainly is no other than accidentall) would forthwith pronounce and maintaine it an *Aſarum*: ſome alſo refer it to other things,as to Primroſes,*Vincitoxicum*,&c. Others more warily named it *Serpentaria Virginiana*,and *Radix Virginiana*,names as it were offering themſelues and eaſily to be fitted and impoſed vpon ſundry things,but yet too generall,and therefore not fit any more to be vſed, ſeeing the true and ſpecifick denomination is found.‡

¶ *The Place.*

Pliny ſheweth,that the Birthwoorts grow in fat and champion places,the fieldes of Spaine are full

full of theſe three long and round Birthwoorts: they are alſo found in Italie and Narbone or Languedock, a countrey in France. *Petrus Bellonius* writeth, that he found branched Birthwoort vpon Ida, a mountaine in Candie: *Carolus Cluſius* ſaith, that he found this ſame about Hiſpalis, and in many other places of Granado in Spain, among buſhes and brambles: they grow all in my garden.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

Birthwoort is called in Greeke ἀριστολοχία: in Latine likewiſe *Ariſtolochia*, becauſe it is ἄριστα τοῖς λόχιοις that is to ſay, good for women newly brought a bed, or deliuered with childe: in Engliſh, Birthwort, Hartwoort, and of ſome, Ariſtolochia.

The firſt is called *Ariſtolochia longa*, or long Birthwoort, of the forme of his root, and likewiſe *Ariſtolochia mas*, or male Birthwoort: the ſecond is thought to be *Fœmina* or female Birthwoort, & it is called *Rotunda Ariſtolochia*, or round Birthwoort: of diuers alſo *Terræ malum*, the Apple of the earth: yet *Cyclaminus* is alſo called *Terræ malum*, or the Apple of the earth.

¶ *The Temperature.*

All theſe Birthwoorts are of temperature hot and drie, and that in the third degree, hauing beſides a power to clenſe.

¶ *The Vertues.*

Dioſcorides writeth, that a dram weight of long Birthwoort drunke with wine and alſo applied, is A
good againſt ſerpents and deadly things: and that being drunke with myrrhe and pepper, it expelleth whatſoeuer is left in the matrix after the childe is deliuered, the floures alſo & dead children: and that being put vp in a peſſarie it performeth the ſame.

Round Birthwoort ſerueth for all theſe things, and alſo for the reſt of the other poiſons: it is B
likewiſe auaileable againſt the ſtuffing of the lungs, the hicket, the ſhakings or ſhiuerings of agues, hardneſſe of the milt or ſpleene, burſtings, cramps, and conuulſions, paines of the ſides if it be drunk with water.

It plucketh out thornes, ſplinters, and ſhiuers, and being mixed in plaiſters, or pulteſſes, it draws C
forth ſcales or bones, remoueth rottenneſſe or corruption, mundifieth and ſcoureth foule and filthy vlcers, and filleth them vp with new fleſh, if it be mixed with Ireos and honie.

Galen ſaith, that branched Birthwoort is of a more ſweet and pleaſant ſmell: and therefore is v- D
ſed in ointments, but it is wea'er in operation than the former ones.

Birthwoort, as *Pliny* writeth, being drunk with water is a moſt excellent remedie for cramps and E
conuulſions, bruiſes, and for ſuch as haue falne from high places.

It is good for them that are ſhort-winded, and are troubled with the falling ſickneſſe. F

The round *Ariſtolochia* doth beautifie, clenſe, and faſten the teeth, if they be often fretted or rub- G
bed with the pouder thereof.

‡ The root of the Virginian *Piſtolochia*, which is of a ſtrong and aromaticke ſent, is a ſingular & H
much vſed Antidote againſt the bite of the Rattle-ſnake, or rather Adder or Viper, whoſe bite is very deadly, and therfore by the prouidence of the Creator he hath vpon his taile a skinny dry ſubſtance parted into cels which containe ſome looſe, hard drie bodies that rattle in them (as if one ſhould put little ſtones or peaſe into a ſtiffe and very dry bladder) that ſo he may by this noiſe giue warning of his approch, the better to be auoided; but if any be bitten, they know, nor ſtand in need of no better antidote, than this root, which they chew, and apply to the wound, & alſo ſwallow ſome of it downe, by which means they quickly ouercome the malignitie of this poiſonous bite, which otherwiſe in a very ſhort time would proue deadly. Many alſo commend the vſe of this againſt the plague, ſmall pox, meaſels, and ſuch like maligne and contagious diſeaſes. ‡

Chap. 312. *Of Violets.*

The Kindes.

There might be deſcribed many kinds of floures vnder this name of violets, if their differences ſhould be more curiouſly looked into than is neceſſarie: for we might ioine hereunto the ſtock Gillofloures, the Wall floures, Dames Gillofloures, Marians violets, and likewiſe ſome of the bulbed floures, becauſe ſome of them by *Theophraſtus* are termed Violets. But this was not our charge, holding it ſufficient to diſtinguiſh and diuide them as neere as may be in kindred and neighbourhood; addreſſing my ſelfe vnto the Violets called the blacke or purple violets, or March Violets of the Garden, which haue a great prerogatiue aboue others, not onely becauſe the minde conceiueth a certaine pleaſure and recreation by ſmelling and handling of thoſe moſt odoriferous flours, but alſo for that very many by theſe Violets receiue ornament and comely grace: for there bee made of them Galands for the head, Noſe-gaies, and poeſies, which are delightfull to looke on, and pleaſant to ſmell to, ſpeaking nothing of their appropriate vertues; yea Gardens themſelues receiue by theſe the greateſt ornament of all, chiefeſt beautie and moſt gallant grace; and the re-

creation of the minde which is taken hereby, cannot be but very good and honeſt: for they admoniſh and ſtir vp a man to that which is comely and honeſt; for floures through their beautie, variety of colour, and exquiſite forme, do bring to a liberall and gentle manly minde, the remembrance of honeſtie, comelineſſe, and all kindes of vertues. For it would be an vnſeemely and filthie thing (as a certaine wiſe man ſaith) for him that doth looke vpon and handle faire and beautifull things, and who frequenteth and is conuerſant in faire and beautifull places, to haue his minde not faire, but filthie and deformed.

¶ *The Deſcription.*

1 THe blacke or purple Violet doth forthwith bring from the root many leaues, broad, ſleightly indented in the edges, rounder than the leaues of Iuie: among the midſt whereof ſpring vp fine ſlender ſtems, and vpon euerie one a beautifull floure ſweetly ſmelling, of a blew darkiſh purple, conſiſting of fiue little leaues, the loweſt whereof is the greateſt; and after them doe appeare little hanging cups or knaps, which, when they be ripe, do open and diuide themſelues into three parts. The ſeed is ſmall, long, and ſomewhat round withall. The root conſiſteth of many threddie ſtrings.

1 *Viola nigra ſive purpurea.*
The purple Garden Violet.

2 *Viola flore albo.*
The white Garden Violet.

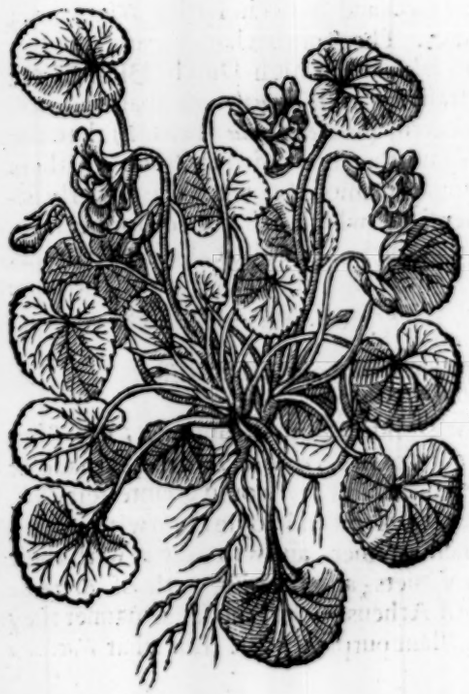
2 The white garden Violet hath many milke white floures, in forme and figure like the precedent: the colour of whoſe floures eſpecially ſetteth forth the difference.

3 The double garden violet hath leaues, creeping branches, and roots like the garden ſingle violet; differing in that, that this ſort of Violet bringeth forth moſt beautifull ſweet double floures, and the other ſingle.

4 The white double Violet likewiſe agreeth with the other of his kinde, and only differeth in the colour. For as the laſt deſcribed bringeth double blew or purple floures: contrariwiſe this plant beareth double white floures, which maketh the difference.

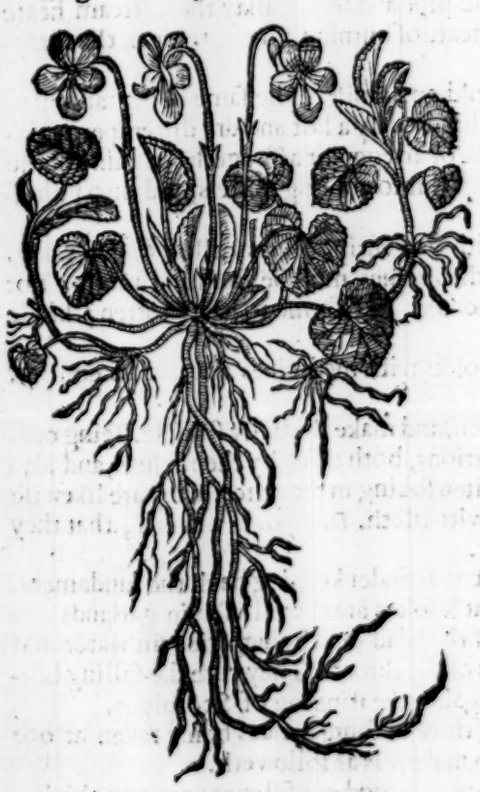
5 The yellow Violet is by nature one of the wilde Violets, for it groweth ſeldome any where but vpon moſt high and craggie mountains, from whence it hath bin diuers times brought into the garden, but it can hardly be brought to culture, or grow in the garden without great induſtrie. And by the relation of a Gentleman often remembred, called M^r. *Thomas Hesketh*, who found it growing

3 *Viola martia purpurea multiplex.*
The double garden purple Violet.



5 *Viola martia lutea.*
Yellow Violets.

† 6 *Viola canina ſylueſtris.*
Dogs Violets, or wilde Violets.



growing vpon the hills in Lancaſhire, neere vnto a village called Latham; and though he brought them into his garden, yet they withered and pined. The whole plant is deſcribed to be like vnto the field Violet, and differeth from it, in that this plant bringeth forth yellow floures, yet like in forme and figure, but without ſmell.

6 The wilde field Violet with round leaues riſeth forth of the ground from a fibrous root, with long ſlender branches, whereupon do grow round ſmooth leaues. The floures grow at the top of the ſtalkes, of a light blew colour: ‡ and this growes commonly in Woods and ſuch like places, and floures in Iuly and Auguſt. There is another varietie of this wilde Violet, which hath the leaues longer, narrower, and ſharper pointed. And this was formerly figured and deſcribed in this place by our Author. ‡

7 There is found in Germanie about Noremberg and Strasborough, a kinde of Violet which is altogether a ſtranger in theſe parts. It hath (ſaith my Author) a thicke and tough root of a wooddy ſubſtance, from which riſeth vp a ſtalke diuiding it ſelfe into diuers branches, of a wooddy ſubſtance; whereupon grow long iagged leaues like thoſe of the Panſey. The floures grow at the top, compact of fiue leaues apiece, of a watchet colour.

¶ The

¶ *The Place.*

The Violet groweth in gardens almoſt euery where: the others which are ſtrangers haue beene touched in their deſcriptions.

¶ *The Time.*

The floures for the moſt part appeare in March, at the fartheſt in Aprill.

¶ *The Names.*

The Violet is called in Greeke Ἰον: of *Theophraſtus*, both Ἰον μέλαν, and μελανιον: in Latine, *Nigra viola*, or blacke Violet, of the blackiſh purple colour of the floures. The Apothecharies keepe the Latine name *Viola*; but they call it *Herba Violaria*, and *Mater Violarum*: in high-Dutch, **Blau Viel**: in low-Dutch, **Violeten**: in French, *Violette de Mars*: in Italian, *Viola mammola*: in Spaniſh, *Violeta*: in Engliſh, Violet. *Nicander* in his Geoponickes beleeueth, (as *Hermolaus* ſheweth) that the Grecians did call it Ἰον, becauſe certaine Nymphs of Ionia gaue that floure firſt to *Iupiter*. Others ſay it was called Ἰον, becauſe when *Iupiter* had turned the young Damoſell *Io*, whom he tenderly loued, into a Cow, the earth brought forth this floure for her food: which being made for her ſake, receiued the name from her; and thereupon it is thought that the Latines alſo called it *Viola*, as though they ſhould ſay *Vitula*, by blotting out the letter *t*. *Seruius* reporteth, That for the ſame cauſe the Latines alſo name it *Vaccinium*, alledging the place of *Virgil* in his Bucolicks:

Alba liguſtra cadunt, vaccinia nigra leguntur.

Notwithſtanding *Virgil* in his tenth Eclog ſheweth, that *Vaccinium* and *Viola* do differ.

Ei nigræ violæ ſunt, & vaccinia nigra.

† *Vitruvius* alſo in his ſeuenth booke of Architecture or Building doth diſtinguiſh *Viola* from *Vaccinium*: for he ſheweth that the colour called *Sile Atticum*, or the Azure of Athens, is made *ex Viola*; and the gallant purple, *ex Vaccinio*. The Dyers, ſaith he, when they would counterfeit *Sile*, or Azure of Athens, put the dried Violets into a fat, kettle, or caldron, and boyle them with water; afterwards when it is tempered they poure it into a linnen ſtrainer, and wringing it with their hands, receiue into a mortar the liquor coloured with the Violets; and ſteeping earth of *Erethria* in it, and grinding the ſame, they make the Azure colour of Athens. After the ſame manner they temper *Vaccinium*, and putting milke vnto it, do make a gallant purple colour. But what *Vaccinia* are we will elſewhere declare.

¶ *The Temperature.*

The floures and leaues of the Violets are cold and moiſt.

¶ *The Vertues.*

A The floures are good for all inflammations, eſpecially of the ſides and lungs; they take away the hoarſeneſſe of the cheſt, the ruggedneſſe of the winde-pipe and iawes, allay the extream heate of the liuer, kidneyes, and bladder; mitigate the fierie heate of burning agues; temper the ſharpneſſe of choler, and take away thirſt.

B There is an oyle made of Violets, which is likewiſe cold and moiſt. The ſame being anointed vpon the teſticles, doth gently prouoke ſleepe which is hindred by a hot and dry diſtemper: mixed or laboured together in a woodden diſh with the yelke of an egge, it aſſwageth the pain of the fundament and hemorrhoides: it is likewiſe good to be put into cooling cliſters, and into pulteſſes that coole and eaſe paine.

C But let the oyle in which the Violets be ſteeped be either of vnripe oliues, called *Omphacinum*, or of ſweet Almonds, as *Meſues* ſaith, and the Violets themſelues muſt be freſh and moiſt: For being dry, and hauing loſt their moiſture, they doe not coole, but ſeeme to haue gotten a kinde of heate.

D The later Phyſitians do thinke it good to mix dry Violets with medicines that are to comfort and ſtrengthen the heart.

E The leaues of Violets inwardly taken do coole, moiſten, and make the belly ſoluble. Being outwardly applied, they mitigate all kinde of hot inflammations, both taken by themſelues, and alſo applied with Barley floure dried at the fire, after it hath lien ſoking in the water. They are likewiſe laid vpon a hot ſtomacke, and on burning eyes, as *Galen* witneſſeth. *Dioſcorides* writeth, that they be moreouer applied to the fundament that is fallen out.

F They may helpe the fundament that is fallen out, not as a binder keeping back the fundament, but as a ſuppler and a mollifier. Beſides, *Pliny* ſaith that Violets are as well vſed in garlands, as ſmelt vnto; and are good againſt ſurfeting, heauineſſe of the head; and being dried in water and drunke, they remoue the Squinancie or inward ſwellings of the throat. They cure the falling ſickneſſe, eſpecially in yong children, and the ſeed is good againſt the ſtinging of Scorpions.

G There is a ſyrrup made of Violets and Sugar, whereof three or foure ounces being taken at one time, ſoften the belly, and purge choler. The manner to make it is as followeth.

H Firſt make of clarified ſugar by boyling a ſimple ſyrrup of a good conſiſtence or meane thickeneſſe, whereunto put the floures cleane picked from all manner of filth, as alſo the white ends

nipped

nipped away, a quantitie according to the quantitie of the ſyrrup, to your owne diſcretion, wherein let them infuſe or ſteepe foure and twenty houres, and ſet vpon a few warme embers; then ſtrain it, and put more Violets into the ſame ſyrrup: thus do three or foure times, the oftner the better; then ſet them vpon a gentle fire to ſimper, but not to boyle in any wiſe: ſo haue you it ſimply made of a moſt perfect purple colour, and of the ſmell of the floures themſelues. Some do adde thereto a little of the iuyce of the floures in the boyling, which maketh it of better force and vertue. Likewiſe ſome do put a little quantitie of the iuyce of Lymons in the boyling, which doth greatly encreaſe the beauty thereof, but nothing at all the vertue.

There is likewiſe made of Violets and ſugar certain plates called Sugar Violet, or Violet tables, I
or Plate, which is moſt pleaſant and wholeſome, eſpecially it comforteth the heart and the other inward parts.

The decoction of Violets is good againſt hot feuers, and the inflammation of the liuer and all K
other inward parts: the like propertie hath the iuyce, ſyrrup, or conſerue of the ſame.

Syrrup of Violets is good againſt the inflammation of the lungs and breſt, againſt the pleuriſie L
and cough, againſt feuers and agues in yong children, eſpecially if you put vnto an ounce of Syrrup eight or nine drops of oyle of Vitrioll, and mix it together, and giue it to the childe a ſpoonefull at once.

The ſame giuen in manner aforeſaid is of great efficacie in burning feuers and peſtilent diſeaſes, M
greatly cooling the inward parts: and it may ſeeme ſtrange to ſome, that ſo ſharpe a corroſiue as oyle of Vitriol ſhould be giuen into the body; yet being delayed and giuen as aforeſaid, ſucking children may take it without any perill.

The ſame taken as aforeſaid cureth all inflammations of the throat, mouth, uvula, ſquinancie, N
and the falling euill in children.

Sugar-Violet hath power to ceaſe inflammations, roughneſſe of the throat, and comforteth the O
heart, aſſwageth the paines of the head, and cauſeth ſleepe.

The leaues of Violets are vſed in cooling plaiſters, oyles, and comfortable cataplaſmes or pul- P
teſſes; and are of greater efficacie among other herbes, as Mercurie, Mallowes, and ſuch like, in cliſters, for the purpoſes aforeſaid.

Chap. 313. *Of Hearts-eaſe, or Panſies.*

¶ *The Deſcription.*

1 THe Hearts-eaſe or Paunſie hath many round leaues at the firſt comming vp; afterward they grow ſomewhat longer, ſleightly cut about the edges, trailing or creeping vpon the ground. The ſtalkes are weake and tender, whereupon do grow floures in forme and figure like the Violet, and for the moſt part of the ſame bigneſſe, of three ſundry colours; whereof it tooke the ſyrname *Tricolor*, that is to ſay, purple, yellow, and white or blew: by reaſon of the beauty and brauerie of which colours they are very pleaſing to the eye; for ſmell they haue little or none at all. The ſeed is contained in little knaps, of the bigneſſe of a Tare, which come forth after the floures be fallen, and do open of themſelues when the ſeed is ripe. The root is nothing elſe but as it were a bundle of threddy ſtrings.

2 The vpright Paunſie bringeth forth long leaues deepely cut in the edges, ſharpe pointed, of a bleake or pale greene colour, ſet vpon ſlender vpright ſtalkes, cornered, ioynted, or kneed a foot high or higher; whereupon do grow very faire floures of three colours, *viz.* of purple, blew, and yellow, in ſhape like the common Hearts-eaſe, but greater and fairer: which colours are ſo excellently and orderly placed, that they bring great delectation to the beholders, though they haue little or no ſmell at all. For oftentimes it hapneth, that the vppermoſt floures are differing from thoſe that grow vpon the middle of the plant, and thoſe varie from the lowermoſt, as Nature liſt to dally with things of ſuch beauty. The ſeed is like the precedent.

3 The wilde Paunſie differeth from that of the garden, in leaues, roots, and tender branches: the floures of this wilde one are of a bleake and pale colour, far inferiour in beauty to that of the garden, wherein conſiſteth the difference.

4 Stony Hearts-eaſe is a baſe and low plant: The leaues are rounder, and not ſo much cut about the edges as the others: The branches are weake and feeble, trailing vpon the ground: The floures are likewiſe of three colours, that is to ſay, white, blew, and yellow, void of ſmell. The root periſheth when it hath perfected his ſeed.

5 There is found in ſundry places of England a wilde kinde hereof, bringing floures of a faint yellow colour, without mixture of any other colour, yet hauing a deeper yellow ſpot in the loweſt leafe,

1 *Viola tricolor.*
Hearts-eaſe.

2 *Viola aſſurgens tricolor.*
Vpright Hearts-eaſe.

3 *Viola tricolor ſylueſtris.*
Wilde Paunſies.

4 *Viola tricolor petræa.*
Stony Hearts-eaſe.

leaſe with foure or fiue blackiſh purple lines, wherein it differeth from the other wilde kinde: and this hath beene taken of ſome yong Herbariſts to be the yellow Violet.

¶ *The Place.*

The Hearts-eaſe groweth in fields in many places, and in gardens alſo, and that oftentimes of it ſelfe: it is more gallant and beautifull than any of the wilde ones.

Matthiolus reporteth, that the vpright Paunſie is found on mount Baldus in Italy. *Lobel* ſaith that it groweth in Languedocke in France, and on the tops of ſome hills in England; but as yet I haue not ſeene the ſame.

Thoſe with yellow floures haue been found by a village in Lancaſhire called Latham, foure miles from Kyrckham, by M^r. *Thomas Hesketh* before remembred.

¶ *The Time.*

They floure not onely in the Spring, but for the moſt part all Sommer thorow, euen vntill Autumne.

¶ *The Names.*

Hearts-eaſe is named in Latine *Viola tricolor*, or the three coloured Violet; and of diuers, *Iacea*; (yet there is another *Iacea* ſyrnamed *Nigra*: in Engliſh, Knap-weed, Bull-weed, and Matfellon) of others, *Herba Trinitatis*, or herbe Trinitie, by reaſon of the triple colour of the floures: of ſome others, *Herba Clauellata*: in French, *Penſees*: by which name they became knowne to the Brabanders and others of the Low-countries that are next adioyning. It ſeemeth to be *Viola flammea*, which *Theophraſtus* calleth ἰόλα, which is alſo called ἰόϊον: in Engliſh, Hearts-eaſe, Paunſies, Liue in idleneſſe, Cull me to you, and Three faces in a hood.

The vpright Panſie is called not vnproperly *Viola aſſurgens*, or *Surrecta*, and withall *Tricolor*, that is to ſay, ſtraight or vpright Violet three coloured: of ſome, *Viola arboreſcens*, or Tree Violet, for that in the multitude of branches and manner of growing it reſembles a little tree.

¶ *The Temperature.*

It is of temperature obſcurely cold, but more euidently moiſt, of a tough and ſlimie iuyce, like that of the Mallow; for which cauſe it moiſtneth and ſuppleth, but not ſo much as the Mallow doth.

¶ *The Vertues.*

It is good, as the later Phyſitions write, for ſuch as are ſicke of an ague, eſpecially children and infants, whoſe conuulſions and fits of the falling ſickneſſe it is thought to cure. A

It is commended againſt inflammations of the lungs and cheſt, and againſt ſcabs and itchings of the whole body, and healeth vlcers. B

The diſtilled water of the herbe or floures giuen to drinke for ten or more dayes together, three ounces in the morning, and the like quantitie at night, doth wonderfully eaſe the paines of the French diſeaſe, and cureth the ſame, if the Patient be cauſed to ſweat ſundry times, as *Coſtæus* reporteth, in his booke *de natura Vniuerſ. ſtirp.* C

Chap. 314. *Of Ground-Iuy, or Ale-hoofe.*

¶ *The Deſcription.*

1 GRound Iuy is a low or baſe herbe; it creepeth and ſpreads vpon the ground hither and thither all about, with many ſtalkes of an vncertaine length, ſlender, and like thoſe of the Vine, ſomething cornered, and ſometimes reddiſh: whereupon grow leaues ſomething broad and round, wrinkled, hairy, nicked in the edges, for the moſt part two out of euerie ioynt: amongſt which come forth the floures gaping like little hoods, not vnlike to thoſe of Germander, of a purpliſh blew colour: the roots are very threddy: the whole plant is of a ſtrong ſmell and bitter taſte.

‡ 2 Vpon the rockie and mountainous places of Prouince and Daulphine growes this other kinde of Ale-hoofe, which hath leaues, ſtalkes, floures, and roots like in ſhape to thoſe of the former, but the floures and leaues are of a light purple colour, and alſo larger and longer. This by *Lobel* is called *Aſarina, ſiue Saxatilis hedera.* ‡

¶ *The Place.*

It is found as well in tilled as in vntilled places, but moſt commonly in obſcure and darke places, vpon banks vnder hedges, and by the ſides of houſes.

¶ *The Time.*

It remaineth greene not onely in Sommer, but alſo in Winter at any time of the yeare: it floureth from Aprill till Sommer be far ſpent.

¶ *The*

1 *Hedera terreſtris.*
Ale-hoofe.

‡ 2 *Hedera ſaxatilis.*
Rocke Ale-hoofe.

¶ *The Names.*

It is commonly called *Hedera terreſtris*: in Greeke, χαμαικισσος: alſo *Corona terræ*: in high-Dutch, **Gundelreb**: in low-Dutch, **Onderhaue**: in French, *Lierre terreſtre*: *Hedera humilis* of ſome, and *Chamæciſſum*: in Engliſh, Ground-Iuy, Ale-hoofe, Gill go by ground, Tune-hoofe, and Catsfoot. ‡ Many queſtion whether this be the *Chamæciſſus* of the Antients: which controuerſie *Dodonæus* hath largely handled, *Pempt.* 3. *lib.* 3. *cap.* 4. ‡

¶ *The Temperature.*

Ground-Iuie is hot and dry, and becauſe it is bitter it ſcoureth, and remoueth ſtoppings out of the intrals.

¶ *The Vertues.*

A Ground-Iuy is commended againſt the humming noyſe and ringing ſound of the eares, being put into them, and for them that are hard of hearing.

B *Matthiolus* writeth, That the iuyce being tempered with Verdugreaſe, is good againſt fiſtulaes and hollow vlcers.

C *Dioſcorides* teacheth, That halfe a dram of the leaues being drunke in foure ounces and a halfe of faire water, for fourty or fifty dayes together, is a remedie againſt the Sciatica, or ache in the huckle bone.

D The ſame taken in like ſort ſix or ſeuen dayes doth alſo cure the yellow jaundice. *Galen* hath attributed (as we haue ſaid) all the vertue vnto the floures: Seeing the floures of Ground-Iuy (ſaith he) are very bitter, they remoue ſtoppings out of the liuer, and are giuen to them that are vexed with the Sciatica.

E Ground-Iuy, Celandine, and Daiſies, of each a like quantitie, ſtamped and ſtrained, and a little ſugar and roſe water put thereto, and dropped with a feather into the eyes, taketh away all manner of inflammation, ſpots, webs, itch, ſmarting, or any griefe whatſoeuer in the eyes, yea although the ſight were nigh hand gone: it is proued to be the beſt medicine in the world.

F The herbes ſtamped as aforeſaid, and mixed with a little ale and honey, and ſtrained, takes away the pinne and web, or any griefe out of the eyes of horſe or cow, or any other beaſt, being ſquirted into the ſame with a ſyringe, or I might haue ſaid the liquor iniected into the eyes with a ſyringe. But I liſt not to be ouer eloquent among Gentlewomen, to whom eſpecially my Works are moſt neceſſarie.

G The women of our Northerne parts, eſpecially about Wales and Cheſhire, do tunne the herbe Ale-hoof into their Ale; but the reaſon thereof I know not: notwithſtanding without all controuerſie

uerſie it is moſt ſingular againſt the griefes aforeſaid: being tunned vp in ale and drunke, it alſo purgeth the head from rhumaticke humors flowing from the braine.

Hedera terreſtris boyled in water ſtayeth the termes; and boyled in mutton broth it helps weake I and aking backes.

They haue vſed to put it into ointments againſt burning with fire, gunpouder, and ſuch like. K

Hedera terreſtris being bound in a bundle, or chopt as herbes for the pot, and eaten or drunke as L thin broth ſtayeth the flux in women.

Chap. 315. *Of Iuy.*

¶ *The Kindes.*

THere be two kindes of Iuy, as *Theophraſtus* witneſſeth, reckoned among the number of thoſe plants which haue need to be propped vp; for they ſtand not of themſelues, but are faſtned to ſtone walls, trees, and ſuch like, and yet notwithſtanding both of a wooddy ſubſtance, and yet not to be placed among the trees, ſhrubs, or buſhes, becauſe of the affinitie they haue with climbing herbes; as alſo agreeing in forme and figure with many other plants that climbe, and are indeed ſimply to be reckoned among the herbes that clamber vp. But if any will cauill, or charge me with my promiſe made in the beginning of this hiſtorie, where we made our diuiſion, namely, to place each plant as neere as may be in kindred and neighbourhood; this promiſe I haue fulfilled, if the curious eye can be content to reade without raſhneſſe thoſe plants following in order, and not onely this climbing Iuy that lifteth her ſelfe to the tops of trees, but alſo the other Iuy that creepeth vpon the ground.

Of the greater or the climing Iuy there are alſo many ſorts; but eſpecially three, the white, the blacke, and that which is called *Hedera Helix*, or *Hedera ſterilis*.

¶ *The Deſcription.*

1 THe greater Iuy climbeth on trees, old buildings, and walls: the ſtalkes thereof are wooddy, and now and then ſo great as it ſeemes to become a tree; from which it ſendeth a multitude of little boughes or branches euery way, whereby as it were with arms it creepeth and wandereth far about: it alſo bringeth forth continually fine little roots, by which it faſtneth it ſelfe and cleaueth wonderfull hard vpon trees, and vpon the ſmootheſt ſtone walls: the leanes are ſmooth, ſhining eſpecially on the vpper ſide, cornered with ſharpe pointed corners. The floures are very ſmall and moſſie; after which ſucceed bundles of black berries, euery one hauing a ſmall ſharpe pointall.

There is another ſort of great Iuy that bringeth forth white fruit, which ſome call *Acharnicam irriguam*; and alſo another leſſer, the which hath blacke berries. This *Pliny* calleth *Selinitium*.

We alſo finde mentioned another ſort hereof ſpred abroad, with a fruit of a yellow Saffron colour, called of diuers *Dionyſias*, as *Dioſcorides* writeth: others *Bacchica*, of which the Poets vſed to make garlands, as *Pliny* teſtifieth, *lib. 16. cap. 34.*

2 Barren Iuy is not much vnlike vnto the common Iuy aforeſaid, ſauing that his branches are both ſmaller and tenderer, not lifting or bearing it ſelfe vpward, but creeping along by the ground vnder moiſt and ſhadowie ditch bankes. The leaues are moſt commonly three ſquare, cornered, of a blackiſh greene colour, which at the end of Sommer become browniſh red vpon the lower ſide. The whole plant beareth neither floures nor fruit, but is altogether barren and fruitleſſe.

‡ 3 There is kept for nouelties ſake in diuers gardens a Virginian, by ſome (though vnfitly) termed a Vine, being indeed an Iuy. The ſtalkes of this grow to a great heighth, if they be planted nigh any thing that may ſuſtaine or beare them vp: and they take firſt hold by certaine ſmall tendrels, vpon what body ſoeuer they grow, whether ſtone, boords, bricke, yea glaſſe, and that ſo firmely, that oftentimes they will bring pieces with them if you plucke them off. The leaues are large, conſiſting of foure, fiue, or more particular leaues, each of them being long, and deeply notched about the edges, ſo that they ſomewhat reſemble the leaues of the Cheſnut tree: the floures grow cluſtering together after the manner of Iuy, but neuer with vs ſhew themſelues open, ſo that we cannot iuſtly ſay any thing of their colour, or the fruit that ſucceeds them. It puts forth his leaues in April, and the ſtalkes with the rudiments of the floures are to be ſeene in Auguſt. It may as I ſaid be fitly called *Hedera Virginiana*. ‡

¶ *The Place.*

Iuy groweth commonly about walls and trees; the white Iuy groweth in Greece, and the barren Iuy groweth vpon the ground in ditch bankes and ſhadowie woods.

1 *Hedera corymboſa.*
Clymbing or berried Iuy.

2 *Hedera Helix.*
Barren or creeping Iuy.

¶ *The Time.*

Iuy flouriſheth in Autumne: the berries are ripe after the Winter Solſtice.

¶ *The Names.*

Iuy is called in Latine *Hedera*: in Greeke, κίσσος, and κιττος: in high-Dutch, **Epheu**: in low-Dutch, **Ueyle**: in Spaniſh, *Yedra*: in French, *Liarre*.

The greater Iuy is called of *Theophraſtus* ὑψηλὸς κιττος: in Latine, *Hedera attollens*, or *Hedera aſſurgens*: *Gaza* interpreteth it *Hedera excelſa*. The later Herbariſts would haue it to be *Hedera arborea*, or tree Iuy, becauſe it groweth vpon trees, and *Hedera muralis*, which hangeth vpon walls.

Creeping or barren Iuy is called in Greeke πεζὸς κιττος: in Engliſh, Ground-Iuy: yet doth it much differ from *Hedera terreſtris*, or Ground-Iuy before deſcribed: of ſome it is called *Clanicula*, *Hedera Helix*, and *Hedera ſterilis*; and is that herbe wherein the Bore delighteth, according to *Iohannes Khuenius*.

¶ *The Temperature.*

Iuy, as *Galen* ſaith, is compounded of contrarie faculties; for it hath a certaine binding earthy and cold ſubſtance, and alſo a ſubſtance ſomewhat biting, which euen the very taſte doth ſhew to be hot. Neither is it without a third facultie, as being of a certaine warme wateric ſubſtance, and that is if it be greene: for whileſt it is in drying, this watery ſubſtance being earthy, cold, and binding conſumeth away, and that which is hot and biting remaineth.

¶ *The Vertues.*

A The leaues of Iuy freſh and greene boyled in wine, do heale old vlcers, and perfectly cure thoſe that haue a venomous and malicious quality ioyned with them; and are a remedy likewiſe againſt burnings and ſcaldings.

B Moreouer, the leaues boyled with vineger are good for ſuch as haue bad ſpleens; but the floures or fruit are of more force, being very finely beaten and tempered with vineger, eſpecially ſo vſed they are commended againſt burnings.

C The iuyce drawne or ſniſt vp into the noſe doth effectually purge the head, ſtayeth the running of the eares that hath beene of long continuance, and healeth old vlcers both in the eares and alſo in the noſthrils: but if it be too ſharpe, it is to be mixed with oyle of Roſes, or ſallad oyle.

D The gum that is found vpon the trunke or body of the old ſtocke of Iuy, killeth nits and lice, and taketh away haire: it is of ſo hot a qualitie, as that it doth obſcurely burne: it is as it were a certaine

certaine wateriſh liquor congealed of thoſe gummie drops. Thus farre *Galen*.

The very ſame almoſt hath *Dioſcorides*, but yet alſo ſomewhat more: for ouer and beſides hee E
ſaith, that fiue of the berries beaten ſmall, and made hot in a Pomegranat rinde, with oyle of roſes, and dropped into the contrarie eare, doth eaſe the tooth-ache; and that the berries make the haire blacke.

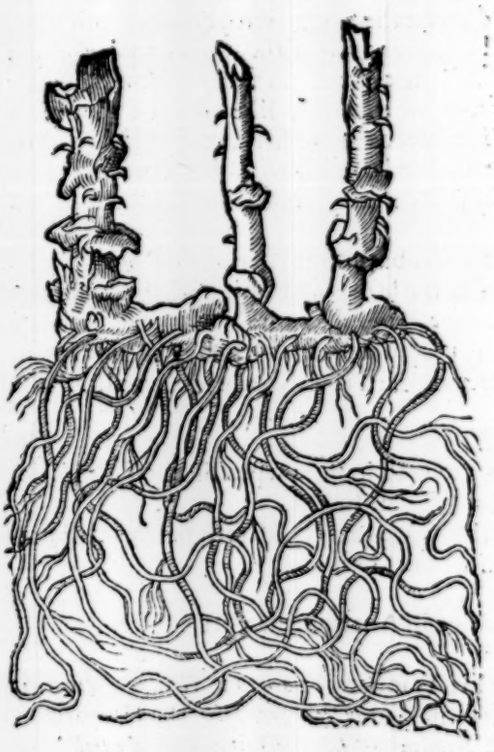
Iuy in our time is very ſeldome vſed, ſaue that the leaues are layd vpon little vlcers made in the F
thighes, legs, or other parts of the body, which are called Iſſues; for they draw humors and wateriſh ſubſtance to thoſe parts, and keepe them from hot ſwellings or inflammations, that is to ſay, the leaues newly gathered, and not as yet withered or dried.

Some likewiſe affirme that the berries are effectuall to procure vrine; and are giuen vnto thoſe G
that be troubled with the ſtone and diſeaſes of the kidneyes.

The leaues laid in ſteepe in water for a day and a nights ſpace, helpe ſore and ſmarting wate- H
riſh eyes, if they be bathed and waſhed with the water wherein they haue beene infuſed.

Chap. 316. *Of rough Binde-weed.*

1 *Smilax Peruviana, Salſa parilla.*
Rough Binde-weed of Peru.



2 *Smilax aſpera.*
Common rough Binde-weed.

¶ *The Deſcription.*

1 ALthough we haue great plenty of the roots of this Binde-weed of Peru, which we vſually cally *Zarza*, or *Sarſa Parilla*, wherewith diuers griefes and maladies are cured, and that theſe roots are very well knowne to all; yet ſuch hath beene the careleſneſſe and ſmall prouidence of ſuch as haue trauelled into the Indies, that hitherto not any haue giuen vs inſtruction ſufficient, either concerning the leaues, floures, or fruit: onely *Monardus* ſaith, that it hath long roots deepe thruſt into the ground: which is as much as if a great learned man ſhould tell the ſimple, that our common carrion Crow were of a blacke colour. For who is ſo blinde that ſeeth the root it ſelfe, but can eaſily affirme the roots to be very long? Notwithſtanding, there is in the reports of ſuch as ſay they haue ſeene the plant it ſelfe growing, ſome contradiction or contrarietie: ſome report that it is a kind of Bind-weed, and eſpecially one of theſe rough Bindweeds:

3 *Smilax aſpera Luſitanica.*
Rough Binde-weed of Portugall.

3 This rough Binde-weed, found for the moſt part in the barren mountaines of Portugal, differeth not from the precedent in ſtalkes and floures, but in the leaues and fruit; for the leaues are ſofter, and leſſe prickly, and ſometimes haue no prickles at all, and they are alſo oftentimes much narrower: the fruit or berry is not red but blacke when as it commeth to be ripe. The root hereof is one ſingle root of a wooddy ſubſtance, with ſome fibres annexed thereto, wherein conſiſteth the difference.

¶ *The Place.*

Zarza parilla, or the prickly Binde-weed of America, groweth in Peru a prouince of America, in Virginia, and in diuers other places both in the Eaſt and Weſt Indies.

The others grow in rough and vntilled places, about the hedges and borders of fields, on mountaines and vallies, in Italy, Languedock in France, Spaine, and Germany.

¶ *The Time.*

They floure and flouriſh in the Spring: their fruit is ripe in Autumne, or a little before.

¶ *The Names.*

It is named in Greeke σμίλαξ τραχεῖα. *Gaza* (*Theophraſtus* his Tranſlator) names it *Hedera Cilicia*; as likewiſe *Pliny*, who *lib.* 24. *cap.* 10 writeth, that it is alſo ſyrnamed *Nicophoron*. Of the Hetrurians, *Hedera ſpinoſa*, and *Rubus ceruinus*: of the Caſtilians in Spaine, as *Lacuna* ſaith, *Zarza parilla*, as though they ſhould ſay *Rubus viticula*, or Bramble little Vine. *Parra*, as *Matthiolus* interpreteth it, doth ſignifie a Vine; and *Parilla*, a ſmall or little Vine.

Diuers affirme that the root (brought out of Peru a prouince in America) which the later Herbariſts do call *Zarza*, is the root of this Bindeweed. *Garcias Lopius Luſitanus* granteth it to be like thereunto, but yet he doth not affirme that it is the ſame. Plants are oftentimes found to be like one another, which notwithſtanding are proued not to be the ſame by ſome little difference; the diuers conſtitution of the weather and of the ſoile making the difference.

Zarzaparilla of Peru is a ſtrange plant, and is brought vnto vs from the Countries of the new world called America; and ſuch things as are brought from thence, although they alſo ſeeme and are like to thoſe that grow in Europe, notwithſtanding they doe often differ in vertue and operation: for the diuerſitie of the ſoile and of the weather doth not only breed an alteration in the form,

but

others, as one Mr. *White* an excellent painter, who carried very many people into Virginia (or after ſome Norembega) there to inhabit, at which time hee did ſee thereof great plentie, as he himſelfe reported vnto me, with this bare deſcription; It is (ſaith he) the root of a ſmall ſhrubbie tree, or hedge tree, ſuch as are thoſe of our country called Haw-thorns, hauing leaues reſembling thoſe of Iuy, but the floures or fruit he remembreth not. ‡ It is moſt certaine, that *Sarſa parilla* is the root of the Americane *Smilax aſpera*, both by conſent of moſt Writers, and by the relation of ſuch as haue ſeene it growing there. ‡

2 The common rough Binde-weed hath many branches ſet full of little ſharpe prickles, with certaine claſping tendrels, wherewith it taketh hold vpon hedges, ſhrubs, and whatſoeuer ſtandeth next vnto it, winding and claſping it ſelfe about from the bottom to the top; whereon are placed at euery ioint one leafe like that of Iuy, without corners, ſharpe pointed, leſſer and harder than thoſe of ſmooth Binde-weed, oftentimes marked with little white ſpots, and garded or bordered about the edges with crooked prickles. The floures grow at the top of crooked ſtalks of a white colour, and ſweet of ſmell. After commeth the fruit like thoſe of the wilde Vine, greene at the firſt, and red when they be ripe, and of a biting taſte; wherein is contained a blackiſh ſeed in ſhape like that of hempe. The root is long, ſomewhat hard, and parted into very many branches.

but doth moſt of all preuaile in making the vertues and qualities greater or leſſer. Such things as grow in hot places be of more force, and greater ſmell; and in cold, of leſſer. Some things that are deadly and pernitious, being remoued wax milde, and are made wholeſome: ſo in like manner, although *Zarza parilla* of Peru be like to rough Binde-weed, or to Spaniſh *Zarza parilla*, notwithſtanding by reaſon of the temperature of the weather, and alſo through the nature of the ſoile, it is of a great deale more force than that which groweth either in Spaine or in Africke.

The roots of *Zarza parilla* of Peru, which are brought alone without the plant, be long and ſlender, like to the leſſer roots of common liquorice, very many oftentimes hanging from one head, in which roots the middle ſtring is hardeſt. They haue little taſte, and ſo ſmall a ſmell that it is not to be perceiued. Theſe are reported to grow in Honduras a prouince of Peru. They had their name of the likeneſſe of rough Binde-weed, which among the inhabitants it keepeth; ſignifying in Spaniſh, a rough or prickly vine, as *Garcias Lopius* witneſſeth.

¶ *The Temperature.*

The roots are of temperature hot and dry, and of thin and ſubtill parts, inſomuch as their decoction doth very eaſily procure ſweat.

¶ *The Vertues.*

The roots are a remedie againſt long continuall paine of the ioynts and head, and againſt cold diſeaſes. They are good for all manner of infirmities wherein there is hope of cure by ſweating, ſo that there be no ague ioyned. A

The cure is perfected in few dayes, if the diſeaſe be not old or great; but if it be, it requireth a longer time of cure. The roots here meant are as I take it thoſe of *Zarza parilla*, whereof this *Smilax aſpera* or rough Binde-weed is holden for a kinde: notwithſtanding this of Spain and the other parts of Europe, though it be counted leſſe worth, yet is it commended of *Dioſcorides* and *Pliny* againſt poyſons. The leaues hereof, ſaith *Dioſcorides*, are a counterpoyſon againſt deadly medicines, whether they be drunke before or after. B

† The ſecond and fourth were both formerly of one plant, I meane the hiſtorie; for the figure in the fourth place ſhould haue been in the third, and the figure in the third was the ſame with the ſecond, and ſhould haue been in the fourth place.

Chap. 317. *Of ſmooth or gentle Binde-weed.*

1 *Smilax lenis ſiue læuis maior.*
Great ſmooth Binde-weed.

2 *Smilax lenis minor.*
Small Binde-weed.

¶ *The Deſcription.*

1 IT is a ſtrange thing vnto me, that the name of *Smilax* ſhould be ſo largely extended, as that it ſhould be aſſigned to thoſe plants that come nothing neere the nature, and ſcarſly vnto any part of the forme of *Smilax* indeed. But we will leaue controuerſies to the further conſideration of ſuch as loue to dance in quag-mires, and come to this our common ſmooth *Smilax*, called and knowne by that name among vs, or rather more truly by the name of *Convolvulus maior*, or *Volubilis maior*: It beareth the long branches of a Vine, but tenderer, and for the length and great ſpreading therof it is very fit to make ſhadows in arbors: the leaues are ſmooth like Iuie, but ſomewhat bigger, and being broken are full of milke: amongſt which come forth great white and hollow floures like bells. The ſeed is three cornered, growing in ſmall huskes couered with a thin skin. The root is ſmall, white and long, like the great Dogs graſſe.

2 *Smilax lenis minor* is much like vnto the former in ſtalkes, leaues, floures, ſeed, and roots, ſauing that in all reſpects it is much ſmaller, and creepeth vpon the ground. The branches are ſmall and ſmooth: the little leaues tender and ſoft: the floures like vnto little bells, of a purple colour: the ſeed three cornered like vnto the others.

3 *Convolvulus minimus ſpicæ-folius.*
Lauander leafed Binde-weed.

† 4 *Convolvulus argenteus Althææ folio.*
Siluer leafed Binde-weed.

3 This Bindweed *Pena* ſaith he neuer ſaw but in the brinks of quicke-ſets and Oliuets in Prouence, Sauoy, and Narbone; notwithſtanding I found it growing in the corne fields about great Dunmow in Eſſex, in ſuch abundance, that it doth much hurt vnto their corne. This kind of Bindweed or *Volubilis* is like vnto the ſmall Bindweed before mentioned, but it hath a finer floure, plaited or folded in the compaſſe of the bell very orderly, eſpecially before the Sun riſe (for after it opens it ſelfe the welts are not ſo much perceiued) and it is of a darke purple colour: the ſeed is not vnlike the reſt, cornered and flat, growing out of ſlender branches which ſtand vpright and thicke together, proceeding out of a wooddy white root. The leaues are long and narrow, reſembling *Linaria* both in colour and hairineſſe, in taſte drying, and ſomewhat heating.

‡ 4 The

5 *Volubilis nigra.*
Blacke Bindweed.

‡ 4 The ſtalkes and branches of this are ſome cubite long, ſlender, weake and hairy, ſo that they lie vpon the ground, if they haue nothing to ſuſtaine them: vpon theſe without any order grow leaues, ſhaped like thoſe of Iuy, or the marſh Mallow, but leſſe, and couered ouer with a ſiluer-like downe or hairineſſe, and diuided ſomewhat deep on the edges, ſometimes alſo curled, and otherwhiles onely ſnipt about. The floure growes vpon long ſtalkes like as in other plants of this kinde, and conſiſts of one folding leafe, like as that of the laſt mentioned, and it is either of a whitiſh purple, or elſe abſolute purple colour: The root is ſmall and creeping. It growes in many places of Spaine, and there floures in March and Aprill. *Cluſius* calls this *Convoluulus Altheæ folio*, and ſaith that the Portugals name it *Verdezilla*, and commend it as a thing moſt effectuall to heale wounds. Our Authour gaue the figure hereof (how fitly let the Reader iudge) by the name of *Papauer cornutum luteum minus*, making it a horned Poppy, as you may ſee in the former Edition, *Pag.* 294. ‡

† 5 This kinde of Bindweed hath a tough root full of threddie ſtrings, from which riſe vp immediatly diuers trailing branches, wherupon grow leaues like the common field Bindweed, or like thoſe of Orach, of a black green colour, whereof it tooke his name: the floures are ſmal, and like thoſe of Orach: the ſeed is black, three ſquare, like, but leſſe than that of Buck-wheat. The whole plant is not onely a hurtfull weed, but of an euill ſmell alſo, and too frequently found amongſt corne. *Dodonæus* calls this *Convolvulum nigrum*: and *Helxine, Ciſſampelos*: *Tabernamontanus*, *Volubilis nigra*: and *Lobel*, *Helxine Ciſſampelos altera Atriplicis effigie.*

¶ *The Place.*

All theſe kindes of Bindweeds do grow very plentifully in moſt parts of England, ‡ The third and fourth excepted. ‡

¶ *The Time.*

They do floure from May to the end of Auguſt.

¶ *The Names.*

The great Bindweed is called in Greeke σμίλαξ λεία: in Latine, *Smilax Lænis*: of *Galen* and *Paulus Ægineta*, μίλαξ λεία: it is ſurnamed *Lænis* or ſmooth, becauſe the ſtalkes and branches thereof haue no prickles at all. *Dolichus* called alſo *Smilax hortenſis*, or Kidney beane, doth differ from this: and likewiſe *Smilax* the tree, which the Latines call *Taxus*: in Engliſh, the Yew tree. The later Herbariſts do call this Bindweed *Volubilis maior*, *Campanella*, *Funis arborum*, *Convoluulus albus* and *Smilax lænis maior*: in like manner *Pliny* in his 21. booke, 5. chapt. doth alſo name it *Conuoluulus*. It is thought to be *Liguſtrum*, not the ſhrub priuet, but that which *Martial* in his firſt booke of Epigrams ſpeaketh of, writing againſt *Procillus*.

The ſmall Bindweed is called *Convoluulus minor*, and *Smilax lænis minor*, *Volubilis minor*: in high Dutch, **Winckraut**: in Low Dutch, **Wrange**: in French, *Liſeron*: in Italian, *Vilucchio*: in Spaniſh, *Campanilla Yerua*: in Engliſh, Withwinde, Bindeweed, and Hedge-bels.

¶ *The Nature.*

Theſe herbs are of an hot and dry temperature.

¶ *The Vertues.*

The leaues of blacke Bindweed called *Helxine Ciſſampelos*, ſtamped and ſtrained, and the iuice drunken, doth looſe and open the bellie exceedingly. A

The leaues pound and laid to the grieued place, diſſolueth, waſteth, and conſumeth hard lumps and ſwellings, as *Galen* ſaith. B

The

D The reſt of the Bindweeds are not fit for medicine, but vnprofitable weeds, and hurtfull vnto each thing that groweth next vnto them.

† The deſcription which our Author intended in the firſt place for *Volubilis nigra*, and took out of the 274. page of the *Aduerſaria*, but ſo confuſedly and imperfectly, neither agreeing with that he intended, I haue omitted as impertinent, and made his later, though alſo vnperfect deſcription, ſomewhat more compleat and agreeable to the plant figured and intended.

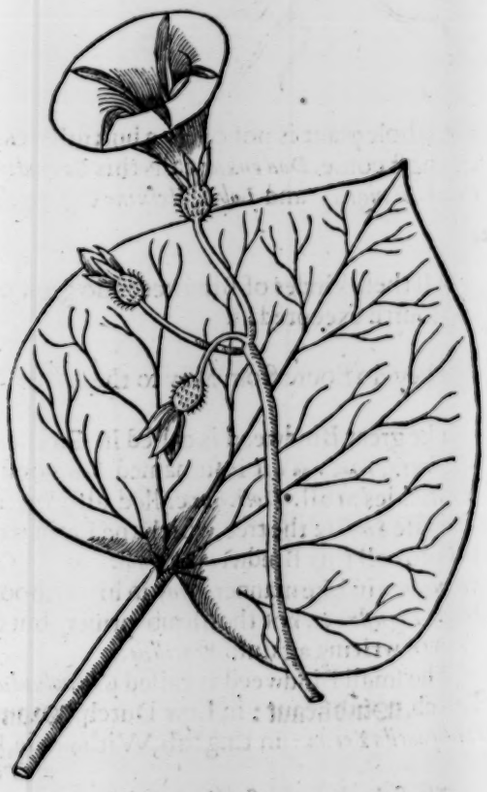
Chap. 318. *Of Blew Bindweed.*

¶ *The Deſcription.*

1 Blew Bindweed bringeth forth long, tender, and winding branches, by which it climeth vpon things that ſtand neere vnto it, and foldeth it ſelfe about them with many turnings and windings, wrapping it ſelfe againſt the Sun, contrary to all other things whatſoeuer, that with their claſping tendrels do embrace things that ſtand neere vnto them; whereupon doe grow broad cornered leaues very like vnto thoſe of Iuie, ſomething rough and hairy, of an ouerworne ruſſet greene colour: among which come forth moſt pleaſant floures bell faſhion, ſomthing cornered as are thoſe of the common Bindweed, of a moſt ſhining azure colour tending to purple: which being paſt, there ſucceed round knobbed ſeed veſſels, wherein is contained long blackiſh ſeed of the bigneſſe of a Tare, and like vnto thoſe of the great hedge Bindweed. The root is thredy, and periſheth at the firſt approchof Winter.

1 *Convolvulus Cæruleus.*
Blew Binde-weed.

‡ 2 *Convolvulus cærnleus folio rotundo.*
Round leaued blew Bindweed.



‡ 2 There are alſo kept in our gardens two other blew floured Bindweeds. The one a large and great plant, the other a leſſer. The great ſends vp many large and long winding branches, like thoſe of the laſt deſcribed, and a little hairie: the leaues are large and roundiſh, ending in a ſharpe point: the floures are as large as thoſe of the great Bindweed, and in ſhape like them, but blew of colour, with fiue broad purpliſh veines equally diſtant each from other: and theſe floures commonly grow three neere together vpon three ſeuerall ſtalks ſome inch long, faſtened to another

ſtalke

‡ 3 *Convolvulus cæruleus minor, folio oblongo.*
Small blew Bindweed.

ſtalke ſome handfull long: the cup which holds the floures, and afterwards becomes the ſeed veſſell, is rough and hairie: the ſeed is blacke, and of the bigneſſe of a Tare: the root is ſtringie, and laſts no longer than to the perfecting of the ſeed. I haue onely giuen the figure of the leafe and floure largely expreſt, becauſe for the root and manner of growing it reſembles the laſt deſcribed.

3 This ſmall blew Bindweed ſendeth forth diuers long ſlender creeping hairie branches, lying flat vpon the ground, vnleſſe there be ſomething for it to reſt vpon: the leaues be longiſh and hairy, and out of their boſomes (almoſt from the bottome to the tops of the ſtalks) come ſmall foot-ſtalkes carrying beautifull floures of the bigneſſe and ſhape of the common ſmal Bindweed, but commonly of three colours; that is, white in the verie bottome, yellow in the middle, and a perfect azure at the top; and theſe twine themſelues vp, open and ſhut in fiue plaits like as moſt other floures of this kinde doe. The ſeed is contained in round knaps or heads, and is blacke and cornered: the root is ſmall, and periſhes euery yeare. *Bauhine* was the firſt that ſet this forth, and that by the name of *Convolvulus peregrinus cæruleus folio oblongo.* ‡

¶ *The Place.*

The ſeede of this rare plant was firſt brought from Syria and other remote places of the world, and is a ſtranger in theſe Northern parts; yet haue I brought vp and nouriſhed it in my garden vnto flouring, but the whole plant periſhed before it could perfect his ſeed.

¶ *The Time.*

The ſeed muſt be ſowne as Melons and Cucumbers are, and at the ſame time: it floured with me at the end of Auguſt.

¶ *The Names.*

It is called *Campana Lazula*, and *Lazura*: of the later Herbariſts *Campana Cærulea*, and alſo *Convolvulum Caruleum*: it is thought to be the *Liguſtrum nigrum*; of which *Columella* in his tenth booke hath made mention.

Fer calathis violam, & nigro permiſta liguſtro
Balſama cum Caſſia nectens, &c.

In baskets bring thou Violets, and blew Bindweed withall,
But mixed with pleaſant Baulme, and Caſſia medicinall.

For if the greater ſmooth Withwinde, or Bindweed be *Liguſtrum*, then may this be not vnproperly called *Liguſtrum nigrum*: for a blew purple colour is oftentimes called blacke, as hath beene ſaid in the blacke Violet. But there be ſome that would haue this Bindweed to be *Granum nil Auicennæ*, of which he writeth in the 306. chapter; the which differeth from that *Nil* that is deſcribed in the 512. chapter. For this is *Iſatis Græcorum*, or the Grecian Woad: but that is a ſtrange plant, and is brought from India, as both *Auicen* and *Serapio* doe teſtifie: *Auicen* in this manner: what is *Granum Nil?* It is *Cartamum Indum*: and *Serapio* thus; *Habal Nil*, is *Granum Indicum*, in *cap.* 283. where the ſame is deſcribed in theſe words: [The plant thereof is like to the plant of *Leblab*, that is to ſay of *Convolvulus*, or Bindweed, taking hold of trees with his tender ſtalks: it hath bough green branches and leaues, and there commeth out by euery leafe a purple floure, in faſhion of the Belflowres: and when the floure doth fall away, it yeeldeth a ſeed in ſmall cods (I read little heads) in

in which are three graines, leſſer than the ſeedes of Staueſaker] to which deſcription this blew Bindweed is anſwerable.

There be alſo other ſorts of Bindweeds, which be referred to *Nil Auicennæ*, which no doubt may be kinds of *Nil*; for nothing gainſaith it why they ſhould not be ſo. Therefore to conclude, this beautifull Bindeweed, which we call *Conuolvulus Cæruleus*, is called of the Arabians *Nil*: of *Serapio*, *Hab al Nil*: about Alepo and Tripolis in Syria the inhabitants call it *Haſmiſen*: the Italians, *Campana azurea*: of the beautifull azured floures, and alſo *Fior de notte*, becauſe his beautie appeares moſt in the night.

¶ *The Temperature.*

Conuolvulus Cæruleus, or *Nil*, as *Auicen* ſaith, is hot and drie in the firſt degree: but *Serapio* maketh it to be hot and drie in the third degree.

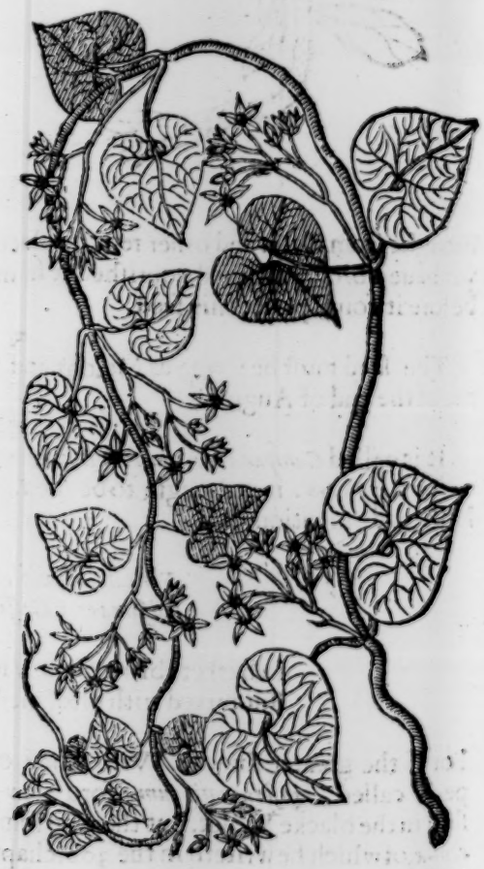
¶ *The Vertues.*

A It purgeth and voideth forth raw, thicke, flegmaticke, and melancholicke humours: it driues out all kinde of wormes, but it troubleth the belly, and cauſeth a readineſſe to vomit, as *Auicen* ſaith: it worketh ſlowly, as *Serapio* writeth, in whom more hereof may be found, but to little purpoſe, wherefore we thinke good to paſſe it ouer.

Chap. 319. *Of Scammonie, or purging Bindweed.*

1 *Scammonium Syriacum*
Syrian Scammonie.

† 2 *Scamonea Valentina.*
Scammonie of Valentia.



¶ *The Deſcription.*

1 SCammonie of Syria hath many ſtalks riſing from one root, which are long, ſlender, and like the claſping tendrels of the vine, by which it climeth and taketh hold of ſuch things as are next vnto it. The leaues bee broad, ſharpe pointed like thoſe of the ſmooth or hedge Bindweed: among which come forth very faire white floures tending to a buſh colour, bell faſhion. The root is long, thicke, and white within: out of which is gathered a iuice that beeing hardned

hardned, is greatly vſed in Phyſicke: for which conſideration, there is not any plant growing vpon the earth, the knowledge whereof more concerneth a Phyſition, both for his ſhape and properties, than this Scammonie, which *Pena* calleth *Lactaria ſcanſoriaque volvula*, that is, milkie and climbing Windweed, whereof it is a kinde; although for diſtinction ſake I haue placed them as two ſeuerall kindes. And although this herbe be ſuſpected, and halfe condemned of ſome learned men, yet there is not any other herbe to be found, whereof ſo ſmall a quantitie will do ſo much good: neither could thoſe which haue carped at it, and reproued this herbe, finde any ſimple in reſpect of his vertues to be put in his roome: and hereof inſueth great blame to all practitioners, who haue not endeuoured to bee better acquainted with this herbe, chiefely to auoid the deceit of the craftie Drug-feller and Medicine-maker of this confected Scammonie, brought vs from farre places, rather to be called I feare infected Scammonie, or poiſoned Scammonie, than confected. But to auoid the inconueniences hereof, by reaſon of the counterfeiting and ill mixing thereof: I haue therefore thought good to ſet downe what I haue taken out of the diligent, and no leſſe learned obſeruations of *Pena*, concerning this plant, *Anno* 1561, or 1562. *Vid. adverſ. pag.* 272.

‡ 3 *Scammonium Monſpelienſe.*
French Scammonie.

Sequinus Martinellus an Apothecarie of Venice, being a moſt diligent ſearcher of Simples, that he might haue the right Scammony of Antioch, trauelled into Syria, where from the citie of Alepo hee ſent an 100. weight of the iuice of Scammonie of Antioch, prepared and hardned into a lumpe, at the making whereof he was preſent himſelfe. This man ſent alſo of the ſeeds thereof, which in all points anſwered the cornered ſeed of *Volubilis*; which being ſowne in the beginning of the Spring at Padua and Venice, grew vp to the form of a braue & goodly *Convolvulus*, in leaues, floures, and ſhew ſo like vnto our *Ciſſampelos*, that a man would haue taken it for the ſame without controuerſie, ſauing that the root was great, and in bigneſſe equall to the great Brionie, as alſo in tenderneſſe. The outward bark of the root was of a dusky colour, and white within: the inner pith beeing taken forth ſeemeth in all mens iudgements to be the ſame and the beſt allowed *Turbith officinarum*: and yet it differeth from Turbith, in that, that it is more brittle, and will more eaſily bee broken, though the pith in Scammonie bee no leſſe gummie and ful of milkie iuice, than Turbith. Further *Pena* reporteth, that afterward hee ſent of this ſeed vnto Antwerpe, where it grew very brauely, the climing ſtrings and branches growing vp to the height of fiue or ſix cubites, not differing from that which was ſowne in Italie. Alſo *William Dries* of Antwerp, a moſt excellent Apothecary, did cut off the branches of his Antwerpian Scammonie from the root, and dried them, planted the ſeeds in his garden, and conferred the ſuperfluous branched roots with the Turbith of Alexandria, and could not find them to differ or diſagree the one from the other in any point. But he that will know more concerning the making, difference, choice and vſe of Scammony, let him reade *Pena* in his chapter of Scammonie, in the place formerly cited, where he ſhall finde many excellent ſecrets worthy the noting of thoſe which would know how to vſe ſuch rare and excellent medicines.

2 Scammony of Valentia (whereof I haue plentie in my garden) is alſo a kinde of Bindweed, growing naturally by the ſea ſide vpon the grauelly ſhore, by the mouth of the riuer Rhodanus, at the waters called *Aquas Marianas*, where the Apothecaries of Montpellier gather of it great plentie, who haue attempted to harden the milkie iuice thereof, to vſe it in ſtead of Scammonie of Antioch. This plant bringeth forth many ſlender branches, which will climbe and very well run vpon a pole; as being ſupported therewith, and mounteth to the height of fiue or ſix cubits, climbing & ramping like the firſt kinde of Scammonie. The leaues are greene, ſmooth, plaine, and ſharpe pointed,

pointed,which being broken do yeeld abundance of milke: the floures are white,ſmall,and ſtarre-faſhion: the roots white and many,ſhooting forth ſundry other roots,whereby it mightily increaſeth.

† 3 This ſtrange kinde of Scammonie, which *Cluſius* maketh rightly to be *Periploca ſpecies*, hath very many long branches ramping and taking hold of ſuch things as do grow neere vnto them, of a darkiſh aſhe colour:whereupon do grow leaues ſharp pointed,crooked at the ſetting on of the ſtalke like thoſe of the blacke Bryonie,and likewiſe of an aſhe colour,ſet together by couples:from the boſome whereof thruſt forth ſmall tender foot-ſtalkes, whereon are placed ſmall white floures ſtarre-faſhion: the ſeeds are contained in long coddes,and are wrapped vp in downe,like as thoſe of Swallow-wort. The root is very long,ſlender,and creeping,like that of the ſmall Bindweed, ſo that if it once take in any ground, it can hardly be deſtroyed.

¶ *The Place.*

It doth grow in hot regions, in a fat ſoile,as in Miſia,Syria,and other like countries of Aſia;it is likewiſe found in the Iſland of Candia,as *Bellon.* witneſſes;from whence I had ſome ſeeds,of which ſeed I receiued two plants that proſpered exceeding well; the one whereof I beſtowed vpon a learned Apothecarie of Colcheſter, which continueth to this day,bearing both floures and ripe ſeed. But an ignorant weeder of my garden plucked mine vp,and caſt it away in my abſence, in ſtead of a weede: by which miſchance I am not able to write heereof ſo abſolutely as I determined: it likewiſe groweth neere vnto the ſea ſide about Tripolis in Syria, where the inhabitants doe call it *Meudheudi.*

¶ *The Time.*

It floured in my garden about S. *Iames* tide,as I remember; for when I went to Briſtow Faire, I left it in floure;but at my returne it was deſtroyed as aforeſaid.

¶ *The Names.*

The Greekes call it σκαμμωνία: the Latines,*Scammonium*, ſo naming not onely the plant it ſelfe,but alſo the hard and condenſed iuice: of the Apothecaries,*Scammonea*;and when it is prepared,*Diagridium*: as though they ſhould ſay, διὰ γρίδιον: which ſignifieth a little teare: both the herbe and iuice are named *Scamony*: of *Rhaſis*, *Coriziola.*

¶ *The Temperature.*

The iuice doth mightily purge by the ſtoole,and is the ſtrongeſt purge whatſoeuer; for as *Oribaſius* ſaith,it is in no part ouercome by thoſe things which ſtir and moue the body. It worketh the ſame not vehemently by any hot qualitie, but by ſome other hid and ſecret propertie of the whole ſubſtance; for there is no extremitie of heat perceiued in it by taſte: for with what liquor or thing ſoeuer it is mixed,it giueth vnto it no bitterneſſe, biting,or other vnpleaſant taſte at all,and therefore it is not to be accounted among the extreme hot medicines, but among thoſe that are moderately hot and drie.

¶ *The Vertues.*

A It clenſeth and draweth forth eſpecially choler: alſo thinne and wateriſh humours, and oftentimes flegme, yet is it as *Paulus* teacheth more hurtfull to the ſtomacke than any other medicine.

B *Meſues* thinketh that it is not onely troubleſome and hurtfull to the ſtomacke, but alſo that it ſhaueth the guts,gnawing and fretting the intrails; openeth the ends of the veins,and through the eſſence of his whole ſubſtance,it is an enemy to the heart,and to the reſt of the inward parts:if it be vſed immoderately and in time not conuenient,it cauſeth ſwounings,vomitings, and ouerturnings of the ſtomacke,ſcouring,the bloudy flux and vlcers in the lower gut, which bring a continuall deſire to the ſtoole.

C Theſe miſchiefes are preuented if the Scammonie be boiled in a Quince and mixed with the ſlime or mucilage of *Pſillium*,called Fleawoort,the pap or pulp of Prunes,or other things that haue a ſlimie iuice,with a little Maſticke added, or ſome other eaſie binding thing.

D *Plinie* affirmeth that the hurt thereof is taken away if Aloes be tempered with it: [Scammonie (ſaith he) ouerthroweth the ſtomack,purgeth choler,looſeth the belly vnleſſe two drams of Aloes be put vnto one ſcruple of it] which alſo *Oribaſius* alloweth of in the firſt booke of his *Synopſes*, and the ſeuenth booke of his medicinall Collections.

E The old Phyſitions were alſo wont to boile Scammonie in a Quince,and to giue the Quince to be eaten,hauing caſt away the Scammonie: and this Quince ſo taken doth moue the belly without any hurt vnto the ſtomacke,as *Galen* in his firſt booke of the Faculties of Nouriſhments doth ſet downe,and likewiſe in his third booke of the Faculties of ſimple Medicines.

F The Apothecaries doe vſe Scammonie prepared in a Quince, which as we haue ſaid they name *Diagridium*,and do mix it in diuers compoſitions.

They

They keepe vſually in their ſhops two compoſitions, or electuaries, the one of *Pſillium* or Flea woort, ſet downe by *Meſue*: the other of Prunes fathered vpon *Nicolaus*, which were deuiſed for the tempering and correction of Scammony, and be commended for hot burning agues, and tertians, and for what diſeaſes ſoeuer that proceed of choler. G

Galen hath taken Maſticke and *Bdellium* out of the pilles called *Cochia*, which alſo conteine in them a great and ſufficient quantitie of Scammonie, as we may reade in his firſt booke of medicines according to the places affected, which alſo we meane to touch in the chapter of Coloquintida, where we intend to intreat at large concerning maſticke, and other binding things, that are accuſtomed to be mixed for the correction of ſtrong and violent purgers. H

The quantitie of Scammony, or of *Diagrid um* it ſelfe, as *Meſue* writeth, is from fiue graines to ten or twelue: it may be kept as the ſame Author ſheweth, foure yeeres: *Pliny* iudgeth it to be after two yeeres little worth: it is to be vſed, ſaith he, when it is two yeeres old, and it is not good before, nor after. The mixing or otherwiſe the vſe thereof, more than is ſet downe, I thinke it not expedient to ſet forth in the Phyſicall vertues of Scammony, vpon the receipt whereof many times death inſueth: my reaſons are diuers, for that the ſame is very dangerous, either if too great a quantitie thereof be taken, or if it be giuen without correction; or taken at the hands of ſome runnagate phyſicke-monger quackſaluer, old women-leaches, and ſuch like abuſers of Phyſicke, and deceiuers of people. The vſe of Scammony I commit to the learned, vnto whome it eſpecially and onely belongeth, who can very carefully and curiouſly vſe the ſame. I

The titles of the ſecond and third were formerly tranſpoſed, and both the figures belonged to the ſecond deſcription, which was of the *Scammonium Monſpelienſe* of the Authors, being the ſame with the *Scammonea Valentina* of *Cluſius*.

CHAP. 320. *Of Briony, or the white Vine.*

¶ *The Kindes.*

There be two kindes of Bryony, the one white, the other blacke: of the white Briony as followeth.

Bryonia alba.
White Bryonie.

¶ *The Deſcription.*

WHite Briony bringeth forth diuers long and ſlender ſtalkes with many claſping tendrels like the Vine, wherewith it catcheth hold of thoſe things that are next vnto it. The leaues are broad, fiue cornered, and indented like thoſe of the Vine; but rougher, more hairie, and whiter of colour. The floures be ſmall and white, growing many together. The fruite conſiſteth in little cluſters, the berries whereof are at the firſt greene, and red when they be ripe. The roote is very greate, long, and thicke, growing deepe in the earth, of a white yellowiſh colour, extreame bitter, and altogether of an vnpleaſant taſte. The Queenes chiefe Surgion Mr. *William Godorous*, a very curious and learned gentleman ſhewed me a root hereof, that waied halfe an hundred weight, and of the bigneſſe of a child of a yeere old.

¶ *The Place.*

Briony groweth almoſt euery where among pot-herbes, hedge-buſhes, and ſuch like places.

¶ *The Time.*

It floureth in May, and bringeth forth his grapes in Autumne.

¶ *The Names.*

Bryony is called in Greek, [illegible] in Latine,

Vitis alba, or white Vine, and it is named, ἄμπελος, becauſe it is not onely like the Vine in leaues, but alſo for that it bringeth forth his fruite made vp after the likeneſſe of a little cluſter, although the berries ſtand not cloſe together: it is called of *Pliny*, *Bryonia*, and *Madon*: of the Arabians, *Alpheſera*: of *Matthæus Sylvaticus*, *Viticella*: in the poore mans Treaſure, *Roraſtrum*: of *Apuleius*, *Apiaſtellum*, *vitis Taminia*, *Vitis alga*, and *Vitalba*: in high Dutch, **Suchwurtz**: in low Dutch, **Bzionie**: in Engliſh, Bryony, white Bryony, and tetter Berrie: in French, *Couleuree*: in Italian, *Zucca ſylvatica*: in Spaniſh, *Nueza blanca*.

¶ *The Temperature.*

White Briony is in all parts hot and dry, exceeding the third degree, eſpecially of heate, with an exceeding great force of clenſing and ſcouring, by reaſon whereof it purgeth and draweth forth, not onely cholericke and flegmaticke humours, but alſo watrie.

¶ *The Vertues.*

A *Dioſcorides* writeth that the firſt ſprings or ſproutings being boiled and eaten, do purge by ſiege and vrine. *Galen* ſaith, that all men vſe accuſtomably to eate of it in the ſpring time, and that it is a nouriſhment wholeſome, by reaſon of the binding qualitie that it hath; which is to be vnderſtood of thoſe of the wilde Vine, called in Latine, *Tamus*; and not of the ſproutings of this plant; for the ſproutings of the firſt ſprings of white Bryony are nothing binding at all, but do mightily purge the belly, and torment the ſtomacke.

B *Dioſcorides* alſo affirmeth, that the juice of the root being preſſed out in the ſpring, and drunke with meade or honied water, purgeth flegme: and not onely the juice, but alſo the decoction of the root draweth forth flegme, choler, and wateriſh humours, and that very ſtrongly; and it is withall oftentimes ſo troubleſome to the ſtomacke, as it procureth vomite.

C This kinde of ſtrong purgation is good for thoſe that haue the dropſie, the falling ſickeneſſe, and the dizzineſſe and ſwimming of the braine and head, which hath continued long, and is hardly to be remooued: yet notwithſtanding it is not dayly to be giuen (as *Dioſcorides* admoniſheth) to them that haue the falling ſickeneſſe, for it will be troubleſome enough to take it now and then: and it is (as we haue ſaid) an exceeding ſtrong medicine, purging with violence, and very forceable for mans nature.

D The root put vp in manner of a peſſary bringeth forth the dead child and afterbirth: being boiled for a bath to ſit in, it worketh the ſame effect.

E It ſcoureth the skin, and taketh away wrinckles, freckles, ſunne burning, blacke marks, ſpots, and ſcars of the face, being tempered with the meale of vetches or Tares, or of Fenugreeke: or boiled in oile till it be conſumed; it taketh away blacke and blew ſpots which come of ſtripes: it is good againſt Whitlowes: being ſtamped with wine and applied it breaketh biles, and ſmall apoſtumes, it draweth forth ſplinters and broken bones, if it be ſtamped and laid thereto.

F The ſame is alſo fitly mixed with eating medicines, as *Dioſcorides* writeth.

G The fruit is good againſt ſcabs and the leprie, if it be applied and annointed on, as the ſame Author affirmeth.

H *Galen* writeth, that it is profitable for Tanners to thicken their leather hides with.

I Furthermore, an electuary made of the roots and hony or ſugar, is ſingular good for them that are ſhort winded, troubled with an old cough, paine in the ſides, and for ſuch as are hurt and burſten inwardly: for it diſſolueth and ſcatereth abroad congealed and clottered bloud.

K The root ſtamped with ſalt is good to be laid vpon filthy vlcers and ſcabbed legs. The fruite is likewiſe good to the ſame intent if it be applied in manner aforeſaid.

L The root of Bryony and of wake-Rob in ſtamped with ſome ſulphur or brimſtone, and made vp into a maſſe or lump and wrapped in a linnen clout, taketh away the morphew, freckles, and ſpots of the face, if it be rubbed with the ſame being dipped firſt in vineger.

Chap. 321. *Of blacke Brionie, or the wilde Vine.*

¶ *The Deſcription.*

1 THe black Bryony hath long flexible branches of a woodie ſubſtance, couered with a gaping or clouen barke growing very farre abroad, winding it ſelfe with his ſmall tendrels about trees, hedges, and what elſe is next vnto it, like vnto the branches of the Vine. The leaues are like vnto thoſe of Iuie or garden Nightſhade, ſharpe pointed, and of a ſhining greene colour: the floures are white, ſmall, and moſſie; which being paſt, there ſucceed little cluſters of red berries

1 *Bryonia nigra.*
Blacke Bryonie.

berries, ſomwhat bigger than thoſe of the ſmall Raiſons, or Ribes, which wee call Currans, or ſmall Raiſins. The root is very great and thick, oftentimes as bigge as a mans legge, blackiſh without, and verie clammie or ſlimie within; which being but ſcraped with a knife, or any other thing fit for that purpoſe, it ſeemeth to be a matter fit to ſpread vpon cloth or leather in manner of a plaiſter or Seare-cloth: which being ſo ſpread and vſed, it ſerueth to lay vpon many infirmities, and vnto verie excellent purpoſes, as ſhall bee declared in the proper place.

2 The wilde Blacke Bryonie reſembleth the former, as well in ſlender Vinie ſtalkes as leaues; but claſping tendrels hath it none, neuertheleſſe by reaſon of the infinite branches, and the tenderneſſe of the ſame, it taketh hold of thoſe things that ſtand next vnto it, although eaſie to bee looſed, contrarie vnto the other of his kinde. The berries heereof are blacke of colour when they be ripe. The root alſo is blacke without, and within of a pale yellow colour like box. ‡ This which is here deſcribed is the *Bryonia nigra* of *Dodonæus*; But *Bauhine* calleth it *Bryonia Alba*, and ſaith it differeth from the common white Bryonie, onely in that the root is of a yellowiſh boxe colour on the inſide, and the fruit or berries are blacke when as they come to ripeneſſe.

Bryonia nigra florens non fructum ferens.

3 This is altogether like the firſt deſcribed in roots, branches, and leaues; onely the foot-ſtalks whereon the floures grow are about eight or nine inches long: the floures are ſomething greater, hauing neither before or after their flouring any berries or ſhew thereof; but the floures and foot-ſtalks do ſoone wither and fall away: this I haue heretofore, and now this Sommer, 1621, diligently obſerued, becauſe it hath not beene mentioned or obſerued by any that I know. *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt of theſe plants doth grow in hedges and buſhes almoſt euery where.

The ſecond groweth in Heſſia, Saxonie, Weſtphalia, Pomerland, and Miſnia, where white Bryonie doth not grow, as *Valerius Cordus* hath written, who ſaith that it growes vnder Haſell-trees, neere vnto a citie of Germanie called Argentine, or Strawsborough.

¶ *The Time.*

They ſpring in March, bring forth their floures in May, and their ripe fruit in September.

¶ *The Names.*

Blacke Bryonie is called in Greeke ἄμπελος ἀγρία: in Latine, *Bryonia nigra*: and *Vitis ſylueſtris*, or wilde Vine; notwithſtanding it doth not a little differ from *Labruſca*, or *Vitis Vinifera ſylueſtris*, that is to ſay, from the wilde vine, which bringeth forth wine, which is likewiſe called *Ampelos agria*: Why both theſe were called by one name, *Pliny* was the cauſe, who could not ſufficiently expound them in his 23. booke, firſt chapter; but confounded them, and made them all one, in which errour are alſo the Arabians.

This wilde Vine alſo is called in Latine, *Tamus*, and the fruit thereof *Vua Taminia*. *Pliny* nameth it alſo *Salicaſtrum*. *Ruellius* ſaith that in certaine ſhops it is called *Sigillum B. Mariæ*; it is alſo called *Cyclaminus altera* but not properly: in Engliſh, Blacke Bryonie, wilde Vine, and our Ladies-ſeale.

¶ *The Temperature.*

The roots of the wild Vine are hot and drie in the third degree: the fruit is of like temperature, but yet nor ſo forceable: both of them ſcoure and waſte away.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that the roots do purge wateriſh humours, and are good for ſuch as haue the dropſie; if they be boiled in wine, adding vnto the wine a little ſea water, and bee drunke in three ounces of faire freſh water: he ſaith furthermore, that the fruit or berries doth take away the Sunburne and other blemiſhes of the skin.

B The berries do not onely clenſe and remoue ſuch kinde of ſpots, but do alſo very quickly waſte and conſume away blacke and blew marks that come of bruiſes and drie beatings, which thing alſo the roots performe being laid vpon them.

C The young and tender ſproutings are kept in pickle, and reſerued to be eaten with meat as *Dioſcorides* teacheth. *Matthiolus* writeth that they are ſerued at mens tables alſo in our age in Tuſcanie: others report the like alſo to be done in Andaloſia, one of the kingdomes of Granado.

D It is ſaid that ſwine ſeeke after the roots hereof, which they dig vp and eat with no leſſe delight than they do the roots of *Cyclaminus*, or *Panis porcinus*, whereupon it was called *Cyclaminus altera*; or Sow-bread; if this reaſon ſtand for good, then may we in like manner ioine hereunto many other roots, and likewiſe call them *Cyclaminus altera*, or Sow-bread: for ſwine do not ſeeke after the roots of this onely, digge them vp and greedily deuoure them, but the roots of diuers other plants alſo, of which none are of the kindes of Sow-bread. It would therefore be a point of raſhneſſe to affirm *Tamus* or our Ladies-ſeale to be a kinde of Sowbread, becauſe the roots thereof are pleaſant meat to ſwine.

E The root ſpred vpon a piece of ſheepes leather, in manner of a plaiſter whileſt it is yet freſh and green, taketh away blacke or blew marks, all ſcars and deformitie of the skin, breaketh hard apoſtems, draweth forth ſplinters and broken bones, diſſolueth congealed bloud; and being laid on and vſed vpon the hip or huckle bones, ſhoulders, armes, or any other part where there is great pain and ache, it taketh it away in ſhort ſpace, and worketh very effectually.

† The figure that was formerly in the ſecond place of this chapter did no waies agree with the diſcription, for it was of the *Vinea* or Trauellors ioy (hereafter to be mentioned; which *Tabernamontanus*, (whoſe figures our Author made vſe of) calls *Vitis nigra ſecunda*.

Chap. 322. *Of Bryonie of Mexico.*

¶ *The Deſcription.*

1 THat plant which is now called *Mechoacan*, or Bryonie of Mexico, commeth verie neere the kinds of Bindweeds, in leaues and trailing branches, but in roots like the Brionies; for there ſhooteth from the root thereof many long ſlender tendrels, which do infinitly graſpe and claſpe about ſuch things as grow or ſtand next vnto them: whereupon grow great broad leaues ſharpe pointed, of a darke greene colour, in ſhape like thoſe of our Ladies-ſeale, ſomwhat rough and hairie, and a little biting the tongue: among the leaues come forth the floures (as *Nicolaus Monardus* writeth) not vnlike thoſe of the Orenge tree, but rather of the golden Apple of Ioue, conſiſting of fiue ſmall leaues: out of the middeſt whereof commeth forth a little clapper or peſtell in manner of a round lumpe, as big as a Haſell nut; which being diuided with a thin skin, or membrane, that commeth through it, openeth into two parts, in each whereof are contained two ſeeds, as bigge as Peaſe, in colour blacke and ſhining. The root is thicke and long, verie like vnto the root of white Bryonie, whereof we ma e this a kinde, although in the taſte of the roots there is ſome difference: for the root of white Bryonie hath a bitter taſte, and this hath little or no taſte at all.

2 The Bryony, or *Mechoacan* of Peru groweth vp with many long trailing flexible branches, interlaced with diuers Vinie tendrels, which take hold of ſuch things as are next or neere vnto them, euen in ſuch manner of claſping and climing as doth the blacke Bryonie, or wine Vine, whereunto it is very like almoſt in each reſpect, ſauing that his moſſie floures do ſmell very ſweetly. The fruit as yet I haue not obſerued, by reaſon that the plant which doth grow in my garden did not perfect the ſame, by occaſion of the great rain and intemperate weather that happened in *An.* 1596. but I am in good hope to ſee it in his perfection, & then we ſhall eaſily iudge whether it be that right *Mechoacan* that hath been brought from Mexico and other places of the Weſt Indies or no? The root by the figure ſhould ſeeme to anſwer that of the wilde Vine, but as yet thereof I cannot write certainly.

‡ 3 There is brought to vs and into vſe of late time the root of another plant, which ſeemes

1 *Mechoacan.*
Bryonie of Mexico.

2 *Mechoacan Peruviana.*
Bryonie of Peru.

haue much affinitie with *Mechoacan*, and therefore *Bauhine* hath called it *Bryonia Mechoacan nigricans*, and thus deliuers the hiſtorie thereof. [It is a root like *Mechoacan*, but couered with a blackiſh barke, and reddiſh (or rather grayiſh) on the inſide: and cut into ſlices, it was brought ſome yeares agone out of India by the name of *Chelapa*, or *Gelapa*. It is called by thoſe of Alexandria and Marſeilles *Ialapium* or *Gelapum*: and of thoſe of Marſeilles it is thought the blacke or male *Mechoacan*: The taſte is not vngratefull, but gummy, and by reaſon of the much gummineſſe, put to the fire it quickly flames: it in facultie exceeds the common *Mechoacan*; for by reaſon of the great gummineſſe it more powerfully purgeth ſerous humours with a little griping, alſo it principally ſtrengthens the liuer and ſtomacke; wherefore it is ſafely giuen in the weight of ʒj. and performes the operation without nauſeouſneſſe. It is vſually giuen in Succorie water, or ſome thin broth three houres before meat.] Thus much *Bauhine*, who ſaith it was firſt brought to theſe parts eleuen yeres before he ſet forth his *Prodromus*, ſo that was about 1611. It hath beene little vſed here till within this ten yeares. ‡

¶ *The Place.*

Some write that *Mechoacan* was firſt found in the Prouince of New Spaine, neere vnto the citie of Mexico or Mexican, whereof it tooke his name. It groweth likewiſe in a prouince of the Weſt Indies called *Nicaragua* and *Quito*, where it is thought the beſt doth grow.

¶ *The Names.*

It beareth his name as is ſaid, of the prouince in which it is found. Some take it to be *Bryonia ſpecies*, or to be a kinde of Bryonie: but ſeeing the root is nothing bitter, but rather without taſte, it hath little agreement with Bryonie; for the root of Bryonie is verie bitter. Diuers name it *Rha album*, or white Rubarbe, but vnproperly, being nothing like. It commeth neere vnto Scammony, and if I might yeeld my cenſure, it ſeemeth to be *Scammonium quoddam Americanum*, or a certain Scammonie of America. Scammonie creepeth, as wee haue ſayd, after the manner of Bindweed. The root is both white and thicke: the iuice hath but little taſte, as alſo hath this of *Mechoacan*: it is called in Engliſh, Mechoca and Mechocan, and may bee called Indian Bryonie.

¶ *The Temperature.*

The root is of a meane temperature between hot and cold, but yet drie.

¶ *The Vertues.*

A It purgeth by ſiege, eſpecially flegme, and then wateriſh humours. It is giuen from one ful dram weight to two, and that with wine, or with ſome diſtilled water (according as the diſeaſe requireth) or els in fleſh broth.

B It is to be giuen with good effect to all, whoſe diſeaſes proceed of flegme and cold humors. It is good againſt head-ache that hath continued long, old coughes, hardneſſe of breathing, the colick, paine of the kidneies and ioints, the diſeaſes of the reines and belly.

Chap. 323. *Of the Manured Vine.*

¶ *The Kindes.*

THe Vine may be accounted among thoſe plants that haue need of ſtaies and props, and cannot ſtand by themſelues; it is held vp with poles and frames of wood, and by that meanes it ſpreadeth all about and climbeth aloft: it ioyneth it ſelfe vnto trees, or whatſoeuer ſtandeth next vnto it.

Of Vines that bring forth wine, ſome be tame and husbanded, and others that be wilde: of tame Vines there are many that are greater, and likewiſe another ſort that be leſſer.

¶ *The Deſcription.*

THe trunke or bodie of the Vine is great and thicke, very hard, couered with many barkes, and thoſe full of cliffes or chinkes; from which grow forth branches, as it were armes, many waies ſpreading; out of which come forth iointed ſhoots and ſprings: and from the boſome of thoſe ioints, leaues, and claſping tendrels; and likewiſe bunches or cluſters filled ful of grapes: the leaues be broad, ſomething round, fiue cornered, and ſomewhat indented about the edges; amongſt which come forth many claſping tendrels, that take hold of ſuch props or ſtaies as do ſtand next vnto it. The grapes do differ both in colour and greatneſſe, and alſo in many other things, the which to diſtinguiſh ſeuerally were impoſſible, conſidering the infinite ſorts or kindes, and alſo thoſe which are tranſplanted from one region or climate to another, do likewiſe alter both from the forme and taſte they had before, in conſideration whereof it ſhall be ſufficient to ſet forth the figure of the manured grape, and ſpeake ſomewhat of the reſt.

There is found in Græcia and the parts of Morea, as *Pantalarea*, *Zante*, *Cephalonia*, and *Petras* (whereof ſome are Iſlands, and the other of the continent) a certaine Vine that hath a trunke or bodie of a wooddie ſubſtance, with a ſcaly or rugged bark, of a grayiſh colour, whereupon do grow faire broad leaues, ſleightly indented about the edges, not vnlike vnto thoſe of the Marſh-mallow: from the boſome whereof come forth many ſmall claſping tendrels, and alſo tough and pliant foot-ſtalkes, whereon do grow verie faire bunches of grapes, of a watchet blewiſh colour: from the which fruit commeth forth long tender laces or ſtrings, ſuch as is found among Sauorie; whereupon wee call that plant which hath it laced Sauorie, not vnlike that that groweth among, and vpon Flax, which we call Dodder, or *Podagra lini*, whereof is made a blacke wine, which is called Greeke wine, yet of the taſte of Sacke. The laced fruit of this Vine may be fitly termed *Vua barbata*, Laced or bearded grapes.

The plant that beareth thoſe ſmall Raiſins which are commonly called Corans or Currans, or rather Raiſins of Corinth, is not that plant which among the vulgar people is taken for Currans, being a ſhrubbe or buſh that bringeth forth ſmall cluſters of berries, differing as much as may bee from Corans, hauing no affinitie with the Vine or any kinde thereof. The Vine that beareth ſmall Raiſins or Corans hath a bodie or ſtocke as other Vines haue, branches and tendrels likewiſe. The leaues are larger than any of the others, ſnipt about the edges like the teeth of a ſaw: among which come forth cluſters of grapes, in forme like the other, but ſmaller, of a blewiſh colour; which being ripe are gathered and laid vpon hurdles, carpets, mats, and ſuch like, in the Sun to drie: then are they carried to ſome houſe and laied vpon heapes, as we lay apples and corne in a garner, vntill the merchants do buy them: then do they put them into large Buts or other woodden veſſels, and tread them downe with their bare feet, which they call Stiuing, and ſo are they brought into theſe parts for our vſe. ‡ And they are commonly termed in Latine, *Vua Corinthiacæ*, and *Paſſulæ minores*. ‡

‡ There

Vitis Vinifera.
The manured Vine.

‡ There is alſo another which beareth exceeding faire grapes, whereof they make Raiſins, whiter coloured, and much exceeding the bigneſſe of the common Raiſin of the Sunne: yet that Grape whereof the Raiſin of the Sun is made is a large one, and thought to be the *Vua Zibibi* of the Arabians; and it is that which *Tabernamontanus* figured vnder that name, who therein was followed by our Author: but the figures being little to the purpoſe, I haue thought good to omit them. ‡

There is another kinde of Vine, which hath great leaues very broad, of an ouerworne colour; whereupon do grow great bunches of Grapes of a blewiſh colour: the pulpe or meate whereof ſticketh or cleaueth ſo hard to the graines or little ſtones, that the one is not eaſily diuided from the other; reſembling ſome ſtarued or withered berrie that hath been blaſted, whereof it was named *Duracina.*

There be ſome vines that bring forth grapes of a whitiſh or reddiſh yellow colour: others of a deepe red, both in the outward skinne, pulpe, and iuyce within.

There be others whoſe grapes are of a blew colour, or ſomething red, yet is the iuyce like thoſe of the former. Theſe grapes do yeeld forth a white wine before they are put into the preſſe, and a reddiſh or paller Wine when they are trodden with the husks, and ſo left to macerate or ferment, with which if they remaine too long they yeeld forth a wine of a higher colour.

There be others which make a blacke and obſcure red wine, whereof ſome bring bigger cluſters, and conſiſt of greater grapes; others of leſſer: ſome grow more cluſtred and cloſer together, others looſer: ſome haue but one ſtone, others more: ſome make a more auſtere or harſh wine; others a more ſweet: of ſome the old wine is beſt; of diuers, the firſt yeares wine is moſt excellent: ſome bring forth fruit foure ſquare, of which ſorts or kindes we haue great plenty.

¶ *The Place.*

A fit ſoile for Vines, ſaith *Florentinus*, is euery blacke earth, which is not very cloſe nor clammy, hauing ſome moiſture; notwithſtanding *Columella* ſaith that great regard is to be had what kinde or ſort of Vine you would nouriſh, according to the nature of the countrey and ſoile.

A wiſe husbandman will commit to a fat and fruitfull ſoile a leane Vine, and of his own nature not too fruitfull: to a leane ground a fruitfull vine: to a cloſe and compact earth a ſpreading vine, and that is full of matter to make branches of: to a looſe and fruitfull ſoile a Vine of few branches. The ſame *Columella* ſaith, that the Vine delighteth not in dung, of what kinde ſoeuer it be; but freſh mould mixed with ſome ſhauings of horne is the beſt to be diſpoſed about the roots, to cauſe fertilitie.

¶ *The Time.*

Columella ſaith, that the Vines muſt be pruned before the young branches bud forth. *Palladius* writeth, in Februarie: if they be pruned later they loſe their nouriſhment with weeping.

¶ *The Names.*

The Vine is called in Greeke Ἄμπελος ἡμερὶς: as much to ſay in Latine as, *Vitis Vinifera*, or the Vine which beareth wine; and Ἄμπελος ἥμερος: that is, *Vitis manſuefacta, ſiue cultiua*, Tame or manured Vine. And it is called ἡμερὶς, that it may differ from both the Bryonies, the white and the blacke, and from *Tamus*, or our Ladies Seale, which be likewiſe named Ἄμπελος. It is called *Vitis*, becauſe *inuitatur aduuas parendas*. It is cheriſhed to the intent to bring forth full cluſters, as *Varro* ſaith.

Pliny maketh *Vua Zibebi*, *Alexandrina vitis*, or Vine of Alexandria, in his fourteenth booke, and third chapter, deſcribing the ſame by thoſe very words that *Theophraſtus* doth. *Dioſcorides* ſetteth it downe to be *altera ſpecies Vitis ſylueſtris*, or a ſecond kinde of wilde Vine; but wee had rather retaine it among the tame Vines. We may name it in Engliſh, Raiſin Vine. The fruits hereof are

called

called in ſhops by the name of *Paſſularum de Corintho*: in Engliſh, Currans, or ſmall Raiſins.

Syluestris Vitis or wilde Vine is called in Greeke Ἀμπελος ἀγρια: and in Latine *Labruſca*; as in *Virgils* Eclogs:

——— *Adſpice vt antrum*
Syluestris raris ſparſit labruſca racemis.

——— See how the wilde Vine
Bedecks the caue with ſparſed cluſters fine.

To this wilde Vine doth belong thoſe which *Pliny* in his ſixteenth booke, chapter 27. reporteth to be called *Triferæ*, or that bring three ſundry fruits in one yeare, as *Inſanæ* and mad bearing Vines, becauſe in thoſe ſome cluſters are ripe and full growne, ſome in ſwelling, and others but flouring.

The fruit of the Vine is called in Greeke βοτρυς, and σταφυλη: in Latine, *Racemus*, and *Vua*: in Engliſh, a bunch or cluſter of Grapes.

The cluſter of Grapes that hath been withered or dried in the Sun is named in Greeke σταφις: in Latine, *Vua paſſa*: in ſhops, *Paſſula*: in Engliſh, Raiſins of the Sun.

The berry or Grape it ſelfe is called in Latine *Acinus*, and alſo *Granum*, as *Democritus* ſaith, ſpeaking of the berry.

The ſeeds or ſtones contained within the berries are called in Latine, *Vinacea*, and ſometimes *Nuclei*: in ſhops, *Arilli*, as though they ſhould ſay *Ariduli*, becauſe they are dry, and yeeld no iuyce; notwithſtanding *Vinacea* are alſo taken in *Columella* for the droſſe or remnant of the Grapes after they be preſſed.

The ſtalke, which is in the middle of the cluſters, and vpon which the grapes do hang, is called of *Galen*, κιστυγξ: of *Varro*, *Scapus uuarum*.

¶ *The Temperature and Vertues.*

A The tender and claſping branches of the Vine and the leaues do coole, and mightily bind. They ſtay bleeding in any part of the body: they are good againſt the laske, the bloudy flix, the heart-burne, heate of the ſtomacke, or readineſſe to vomit. It ſtayeth the luſting or longing of women with childe, though they be but outwardly applied, and alſo taken inwardly any manner of waies. They be moreouer a remedie for the inflammation of the mouth, and almonds of the throat, if they be gargled, or the mouth waſhed therewith.

B Of the ſame faculty be alſo the cluſters gathered before they be ripe; and likewiſe the bunches of the wilde grape, which is accounted to be more effectuall againſt all thoſe infirmities.

C *Dioſcorides* ſaith, That the liquor which falleth from the body and branches being cut, and that ſometime is turned as it were into a gum (which driueth forth ſtones out of the kidnies and bladder, if the ſame be drunke in wine) healeth ring-wormes, ſcabs, and lepric, but the place is firſt to be rubbed with Nitre. Being often anointed or layd on it taketh away ſuperfluous haires: but yet he ſaith that the ſame is beſt which iſſueth forth of the greene and ſmaller ſtickes, eſpecially that liquor which falleth away whileſt the branches are burning, which taketh away warts, if it be laid on them.

D The ſtones and other things remaining after the preſſing are good againſt the bloudy flix, the laske of long continuance, and for thoſe that are much ſubiect to vomiting.

E The aſhes made of the ſtickes and droſſe that remaine after the preſſing, being laid vpon the piles and hard ſwellings about the fundament, doe cure the ſame, being mixed with oile of Rue, or Herbe-grace and vineger, as the ſame Author affirmeth, it helpeth to ſtrengthen members out of ioynt, and ſuch as are bitten with any venomous beaſt, and eaſeth the paine of the ſpleene or milt, being applied in manner of a plaiſter.

F The later age do vſe to make a lie of the aſhes of Vine ſticks, in compoſitions of cauſticke and burning medicines, which ſerue in ſtead of an hot-iron: the one we call a potentiall cauterie, and the other actuall.

¶ *Of Grapes.*

G OF Grapes, thoſe that are eaten raw do trouble the belly, and fill the ſtomacke full of winde, eſpecially ſuch as are of a ſowre and auſtere taſte; ſuch kindes of grapes doe very much hinder the concoction of the ſtomacke; and while they are diſperſed through the liuer and veins they ingender cold and raw iuyce, which cannot eaſily be changed into good bloud.

H Sweet grapes and ſuch as are thorow ripe, are leſſe hurtfull; their iuyce is hotter, and is eaſilier diſperſed. They alſo ſooner paſſe thorow the belly, eſpecially being moiſt, and moſt of all if the liquor with the pulpe be taken without the ſtones and skin, as *Galen* ſaith.

I The ſubſtance of the ſtones, although it be drier, and of a binding quality, doth deſcend thorow

all

all the bowels, and is nothing changed: as alſo the skins, which are nothing at all altered in the body, or very little.

Thoſe grapes which haue a ſtrong taſte of wine are in a meane betweene ſoure and ſweet. A

Such grapes as haue little iuyce do nouriſh more, and thoſe leſſe that haue more iuyce: but theſe do ſooner deſcend; for the body receiueth more nouriſhment by the pulpe than by the iuice; by the iuyce the belly is made more ſoluble. B

Grapes haue the preheminence among the Autumne fruits, and nouriſh more than they all, but yet not ſo much as figs: and they haue in them little ill iuyce, eſpecially when they be thorow ripe. C

Grapes may be kept the whole yeare, being ordered after that manner as *Ioachimus Camerarius* reporteth. You ſhall take (ſaith he) the meale of muſtard ſeed, and ſtrew in the bottome of any earthen pot well leaded; whereupon you ſhall lay the faireſt bunches of the ripeſt grapes, the which you ſhall couer with more of the foreſaid meale, and lay vpon that another ſort of Grapes, ſo doing vntill the pot be full. Then ſhall you fill vp the pot to the brim with a kinde of ſweete Wine called Muſt. The pot being very cloſe couered ſhall be ſet into ſome Cellar or other cold place. The Grapes you may take forth at your pleaſure, waſhing them with faire water from the powder. D

¶ *Of Raiſins.*

OF Raiſins moſt are ſweet; ſome haue an auſtere or harſh taſte. Sweet Raiſins are hotter; auſtere colder: both of them do moderately binde, but the auſtere ſomewhat more, which doe more ſtrengthen the ſtomacke. The ſweet ones do neither ſlacken the ſtomacke, nor make the belly ſoluble, if they be taken with their ſtones, which are of a binding qualitie: otherwiſe the ſtones taken forth, they do make the belly looſe and ſoluble. E

Raiſins do yeeld good nouriſhment to the body, they haue in them no ill iuyce at all, but doe ingender ſomewhat a thicke iuyce, which notwithſtanding doth nouriſh the more. F

There commeth of ſweet and fat Raiſins moſt plenty of nouriſhment: of which they are the beſt that haue a thin skin. G

There is in the ſweet ones a temperate and ſmoothing qualitie, with a power to cleanſe moderately. They are good for the cheſt, lungs, winde-pipe, kidneyes, bladder, and for the ſtomacke; for they make ſmooth the roughneſſe of the winde-pipe, and are good againſt hoarſeneſſe, ſhortneſſe of breath, or difficultie of breathing: they ſerue to concoct the ſpittle, and to cauſe it to riſe more eaſily in any diſeaſe whatſoeuer of the cheſt, ſides, and lungs, and do mitigate the paine of the kidneyes and bladder, which hath ioyned with it heate and ſharpeneſſe of vrine: they dull and allay the malice of ſharpe and biting humors that hurt the mouth of the ſtomacke. H

Moreouer, Raiſins are good for the liuer, as *Galen* writeth in his ſeuenth booke of medicines, according to the places affected: for they be of force to concoct raw humors, and to reſtrain their malignitie, and they themſelues do hardly putrifie: beſides, they are properly and of their owne ſubſtance familiar to the intrals, and cure any diſtemperature, and nouriſh much; wherein they are chiefely to be commended, for Raiſins nouriſh, ſtrengthen, reſiſt putrifaction, and if there be any diſtemperature by reaſon of moiſture or coldneſſe, they helpe without any hurt, as the ſaid *Galen* affirmeth. I

The old Phyſitians haue taught vs to take forth the ſtones, as we may ſee in diuers compoſitions of the antient writers; as in that compoſition which is called in *Galen*, *Arteriaca Mithridatis*, which hath the ſeeds of the Raiſins taken forth: for ſeeing that Raiſins containe in them a thicke ſubſtance, they cannot eaſily paſſe through the veines, but are apt to breed obſtructions and ſtoppings of the intrals: which things happen the rather by reaſon of the ſeeds; for they ſo much the harder paſſe through the body, and do quicklier and more eaſily cauſe obſtructions, in that they are more aſtringent or binding. Wherefore the ſeeds are to be taken out, for ſo ſhall the iuyce of the Raiſins more eaſily paſſe, and the ſooner be diſtributed through the intrals. K

Dioſcorides reporteth, That Raiſins chewed with pepper draw flegme and water out of the head. L

Of Raiſins is made a pulteſie good for the gout, rottings about the ioynts, gangrens, and mortified vlcers: being ſtamped with the herbe All-heale it quickly takes away the nailes that are looſe in the fingers or toes, being laid thereon.

¶ *Of Muſt.*

MVſt, called in Latine *Muſtum*, that is to ſay, the liquor newly iſſuing out of the grapes when they be trodden or preſſed, doth fill the ſtomacke and intrals with winde; it is hardly digeſted; it is of a thicke iuyce, and if it do not ſpeedily paſſe through the body it becommeth more hurtfull. M

hurtfull. It hath onely this one good thing in it (as *Galen* ſaith) that it maketh the body ſoluble.

A That which is ſweeteſt and preſſed out of ripe Grapes doth ſooneſt paſſe through; but that which is made of ſoure and auſtere grapes is worſt of all: it is more windy, it is hardly concocted, it ingendreth raw humors; and although it doth deſcend with a looſeneſſe of the belly, notwithſtanding it oftentimes withall bringeth the collicke and paines of the ſtone: but if the belly be not mooued all things are the worſe, and more troubleſome; and it oftentimes brings an extreame laske, and the bloudy flix.

B That firſt part of the wine that commeth forth of it ſelfe before the Grapes be hard preſſed, is anſwerable to the Grape it ſelfe, and doth quickly deſcend; but that which iſſues forth afterward, hauing ſome part of the nature of the ſtones, ſtalks, and skins, is much worſe.

¶ *Of Cute.*

C OF Cute that is made of Muſt, which the Latines call *Sapa*, and *Defrutum*, is that liquor which we call in Engliſh Cute, which is made of the ſweeteſt Muſt, by boyling it to a certain thickneſſe, or boyling it to a third part, as *Columella* writeth.

D *Pliny* affirmeth, That *Sapa* and *Defrutum* do differ in the manner of the boyling; and that *Sapa* is made when the new wine is boyled away till onely a third part remaineth: and *Defrutum* till halfe be boyled.

E *Siræum*, (ſaith he in his fourteenth booke, *cap.* 17.) which others call [illegible], and we *Sapa*, a worke of wit, and not of nature, is made of new wine boyled to a third part; which being boiled to halfe we call *Defrutum*.

F *Palladius* ioyneth to theſe *Carænum*, which as he ſaith is made when a third part is boiled away, and two remaine.

G *Leontius* in his Geoponicks ſheweth, that *Hepſema* muſt be made of eight parts of new wine, and an hundred of wine it ſelfe boyled to a third.

H *Galen* teſtifieth, that [illegible] is new wine very much boyled. The later Phyſitians do call *Hepſema* or *Sapa* boyled wine.

I Cute or boyled wine is hot, yet not ſo hot as wine, but it is thicker; yet not ſo eaſily diſtributed or carried through the body, and it ſlowly deſcendeth by vrine, but by the belly oftentimes ſooner; for it moderately maketh the ſame ſoluble.

K It nouriſheth more, and filleth the body quickly; yet doth it by reaſon of his thickneſſe ſticke in the ſtomacke for a time, and is not ſo fit for the liuer or for the ſpleene. Cute alſo doth digeſt raw humors that ſticke in the cheſt and lungs, and raiſeth them vp ſpeedily. It is therefore good for the cough and ſhortneſſe of breath.

L The Vintners of the Low-countries (I will not ſay of London) doe make of Cute and Wine mixed in a certain proportion, a compound and counterfeit wine, which they ſell for Candy wine, commonly called Malmſey.

M *Pliny lib.* 14. *cap.* 9. ſaith, that Cute was firſt deuiſed for a baſtard hony.

¶ *Of Wine.*

N TO ſpeake of Wine, the iuyce of Grapes, which being newly preſſed forth is called as we haue ſaid *Muſtum* or new wine: after the dregs and droſſe are ſetled, and now it appeareth pure and cleere, it is called in Greeke [illegible]: in Latine *Vinum*: in Engliſh, Wine, and that not vnproperly. For certaine other iuyces, as of Apples, Pomegranats, Peares, Medlars, or Seruices, or ſuch as otherwiſe made (for examples ſake) of barley and Graine, be not at all ſimply called wines, but with the name of the thing added whereof they do conſiſt. Hereupon is the wine which is preſſed forth of the pomegranat berries named *Rhoites*, or wine of pomegranats: out of Quinces, *Cydonites*, or wine of Quinces: out of Peares, *Apyites*, or Perry: and that which is compounded of barley is called *Zythum*, or Barley wine: in Engliſh, Ale or Beere.

O And other certaine wines haue borrowed ſyrnames of the plants that haue beene ſteeped or infuſed in them; and yet all wines of the Vine, as Wormwood wine, Myrtle wine, and Hyſſop wine, and theſe are all called artificiall wines.

P That is properly and ſimply called wine which is preſſed out of the grapes of the vine, and is without any manner of mixture.

Q The kindes of wines are not of one nature, nor of one facultie or power, but of many differing one from another: for there is one difference thereof in taſte, another in colour; the third is referred to the conſiſtence or ſubſtance of the wine; the fourth conſiſteth in the vertue and ſtrength thereof. *Galen* addeth that which is found in the ſmell, which belongs to the vertue and ſtrength of the wine.

That

That may alſo be ioyned vnto them which reſpecteth the age: for by age wines become hotter and ſharper, and doe withall change oftentimes the colour, the ſubſtance, and the ſmell: for ſome wines are ſweet of taſte; others auſtere or ſomething harſh; diuers of a rough taſte, or altogether harſh; and moſt of them ſufficient ſharpe: there be likewiſe wines of a middle ſort, inclining to one or other qualitie. A

Wine is of colour either white or reddiſh, or of a blackiſh deepe red, which is called blacke, or of ſome middle colour betweene theſe. B

Some wine is of ſubſtance altogether thin; other ſome thicke and fat; and many alſo of a middle conſiſtence. C

One wine is of great ſtrength, and another is weake, which is called a wateriſh wine: a ful wine is called in Latine *Vinoſum*. There be alſo among theſe very many that be of a middle ſtrength. D

There is in all wines, be they neuer ſo weake, a certaine winie ſubſtance thin and hot. There be likewiſe waterie parts, and alſo diuers earthy: for wine is not ſimple, but (as *Galen* teſtifieth in his fourth booke of the faculties of medicines) conſiſteth of parts that haue diuers faculties. E

Of the ſundry mixture and proportion of theſe ſubſtances one with another there riſe diuers and ſundry faculties of the wine. F

That is the beſt and fulleſt wine in which the hot and winie parts do moſt of all abound: and the weakeſt is that wherein the waterie haue the preheminence. G

The earthy ſubſtance abounding in the mixture cauſeth the wine to be auſtere or ſomething harſh, as a crude or raw ſubſtance doth make it altogether harſh. The earthy ſubſtance being ſeuered falleth downe, and in continuance of time ſinketh to the bottome, and becomes the dregs or lees of the wine: yet it is not alwaies wholly ſeuered, but hath both the taſt and other qualities of this ſubſtance remaining in the wine. H

All wines haue their heate, partly from the proper nature and inward or originall heate of the vine, and partly from the Sun: for there is a double heate which ripeneth not only the grapes, but alſo all other fruits, as *Galen* teſtifieth; the one is proper and naturall to euery thing; the other is borrowed of the Sun: which if it be perceiued in any thing, it is vndoubtedly beſt and eſpecially in the ripening of grapes. I

For the heate which proceeds from the Sun concocteth the grapes and the iuyce of the grapes, and doth eſpecially ripen them, ſtirring vp and increaſing the inward and naturall heat of the wine, which otherwiſe is ſo ouerwhelmed with aboundance of raw and wateriſh parts, as it ſeemes to be dulled and almoſt without life. K

For vnleſſe wine had in it a proper and originall heate, the grapes could not be ſo concocted by the force of the Sun, as that the wine ſhould become hot; no leſſe than many other things naturally cold, which although they be ripened and made perfect by the heate of the Sun, do not for all that loſe their originall nature; as the fruits, iuyces, or ſeeds of Mandrake, Nightſhade, Hemlocke, Poppy, and of other ſuch like, which though they be made ripe, and brought to full perfection, yet ſtill retaine their owne cold qualitie. L

Wherefore ſeeing that wine through the heate of the Sunne is for the moſt part brought to his proper heate, and that the heate and force is not all alike in all regions and places of the earth; therefore by reaſon of the diuerſitie of regions and places, the wines are made not a little to differ in facultie. M

The ſtronger and fuller wine groweth in hot countries and places that lie to the Sun; the rawer and weaker in cold regions and prouinces that lie open to the North. N

The hotter the Sommer is the ſtronger is the wine; the leſſe hot or the moiſter it is, the leſſe ripe is the wine. Notwithſtanding not onely the manner of the weather and of the Sunne maketh the qualities of the wine to differ, but the natiue propertie of the ſoile alſo; for both the taſt and other qualities of the Wine are according to the manner of the Soile. And it is very well knowne, that not only the colour of the wine, but the taſte alſo dependeth vpon the diuerſity of the grapes. O

Wine (as *Galen* writeth) is hot in the ſecond degree, and that which is very old in the third; but new wine is hot in the firſt degree: which things are eſpecially to be vnderſtood concerning the meane betweene the ſtrongeſt and the weakeſt; for the fulleſt and mightieſt (being but *Horna*, that is as I take it of one yeare old) are for the moſt part hot in the ſecond degree. The weakeſt and the moſt wateriſh wines, although they be old, do ſeldome exceed the ſecond degree. P

The drineſſe is anſwerable to the heate in proportion, as *Galen* ſaith in his booke of Simples: but in his bookes of the gouernment of health he ſheweth, that wine doth not onely heate, but alſo moiſten our bodies, and that the ſame doth moiſten and nouriſh ſuch bodies as are extreme dry: and both theſe opinions be true. Q

For the faculties of wine are of one ſort as it is a medicine, and of another as it is a nouriſhment; which *Galen* in his booke of the faculties of nouriſhments doth plainly ſhew, affirming that thoſe qualities of the wine which *Hippocrates* writeth of in his booke of the manner of diet, be not R

as

as a nouriſhment, but rather as of a medicine. For wine as it is a medicine doth dry, eſpecially being outwardly applied; in which caſe, for that it doth not nouriſh the body at all, the drines doth more plainly appeare, and is more manifeſtly perceiued.

A Wine is a ſpeciall good medicine for an vlcer, by reaſon of his heate and moderate drying, as *Galen* teacheth in his fourth booke of the method of healing.

B *Hippocrates* writeth, That vlcers, what manner of ones ſoeuer they are, muſt not be moiſtned vnleſſe it be with wine: for that which is dry (as *Galen* addeth) commeth neerer to that which is whole, and the thing that is moiſt, to that which is not whole.

C It is manifeſt that Wine is in power or facultie dry, and not in act; for Wine actually is moiſt and liquid, and alſo cold: for the ſame cauſe it likewiſe quencheth thirſt, which is an appetite or deſire of cold and moiſt, and by this actuall moiſture (that we may ſo terme it) it is if it be inwardly taken, not a medicine, but a nouriſhment; for it nouriſheth, and through his moiſture maketh plenty of bloud; and by increaſing the nouriſhment it moiſtneth the body, vnleſſe peraduenture it be old and very ſtrong: for it is made ſharpe and biting by long lying, and ſuch kinde of Wine doth not onely heate, but alſo conſume and dry the body, for as much as it is not now a nouriſhment, but a medicine.

D That wine which is neither ſharpe by long lying, nor made medicinable, doth nouriſh and moiſten, ſeruing as it were to make plenty of nouriſhment and bloud, by reaſon that through his actuall moiſture it more moiſtneth by feeding, nouriſhing, and comforting, than it is able to dry by

E his power.

Wine doth refreſh the inward and naturall heate, comforteth the ſtomacke, cauſeth it to haue an appetite to meate, moueth coucoction, and conueyeth the nouriſhment through all parts of the body, increaſeth ſtrength, inlargeth the body, maketh flegme thinne, bringeth forth by vrine cholericke and waterie humors, procureth ſweating, ingendreth pure bloud, maketh the body wel coloured, and turneth an ill colour into a better.

F It is good for ſuch as are in a conſumption by reaſon of ſome diſeaſe, and that haue need to haue their bodies nouriſhed and refreſhed (alwaies prouided they haue no feuer,) as *Galen* ſaith in his ſeuenth booke of the Method of curing. It reſtoreth ſtrength moſt of all other things, and that ſpeedily: It maketh a man merry and ioyfull: It putteth away feare, care, troubles of minde, and ſorrow: It moueth pleaſure and luſt of the body, and bringeth ſleepe gently.

G And theſe things proceed of the moderate vſe of wine: for immoderate drinking of wine doth altogether bring the contrarie. They that are drunke are diſtraughted in minde, become fooliſh, and oppreſſed with a drowſie ſleepineſſe, and be afterward taken with the Apoplexy, the gout, or altogether with other moſt grieuous diſeaſes; the braine, liuer, lungs, or ſome other of the intrals being corrupted with too often and ouermuch drinking of wine.

H Moreouer, wine is a remedy againſt taking of Hemlocke or green Coriander, the iuyce of black Poppy, Wolfs-bane, and Leopards-bane, Tode-ſtooles, and other cold poyſons, and alſo againſt the biting of ſerpents, and ſtings of venomous beaſts, that hurt and kill by cooling.

I Wine alſo is a remedie againſt the ouer-fulneſſe and ſtretching out of the ſides, windy ſwellings, the greene ſickneſſe, the dropſie, and generally all cold infirmities of the ſtomack, liuer, milt, and alſo of the matrix.

K But Wine which is of colour and ſubſtance like water, through ſhining bright, pure, of a thin ſubſtance, which is called white, is of all wines the weakeſt; and if the ſame ſhould be tempered with water it would beare very little: and hereupon *Hippocrates* calleth it ὑδροπότην, that is to ſay, bearing little water to delay it withall.

L This troubbleth the head and hurteth the ſinewes leſſe than others do, and is not vnpleaſant to the ſtomacke: it is eaſily and quickly diſperſed thorow all parts of the body: it is giuen with far leſſe danger than any other wine to thoſe that haue the Ague (except ſome inflammation or hot ſwelling be ſuſpected) and oftentimes with good ſucceſſe to ſuch as haue intermitting feuers; for as *Galen*, *lib.* 8. of his Method ſaith, it helpeth concoction, digeſteth humors that be halfe raw, procureth vrine and ſweat, and is good for thoſe that cannot ſleepe, and that be full of care and ſorrow, and for ſuch as are ouerwearied.

M Blacke wine, that is to ſay wine of a deepe red colour, is thicke, and hardly diſperſed, and doth not eaſily paſſe through the bladder: it quickly taketh hold of the braine, and makes a man drunk: it is harder of digeſtion: it remaineth longer in the body; it eaſily ſtoppeth the liuer and ſpleene; for the moſt part it bindes, notwithſtanding it nouriſheth more, and is more fit to ingender bloud: it filleth the body with fleſh ſooner than others do.

N That which is of a light crimſon red colour is for the moſt part more delightfull to the taſte, fitter for the ſtomacke; it is ſooner and eaſier diſperſed: it troubleth the head leſſe, it remains not ſo long vnder the ſhort ribs, and eaſilier deſcendeth to the bladder than blacke wine doth: it doth

alſo

alſo make the belly coſtiue, if ſo be that it be not ripe. For ſuch crude and rough wines do oftentimes moleſt weake ſtomackes, and are troubleſome to the belly.

Reddiſh yellow wine ſeemeth to be in a meane betweene a thin and thicke ſubſtance: otherwiſe it is of all vines the hotteſt; aand ſuffereth moſt water to be mixed with it, as *Hippocrates* writeth. A

The old vine of this kinde, being of a thin ſubſtance and good ſmell, is a ſingular medicine for all thoſe that are much ſubject to ſwouning, although the cauſe thereof proceed of choler that hurteth the mouth of the ſtomacke, as *Galen* teſtifieth in the 12. booke of his method. B

Sweete wine the leſſe hot it is, the leſſe doth it trouble the head, and offend the minde; and it better paſſeth through the belly, making it oftentimes ſoluble: but it doth not ſo eaſily paſſe or deſcend by vrine. C

Againe, the thicker it is of ſubſtance, the harder and ſlowlier it paſſeth through: it is good for the lungs, and for thoſe that haue the cough. It ripeneth raw humours that ſticke in the cheſt, and cauſeth them to be eaſilier ſpit vp; but it is not ſo good for the liuer, whereunto it bringeth no ſmall hurt when either it is inflamed, or ſchirrous, or when it is ſtopped. It is alſo an enemy to the ſpleene, it ſticketh vnder the ſhort ribs, and is hurtfull to thoſe that are full of choler. For this kind of wine, eſpecially the thicker it is, is in them very ſpeedily turned into choler: and in others when it is well concocted, it increaſeth plenty of nouriſhment. D

Auſtere wine, or that which is ſomewhat harſh in taſt, nouriſheth not much; and if ſo be that it be thin and white, it is apt to prouoke vrine, it leſſe troubleth the head, it is not quickly digeſted, for which cauſe it is the more to be ſhunned, as *Galen* ſaith in his 12. booke of his method. E

That wine which is altogether harſh or rough in taſt, the leſſe ripe it is, the neerer it commeth to the qualities of Veriuice made of ſower grapes, being euidently binding. It ſtrengtheneth a weake ſtomacke; it is good againſt the vnkindely luſting or longing of women with child; it ſtaieth the laske, but it ſticketh in the bowels: breedeth ſtoppings in the liuer and milt; it ſlowly deſcendeth by vrine, and ſomething troubleth the head. F

Old wine which is alſo made ſharpe by reaſon of age, is not onely troubleſome to the braine, but alſo hurteth the ſinewes: it is an enemy to the entrailes, and maketh the body leane. G

New wine, and wine of the firſt yeere, doth eaſily make the body to ſwell, and ingendreth winde, it cauſeth troubleſome dreames, eſpecially that which is not throughly refined, or thicke, or very ſweet: for ſuch do ſooner ſticke in the intrailes than others do. Other wines that are in a meane in colour, ſubſtance, taſte, or age, as they do decline in vertues and goodneſſe from the extreames; ſo alſo they be free from their faults and diſcommodities. They come neere in faculties to thoſe wines whereunto they be next, either in colour, taſte, or ſubſtance, or elſe in ſmell or in age. H

Wine is fitteſt for thoſe that be of nature cold and dry; and alſo for old men, as *Galen* ſheweth in his fifth booke of the gouernment of health: for it heateth all the members of their bodies, and purgeth away the watery part of the bloud, if their be any. I

The beſt wines are thoſe that be of a fat ſubſtance: for thoſe both increaſe bloud, and nouriſh the body; both which commodities they bring to old men, eſpecially at ſuch time as they haue no ſerous humour in their veines, and haue need of much nouriſhment. It happeneth that oftentimes there doth abound in their bodies a wateriſh excrement, and then ſtand they in moſt need of all of ſuch wines as do prouoke vrine. K

As wine is beſt for old men, ſo it is worſt for children: by reaſon that being drunke, it both moiſteneth and dryeth ouermuch, and alſo filleth the head with vapours, in thoſe who are of a moiſt and hot complection, or whoſe bodies are in a meane betweene the extreames, whom *Galen* in his booke of the gouernment of health doth perſuade, that they ſhould not ſo much as taſte of wine for a very long time: for neither is it good for them to haue their heads filled, nor to be made moiſt and hot, more than is ſufficient, becauſe they are already of ſuch a heate and moiſture, as if you ſhould but little increaſe either qualitie, they would forthwith fall into the extreme. L

And ſeeing that euery exceſſe is to be ſhunned, it is expedient moſt of all to ſhun this, by which not onely the body, but alſo the minde receiueth hurt. M

Wherefore we thinke, that wine is not fit for men that be already of full age, vnleſſe it be moderately taken, becauſe is carieth them headlong into fury and luſt, and troubleth and dulleth the reſonable part of the minde. N

¶ *Of the delaying, or tempering of Wine.*

IT was an ancient cuſtome, and of long continuance in old time, for wines to be mixed with water, as it is plaine and euident not onely by *Hippocrates*, but alſo by other old mens writings. Wine firſt began to be mixed with water for health and wholeſomeneſſe ſake: for as *Hippocrates* writeth in his booke of ancient Phyſicke, being ſimply and of it ſelfe much drunke, it maketh O

keth a man in ſome ſort weake and feeble: which thing *Ouid*, ſeemeth alſo to allow of writing thus:

Vt Venus enervat vires, ſic copia vini
Et tentat greſſus, debilitatque pedes.

As Venery the vigour ſpends, ſo ſtore of wine
Makes man to ſtagger, makes his ſtrength decline.

A Moreouer, wine is the ſweeter, hauing water poured into it, as *Athenæus* ſaith. *Homer* likewiſe commendeth that wine which is well and fitly allaied. *Philocorus* writeth (as *Athenæus* reporteth) that *Amphictyon* king of Athens was the firſt that allaied wine, as hauing learned the ſame of *Dionyſius*: wherefore he ſaith, that thoſe who in that manner drunke it remained in health, that before had their bodies feebled and ouerweakened with pure and vnmixed wine.

B The maner of mingling or tempering of wine was diuers: for ſometimes to one part of wine, there were added two, and ſometimes three or foure of water; or two parts of wine three of water: of a leſſe delay was that which conſiſted of equall parts of wine and water.

C The old Comedians did thinke that this leſſer mixture was ſufficient to make men mad, among whom was *Mneſitheus*, whoſe words be extant in *Athenæus*.

D *Hippocrates* in the ſeuenth booke of his Aphoriſmes ſaith, that this manner of tempering of wine and water by equall parts bringeth as it were a light pleaſant drunkenneſſe, and that it is a kinde of remedy againſt diſquietneſſe, yawnings, and ſhiuerings; and this mingling belongeth to the ſtrongeſt wines.

E Such kinde of wines they might be which in times paſt the Scythians were reported of the old writers to drinke, who for this cauſe do call vnmixed wine the Scythians drinke. And they that drinke ſimple wine ſay, that they will *Scythizare*, or do as the Scythians do; as we may reade in the tenth booke of *Athenæus*.

F The Scythians, as *Hippocrates* and diuers other of the old writers affirme, be people of Germany beyond the floud Danubius, which is alſo called Iſter: Rhene is a riuer of Scythia: and *Cyrus* hauing paſſed ouer Iſter is reported to haue come into the borders of the Scythians.

G And in this our age all the people of Germany do drinke vnmixed wine, which groweth in their owne countrey, and likewiſe other people of the North parts, who make no ſcruple at all to drinke of the ſtrongeſt wines without any mixture.

¶ *Of the liquor which is deſtilled out of wine, commonly called*, Aqua vitæ.

H THere is drawne out of Wine a liquor, which in Latine is commonly called *Aqua vitæ*, or water of life, and alſo *Aqua ardens*, or burning water, which as diſtilled waters are drawne out of herbes and other things, is after the ſame manner diſtilled out of ſtrong wine, that is to ſay, by certaine inſtruments made for this purpoſe, which are commonly called Limbeckes.

I This kinde of liquor is in colour and ſubſtance like vnto waters diſtilled out of herbes, and alſo reſembleth cleere ſimple water in colour, but in faculty it farre differeth.

K It beareth the ſyrname of life, becauſe that it ſerueth to preſerue and prolong the life of man.

L It is called *Ardens*, burning, for that it is eaſily turned into a burning flame: for ſeeing it is not any other thing than the thinneſt and ſtrongeſt part of the wine, it being put to the flame of fire, is quickly burned.

M This liquor is very hot, and of moſt ſubtill and thin parts, hot and dry in the later end of the third degree, eſpecially the pureſt ſpirits thereof: for the purer it is, the hotter it is, the dryer, and of thinner parts: which is made more pure by often diſtilling.

N This water diſtilled out of wine is good for all thoſe that are made cold either by a long diſeaſe, or through age, as for old and impotent men: for it cheriſheth and increaſeth naturall heate; vpholdeth ſtrength, repaireth and augmenteth the ſame: it prolongeth life, quickeneth all the ſenſes, and doth not only preſerue the memory, but alſo recouereth it when it is loſt: it ſharpeneth the ſight.

O It is fit for thoſe that are taken with the Catalepſie (which is a diſeaſe in the braine proceeding of drineſſe and cold) and are ſubject to dead ſleepes, if there be no feuer joined; it ſerueth for the weakeneſſe, trembling, and beating of the hart; it ſtrengtheneth and heateth a feeble ſtomacke; it conſumeth winde both in the ſtomacke, ſides, and bowels; it maketh good concoction of meate, and is a ſingular remedy againſt cold poiſons.

P It hath ſuch force and power, in ſtrengthening of the hart, and ſtirreth vp the inſtruments of the ſenſes,

ſenſes, that it is moſt effectuall, not onely inwardly taken to the quantitie of a little ſpoonefull, but alſo outwardly applied: that is to ſay, ſet to the noſthrils, or laid vpon the temples of the head, and to the wreſts of the armes; and alſo to foment and bath ſundry hurts and griefes.

Being held in the mouth it helpeth the tooth-ache: it is alſo good againſt cold cramps and convulſions, being chafed and rubbed therewith. A

Some are bold to giue it in quartaines before the fit, eſpecially after the height or prim of the diſeaſe. B

This water is to be giuen in wine with great iudgement and diſcretion; for ſeeing it is extreme hot, and of moſt ſubtill parts, and nothing elſe but the very ſpirit of the wine, it moſt ſpeedily peirceth through, and doth eaſily aſſault and hurt the braine. C

Therefore it may be giuen to ſuch as haue the apoplexie and falling ſickneſſe, the megrim, the headach of long continuance, the Vertigo, or giddineſſe proceeding through a cold cauſe: yet can it not be alwaies ſafely giuen, for vnleſſe the matter the efficient cauſe of the diſeaſe be ſmall, and the ſicke man of temperature very cold, it cannot be miniſtred without danger: for that it ſpredeth and diſperſeth the humours, it filleth or ſtuffeth the head, and maketh the ſicke man worſe: and if the humours be hot, as bloud is, it doth not a little increaſe inflammations alſo. D

This water is hurtfull to all that be of nature and complexion hot, and moſt of all to cholericke men: it is alſo offenſiue to the liuer, and likewiſe vnprofitable for the kidnies, being often and plentifully taken. E

If I ſhould take in hand to write of euery mixture, of each infuſion, of the ſundry colours, and euery other circumſtance that the vulgar people doe giue vnto this water, and their diuers vſe, I ſhould ſpend much time but to ſmall purpoſe.

¶ *Of Argall, Tartar, or wine Lees.*

The Lees of wine which is become hard like a cruſt, and ſticketh to the ſides of the veſſell, and wine casks, being dried, hard, ſound, and well compact, and which way be beaten into powder, is called in ſhops *Tartarum*: in Engliſh, Argall, and Tartar. F

Theſe Lees are vſed for many things; the ſiluer-Smiths poliſh their ſiluer herewith: the Diers vſe it: and it is profitable in medicine. G

It doth greatly dry and waſt away, as *Paulus Ægineta* ſaith: it hath withall a binding facultie, proceeding from the kinde of wine, of which it commeth. H

The ſame ſerueth for moiſt diſeaſes of the body: it is good for them that haue the greene ſickneſs and the dropſie, eſpecially that kinde that lieth in the fleſh, called in Latine, *Leucophlagmatica*: being taken euery day faſting halfe a penny weight or a full penny weight (which is a dram and nine graines after the Romanes computation) doth not onely dry vp the wateriſh excrements, and voideth them by vrine, but it preuaileth much to clenſe the belly by ſiege. I

It would worke more effectually, if it were mixed either with hot ſpices, or with other things that breake winde, or elſe with diuretickes, which are medicines that prouoke vrine; likewiſe to be mixed with gentle purgers, as the ſicke mans caſe ſhall require. K

The ſame of it ſelfe, or tempered with oile of Myrtles, is a remedy againſt ſoft ſwellings, as *Dioſcorides* teacheth: it ſtaieth the laske, and vomiting, being applied outwardly vpon the region of the ſtomacke in a pultis; and if it be laid to the bottome of the belly and ſecret parts, it ſtoppeth the whites, waſteth away hot ſwellings of the kernels in the flankes, and other places, which be not yet exulcerated: it aſſwageth great breſts, and dryeth vp the milke, if it be annointed on with vineger. L

Theſe Lees are oftentimes burnt: if it become all white it is a ſigne of right and perfect burning, for till then it muſt be burned: being ſo burnt, the Grecians terme it, ὀπίσσωσις, as *Ægineta* ſaith: the Apothecaries call it, *Tartarum uſtum*, and *Tartarum calcinatum*: that it to ſay, burnt or calcined Tartar. M

It hath a very great cauſticke or burning qualitie: it clenſeth and throughly heateth, bindeth, eateth, and very much drieth, as *Dioſcorides* doth write: being mixed with Roſin, it maketh rough and ill nailes to fall away: *Paulus* ſaith, that it is mixed with cauſticks or burning medicines to increaſe their burning qualitie: it muſt be vſed whileſt it is new made, becauſe it quickly vaniſheth: for the Lees of wine burned, do ſoone relent or wax moiſt, and are ſpeedily reſolued into liquor. therefore he that would vſe it dry, muſt haue it put in a glaſſe, or glaſſed veſſell well ſtopped, and ſet in a hot and dry place. It melteth and is turned into liquor if it be hanged in a linnen bag in ſome place in a celler vnder the ground. N

The Apothecaries call this liquor that droppeth away from it, oile of Tartar. It retaineth a cauſticke and burning quality, and alſo a very dry facultie: it very ſoon taketh away leprie, ſcabs, tetters, and other filth and deformitie of the skin and face: with an equall quantitie of Roſe water added, O

added, and as much Ceruſe as is ſufficient for a liniment, wherewith the blemiſhed or ſpotted parts muſt be anointed ouer night.

¶ *The briefe ſumme of that hath been ſaid of the Vine.*

A THe iuyce of the greene leaues, branches, and tendrels of the Vine drunken, is good for thoſe that vomit and ſpit bloud, for the bloudy flix, and for women with childe that vomite ouermuch. The kernell within the grapes boyled in water and drunke hath the ſame effect.

B Wine moderately drunke profiteth much, and maketh good digeſtion, but it hurteth and diſtempereth them that drinke it ſeldome.

C White wine is good to be drunke before meate; it preſerueth the body, and pierceth quickely into the bladder: but vpon a full ſtomacke it rather maketh oppilations or ſtoppings, becauſe it doth ſwiftly driue downe meate before Nature hath of her ſelfe digeſted it.

D Claret wine doth greatly nouriſh and warme the body, and is wholeſome with meate, eſpecially vnto phlegmaticke people; but very vnwholeſome for yong children, as *Galen* ſaith, becauſe it heateth aboue nature, and hurteth the head.

E Red wine ſtops the belly, corrupteth the bloud, breedeth the ſtone, is hurtfull to old people, and good or profitable to few, ſaue to ſuch as are troubled with the laske, bloudy flix, or any other looſeneſſe of the body.

F Sacke or Spaniſh wine hath beene vſed of a long time to be drunke after meate, to cauſe the meate the better to digeſt; but common experience hath found it to be more beneficiall to the ſtomacke to be drunke before meate.

G Likewiſe Malmſey, Muskadell, Baſtard, and ſuch like ſweet wines haue been vſed before meat, to comfort the cold and weake ſtomacke, eſpecially being taken faſting: but experience teacheth, that Sacke drunke in ſtead thereof is much better, and warmeth more effectually.

H Almighty God for the comfort of mankinde ordained Wine; but decreed withall, That it ſhould be moderatly taken, for ſo it is wholſome and comfortable: but when meaſure is turned into exceſſe, it becommeth vnwholeſome, and a poyſon moſt venomous, relaxing the ſinewes, bringing with it the palſey and falling ſickneſſe: to thoſe of a middle age it bringeth hot feuers, frenſie, and lecherie; it conſumeth the liuer and other of the inward parts: beſides, how little credence is to be giuen to drunkards it is euident; for though they be mighty men, yet it maketh them monſters, and worſe than brute beaſts. Finally in a word to conclude; this exceſſiue drinking of Wine diſhonoreth Noblemen, beggereth the poore, and more haue beene deſtroyed by ſurfeiting therewith, than by the ſword.

Chap. 324. *Of Hops.*

¶ *The Kindes.*

THere be two ſorts of Hops: one the manured or the Garden Hop; the other wilde or of the hedge.

¶ *The Deſcription.*

1 THe Hop doth liue and flouriſh by embracing and taking hold of poles, pearches, and other things vpon which it climeth. It bringeth forth very long ſtalkes, rough, and hairie; alſo rugged leaues broad like thoſe of the Vine, or rather of Bryonie, but yet blacker, and with fewer dented diuiſions: the floures hang downe by cluſters from the tops of the branches, puffed vp, ſet as it were with ſcales like little canes, or ſcaled Pine apples, of a whitiſh colour tending to yellowneſſe, ſtrong of ſmell: the roots are ſlender, and diuerſly folded one within another.

2 The wilde Hop differeth not from the manured Hop in forme or faſhion, but is altogether leſſer, as well in the cluſters of floures, as alſo in the franke ſhoots, and doth not bring forth ſuch ſtore of floures, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The Hop ioyeth in a fat and fruitfull ground: it proſpereth the better by manuring: alſo it groweth among briers and thornes about the borders of fields, I meane the wilde kinde.

¶ *The*

1 *Lupus ſalictarius.*
Hops.

¶ *The Time.*

The floures of hops are gathered in Auguſt and September, and reſerued to be vſed in beere: in the Spring time come forth new ſhoots or buds: in the Winter onely the roots remaine aliue.

¶ *The Names.*

It is called in ſhops and in all other places *Lupulus*: of ſome, *Lupus ſalictarius*, or *Lupulus ſalictarius*: in high-Dutch, **Hopffen**: in low-Dutch, **Hoppe**: in Spaniſh, *Hombrezillos*: in French, *Houblon*: in Engliſh, Hops.

Pliny, lib. 21. cap. 15. maketh mention of Hops among the prickly plants.

¶ *The Temperature.*

The floures of the hop are hot and dry in the ſecond degree: they fill and ſtuffe the head, and hurt the ſame with their ſtrong ſmell. Of the ſame temperature alſo are the leaues themſelues, which doe likewiſe open and clenſe.

¶ *The Vertues.*

The buds or firſt ſprouts which come forth in the Spring are vſed to be eaten in ſallads; yet are they, as *Pliny* ſaith, more toothſome than nouriſhing, for they yeeld but very ſmall nouriſhment: notwithſtanding they be good for the intrals, both in opening and procuring of vrine, and likewiſe in keeping the body ſoluble. A

The leaues and little tender ſtalkes, and alſo the floures themſelues remoue ſtoppings out of the liuer and ſpleene, purge by vrine, helpe the ſpleene, clenſe the bloud, and be profitable againſt long lingering Agues, ſcabs, and ſuch like filth of the skin, if they be boyled in whay. B

The iuyce is of more force, and doth not onely remoue obſtructions out of the intrals, but it is alſo thought to auoid choler and flegme by the ſtoole. It is written, that the ſame dropped into the eares taketh away the ſtench and corruption thereof. C

The floures are vſed to ſeaſon Beere or Ale with, and too many do cauſe bitterneſſe thereof, and are ill for the head. D

The floures make bread light, and the lumpe to be ſooner and eaſilier leauened, if the meale be tempered with liquor wherein they haue been boyled. E

The decoction of hops drunke openeth the ſtoppings of the liuer, the ſpleene, and kidneyes, and purgeth the bloud from all corrupt humors, cauſing the ſame to come forth with the vrine. F

The iuyce of Hops openeth the belly, and driueth forth yellow and cholericke humours, and purgeth the bloud from all filthineſſe. G

The manifold vertues of Hops do manifeſtly argue the wholſomeneſſe of beere aboue ale; for the hops rather make it a phyſicall drinke to keepe the body in health, than an ordinary drinke for the quenching of our thirſt. H

CHAP. 325. *Of Trauellers-Joy.*

¶ *The Deſcription.*

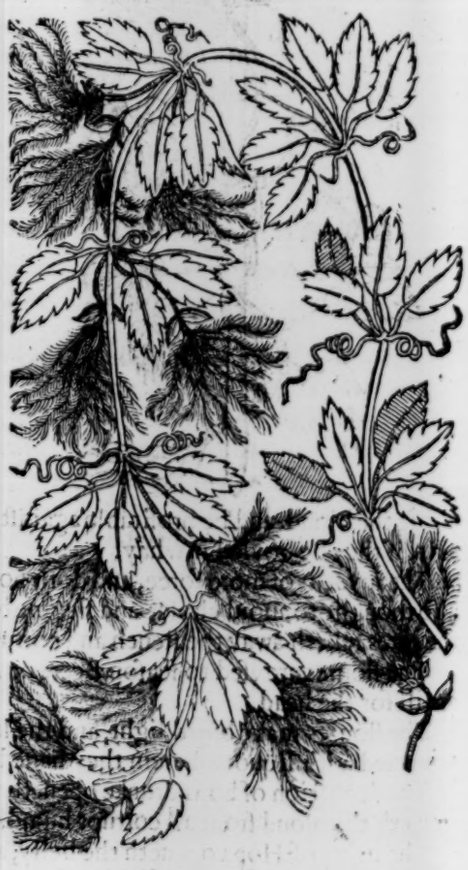
1 THe plant which *Lobel* ſetteth forth vnder the title of *Viorna*, *Dodonæus* makes *Vitis alba*, but not properly; whoſe long wooddy and viny branches extend themſelues very far, and into infinite numbers, decking with his claſping tendrels and white ſtarre-like floures (being very ſweet) all the buſhes, hedges, and ſhrubs that are neere vnto it. It ſends forth many branched ſtalkes, thicke, tough, full of ſhoots and claſping tendrels, wherewith it foldeth it ſelfe vpon the hedges, and taketh hold and climeth vpon euery thing that ſtandeth neere vnto it.

it. The leaues are faſtned for the moſt part by fiues vpon one rib or ſtem, two on either ſide, and one in the midſt or point ſtanding alone; which leaues are broad like thoſe of Iuy, but not cornered at all: among which come forth cluſters of white floures, and after them great tufts of flat ſeeds, each ſeed hauing a fine white plume like a feather faſtned to it, which maketh in the winter a goodly ſhew, couering the hedges white all ouer with his feather-like tops. The root is long, tough, and thicke, with many ſtrings faſtned thereto.

2 *Cluſius* hath ſet forth a kind of *Clematis*, calling it *Clematis Bætica*, hauing a maruellous long ſmall branch full of ioynts, with many leaues indented about the edges like thoſe of the peare tree, but ſtiffer and ſmaller, comming from euery ioynt; from whence alſo at each ioynt proceed two ſmall claſping tendrels, as alſo the ſmall foot-ſtalkes whereon the ſeeds do ſtand, growing in great tufted plumes or feathers, like vnto the precedent, whereof it is a kinde. The floures are not expreſſed in the figure, nor ſeene by the Author, and therefore what hath been ſaid ſhall ſuffice.

1 *Viorna.*
The Trauellers Ioy.

2 *Clematis Bætica.*
The Spaniſh Trauellers Ioy.



¶ *The Place.*

The Trauellers Ioy is found in the borders of fields among thornes and briers, almoſt in euerie hedge as you go from Graueſend to Canturbury in Kent; in many places of Eſſex, and in moſt of theſe Southerly parts about London, but not in the North of England that I can heare of.

The ſecond is a ſtranger in theſe parts: yet haue I found it in the Iſle of Wight, and in a wood by Waltham abbey.

¶ *The Time.*

The floures come forth in Iuly: the beauty thereof appeares in Nouember and December.

¶ *The Names.*

The firſt is called commonly *Viorna, quaſi vias ornans*, of decking and adorning waies and hedges, where people trauel; and thereupon I haue named it the Trauellers Ioy: of *Fuchſius* it is called *Vitis nigra*: of *Dodonæus*, *Vitalba*: of *Matthiolus*, *Clematis altera*: of *Cordus*, *Vitis alba*: of *Dioſcorides*, *Vitis ſylueſtris*: of *Theophraſtus*, *Atragene*: in Dutch, **Lincn**: in French, as *Ruellius* writeth, *Viorne*.

¶ *The Temperature and Vertues.*

Theſe plants haue no vſe in phyſicke as yet found out, but are eſteemed onely for pleaſure, by reaſon of the goodly ſhadow which they make with their thicke buſhing and clyming, as alſo for the beauty of the floures, and the pleaſant ſent or ſauor of the ſame.

CHAP.

Chap. 326. *Of Ladies Bower, or Virgins Bower.*

¶ *The Description.*

1 THat which *Lobel* describeth by the name *Clematis peregrina*, hath very long and slender stalks like the Vine, which are iointed, of a darke colour; it climeth aloft, and taketh hold with his crooked claspers vpon euery thing that standeth neere vnto it: it hath many leaues diuided into diuers parts; among which come the floures that hang vpon slender foot-stalkes, something like to those of Peruinckle, consisting onely of foure leaues, of a blew colour, and sometimes purple, with certaine threds in the middle: the seeds be flat, plaine, and sharpe pointed. The roots are slender, and spreading all about.

¶ 2 *Clematis peregrina Cærulea, sive rubra.*
Blew or red floured Ladies-bower.

‡ 3 *Clematis Cærulea flore pleno.*
Double floured Virgins-bower.

2 The second differeth not from the other, in leaues, stalkes, branches nor seed. The onely difference consisteth in that, that this plant bringeth forth red floures, and the other blew.

‡ 3 There is preserued also in some Gardens another sort of this *Clematis*, which in rootes, leaues, branches, and manner of growing differs not from the former: but the floure is much different, being composed of abundance of longish narrow leaues, growing thicke together, with foure broader or larger leaues lying vnder, or bearing them vp, and these leaues are of a darke blewish purple colour. *Clusius* calls this *Clematis altera flore pleno.* ‡

¶ *The Place.*

These plants delight to grow in Sunnie places: they prosper better in a fruitfull soile than in barren. They grow in my garden, where they flourish exceedingly.

¶ *The Time.*

They floure in Iuly and August, and perfect their seed in September.

¶ *The Names.*

Ladies Bower is called in Greeke ἀμβροσία: in Latine, *Ambuxum*: in English you may call it Ladies

dies bower, which I take from his aptneſſe in making of Arbors, Bowers, and ſhadie couertures in gardens.

¶ *The Temperature and Vertues.*

The facultie and the vſe of theſe in Phyſicke is not yet knowne.

Chap. 327. *Of purging Peruinckle.*

¶ *The Deſcription.*

1 AMong theſe plants which are called *Clematides* theſe be alſo to be numbred, as hauing certaine affinitie, becauſe of the ſpreading, branching, and ſemblance of the Vine; and this is called *Flammula vrens*, by reaſon of his fierie and burning heate, becauſe that being laid vpon the skin, it burneth the place, and maketh an eſchar, euen as our common cauſtick or corraſiue medicines do. The leaues hereof anſwer both in colour and ſmoothneſſe, *Vinca, Peruinca*, or Peruinckle, growing vpon long clambring tender branches, like the other kindes of climbing plants. The floures are very white, ſtar-faſhion, and of an exceeding ſweet ſmell, much like vnto the ſmell of Hawthorne floures, but more pleaſant, and leſſe offenſiue to the head: hauing in the middle of the floures certaine ſmall chiues or threds. The root is tender, and diſperſeth it ſelfe far vnder the ground.

1 *Clematis vrens.*
Virgins Bower.

2 *Flammula Iouis ſurrecta.*
Vpright Virgins Bower.

2 Vpright Clamberer or Virgins Bower is alſo a kinde of *Clematis*, hauing long tough roots not vnlike to thoſe of Licorice; from which riſeth vp a ſtraight vpright ſtalke, of the height of three or foure cubits, ſet about with winged leaues, compoſed of diuers ſmall leaues, ſet vpon a middle rib, as are thoſe of the aſhe tree, or Valerian, but fewer in number: at the top of the ſtalks come forth ſmall white floures, very like the precedent, but not of ſo pleaſant a ſweet ſmell; after which come the ſeeds, flat and ſharpe pointed.

3 There

3 There is another *Clematis* of the kinde of the white *Clematis* or burning *Clematis*, which I haue recouered from ſeed, that hath been ſent me from a curious and learned citizen of Strawsborough, which is like vnto the others in each reſpect, ſauing that, that the floures heereof are very double, wherein conſiſteth the eſpeciall difference.

4 Amongſt the kindes of climbing or clambering plants, *Carolus Cluſius*, and likewiſe *Lobel* haue numbred theſe two, which approch neere vnto them in leaues and floures, but are far different in claſping tendrels, or climbing otherwiſe, beeing low and baſe plants in reſpect of the others of their kinde. The firſt hath for his roots a bundle of tough tangling threddes, in number infinite, and thicke thruſt together; from which riſe vp many ſmall ſtalkes, of a browniſh colour, foure ſquare, and of a wooddie ſubſtance: whereupon doe grow long leaues, of a biting taſte, ſet together by couples, in ſhape like thoſe of *Aſclepias*, or ſilken Swallow-woort. The floures grow at the toppe of the ſtalkes, of a faire blew or skie colour, conſiſting of foure parts in manner of a croſſe, hauing in the middle a bunched pointell, like vnto the head of field Poppie when it is young, of a whitiſh yellow colour, hauing little or no ſmell at all. The floures beeing paſt, then commeth the ſeed, ſuch as is to be ſeen in the other kindes of *Clematis*. The whole plant dieth at the approch of Winter, and recouereth it ſelfe againe from the root, which indureth, whereby it greatly increaſeth.

4 *Clematis Pannonica.*
Buſh Bower.

5 *Clematis maior Pannonica.*
Great Buſh Bower.

5 The great Buſh Bower differeth not from the former laſt deſcribed, but in greatneſſe: which name of greatneſſe ſetteth forth the difference.

‡ 6 Of theſe there is another, whoſe bending creſted ſtalkes are ſome three cubites high, which ſend forth ſundry ſmall branches, ſet with leaues growing together by threes vpon ſhort foot-ſtalkes, and they are like myrtle leaues, but bigger, more wrinckled, darke coloured, and ſnipt about the edges: the floure reſembles a croſſe, with foure ſharpe pointed rough leaues of a whitiſh blew colour, which containe diuers ſmall looſe little leaues in their middles. The root is long and laſting. It growes vpon the rocky places of mount Baldus in Italy, where *Pona* found it, and he calls it *Clematis cruciata Alpina*. ‡

¶ The

‡ 6 *Clematis cruciata Alpina.*
Virgins Bower of the Alps.

A

¶ *The Place.*

Theſe plants do not grow wilde in England, that I can as yet learne; notwithſtanding I haue them all in my garden, where they flouriſh exceedingly.

¶ *The Time.*

Theſe plants do floure from Auguſt to the end of September.

¶ *The Names.*

There is not much more found of their names than is expreſſed in their ſeuerall titles, notwithſtanding there hath beene ſomewhat ſaid, as I thinke, by heareſay, but nothing of certaintie: wherefore let that which is ſet downe ſuffice. We may in Engliſh call the firſt, Biting Clematis, or white Clematis, Biting Peruinkle or purging Peruinkle, Ladies Bower, and Virgins Bower.

¶ *The Temperature.*

The leafe hereof is biting, and doth mightily bliſter, being, as *Galen* ſaith, of a cauſticke or burning qualitie: it is hot in the beginning of the fourth degree.

¶ *The Vertues.*

Dioſcorides writeth, that the leaues being applied do heale the ſcurfe and lepry, and that the ſeed beaten, and the pouder drunke with faire water or with mead, purgeth flegme and choler by the ſtoole.

Chap. 328. *Of Wood-binde, or Hony-ſuckle.*

The Kindes.

THere be diuers ſorts of Wood-bindes, ſome of them ſhrubs with winding ſtalks, that wrappe themſelues vnto ſuch things as are neere about them. Likewiſe there be other ſorts or kindes found out by the later Herbariſts, that clime not at all, but ſtand vpright, the which ſhall bee ſet forth among the ſhrubbie plants. And firſt of the common Woodbinde.

¶ *The Deſcription.*

1 WOodbinde or Honiſuckle climeth vp aloft, hauing long ſlender wooddie ſtalkes, parted into diuers branches: about which ſtand by certaine diſtances ſmooth leaues, ſet together by couples one right againſt another; of a light greene colour aboue, vnderneath of a whitiſh greene. The floures ſhew themſelues in the topps of the branches many in number, long, white, ſweet of ſmell, hollow within; in one part ſtanding more out, with certaine threddes growing out of the middle. The fruit is like to little bunches of grapes, red when they be ripe, wherein is contained ſmall hard ſeed. The root is wooddie, and not without ſtrings.

2 This ſtrange kind of Woodbind hath leaues, ſtalks, and roots like vnto the common Woodbinde or Honiſuckle, ſauing that neere vnto the place where the floures come forth, the ſtalkes doe grow through the leaues, like vnto the herbe Thorow-wax, called *Perfoliata*, which leaues do reſemble little ſaucers: out of which broad round leaues proceed faire, beautifull, and well ſmelling floures, ſhining with a whitiſh purple colour, and ſomewhat daſht with yellow, by little and little ſtretched out like the noſe of an Elephant, garniſhed within with ſmall yellow chiues or threddes: and when the floures are in their flouriſhing, the leaues and floures do reſemble ſaucers filled with the

the floures of Woodbinde: many times it falleth out, that there is to be found three or foure ſaucers one aboue another, filled with floures, as the firſt, which hath cauſed it to be called double Hony-ſuckle, or Woodbinde.

1 *Periclymenum.*
Woodbinde or Honiſuckles.

2 *Periclymenum perfoliatum.*
Italian Woodbinde.

¶ *The Place.*

The VVoodbinde groweth in woods and hedges, and vpon ſhrubbes and buſhes, oftentimes winding it ſelfe ſo ſtraight and hard about, that it leaueth his print vpon thoſe things ſo wrapped.

The double Honiſuckle groweth now in my garden, and many others likewiſe in great plenty, although not long ſince, very rare and hard to be found, except in the garden of ſome diligent Herbariſts.

¶ *The Time.*

The leaues come forth betimes in the ſpring: the floures bud forth in May and Iune: the fruit is ripe in Autumne.

¶ *The Names.*

It is called in Greeke περικλύμενον: in Latine, *Voluerum maius*: of *Scribonius Largus*, *Syluamater*: in ſhops, *Caprifolium*, and *Matriſylua*: of ſome, *Lilium inter ſpinas*: in Italian, *Vinciboſco*: in High Dutch, **Geysbladt**: in Low Dutch, **Gheytenbladt**, and **Wammekens Cruit**: in French, *Cheurefueille*: in Spaniſh, *Madreſelua*: in Engliſh, VVoodbinde, Honiſuckle, and Caprifoly.

¶ *The Temperature.*

There hath an errour in times paſt growne amongſt a few, and now almoſt paſt recouerie to bee called againe, being growne an errour vniuerſall, which errour is, how the decoction of the leaues of Honiſuckles, or the diſtilled water of the floures, are raſhly giuen for the inflammations of the mouth and throte, as though they were binding and cooling. But contrariwiſe Honiſuckle is neither cold nor binding; but hot, and attenuating or making thinne. For as *Galen* ſaith, both the fruit of VVoodbinde, and alſo the leaues, do ſo much attenuate and heat, as if ſomewhat too much of them be drunke, they will cauſe the vrine to be as red as bloud, yet do they at the firſt onely prouoke vrine.

¶ *The*

¶ *The Vertues.*

A *Dioſcorides* writeth that the ripe ſeed gathered and dried in the ſhadow, and drunke vnto the quantitie of one dram weight, fortie daies together, doth waſte and conſume away the hardneſſe of the ſpleene, remoueth wearieſomneſſe, helpeth the ſhortneſſe and difficultie of breathing, cureth the hicket, procureth bloudie vrine after the ſixt day, and cauſeth women to haue ſpeedie trauell in childe bearing.

B The leaues be of the ſame force: which being drunk thirty daies together, are reported to make men barren, and deſtroy their naturall ſeed.

C The floures ſteeped in oile and ſet in the Sun, is good to annoint the bodie that is benummed, and growne verie cold.

D The diſtilled water of the floures are giuen to be drunke with good ſucceſſe againſt the piſſing of bloud.

E A ſyrrup made of the floures is good to be drunke againſt the diſeaſes of the lungs and ſpleene that is ſtopped, being drunke with a little wine.

F Notwithſtanding the words of *Galen* (or rather of *Dodoneus*) it is certainely found by experience, that the water of Honiſuckles is good againſt the ſoreneſſe of the throte and uvula: and with the ſame leaues boiled, or the leaues and floures diſtilled, are made diuers good medicines againſt cankers, and ſore mouths, as well in children as elder people, and likewiſe for vlcerations and ſcaldings in the priuie parts of man or woman; if there be added to the decoction hereof ſome allome or Verdigreace, if the ſore require greater clenſing outwardly, prouided alwaies that there be no Verdigreace put into the water that muſt be iniected into the ſecret parts.

Chap. 329. *Of Jaſmine, or Gelſemine.*

1 *Iaſminum album.*
VVhite Geſſemine.

2 *Iaſminum Candiflorum maius.*
Great white Geſſemine.

¶ *The Deſcription.*

IAſmine, or Gelſemine, is of the number of thoſe plants which haue need to be ſupported or propped vp, and yet notwithſtanding of it ſelfe claſpeth not or windeth his ſtalkes about

3 *Iaſminum luteum.*
Yellow Iaſmine.

bout ſuch things as ſtand neere vnto it, but onely leaneth and lyeth vpon thoſe things that are prepared to ſuſtaine it about arbors and banqueting houſes in gardens, by which it is held vp. The ſtalks therof are long, round, branched, ioynted or kneed, and of a green colour, hauing within a white ſpungeous pith. The leaues ſtand vpon a middle ribbe, ſet together by couples like thoſe of the aſhe tree, but much ſmaller, of a deepe greene colour. The floures grow at the vppermoſt part of the branches, ſtanding in a ſmal tuft, far ſet one from another, ſweet in ſmel, of colour white. The ſeed is flat and broad like thoſe of Lupines, which ſeldome come to ripeneſſe. The root is tough and threddie.

2 *Lobel* reporteth that he ſaw in a garden at Bruxels, belonging to a reuerend perſon called Mr. *Iohn Boiſot*, a kinde of Gelſemine, very much differing from our Iaſmine, which he nouriſhed in an earthen pot: it grew not aboue, ſaith he, to the height of a cubit, diuided into diuers branches, wherupon did grow leaues like thoſe of the common white Iaſmine, but blacker and rounder. The floures to the ſhew were moſt beautiful, in ſhape like thoſe of the common Iaſmine, but foure times bigger, gaping wide open, white on the vpper ſide, and of a bright red on the vnder ſide.

3 There is a kind hereof with yellow floures: but ſome doe deſcribe for the yellow Iaſmine, the ſhrubbie Trefoile, called of ſome *Trifolium fruticans*: and of others, *Polemonium*. But this yellow Iaſmine is one, and that is another plant, differing from the kindes of Iaſmine, as ſhall be declared in his proper place. The yellow Iaſmine differeth not from the common white Geſmine, in leaues, ſtalks, nor faſhion of the floures: the onely difference is, that this plant bringeth forth yellow floures, and the other white.

4 There is likewiſe another ſort that differeth not from the former in any reſpect, but in the colour of the floure; for this plant hath floures of a blew colour, and the others not ſo, wherein conſiſteth the difference.

¶ *The Place.*

Gelſemine is foſtered in gardens, and is vſed for arbors, and to couer banquetting houſes in gardens: it groweth not wilde in England that I can vnderſtand of, though Mr. *Lyte* be of another opinion: the white Iaſmine is common in moſt places of England: the reſt are ſtrangers, and not ſeene in theſe parts as yet.

¶ *The Time.*

They bring forth their pleaſant floures in Iuly and Auguſt.

¶ *The Names.*

Among the Arabians *Serapio* was the firſt that named Geſſemine, *Zambach*: it is called *Iaſminum*, and *Ieſeminum*, and alſo *Geſſominum*: in Engliſh, Iaſmine, Geſſemine, and Ieſſe.

There is in *Dioſcorides* a compoſition of oile of Iaſmine, which he ſaith is made in Perſia of the white floures of Violets, which Violets ſeeme to be none other than the floures of this Geſſemine: for *Dioſcorides* oftentimes hath reckoned faire and elegant floures amongſt the Violets, ſo that it muſt not ſeeme ſtrange that he calleth the floures of Geſſemine Violets, eſpecially ſeeing that the plant it ſelfe was vnknowne vnto him, as it is euident.

¶ *The Temperature.*

Geſſemine, and eſpecially the floures thereof be hot in the beginning of the ſecond degree, as *Serapio* reporteth out of *Meſue*.

¶ *The Vertues.*

The oile which is made of the floures hereof, waſteth away raw humors, and is good againſt cold rheumes; but in thoſe that are of a hot conſtitution it cauſeth head-ache, and the ouermuch ſmell thereof maketh the noſe to bleed, as the ſame Author affirmeth. It is vſed (as *Dioſcorides* writeth, A

and after him *Aetius*) of the Perſians in their banquets for pleaſure ſake: it is good to be annointed after bathes, in thoſe bodies that haue need to be ſuppled and warmed, but by reaſon of ſmell it is not much vſed.

The leaues boiled in wine vntill they be ſoft, and made vp to the forme of a pultis, and applied, diſſolue cold ſwellings, wens, hard lumps, and ſuch like outgoings.

Chap. 330. *Of Peruinkle.*

¶ *The Deſcription.*

1 Peruinkle hath ſlender and long branches trailing vpon the ground, taking hold here and there as it runneth; ſmall like to ruſhes, with naked or bare ſpaces betweene ioint and ioint. The leaues are ſmooth, not vnlike to the Bay leafe, but leſſer. The floures grow hard by the leaues, ſpreading wide open, compoſed of fiue ſmall blew leaues.

We haue in our London gardens a kinde hereof bearing white floures, which maketh it to differ from the former.

1 *Vinca Peruinca minor.*
Peruinkle.

‡ 2 *Clematis Daphnoides, ſiue Peruinca maior.*
Great Peruinkle.

There is another with purple floures, doubling it ſelfe ſomewhat in the middle, with ſmaller leaues, wherein is the difference.

2 There is another ſort, greater than any of the reſt, which is called of ſome *Clematis Daphnoides*, of the ſimilitude the leaues haue with thoſe of the Bay. The leaues and floures are like thoſe of the precedent, but altogether greater; wherein conſiſteth the difference.

¶ *The Place.*

They grow in moſt of our London gardens; they loue a moiſt and ſhadowie place: the branches remaine alwaies greene.

¶ *The Time.*

The floures of them do flouriſh in March, Aprill, and May, and oftentimes later.

¶ *The*

¶ *The Names.*

Peruinkle is called in Greeke περιβλεπτὶ δαφνοειδὴς: becauſe it bringeth forth ſtalkes, which creepe like thoſe of the Vine, and *Daphnoides* by reaſon that the leaues are like thoſe of the Bay, as aforeſaid. *Pliny* calleth it *Vinca Peruinca*, and *Chamædaphne*: notwithſtanding there is another *Chamædaphne*, of which in his place. The ſame Author likewiſe calleth it *Centunculus*: in High Dutch, **Ingrun**: in Low Dutch, **Vincoorte, maegden cruyt**: in French, *Pucellage, Vauche & Peruauche*: in Italian, *Prouenca*: in Spaniſh, *Peruinqua*: in ſhoppes, *Clematis peruinca*: in Engliſh, Peruinkle, Peruinkle, and Periwinkle.

¶ *The Temperature.*

Peruinkle is ſomething hot, but within the ſecond degree, ſomething drie and aſtringent.

¶ *The Vertues.*

The leaues boiled in wine and drunken, ſtop the laske and bloudie flix. A

An handfull of the leaues ſtamped, and the iuice giuen to drinke in red wine, ſtoppeth the laske and bloudy flix, ſpitting of bloud, which neuer faileth in any bodie, either man or woman: it likewiſe ſtoppeth the inordinate courſe of the monethly ſickneſſe. B

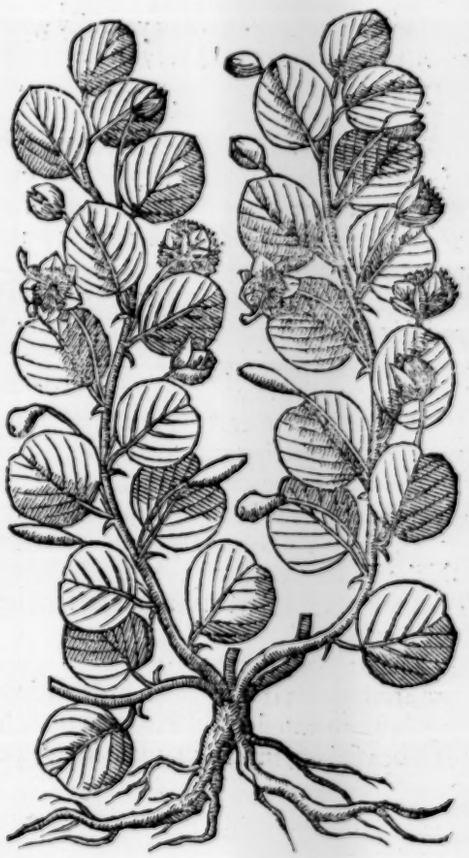
Chap. 331. *Of Capers.*

¶ *The Kindes.*

THere be two ſorts of Capers eſpecially, one with broad leaues ſharpe pointed: the other with rounder leaues. The Brabanders haue alſo another ſort, called *Capparis fabago*, or Bean Capers.

1 *Capparis folio acuto.*
Sharpe leafed Capers.

2 *Capparis rotundiore folio.*
Round leafed Capers.



¶ *The Deſcription.*

1 THe Caper is a prickly ſhrub, the ſhoots or branches whereof be full of ſharpe prickly thornes, trailing vpon the ground if they bee not ſupported or propped vp: whereupon

doe grow leaues like thoſe of the Quince-tree, but rounder: amongſt the which come forth long ſlender foot-ſtalkes, whereon do grow round knoppes, which doe open or ſpread abroad into faire floures, after which commeth in place long fruit, like to an oliue, and of the ſame colour, wherein is contained flat rough-ſeeds, of a duskie colour. The root is wooddie, and couered with a thick bark or rinde, which is much vſed in Phyſicke.

2 The ſecond kinde of Caper is likewiſe a prickly plant, much like the bramble buſh, hauing many ſlender branches ſet full of ſharpe prickles. The whole plant traileth vpon the place where it groweth, beſet with round blackiſh leaues diſorderly placed, in ſhape like thoſe of Aſtrabacca, but greater, approching to the forme of Fole-foot: among which commeth forth a ſmall and tender naked twig, charged at the end with a ſmall knap or bud, which openeth it ſelfe to a ſmall ſtar-like floure, of a pleaſant ſweet ſmell; in place whereof comes a ſmall fruit, long and round like the Cornell berrie, of a browne colour. The root is long and wooddie, and couered with a thicke barke or rinde, which is likewiſe vſed in medicine.

¶ *The Place.*

The Caper groweth in Italy, Spaine, and other hot Regions without manuring, in a leane ſoyle, in rough places amongſt rubbiſh, and vpon old walls, as *Dioſcorides* reporteth.

Theophraſtus writeth, that it is by nature wild, and refuſeth to be husbanded, yet in theſe our daies diuers vſe to cheriſh the ſame, and to ſet it in dry and ſtony places: my ſelfe at the impreſſion hereof, planted ſome ſeeds in the bricke walls of my garden, which as yet do ſpring and grow green, the ſucceſſe I expect.

¶ *The Time.*

The Caper floureth in Sommer, euen vntill Autumne. The knoppes of the floures before they open are thoſe Capers or ſauce that wee eat, which are gathered and preſerued in pickle or Salt.

¶ *The Names.*

It is called in Greeke καππαρις: and in Latine alſo *Capparis*: but properly *Cynosbatos*, or *Canirubus*: which is alſo taken for the wilde Roſe; it is generally called Cappers in moſt languages: in Engliſh, Cappers, Caper, and Capers.

¶ *The Temperature.*

Capers, or the floures not yet fully growne, be of temperature hot, and of thinne parts; if they be eaten greene, they yeeld very little nouriſhment, and much leſſe if they be ſalted. And therefore they be rather a ſauce and medicine, than a meat.

¶ *The Vertues.*

A They ſtir vp an appetite to meat; they be good for a moiſt ſtomack, and ſtay the watering thereof, and clenſeth away the flegme that cleaueth vnto it. They open the ſtoppings of the liuer and milt, with meat; they are good to be taken of thoſe that haue a quartaine Ague, and ill ſpleenes. They are eaten boiled (the ſalt firſt waſhed off) with oile and vineger, as other ſallads be, and ſometimes are boiled with meat.

B The rinde or barke of the root conſiſteth of diuers faculties, it heateth, clenſeth, purgeth, cutteth and digeſteth, hauing withall a certaine binding qualitie.

C This barke is of a ſingular remedie for hard ſpleenes, being outwardly applied, and alſo inwardly taken, and the ſame boiled in vineger or oxymel, or being beaten and mixed with other ſimples: for after this manner it expelleth thicke and groſſe humours, and conueieth away the ſame mixed with bloud, by vrine, and alſo by ſiege, whereby the milt or ſpleene is helped, and the paine of the huckle bones taken away: moreouer it bringeth downe the deſired ſickneſſe, purgeth and draweth flegme out of the head, as *Galen* writeth.

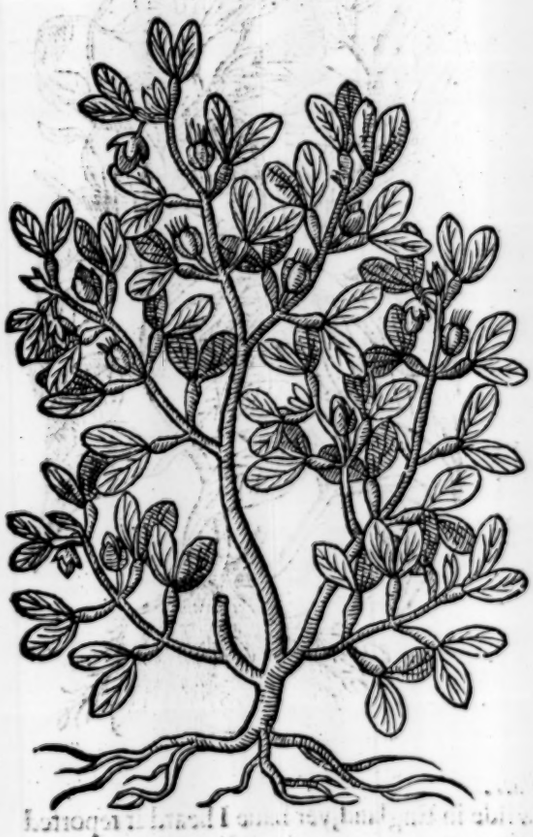
D The ſame barke (as *Dioſcorides* teacheth) doth clenſe old filthie ſores, and ſcoureth away the thicke lips and cruſts about the edges, and being chewed it taketh away the tooth-ache.

E Being ſtamped with vineger, it ſcoureth away tetters or Ring-wormes, hard ſwellings, and cures the Kings-euill.

F The barke of the roots of Capers is good againſt the hardneſſe and ſtopping of the ſpleene, and profiteth much if it be giuen in drinke to ſuch as haue the Sciatica, the Palſie, and thoſe that are burſten or bruiſed by falling from ſome high place: it doth mightily prouoke vrine, inſomuch that if it be vſed ouermuch, or giuen in too great a quantity, it procureth bloud to come with the vrine.

CHAP. 332. *Of Beane Capers.*

Capparis fabago.
Beane Capers.



¶ *The Deſcription.*

THis plant which the Germanes cal **Fabago**, and *Dodonæus* ſauoring of Dutch, calleth it in his laſt Edition *Capparis Fabago*, and properly: *Lobel* calleth it *Capparis Leguminoſa*: between which there is no great difference, who labour to refer this plant vnto the kindes of Capers, which is but a low and baſe herbe, and not a ſhrubbie buſh, as are the true Capers. It bringeth forth ſmooth ſtalks tender and branched, whereupon doe grow long thicke leaues, leſſer than thoſe of the true Capers, and not vnlike to the leaues of Purſlane, comming out of the branches by couples, of a light greene colour. The floures before they be opened are like to thoſe of the precedent, but when they be come to maturitie and full ripeneſſe they waxe white, with ſome yellow chiues in the midſt: which being paſt, there appeare long cods, wherein is contained ſmall flat ſeed. The root is tender, branching hither and thither.

¶ *The Place.*

It groweth of it ſelfe in corne fields of the low Countries, from whence I haue receiued ſeeds for my garden, where they flouriſh.

¶ *The Time.*

It floureth when the Caper doth.

¶ *The Names.*

It is called in Latine of the later Herbariſts *Capparis fabago*: of moſt, *Capparis Leguminoſa*: it is thought to be that herbe which *Auicen* deſcribeth in his 28. chapter, by the name of *Ardifrigi*: wee may content our ſelues that *Capparis fabago* retaine that name ſtill, and ſeeke for none other, vnleſſe it be for an Engliſh name, by which it may be called after the Latine, Beane Caper.

¶ *The Temperature and Vertues.*

Touching the faculties thereof we haue nothing left in writing worth the remembrance.

CHAP. 333. *Of Swallow-wort.*

¶ *The Deſcription.*

1 SWallow-wort with white floures hath diuers vpright branches of a browniſh colour, of the height of two cubits, beſet with leaues not vnlike to thoſe of *Dulcamara* or wooddie Night-ſhade, ſomewhat long, broad, ſharpe-pointed, of a blackiſh greene colour, and ſtrong ſauour: among which come forth very many ſmall white floures ſtar-faſhion, hanging vpon little ſlender foot-ſtalkes: after which come in place thereof long ſharpe pointed cods, ſtuffed full of a moſt perfect white cotton reſembling ſilke, as well in ſhew as handling; (our London Gentlewomen haue named it Silken Ciſlie) among which is wrapped ſoft browniſh ſeed. The roots are very many, white, threddie, and of a ſtrong ſauour.

2 The ſecond kinde is oftentimes found with ſtalkes much longer, climing vpon props or ſuch things as ſtand neere vnto it, attaining to the height of fiue or ſix cubites, wrapping it ſelfe vpon them with many and ſundry foldings: the floures hereof are blacke: the leaues, cods, and roots be like thoſe of the former.

1 *Aſclepias flore albo.*
White Swallow-woort.

2 *Aſclepias flore nigro.*
Blacke Swallow-woort.

¶ *The Place.*

Both theſe kindes do grow in my garden, but not wilde in England; yet haue I heard it reported that it groweth in the fields about Northampton, but as yet I am not certaine of it.

¶ *The Time.*

They floure about Iune, in Autumne the downe hangeth out of the cods, and the ſeed falleth to the ground.

¶ *The Names.*

It is called of the later Herbariſts *Vincetoxicum*: of *Ruellius*, *Hederalis*: in High Dutch, **Swaluwe wortele**, that is to ſay in Latine *Hirundinaria*: in Engliſh, Swallow-woort: of our Gentlewomen it is called Silken Ciſlie; *Æſculapius* (who is ſaid to be the firſt inuenter of Phyſicke, whom therefore the Greekes and Gentiles honored as a God) called it after his owne name *Aſclepias*, or *Æſculapius* herbe, for that he was the firſt that wrote thereof, and now it is called in ſhoppes *Hirundinaria*.

¶ *The Temperature.*

The roots of Swallow-woort are hot and dry; they are thought to be good againſt poiſon.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the roots of *Aſclepias* or Swallow-woort boiled in wine, and the decoction drunke, are a remedie againſt the gripings of the belly, the ſtingings of Serpents, and againſt deadly poiſon, being one of the eſpecialleſt herbes againſt the ſame.

B The leaues boiled and applied in forme of a pultis, cure the euill ſores of the paps or dugs, and matrix, that are hard to be cured.

Chap. 334. *Of Indian Swallow-woort.*

¶ *The Deſcription*

There groweth in that part of Virginia, or Norembega, where our Engliſh men dwelled (intending there to erect a certaine Colonie) a kinde of *Aſclepias*, or Swallow-woort, whicli the

the Sauages call *Wiſanck* : there riſeth vp from a ſingle crooked root one vpright ſtalke a foot high, ſlender, and of a greeniſh colour : whereupon do grow faire broad leaues ſharpe pointed, with many ribs or nerues running through the ſame like thoſe of Ribwort or Plantaine, ſet together by couples at certaine diſtances. The floures come forth at the top of the ſtalks, which as yet are not obſerued, by reaſon the man that brought the ſeeds and plants hereof did not regard them. After which, there come in place two cods (ſeldome more) ſharpe pointed like thoſe of our Swallow-wort, but greater, ſtuffed full of a moſt pure ſilke of a ſhining white colour : among which ſilke appeareth a ſmall long tongue (which is the ſeed) reſembling the tongue of a bird, or that of the herbe called Adders tongue. The cods are not only full of ſilke, but euerie nerue or ſinew wherewith the leaues be ribbed are likewiſe moſt pure ſilke ; and alſo the pilling of the ſtemmes, euen as flax is torne from his ſtalks. This conſidered, behold the iuſtice of God, that as he hath ſhut vp thoſe people and nations in infidelity and nakedneſſe ; ſo hath he not as yet giuen them vnderſtanding to couer their nakedneſſe, nor matter wherewith to doe the ſame ; notwithſtanding the earth is couered ouer with this ſilke, which dayly they tread vnder their feet, which were ſufficient to apparell many kingdomes, if they were carefullly manured and cheriſhed.

Wiſanck, ſiue Vincetoxicum Indianum.
Indian Swallow-wort.

‡ *Apocynum Syriacum Cluſij.*

‡ This Plant, which is kept in ſome gardens by the name of Virginia Silke Graſſe, I take to be the ſame, or very like the *Beidelſar* of *Alpinus* ; and the *Apocynum Syriacum* of *Cluſius* : at Padua they call it *Eſula Indica*, by reaſon of the hot milky iuyce. *Bauhinus* hath very vnfitly named it *Lapathum Ægyptiacum lacteſcens ſiliqua Aſclepiadis*. But he is to be pardoned ; for *Iohannes Carolus Roſenbergus, cap. 16. p. 46.* of his *Animad. & Exerc. Medica*, or *Roſa nobilis iatrica*, hath taken vpon him the credit and inuention of this abſurd denomination : I may call it abſurd, for that neither any way in ſhape or qualitie it reſembles or participates any thing with a Docke. I haue giuen you the figure of our Author with his title, and that of *Cluſius* with his : in the former the cods are only well expreſt ; in the later the leaues and floures reaſonably well, but that they are too few in number, and ſet too far aſunder. Vpon the ſight of the growing and flouring plant I tooke this deſcription : The root is long and creeping ; the ſtalkes two or three cubits high, ſquare, hollow, a finger thicke, and of a light greene colour, ſending out towards the top ſome few branches : vpon this at certaine

certaine ſpaces grow by couples leaues ſome halfe foot long, and three inches broad, darke greene on their vpper ſides, more whitiſh below, and full of large and eminent veines: at the top of the ſtalke and branches it carries moſt commonly an hundred or more floures, growing vpon foot-ſtalkes ſome inch long, all cloſe thruſt together after the manner of the Hyacinth of Peru at the firſt flouring: each floure is thus compoſed; firſt it hath fiue ſmall greene leaues bending backe, which ſerue for the cup: then hath it other fiue leaues foure times larger than the former, which bend backe and couer them; and theſe are greene on the vnder ſide, and of a pale colour with ſome redneſſe aboue: then are there fiue little graines (as I may ſo terme them) of a pleaſant red colour, and on their outſide like cornes of Millet, but hollow on their inſides, with a little thred or chiue comming forth of each of them: theſe fiue ingirt a ſmall head like a button, greeniſh vnderneath, and whitiſh aboue. I haue giuen you the figure of one floure by the ſide of our Authors figure. The leaues and ſtalkes of this plant are very full of a milky iuyce. ‡

¶ *The Place.*

It groweth, as before is rehearſed, in the countries of Norembega, now called Virginia by the honourable Knight Sir *Walter Raleigh*, who hath beſtowed great ſummes of money in the diſcouerie thereof; where are dwelling at this preſent Engliſh men.

¶ *The Time.*

It ſpringeth vp, floureth, and flouriſheth both Winter and Sommer, as do many or moſt of the plants of that countrey. ‡ It dies downe with vs euery Winter and comes vp in the Spring, and floures in Auguſt, but neuer bringeth forth the cods with vs, by reaſon of the coldneſſe of our Climate. ‡

¶ *The Names.*

The ſilke is vſed of the people of Pomeioc and other of the prouinces adioyning, being parts of Virginia, to couer the ſecret parts of maidens that neuer taſted man; as in other places they vſe a white kinde of moſſe Wiſanck: we haue thought *Aſclepias Virginiana*, or *Vincetoxicum Indianum* fit and proper names for it: in Engliſh, Virginia Swallow-wort, or the Silke-wort of Norembega.

¶ *The Nature and Vertues.*

A We finde nothing by report, or otherwiſe of our owne knowledge, of his phyſicall vertues, but onely report of the aboundance of moſt pure ſilke wherewith the whole plant is poſſeſſed.

B ‡ The leaues beaten either crude, or boyled in water, and applied as a pulteſſe, are good againſt ſwellings and paines proceeding of a cold cauſe.

C The milky iuyce, which is very hot, purges violently; and outwardly applied is good againſt tetters, to fetch haire off skins, if they be ſteeped in it, and the like. *Alpinus.* ‡

Chap. 335.

Of the Bombaſte or Cotton-Plant.

¶ *The Deſcription.*

THe Cotton buſh is a low and baſe Plant, hauing ſmall ſtalkes of a cubit high, and ſomtimes higher; diuided from the loweſt part to the top into ſundry ſmall branches, whereupon are ſet confuſedly or without order a few broad leaues, cut for the moſt part into three ſections, and ſometimes more, as Nature liſt to beſtow, ſomewhat indented about the edges, not vnlike to the leafe of the Vine, or rather the Veruaine Mallow, but leſſer, ſofter, and of a grayiſh colour: among which come forth the floures, ſtanding vpon ſlender foot-ſtalkes, the brimmes or edges whereof are of a yellow colour, the middle part purple: after which appeareth the fruit, round, and of the bigneſſe of a Tenniſe ball, wherein is thruſt together a great quantitie of fine white Cotton wooll; among which is wrapped vp blacke ſeed of the bigneſſe of peaſen, in ſhape like the trettles or dung of a cony. The fruit being come to maturitie or ripeneſſe, the huske or cod opens it ſelfe into foure parts or diuiſions, and caſteth forth his wooll and ſeed vpon the ground, if it be not gathered in his time and ſeaſon. The root is ſmall and ſingle, with few threds anexed thereto, and of a wooddy ſubſtance, as is all the reſt of the plant.

¶ *The Place.*

It groweth in India, in Arabia, Egypt, and in certaine Iſlands of the Mediterranean ſea, as Cyprus, Candy, Malta, Sicilia, and in other prouinces of the continent adiacent. It groweth about Tripolis and Aleppo in Syria, from whence the Factor of a worſhipfull merchant in London, Maſter *Nicholas Lete* before remembred, did ſend vnto his ſaid maſter diuers pounds weight of the ſeed; whereof ſome were committed to the earth at the impreſſion hereof, the ſucceſſe we leaue to the

Goſſipium, ſiue Xylon.
The Cotton buſh.

the Lord. Notwithſtanding my ſelfe 3 yeares paſt did ſow of the ſeed, which did grow verie frankly, but periſhed before it came to perfection, by reaſon of the cold froſts that ouertooke it in the time of flouring.

¶ *The Time.*

Cotton ſeed is ſowen in plowed fields in the Spring of the yeare, and reaped and cut down in harueſt, euen as corne with vs; and the ground muſt be tilled and ſowne new againe the next yeare, and vſed in ſuch ſort as we do the tillage for corne and grain: for it is a plant of one yere, and periſheth when it hath perfected his fruit, as many other plants do.

¶ *The Names.*

Cotton is called in Greeke ξύλον, and ῥοπάκιον: in Latine, *Xylum*, and *Goſſipium* after the Greeke: in ſhops, *Lanugo, Bombax*, and *Cotum*: in Italian, *Bombagia*: in Spaniſh, *Algodon*: in high-Dutch, **Baumwool**: in Engliſh and French, Cotton, Bombaſte and Bombace.

Theophraſtus hath made mention hereof in his fourth booke, *cap.* 9. but without a name; and he ſaith it is a tree in Tylus which beares wool. Neither is it any maruell if he took an vnknown ſhrub or plant, and that groweth in Countries farre off, for a tree: ſeeing alſo in this age (in which very many things come to be better knowne than in times paſt) the cotton or wooll hereof is called of the Germanes (as wee haue ſaid) **Baum wooll**, that is, Wooll of a tree, whereas indeed it is rather an herbe or ſmall ſhrub, and not to be numbred among trees.

Of this *Theophraſtus* writeth thus; It is reported that the ſame Iſland (*viz.* Tylus) doth bring forth many trees that beare wooll, which haue leaues like thoſe of the Vine, &c.

Pliny writing of the ſame, *lib.* 19. *cap.* 1. ſaith thus: The vpper part of Egypt toward Arabia bringeth forth a ſhrub which is called *Goſſipion*, or *Xylon*, and therefore the linnen that is made of it is called *Xylina*. It is (ſaith he) the plant that beareth that wooll wherewith the garments are made which the Prieſts of Egypt do weare.

¶ *The Temperature.*

The ſeed of Cotton (according to the opinion of *Serapio*) is hot and moiſt: the wooll it ſelfe is hot and dry.

¶ *The Vertues.*

The ſeed of Cotton is good againſt the cough, and for them that are ſhort winded: it alſo ſtir- A
reth vp the luſt of the body by increaſing naturall ſeed, wherefore it ſurpaſſeth.

The oyle preſſed out of the ſeed taketh away freckles, ſpots, and other blemiſhes of the skin. B

The aſhes of the wooll burned ſtancheth the bleeding of wounds, vſed in reſtrictiue medicines, C
as Bole Armonicke, and is more reſtrictiue than Bole it ſelfe.

To ſpeake of the commodities of the wooll of this plant were ſuperfluous, common experience D
and the dayly vſe and benefit we receiue by it ſhew them. So that it were impertinent to our hiſtorie to ſpeake of the making of Fuſtian, Bombaſies, and many other things that are made of the wooll thereof.

CHAP. 336. *Of Dogs-bane.*

¶ *The Kindes.*

THere be two kindes of Dogs-banes: the one a clymbing or clambering plant; the other an vpright ſhrub.

¶ *The*

¶ *The Deſcription.*

1 DOgs-bane riſeth vp like vnto a ſmall hedge buſh, vpright and ſtraight, vntill it haue attained to a certaine heighth; then doth it claſpe and clime with his tender branches as do the Bindeweeds, taking hold vpon props or poles, or whatſoeuer ſtandeth next vnto it: whereupon do grow faire broad leaues, ſharpe pointed like thoſe of the Bay tree, of a deepe greene colour. The floures come forth at the top of the ſtalkes, conſiſting of fiue ſmall white leaues: which being paſt, there ſucceed long cods, ſet vpon a ſlender foot-ſtalke by couples, ioyning themſelues together at the extreme point, and likewiſe at the ſtalke, making of two pieces knit together one entire cod; which cod is full of ſuch downy matter and ſeed as that of *Aſclepias*, but more in quantity by reaſon the cods are greater; which being dry and ripe, the ſilken cotton hangeth forth, and by little and little ſheddeth, vntill the whole be fallen vpon the ground. The whole plant yeeldeth that yellow ſtinking milky iuyce that the other doth, and ſometimes it is of a white colour, according to the climate where it groweth; for the more cold the country is, the whiter is the iuyce; and the more hot, the yellower. The root is long and ſingle, with ſome threds anexed thereto.

1 *Periploca repens anguſtifolia.*
Climing Dogs-bane.

‡ 2 *Periploca latifolia.*
Broad leafed Dogs-bane.

2 There is another Dogs-bane that hath long and ſlender ſtalkes like thoſe of the Vine, but of a browne reddiſh colour, wherewith it windeth it ſelfe about ſuch things as ſtand neere vnto it, in manner of a Bindweed: whereupon are ſet leaues not vnlike to thoſe of the Iuy, but not ſo much cornered, of a darke greene colour, and of a ranke ſmell being bruiſed betweene the fingers, yeelding forth a ſtinking yellow milky iuyce when it is ſo broken: amongſt which come forth little white floures, ſtanding ſcatteringly vpon little huskes: after the floures come long cods, very like vnto *Aſclepias* or Swallow-wort, but greater, ſtuffed with the like ſoft downy ſilke; among which downe is wrapped vp flat blacke ſeed. The roots are many and threddy, creeping all about within the ground, budding forth new ſhoots in ſundry places, whereby it greatly increaſeth.

¶ *The Place.*

They grow naturally in Syria, and alſo in Italy, as *Matthiolus* reporteth: my louing friend *Iohn Robin* Herbariſt in Paris did ſend me plants of both the kinds for my garden, where they floure and flouriſh; but whether they grow in France, or that he procured them from ſome other region, as yet I haue no certaine knowledge.

¶ *The*

¶ *The Time.*

They begin to bud forth their leaues in the beginning of May, and ſhew their floures in September.

¶ *The Names.*

Dogs-bane is called by the learned of our age *Periploca*: it is euident that they are to be referred to the *Apocynum* of *Dioſcorides*. The former of the two hath been likewiſe called [illegible], and *Braſſica Canina*, or Dogs-Cole: notwithſtanding there is another Dogs Cole, which is a kind of wilde Mercurie. We may call the firſt Creeping Dogs-bane; and the other, Vpright or Syrian Dogs-bane.

¶ *The Temperature.*

Theſe plants are of the nature of that peſtilent or poyſonous herbe *Thora*, which being eaten of Dogs or any other liuing creature doth certainly kill them, except there be in readineſſe an Antidote or preſeruatiue againſt poyſon, and giuen, which by probabilitie is the herbe deſcribed in the former chapter, called *Vincetoxicum*; euen as *Anthora* is the Antidote and remedy againſt the poyſon of *Thora*; and *Herba Paris* againſt *Pardalianches*.

¶ *The Vertues.*

Dogs-bane is a deadly and dangerous plant, eſpecially to foure footed beaſts; for as *Dioſcorides* writeth, the leaues hereof being mixed with bread and giuen, killeth dogs, wolues, Foxes, and leopards, the vſe of their legs and huckle-bones being preſently taken from them, and death it ſelfe followeth incontinent, and therefore not to be vſed in medicine. A

CHAP. 337. *Of Solomons Seale.*

1 *Polygonatum.*
Solomons Seale.

2 *Polygonatum minus.*
Small Solomons Seale.

¶ *The Deſcription.*

1 THe firſt kinde of Solomons Seale hath long round ſtalkes, ſet for the moſt part with long leaues ſomewhat furrowed and ribbed, not much vnlike Plantaine, but narrower, which for the moſt part ſtand all vpon one ſide of the ſtalk, and hath ſmal white floures reſembling the

the floures of Lilly conuall: on the other ſide when the floures be vaded there come forth round berries, which at the firſt are greene, and of a blacke colour tending to blewneſſe; and when they be ripe be of the bigneſſe of Iuy berries, of a very ſweet and pleaſant taſte. The root is white and thicke, full of knobs or ioynts, which in ſome places reſemble the marke of a ſeale, whereof I think it tooke the name *Sigillum Solomonis*; and is ſweet at the firſt, but afterward of a bitter taſte, with ſome ſharpeneſſe.

2 The ſecond kinde of *Polygonatum* doth not much vary from the former, ſauing in the leaues, which be narrower, and grow round about the ſtalke like a ſpur, in faſhion like vnto Woodroofe or red Madder: among the leaues come forth floures like the former, but of a greener white colour: which being paſt, there ſucceed berries like the former, but of a reddiſh colour: which being paſt, there ſucceed berries like the former, but of a reddiſh colour: the roots are thick and knobby like the former, with ſome fibres anexed thereto.

3 *Polygonatum latifolium 2. Cluſij.*
Sweet ſmelling Solomons Seale.

4 *Polygonatum ramoſum.*
Branched Solomons Seale.

3 The third kinde of Solomons Seale, which *Carolus Cluſius* found in the wooddy mountaines of Leitenberg, aboue Manderſtorf, and in many other mountaines beyond the riuer Danubius, eſpecially among the ſtones, hee ſent to London to Mr. *Garth* a worſhipfull Gentleman, and one that greatly delighteth in ſtrange plants, who very louingly imparted the ſame vnto me. This plant hath ſtalkes very like vnto the common Solomons Seale, a foot high, beſet with leaues vpon one ſide of the ſtalke like the firſt and common kinde, but larger, and more approching to the bigneſſe of the broad leafed Plantaine, the taſte whereof is not very pleaſant: from the boſome of which leaues come forth ſmall well ſmelling greeniſh white floures not much vnlike the firſt: which being paſt, there follow ſeeds or berries that are at the firſt green, but afterward blacke, containing within the ſame berries a ſmall ſeed as big as a Vetch, and as hard as a ſtone. The roots are like vnto the other of his kinde, yet not ſo thicke as the firſt.

4 The fourth kind according to my account, but the third of *Cluſius* (which he found alſo in the mountaines aforeſaid) groweth a foot high, but ſeldome a cubit, differing from all the others of his kinde; for his ſtalkes diuide themſelues into ſundry other branches, which are garniſhed with goodly leaues, larger and ſharper pointed than any of the reſt, which do embrace the ſtalks about after the manner of *Perfoliata* or Thorow-wax, yet very like vnto the kindes of Solomons Seale in

ſhew,

ſhew, ſaue that they are ſomewhat hoarie vnderneath the leaues; which at the firſt are ſweete in taſte, but ſomewhat acride or biting towards the later end. From the backe part of the leaues ſhoot forth ſmall long tender and crooked ſtems, bearing at the end little gaping white floures not much vnlike *Lilium conuallium*, ſauouring like Hawthorne floures, ſpotted on the inner ſide with blacke ſpots: which being paſt, there come forth three cornered berries like the narrow leafed Solomons ſeale, greene at the firſt, and red when they be ripe, containing many white hard graines. The roots differ from all the other kindes, and are like vnto the crambling roots of *Thalictrum*, which the grauer hath omitted in the picture.

5 *Polygonatum anguſtifolium ramoſum.*
Narrow leaued Solomons ſeale.

5 This rare ſort of Solomons Seale riſes vp from his tuberous or knobby root, with a ſtraight vpright ſtalke ioynted at certaine diſtances, leauing betweene each ioynt a bare and naked ſtalke, ſmooth, and of a greeniſh colour tending to yellownes; from the which ioynts thruſt forth diuers ſmal branches, with foure narrow leaues ſet about like a ſtar or the herbe Woodroofe: vpon which tender branches are ſet about the ſtalkes by certaine ſpaces long narrow leaues incloſing the ſame round about: among which leaues come forth ſmall whitiſh floures of little regard. The fruit is ſmall, and of a red colour, full of pulpe or meate; among which is contained a hard ſtony ſeed like that of the firſt Solomons ſeale.

‡ 6 There is kept in our gardens, and ſaid to be brought from ſome part of America another *Polygonatum*, which ſends vp a ſtalk ſome foot and more high, and it hath leaues long, neruous, and very greene and ſhining, growing one by another without any order vpon the ſtalke, which is ſomewhat creſted, crooked, and very greene; bearing at the very top thereof, aboue the higheſt leafe, vpon little foot-ſtalks, ſome eight or nine little white floures, conſiſting of ſix leaues apiece, which are ſucceeded by berries, as in the former. This floures in May, and is vulgarly named *Polygonatum Virginianum*, or Virginian Solomons ſeale. ‡

¶ *The Place.*

The firſt ſort of Solomons ſeale growes naturally wilde in Somerſet-ſhire, vpon the North ſide of a place called Mendip, in the pariſh of Shepton Mallet: alſo in Kent by a village called Crayford, vpon Rough or Row hill: alſo in Odiam parke in Hampſhire; in Bradfords wood, neere to a town in Wiltſhire foure miles from Bathe; in a wood neere to a village called Horſley, fiue miles from Gilford in Surrey, and in diuers other places.

That ſort of Solomons ſeale with broad leaues groweth in certaine woods in Yorkſhire called Clapdale woods, three miles from a village named Settle.

¶ *The Time.*

They ſpring vp in March, and ſhew their floures in May: the fruit is ripe in September.

¶ *The Names.*

Solomons ſeale is called in Greeke πολύγονον: in Latine likewiſe *Polygonatum*, of many, Knees, for ſo the Greeke word doth import: in ſhops, *Sigillum Salomonis*, and *Scala cœli*: in Engliſh likewiſe Scala cœli, Solomons ſeale, and White-wort, or white root: in high-Dutch, **weiſswurtz**: in French, *Seau de Solomon*: of the Hetrurians, *Fraſinella*, and *Fraxinella*.

¶ *The Temperature.*

The roots of Solomons ſeale, as *Galen* ſaith, haue both a mixt faculty and qualitie alſo: For they haue (ſaith he) a certaine kinde of aſtriction or binding, and biting withall, and likewiſe a certaine loathſome bitterneſſe, as the ſame Author affirmeth: which is not to be found in thoſe that do grow in our climate.

¶ *The Vertues.*

A *Dioſcorides* writeth, That the roots are excellent good for to ſeale or cloſe vp greene wounds, being ſtamped and laid thereon; whereupon it was called *Sigillum Salomonis*, of the ſingular vertue that it hath in ſealing or healing vp wounds, broken bones, and ſuch like. Some haue thought it tooke the name *Sigillum* of the markes vpon the roots: but the firſt reaſon ſeemes to me more probable.

B The root of Solomons ſeale ſtamped while it is freſh and greene, and applied, taketh away in one night, or two at the moſt, any bruiſe, blacke or blew ſpots gotten by falls or womens wilfulneſſe, in ſtumbling vpon their haſty husbands fiſts, or ſuch like.

C *Galen* ſaith, that neither herbe nor root hereof is to be giuen inwardly: but note what experience hath found out, and of late dayes, eſpecially among the vulgar ſort of people in Hampſhire, which *Galen*, *Dioſcorides*, or any other that haue written of plants haue not ſo much as dreamed of; which is, That if any of what ſex or age ſoeuer chance to haue any bones broken, in what part of their bodies ſoeuer; their refuge is to ſtampe the roots hereof, and giue it vnto the patient in ale to drinke: which ſodoreth and glues together the bones in very ſhort ſpace, and very ſtrangely, yea although the bones be but ſlenderly and vnhandſomely placed and wrapped vp. Moreouer, the ſaid people do giue it in like manner vnto their cattell, if they chance to haue any bones broken, with good ſucceſſe; which they do alſo ſtampe and apply outwardly in manner of a pulteſſe, as well vnto themſelues as their cattell.

D The root ſtamped and applied in manner of a pulteſſe, and layd vpon members that haue been out of ioynt, and newly reſtored to their places, driueth away the paine, and knitteth the ioynt very firmely, and taketh away the inflammation, if there chance to be any.

E The ſame ſtamped, and the iuyce giuen to drinke with ale or white wine, as aforeſaid, or the decoction thereof made in wine, helps any inward bruſe, diſperſeth the congealed and clotted bloud in very ſhort ſpace.

F That which might be written of this herbe as touching the knitting of bones, and that truely, would ſeeme vnto ſome incredible; but common experience teacheth, that in the world there is not to be found another herbe comparable to it for the purpoſes aforeſaid: and therefore in briefe, if it be for bruiſes inward the roots muſt be ſtamped, ſome ale or wine put thereto, ſtrained, and giuen to drinke.

G It muſt be giuen in the ſame manner to knit broken bones, againſt bruiſes, black or blew marks gotten by ſtripes, falls, or ſuch like; againſt inflammation, tumors or ſwellings that happen vnto members whoſe bones are broken, or members out of ioynt, after reſtauration: the roots are to be ſtamped ſmall, and applied pulteſſe or plaiſterwiſe, wherewith many great works haue beene performed beyond credit.

H *Matthiolus* teacheth, That a water is drawne out of the roots, wherewith the women of Italy vſe to ſcoure their faces from ſunne-burning, freckles, morphew, or any ſuch deformities of the skinne.

† That which our Author formerly figured and deſcribed in the fifth place of this chapter, by the name of *Polygonatum acutum Cluſii*, was that deſcribed by him in the fourth place; but the figure was not ſo well expreſt.

Chap. 338. *Of Knee-holme, or Butchers broome.*

¶ *The Deſcription.*

Knee-holme is a low wooddy plant, hauing diuers ſmall branches, or rather ſtems, riſing immediately from the ground, of the height of a foot; whereupon are ſet many leaues like vnto thoſe of the Box tree, or rather of the Myrtle, but ſharpe and pricking at the point. The fruit groweth vpon the middle rib of the leafe, greene at the firſt, and red as Corall when it is ripe, like thoſe of *Aſparagus*, but bigger. The roots are white, branched, of a meane thickneſſe, and full of tough ſprouting ſhoots thruſting forth in other places, whereby it greatly encreaſeth.

¶ *The Place.*

It groweth plentifully in moſt places in England in rough and barren grounds, eſpecially vpon Hampſted heath foure miles from London; in diuers places of Kent, Eſſex, and Barkſhire, almoſt in euery copſe and low wood.

¶ *The Time.*

The young and tender ſprouts come forth at the firſt of the Spring, which are eaten in ſoms places

places, as the yong tender ſtalkes of Aſparagus and ſuch like herbes. The berries are ripe in Auguſt.

Ruſcus, ſiue Bruſcus.
Knee-holme, or Butchers broome.

¶ *The Names.*

It is called in Greeke ὀξυμυρσίνη, as though they ſhould ſay *Acuta Myrtus*, or pricking Myrtle; and *Myrtus ſylueſtris*, or wild Myrtle: in Latine, *Ruſcum*, or *Ruſcus*: in ſhops, *Bruſcus*: of diuers, *Scopa regia*, as teſtifieth *Marcellus Empericus* an old Writer: in high-Dutch, **Myeſdoꝛn**: in low-Dutch, **Stekende palm**: in Italian, *Ruſco*, and *Pontogopi*: in Spaniſh, *Gilbarbeyra*: in Engliſh, Knee-holme, Knee-huluer, Butchers broome, and Petigree.

There be ſome (ſaith *Pliny*, *lib.* 25. *cap.* 13.) that call it *Oxymyrſine*.

Serapio, *cap.* 288. ſuppoſeth that *Myrtus Agria*, or wilde Myrtle, is the ſame that *Cubebæ* are: he alledgeth a reaſon, becauſe *Galen* hath not deſcribed *Myrtus Agria*, or Knee-holme; neither *Dioſcorides Cubebæ*. Which as it is a reaſon of no account, ſo is it alſo without truth: for *Galen* doth no where make mention of *Cubebæ*; and be it that he had, it ſhould not therefore follow that Knee-holme is *Cubebæ*. *Galen* ſpeaketh of *Carpeſium*, which *Auicen* in his 137 chapter maketh to be *Cubebæ*: and that *Carpeſium* doth much differ from Knee-holme, thoſe things do euidently declare which *Galen* hath left written hereof in his firſt book of of Counterpoyſons. *Carpeſium* (ſaith hee) is an herbe like in kinde to that which is called *Phu*, or Setwall, but of greater force, and more aromaticall or ſpicie. This groweth very plentifully in Sida a city of Pamphilia. Alſo he ſaith further, that ſome of the ſtickes of Carpeſium are like to thoſe of Cinnamon: there be two kinds thereof, one which is named *Laërtium*; and another that is called *Ponticum*. They both take their names of the mountaines on which they grow: but *Ponticum* is the better, which is put into medicines in which the herbe *Phu* ought to be put. For *Carpeſium*, as I haue ſaid, is like vnto *Phu*, or Setwall, yet is it ſtronger, and yeeldeth a certaine aromaticall qualitie both in taſte and ſmell. Thus far *Galen*. By which it plainly appeareth, that Knee-holme is not *Carpeſium*, that is to ſay, *Auicenna* his *Cubebæ*, as ſhall be further declared in the chapter of *Cubebæ*.

Herein *Serapio* was likewiſe deceiued, who ſuſpected it to be ſuch a like thing; ſaying, There be certaine fruits or graines called *Cubebæ*, not ſticks: yet do they neither agree with Knee-holm, neither yet were they knowne vnto *Galen*.

Iſaac in the ſecond booke of his practiſe doth number it among the graines: and likewiſe *Haliabbas* in the ſecond booke of his practiſe alſo, *num.* 162. The later Grecians, among whom is *Nicolaus Myrepſus*, call them *Cubebæ*.

¶ *The Temperature.*

The roots of Knee-holme, which be chiefely vſed, are of temperature hot, and meanly dry, with a thinneſſe of eſſence.

¶ *The Vertues.*

The decoction of the roots of Knee-holme made in wine and drunken, prouoketh vrine, breaketh the ſtone, driueth forth grauell and ſand, and eaſeth thoſe that make their water with great paine. A

Dioſcorides writeth the ſame things of the leaues and berries, which moreouer (ſaith hee) bring downe the deſired ſickneſſe, helpe the head-ache and the yellow jaundice. Ouer and beſides, the roots do ſerue to raiſe vp gently tough and groſſe flegm which ſticketh in the lungs and cheſt, and do concoct the ſame. B

Chap. 339. *Of Horſe-tongue or Double-tongue.*

¶ *The Deſcription.*

1 Horſe-tongue ſendeth forth round ſtalkes of a ſpan long; wherupon are ſet long broad and ſharpe pointed leaues, but not pricking as are thoſe of Knee-holme, not vnlike to the leaues of the Bay tree, but leſſer; greater than thoſe of Knee-holm: out of the middle rib whereof commeth forth another leafe, ſharpe pointed alſo, but ſmall, and of the bigneſſe of the leafe of Knee-holme, reſembling a little tongue. From the boſome of which two leaues commeth forth a berry of the bigneſſe of a peaſe, of colour red when it is ripe, which is ſometimes in a manner all hid vnder the leafe. The root is white, long, and tough, and of a ſweet and pleaſant ſmell.

1 *Hippogloſſum mas.*
The male Horſe-tongue.

2 *Hippogloſſum fœmina.*
The female Horſe-tongue.

2 The female Horſe-tongue differeth not from the precedent but in ſtature and colour of the fruit: it riſeth vp (ſaith my Author) foure or fiue handfulls high: the berries come forth of the middle part of the greater leafe, and the ſetting on of the leſſer, of a feint yellowiſh red colour, wherein conſiſteth the difference. ‡ This is all one with the former. ‡

3 There is likewiſe another ſort of Double-tongue ſet forth by *Matthiolus*, which ſeemes vnto ſome not to differ from the firſt deſcribed or beſt known Horſe tongue; being in truth the ſelf ſame plant without any difference: notwithſtanding I haue ſet forth the figure, that it may appeare to be the ſame, or very little different, and that not to be diſtinguiſhed: but *Matthiolus* may not eſcape without reprehenſion, who knowing the vntrue tranſlation of *Ruellius*, would ſet forth ſo falſe a picture in his Commentaries.

‡ Our Author here, as in many other places, miſtakes himſelfe; for *Matthiolus* did not ſet forth that figure that our Author giues in this place, for *Hippogloſſum*, but by the title of *Laurus Alexandrina altera*: and it thus differs from the common Horſe-tongue; it hath ſhorter and rounder leaues, yet ſharpe pointed, and the berries are not couered with little leaues as in the other, neither haue they any apparant ſtalkes at all, but grow cloſe to the leaues, as you may ſee them expreſt in the figure. ‡

¶ *The*

3 *Hippogloſſum Matthioli.*
Italian Horſe-tongue.

¶ *The Place.*

They are found on the Alps of Liguria, and on the mountaines of Auſtria. *Bellonius* writeth, that they do grow very plentifully about the hil Athos.

The firſt of the Horſe-tongues growes in my garden very plentifully.

¶ *The Time.*

That which groweth in my garden floured in the beginning of May: the fruit is ripe in the fall of the leafe.

¶ *The Names.*

Horſe-tongue is called in Greek ἵππόγλωσσον: of the later Herbariſts, *Bonifacia, Vvularia, Biſlingua, Lingua Pagana*, and *Victoriola*. The ſame is alſo named διὸς ἰδαῖα, of Ida a mountaine of Troy, which is called *Alexanders* Troy: of ſome, *Laurus Alexandrina*, or the Bay of Alexandria, and *Laurus Idæa*.

This *Hippogloſſum Bonifacia* is called in high-Dutch, **Zapfinkraut**: in low-Dutch, **Tonghenbladt**: in Spaniſh, *Lengua de Cauallo*: in Engliſh, Horſe-tongue, Tongne-blade, Double-tongue, and Laurel of Alexandria.

¶ *The Temperature.*

Horſe-tongue is euidently hot in the ſecond degree, and dry in the firſt.

¶ *The Vertues.*

The roots of Double-tongue boiled in wine, A
and the decoction drunke, helpeth the ſtrangurie, prouoketh vrine, eaſeth women that haue hard trauell in childe-bearing. It expelleth the ſecondine or after-birth. The root beaten to pouder, whereof ſix drams giuen in ſweet wine, doth helpe the diſeaſes aforeſaid: it bringeth downe the termes, as *Dioſcorides* teacheth. The like writeth *Pliny* alſo: adding further, That it cauſeth women to haue ſpeedy deliuerance, eſpecially if halfe an ounce of the pouder of the root be giuen to drink in a draught of ſweet wine.

Baptiſta Sardus doth notably commend this herb for the diſeaſes of the mother; by giuing, ſaith B
he, a little ſpoonfull of the pouder either of the herbe, the fruit, or of the root, to her that is troubled with the mother, ſhe is thereby forthwith recouered. He alſo writeth, that the ſame is a ſingular good medicine for thoſe that be burſten, if a ſpoonfull of the pouder of the root be drunke in the broth of fleſh certaine dayes together.

Chap. 340. *Of Cucumbers.*

¶ *The Kindes.*

There be diuers ſorts of Cucumber; ſome greater, others leſſer; ſome of the Garden, ſome wilde; ſome of one faſhion, and ſome of another, as ſhall be declared in the following chapters.

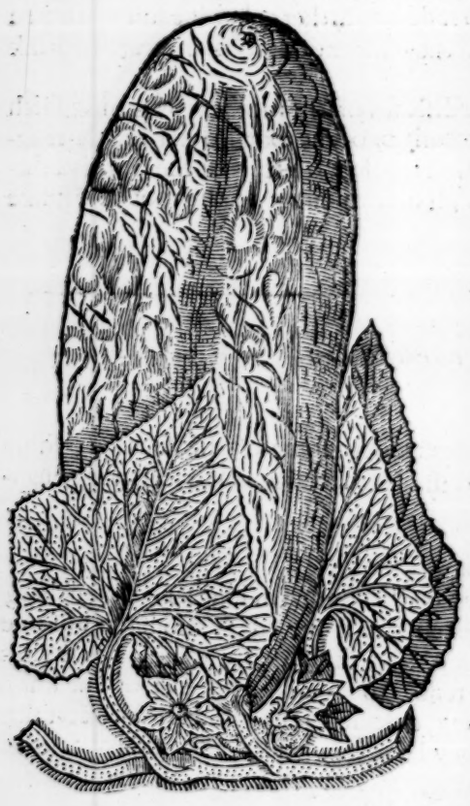
¶ *The Deſcription.*

1 The Cucumber creepes alongſt vpon the ground all about, with long rough branches; whereupon do grow broad rough leaues vneuen about the edges: from the boſome whereof come forth crooked claſping tendrels like thoſe of the Vine. The floures ſhoot forth betweene the ſtalkes and the leaues, ſet vpon tender foot-ſtalks compoſed of fiue ſmall yellow leaues: which being paſt, the fruit ſucceedeth, long, cornered, rough, and ſet with certaine bumpes or riſings, greene at the firſt, and yellow when they be ripe, wherein is contained a firme and ſollid pulpe or ſubſtance tranſparent or thorow-ſhining, which together with the ſeed is eaten a little before they be fully ripe. The ſeeds be white, long, and flat.

1 *Cucumis vulgaris.*
Common Cucumber.

2 *Cucumis Anguina.*
Adders Cucumber.

4 *Cucumis ex Hiſpanica ſemine natus.*
Spaniſh Cucumber.



2 There be alſo certaine long cucumbers, which were firſt made (as is ſaid) by art and manuring, which Nature afterwards did preſerue: for at the firſt, when as the fruit is very little, it is put into ſome hollow cane, or other thing made of purpoſe, in which the cucumber groweth very long, by reaſon of that narrow hollowneſſe, which being filled vp, the cucumber encreaſeth in length. The ſeeds of this kinde of cucumber being ſowne bringeth forth not ſuch as were before, but ſuch as art hath framed; which of their own growth are found long, and oftentimes very crookedly turned: and thereupon they haue beene called *Anguini*, or long Cucumbers.

3 The peare faſhioned Cucumber hath many trailing branches lying flat vpon the ground, rough and prickly; whereon doe ſtand at each ioynt one rough leafe, ſharpe pointed, and of an ouerworn green colour; among which come forth claſping tendrels, and alſo ſlender foot-ſtalks, whereon do grow yellow ſtarre-like floures. The fruit ſucceeds, ſhaped like a peare, as big as a great Warden. The root is threddy.

4 There hath bin not long ſince ſent out of Spain ſome ſeeds of a rare & beautiful cucumber, into Strausburg a city in Germany, which there brought forth long trailing branches, rough & hairy, ſet with very large rough leaues ſharp pointed, faſhioned like vnto the leaues of the

the great Bur-docke,but more cut in or diuided: amongſt which come forth faire yellow floures growing nakedly vpon their tender foot-ſtalks: the which beeing paſt,the fruit commeth in place, of a foot in length,greene on the ſide toward the ground, yellow to the Sun ward, ſtraked with many ſpots and lines of diuers colours. The pulpe or meat is hard and faſt like that of our Pompion.

¶ *The Place.*

Theſe kindes of Cucumbers are planted in gardens in moſt countries of the world.

¶ *The Time.*

According to my promiſe heretofore made,I haue thought it good and conuenient in this place to ſet downe not onely the time of ſowing and ſetting of Cucumbers, Muske-melons, Citruls, Pompions, Gourds,and ſuch like, but alſo how to ſet or ſow all manner and kindes of other colde ſeeds,as alſo whatſoeuer ſtrange ſeeds are brought vnto vs from the Indies, or other hot Regions: *videl.*

Firſt of all in the middeſt of Aprill or ſomewhat ſooner(if the weather be any thing temperate) you ſhall cauſe to be made a bed or banke of hot and new horſe dung taken forth of the ſtable(and not from the dunghill) of an ell in breadth,and the like in depth or thickneſſe,of what length you pleaſe,according to the quantitie of your ſeed:the which bank you ſhal couer with hoops or poles, that you may the more conueniently couer the whole bed or banke with Mats, old painted cloth, ſtraw or ſuch like,to keepe it from the iniurie of the cold froſtie nights, and not hurt the things planted in the bed: then ſhall you couer the bed all ouer with the moſt fertileſt earth finely ſifted, halfe a foot thick,wherein you ſhall ſet or ſow your ſeeds: that being done,caſt your ſtraw or other couerture ouer the ſame;and ſo let it reſt without looking vpon it, or taking away of your couering for the ſpace of ſeuen or eight daies at the moſt,for commonly in that ſpace they will thruſt themſelues vp nakedly forth of the ground:then muſt you caſt vpon them in the hotteſt time of the day ſome water that hath ſtood in the houſe or in the Sun a day before, becauſe the water ſo caſt vpon them newly taken forth of a well or pumpe,will ſo chill and coole them being brought and nouriſhed vp in ſuch a hot place,that preſently in one day you haue loſt all your labour; I mean not only your ſeed,but your banke alſo; for in this ſpace the great heat of the dung is loſt and ſpent,keeping in memorie that euery night they muſt be couered and opened when the day is warmed with the Sun beames: this muſt be done from time to time vntill that the plants haue foure or ſix leaues a piece,and that the danger of the cold nights is paſt: then muſt they be replanted verie curiouſly, with the earth ſticking to the plant,as neere as may be vnto the moſt fruitfull place, and where the Sun hath moſt force in the garden;prouided that vpon the remouing of them you muſt couer them with ſome Docke leaues or wiſpes of ſtraw, propped vp with forked ſtickes,as well to keepe them from the cold of the night, as alſo the heat of the Sun: for they cannot whileſt they be young and newly planted,indure neither ouermuch cold nor ouermuch heat,vntill they are wel rooted in their new place or dwelling.

Oftentimes it falleth out that ſome ſeeds are more franker and forwarder than the reſt, which commonly do riſe vp very nakedly with long necks not vnlike to the ſtalke of a ſmall muſhrome,of a night old. This naked ſtalke muſt you couer with the like fine earth euen to the greene leaues,hauing regard to place your banke ſo that it may be defended from the North-windes.

Obſerue theſe inſtructions diligently,and then you ſhall not haue cauſe to complaine that your ſeeds were not good,nor of the intemperancie of the climat(by reaſon whereof you can get no fruit) although it were in the furtheſt parts of the North of Scotland.

¶ *The Names.*

The Cucumber is named generally *Cucumis*: in ſhops,*Cucumer*: and is taken for that which the Grecians call σικυος ἡμερος: in Latine,*Cucumis ſatiuus*,or garden Cucumber: in High Dutch,**Cucumen**: in Italian,*Concomero*: in Spaniſh,*Cogombro*: in French,*Concombre*: in Low Dutch,**Concommeren**; in Engliſh,Cowcumbers and Cucumbers.

¶ *The Temperature and Vertues.*

All the Cucumbers are of temperature cold and moiſt in the ſecond degree. They putrifie ſoon in the ſtomacke,and yeeld vnto the body a cold and moiſt nouriſhment,and that very little,and the ſame not good. A

Thoſe Cucumbers muſt be choſen which are green and not yet ripe: for when they are ripe and yellow they be vnfit to be eaten. B

The ſeed is cold,but nothing ſo much as the fruit. It openeth and clenſeth, prouoketh vrine, o peneth the ſtoppings of the liuer,helpeth the cheſt and lungs that are inflamed,and being ſtamped and outwardly applied in ſtead of a clenſer,it maketh the skin ſmooth and faire. C

Cucumber(ſaith my Author) taken in meats,is good for the ſtomack and other parts troubled with heat. It yeeldeth not any nouriſhment that is good,inſomuch as the vnmeaſurable vſe thereof filleth the veines with naughty cold humours. D

The ſeed ſtamped and made into milke like as they do with Almonds,or ſtrained with milke or ſweet E

ſweet wine and drunke, looſeth the belly gently, and is excellent againſt the exulceration of the bladder.

F The fruit cut in pieces or chopped as herbes to the pot and boiled in a ſmall pipkin with a piece of mutton, being made into potage with Ote-meale, euen as herb potage are made, whereof a meſſe eaten to break-faſt, as much to dinner, and the like to ſupper; taken in this manner for the ſpace of three weekes together without intermiſſion, doth perfectly cure all manner of ſawce-flegme and copper faces, red and ſhining fierie noſes (as red as red Roſes) with pimples, pumples, rubies, and ſuch like precious faces.

G Prouided alwaies that during the time of curing you do vſe to waſh or bathe the face with this liquour following.

H Take a pinte of ſtrong white wine vineger, pouder of the roots of Ireos or Orrice three dragmes, ſearced or bolted into moſt fine duſt, Brimmeſtone in fine pouder halfe an ounce, Camphire two dragmes, ſtamped with two blanched Almondes, foure Oke Apples cut thorow the middle, and the iuice of foure Limons: put them all together in a ſtrong double glaſſe, ſhake them together very ſtrongly, ſetting the ſame in the Sunne for the ſpace of ten daies: with which let the face be waſhed and bathed daily, ſuffering it to drie of it ſelfe without wiping it away. This doth not only helpe firie faces, but alſo taketh away lentils, ſpots, morphew, Sun-burne, and all other deformities of the face.

† That which formerly was in the ſeeond place by the name of *Cucumis Turcicus*, was the ſame with the fifth of the former Edition (now the fourth) and is therefore omitted.

Chap. 341. *Of Wilde Cucumber.*

Cucumis Aſininus.
Wilde Cucumber.

¶ *The Deſcription.*

THe wilde Cucumber hath many fat hairie branches, very rough and full of iuice, creeping or trailing vpon the ground, wherupon are ſet very rough leaues, hairy, ſharp pointed, & of an ouerworne grayiſh greene colour: from the boſome of which come forth long tender foot-ſtalkes: on the ends whereof doe grow ſmall floures compoſed of fiue ſmall leaues of a pale yellow colour: after which commeth forth the fruit, of the bignes of the ſmalleſt pullets egge, but ſomewhat longer, verie rough and hairy on the outſide, and of the colour and ſubſtance of the ſtalkes, wherein is contained very much water and ſmall hard blackiſh ſeeds alſo, of the bigneſſe of tares; which being come to maturitie and ripeneſſe, it caſteth or ſquirteth forth his water with the ſeeds, either of it owne accord, or being touched with the moſt tender or delicate hand neuer ſo gently, and oftentimes ſtriketh ſo hard againſt thoſe that touch it (eſpecially if it chance to hit againſt the face) that the place ſmarteth long after: whereupon of ſome it hath been called *Noli me tangere*, Touch me not. The root is thicke, white and long laſting.

The Place.

It is found in moſt of the hot countries among rubbiſh, grauell, & other vntilled places: it is planted in gardens in the Low-countries, and being once planted, ſaith *Dodonæus*, it eaſily commeth vp againe many yeares after (which is true:) and yet ſaith he further, that it doth not ſpring againe of the root, but of the ſeeds ſpirted or caſt about: which may likewiſe be true where he hath obſerued it, but in my garden it is otherwiſe, for as I ſaid before, the root is long laſting, and continueth from yeare to yeare.

¶ *The*

¶ *The Time.*

It ſpringeth vp in May, it floureth and is ripe in Autumne, and is to be gathered at the ſame time, to make that excellent compoſition called *Elaterium*.

¶ *The Names.*

It is called in Greeke ἄγριος ἀγγουρος: in Latine, *Agreſtis*, and *Erraticus Cucumis*: in ſhoppes, *Cucumer aſininus*: in Italian, *Cocomero ſaluatico*: in Spaniſh, *Cogumbrillo amargo*: in Engliſh, wilde Cucumber, ſpirting Cucumbers, and touch me not: in French, *Concombres ſauvages*.

¶ *The Temperature.*

The leaues of wilde Cucumbers, roots and their rindes as they are bitter in taſte, ſo they be likewiſe hot and clenſing. The iuice is hot in the ſecond degree, as *Galen* witneſſeth, and of thin parts. It clenſeth and waſteth away.

¶ *The Vertues.*

The iuice called *Elaterium* doth purge forth choler, flegme, and waterie humours, and that with A
force, and not onely by ſiege, but ſometimes alſo by vomit.

The quantity that is to be taken at one time is from fiue grains to ten, according to the ſtrength B
of the patient.

The iuice dried or hardened, and the quantitie of halfe a ſcruple taken, driueth forth by ſiege C
groſſe flegme, cholericke humours, and preuaileth mightily againſt the dropſie, and ſhortneſſe of breath.

The ſame drawne vp into the noſthrils mixed with a little milk, taketh away the redneſſe of the D
eies.

The iuice of the root doth alſo purge flegme, cholericke and wateriſh humours, and is good for E
the dropſie: but not of ſuch force as *Elaterium*, which is made of the iuice of the fruit: the making whereof I commend to the learned and curious Apothecaries: among which number Mr. *William Wright* in Bucklers Burie my louing friend hath taken more paines in curious compoſing of it, and hath more exactly performed the ſame than any other whatſoeuer that I haue had knowledge of.

Chap. 342. *Of Citrull Cucumbers.*

1 *Citrullus officinarum.*
Citrull Cucumber.

‡ 2 *Citrullus minor.*
Small Citrull.

¶ *The*

¶ *The Deſcription.*

1 THe Citrull Cucumber hath many long, flexible, and tender ſtalkes trailing vpon the ground, branched like vnto the Vine, ſet with certaine great leaues deeply cut, and very much iagged: among which come forth long claſping tendrels, and alſo tender footſtalkes, on the ends whereof do grow floures of a gold yellow colour: the fruit is ſomewhat round, ſtraked or ribbed with certaine deepe furrowes alongſt the ſame, of a green colour aboue, and vnderneath on that ſide that lyeth vpon the ground ſomething white: the outward skin whereof is very ſmooth; the meat within is indifferent hard, more like to that of the Pompion than of the Cucumber or Muske melon: the pulpe wherein the ſeed lieth, is ſpungie, and of a ſlimie ſubſtance: the ſeed is long, flat, and greater than thoſe of the Cucumbers: the ſhell or outward barke is blackiſh, ſometimes of an ouerworne reddiſh colour. The fruit of the Citrull doth not ſo eaſily rot or putrifie as doth the Melon, which being gathered in a faire dry day may be kept a long time, eſpecially being couered in a heape of wheat, as *Matthiolus* ſaith; but according to my practiſe you may keepe them much longer and better in a heape of dry ſand.

2 The ſecond kinde of Citrull differeth not from the former, ſauing that it is altogether leſſer, and the leaues are not ſo deepely cut or iagged, wherein conſiſteth the difference.

¶ *The Place and Time.*

The Citrull proſpereth beſt in hot Regions, as in Sicilia, Apulia, Calabria, and Syria, about Alepo and Tripolis. We haue many times ſown the ſeeds, and diligently obſerued the order preſcribed in planting of Cucumbers.

¶ *The Names.*

The later Herbariſts do call it *Anguria*: in ſhoppes, *Citrullus*, and *Cucumus Citrullus*: in Engliſh, Citruls, and Cucumber Citruls, and the ſeed is knowne by the name of *Semen Citrulli*: or Citrull ſeed. But if *Cucumis Citrullus*, be ſo called of the yellow colour of the Citron, then is the common Cucumber properly *Cucumis Citrullus*: which is knowne vnto all to be contrarie.

¶ *The Temperature and Vertues.*

A The meat or pulpe of Cucumer Citrull which is next vnto the bark is eaten raw, but more commonly boiled: it yeeldeth to the bodie little nouriſhment, and the ſame cold: it ingendreth a wateriſh bloud, mitigateth the extremity of heat of the inner parts, and tempereth the ſharpneſſe and feruent heat of choler: being raw and held in the mouth, it takes away the roughneſſe of the tongue in Agues, and quencheth thirſt.

B The ſeeds are of the like facultie with thoſe of Cucumbers.

Chap. 343. *Of the wilde Citrull called* Colocynthis.

¶ *The Deſcription.*

1 COloquintida hath beene taken of many to be a kinde of the wild Gourd, it lieth along creeping on the ground as doe the Cucumbers and Melons, comming neereſt of all to that which in thoſe daies of ſome Herbariſts is called Citrull Cucumber: it bringeth forth vpon his long branches ſmal crooked tendrels like the Vine, and alſo very great broad leaues deepely cut or iagged: among which come forth ſmall floures of a pale yellow colour; then commeth the fruit round as a bowle, couered with a thin rinde, of a yellow colour when it is ripe, which when it is pilled or pared off, the white pulpe or ſpungie ſubſtance appeareth full of ſeedes, of a white or elſe an ouerworne browne colour; the fruit ſo pared or pilled, is dryed for medicine; the which is moſt extreame bitter, and likewiſe the ſeede, and the whole plant it ſelfe in all his parts.

2 The ſeeond kinde of Coloquintida hath likewiſe many long branches and claſping tendrels, wherewith it taketh hold of ſuch things as are neere vnto it. It bringeth forth the like leaues, but not ſo much iagged. The floures are ſmall and yellow: the fruit is faſhioned like a peare, and the other ſort round, wherein the eſpeciall difference conſiſteth.

¶ *The Place.*

Coloquintida is ſowne and commeth to perfection in hot regions, but ſeldome or neuer in theſe Northerly and cold countries.

¶ *The*

1 *Colocynthis.*
The wilde Citrull or Coloquintida.

2 *Colocynthis pyriformis.*
Peare faſhioned Coloquintida.

¶ *The Time.*

It is ſowne in the Spring, and bringeth his fruit to perfection in Auguſt.

It hath beene diuers times deliuered vnto me for a truth, that they doe grow in the ſands of the Mediterranean ſea ſhore, or verie neere vnto it, wilde, for euery man to gather that liſt, eſpecially on the coaſt of Barbarie, as alſo without the mouth of the Streights neere to *Sancta Crux* and other places adiacent; from whence diuers Surgions of London that haue trauelled thither for the curing of ſicke and hurt men in the ſhip haue brought great quantities thereof at their returne.

¶ *The Names.*

It is vulgarly called *Coloquintida:* in Greeke κολοκύνθη: the Latine tranſlators for *Colocynthis* doe oftentimes ſet downe *Cucurbita ſylueſtris:* notwithſtanding there is a *Cucurbita ſylueſtris* that differeth from *Colocynthis*, or Coloquintida: for *Cucurbita ſylueſtris* is called in Greeke κολοκύνθη ἀγρία: or wilde Coloquintida, whereof ſhall be ſet forth a peculiar chapter next after the *Cucurbita* or Gourd: in Engliſh it is called Coloquintida, or Apple of Coloquintida.

¶ *The Temperature.*

Coloquintida as it is in his whole nature and in all his parts bitter, ſo is it likewiſe hot and drie in the later end of the ſecond degree; and therefore it purgeth, clenſeth, openeth and performeth all thoſe things that moſt bitter things do: but that the ſtrong qualitie which it hath to purge by the ſtoole, is, as *Galen* ſaith, of more force than the reſt of his operations.

¶ *The Vertues.*

Which operation of purging it worketh ſo violently, that it doth not onely draw forth flegme A
and choler maruellous ſpeedily, and in very great quantitie: but oftentimes fetcheth forth bloud and bloudy excrements, by ſhauing the guts, and opening the ends of the meſeraicall veines.

So that therefore the ſame is not to bee vſed either raſhly, or without ſome dangerous and ex- B
treme diſeaſe conſtraine thereunto: neither yet at all, vnleſſe ſome tough and clammie thing bee mixed there with, whereby the vehemencie thereof may be repreſſed, the hurtfull force dulled, and the ſame ſpeedily paſſing through the belly, the guts be not fret or ſhaued. *M. ſues* teacheth to mixe with it either Maſtich, or gum Tragacanth.

There be made of it Trochiſes, or little flat cakes, with Maſtich, gum Arabick, Tragacanth and C
Bdelliam,

Bdellium,of theſe,Maſtich hath a manifeſt binding qualitie : but tough and clammie things are much better,which haue no aſtriction at all in them,or very little.

D For by ſuch binding or aſtringent things,violent medicines being reſtrained and bridled, do afterward work their operation with more violence and trouble : but ſuch as haue not binding things mixed with them do eaſilier worke,and with leſſer paine, as be thoſe pils which *Rhaſis* in his ninth booke of *Almanzor* calleth *Illiacæ* : which are compounded of Coloquintida and Scamony, two of the ſtrongeſt medicines that are ; and of a third called gum *Sagapene*, which through his clammineſſe doth as it were daube the intrails and guts,and defend them from the harme that might haue come of either of them.

E The which compoſition,although it be wonderfull ſtrong,and not to be vſed without very great neceſſitie vrge thereunto,doth notwithſtanding eaſily purge, and without any great trouble, and with leſſer torment than moſt of the mildeſt and gentleſt medicins which haue Maſtich and other things mixed with them that are aſtringent.

F And for this cauſe it is very like that *Galen* in his firſt booke of Medicines,according to the places affected,would not ſuffer Maſtich and Bdellium to be in the pilles, which are furnamed *Cochiæ* the which notwithſtanding his Schoolemaſter *Quintus* was alſo woont before to adde vnto the ſame.

G But Coloquintida is not onely good for purgations,in which it is a remedie for the diſſineſſe or the turning ſickneſſe,the megrim, continuall head-ache,the Apoplexie, the falling ſickneſſe, the ſtuffing of the lungs,the gnawings and gripings of the guts and intrailes,and other moſt dangerous diſeaſes, but alſo it doth outwardly worke his operations, which are not altogether to be reiected.

H Common oile wherein the ſame is boiled,is good againſt the ſinging in the eares ,and deafenes: the ſame killeth and driueth forth all manner of wormes of the belly,and doth oftentimes prouoke to the ſtoole,if the nauell and bottome of the belly be therewith annointed.

I Being boiled in vineger, and the teeth waſhed therewith, it is a remedie for the tooth-ache, as *Meſues* teacheth.

K The ſeed is very profitable to keepe and preſerue dead bodies with ; eſpecially if Aloes and Myrrhe be mixed with it.

L The white pulpe or ſpungious pith taken in the weight of a ſcruple openeth the belly mightily,and purgeth groſſe flegme,and cholericke humors.

M It hath the like force if it be boiled and laid to infuſe in wine or ale,and giuen to drinke.

N Being taken after the ſame manner it profiteth the diſeaſes before remembred,that is,the Apoplexie,falling ſickneſſe,giddineſſe of the head,the collicke,looſeneſſe of ſinewes,and places out of ioint,and all diſeaſes proceeding of cold.

O For the ſame purpoſes it may be vſed in cliſters.

P The ſame boiled in oile,and applied with cotton or wooll,taketh away the pain of the Hemorrhoides.

Q The decoction made in wine, and vſed as a fomentation or bathe, bringeth downe the deſired ſickneſſe.

Chap. 344. *Of Muske-Melon,or Million.*

The Kindes.

THere be diuers ſorts of Melons found at this day, differing very notably in ſhape and proportion,as alſo in taſte, according to the climate and countrie where they grow : but of the Antients there was onely one and no more,which is that *Melopepo* called of *Galen*, *Cucumis*,or *Galens* Cucumber : notwithſtanding ſome haue comprehended the Muske-Melons vnder the kindes of Citruls,wherein they haue greatly erred : for doubtleſſe the Muske-Melon is a kinde of Cucumber, according to the beſt approued Authors.

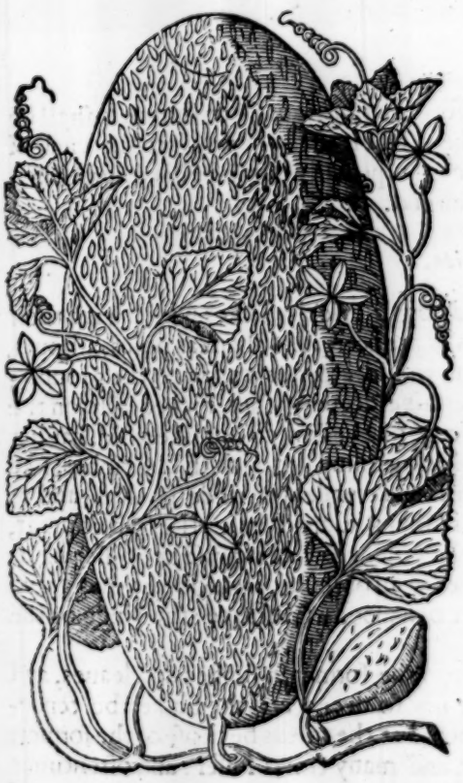
¶ *The Deſcription.*

1 THat which the later Herbariſts do call Muske-Melons is like to the common Cucumber in ſtalks,lying flat vpon the ground,long,branched,and rough. The leaues be much alike,yet are they leſſer,rounder,and not ſo cornered : the floures in like manner bee yellow:the fruit is bigger,at the firſt ſomwhat hairy,ſomthing long,now and then ſomwhat round; oftentimes greater,and many times leſſer : the barke or rinde is of an ouerworne ruſſet greene colour,

1 *Melo.*
The Muske Melon.

2 *Melo Saccharinus.*
Sugar melon.

4 *Melo Hiſpanicus.*
Spaniſh Melons.



colour, ribbed and furrowed very deepely, hauing often chappes or chinkes, and a confuſed roughneſſe: the pulpe or inner ſubſtance which is to be eaten, is of a faint yellow colour. The middle part whereof is full of a ſlimie moiſture, among which is conteined the ſeed, like vnto thoſe of the Cucumber, but leſſer, and of a browner colour.

2 The ſugar Melon hath long trailing ſtalkes lying vpon the ground, whereon are ſet ſmall claſping tendrels like thoſe of the Vine, and alſo leaues like vnto the common Cucumber, but of a greener colour: the fruite commeth forth among thoſe leaues, ſtanding vpon ſlender footſtalkes, round as the fruite of *Coloquintida*, and of the ſame bigneſſe, of a moſt pleaſant taſte like Sugar, whereof it tooke the ſurname *Saccharatus*.

3 The Peare faſhioned Melon hath many long vinie branches, whereupon doe grow cornered leaues like thoſe of the Vine, and likewiſe great ſtore of long tendrels, claſping and taking hold of each thing that it toucheth: the fruite groweth vpon ſlender footſtalkes, faſhioned like vnto a Peare, of the bignes of a great Quince.

4 The Spaniſh Melon bringeth forth long

trailing branches, whereon are ſet broad leaues ſlightly indented about the edges, not diuided at all, as are all the reſt of the Melons. The fruite groweth neere vnto the ſtalke, like vnto the common Pompion, very long, not creſted or furrowed at all, but ſpotted with very many ſuch markes as are on the backeſide of the Harts-tongue leafe. The pulpe or meate is not ſo pleaſing in taſte as the other.

¶ *The Place.*

They delight in hot regions, notwithſtanding I haue ſeen at the Queenes houſe at Saint Iames very many of the firſt ſort ripe, through the diligent and curious nouriſhing of them by a skilfull Gentleman the keeper of the ſaid houſe, called M^r. *Fowle*, and in other places neere vnto the right Honorable the Lord of *Suſſex* houſe, of Bermondſey by London, where from yeere to yeere there is very great plenty, eſpecially if the weather be any thing temperate.

¶ *The Time.*

They are ſet or ſowne in Aprill as I haue already ſhewne in the chapter of Cucumbers: their fruite is ripe in the end of Auguſt, and ſometimes ſooner.

¶ *The Names.*

The Muske Melon is called in Latine, *Melo*: in Italian, *Mellone*: in Spaniſh, *Melon*: in French, *Melons*: in High Dutch, **Melaun**: in low Dutch, **Meloenen**: in Greeke, μῆλον, which doth ſignifie an apple; and therefore this kinde of Cucumber is more truely called μηλοπέπων, or *Melopepon*: by reaſon that *Pepo* hath the ſmell of an apple, whereto the ſmell of this fruit is like; hauing withall the ſmell as it were of Muske: which for that cauſe are alſo named *Melones Muſchatellini*, or Muske Melons.

¶ *The Temperature.*

The meate of the Muske Melon, is very cold and moiſt.

¶ *The Vertues.*

A It is harder of digeſtion than is any of the reſt of Cucumbers: and if it remaine long in the ſtomacke is putrifieth, and is occaſion of peſtilent feuers: which thing alſo *Aëtius* witneſſeth in the firſt booke of his *Tetrabibles*, writing that the vſe of *Cucumeres*, or Cucumbers, breedeth peſtilent feauers; for he alſo taketh *Cucumis* to be that which is commonly called a Melon: which is vſually eaten of the Italians and Spaniards rather to repreſſe the rage of luſt, than for any other Phyſicall vertue.

B The ſeed is of like operation with that of the former Cucumber.

Chap. 345. *Of Melons, or Pompions.*

¶ *The Kindes.*

THere be found diuers kindes of Pompions which differ either in bigneſſe or forme: it ſhall be therefore ſufficient to deſcribe ſome one or two of them, and referre the reſt vnto the view of the figures, which moſt liuely do expreſſe their differences; eſpecially becauſe this volume waxeth great, the deſcription of no moment, and I haſten to an end.

¶ *The Deſcription.*

1 THe great Pompion bringeth forth thicke and rough prickly ſtalkes, which with their claſping tendrells take hold vpon ſuch things as are neere vnto them, as poles, arbours, pales, and ledges, which vnleſſe they were neere vnto them would creepe along vpon the ground; the leaues be wilde, and great, very rough, and cut with certaine deepe gaſhes, nicked alſo on the edges like a ſaw; the floures be very great like vnto a bell cup, of a yellow colour like gold, hauing fiue corners ſtanding out like teeth: the fruite is great, thicke, round, ſet with thicke ribbes, like edges ſticking forth. The pulpe or meate whereof which is next vnder the rinde is white, and of a meane hardneſſe: the pith or ſubſtance in the middle is ſpungie, and ſlimie: the ſeed is great, broad, flat, ſomething white, much greater than that of the Cucumber, otherwiſe not differing at all in forme. The colour of the barke or rinde is oftentimes of an obſcure greene, ſometimes gray. The rinde of the greene Pompion is harder, and as it were of a woody ſubſtance: the rinde of the gray is ſofter and tenderer.

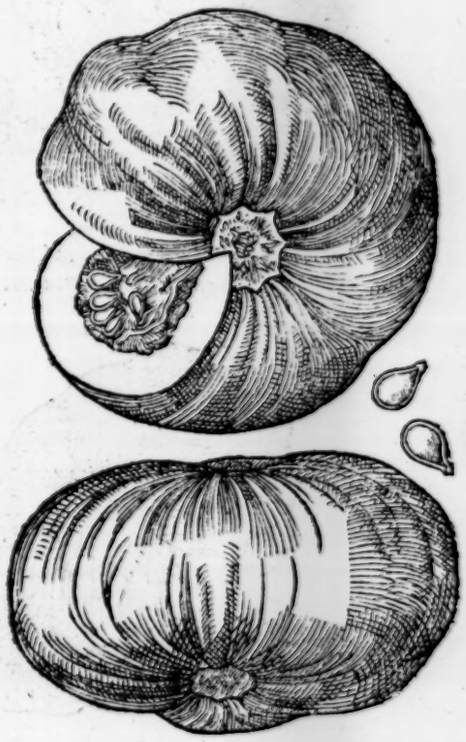
2 The ſecond kinde of Melons or Pompions is like vnto the former in ſtalkes and leaues, and alſo in claſping tendrels: but the gaſhes of the leaues are not ſo deepe, and the ſtalkes be tenderer: the floures are in like manner yellow, gaping, and cornered at the top, as be thoſe of the former: but the fruite is ſomewhat rounder; ſometimes greater, and many times leſſer: and oftentimes

of

of a greene colour with an harder barke, now and then ſofter and whiter. The meat within is like the former: the ſeeds haue alſo the ſame forme, but they be ſomewhat leſſer.

1 *Pepo maximus oblongus.*
The great long Pompion.

2 *Pepo maximus rotundus.*
The great round Pompion.



2 Of this kinde there is alſo another Pompion like vnto the former in rough ſtalkes, and in gaſhed and nicked leaues: the floure is alſo great and yellow, like thoſe of the others: the fruit is of a great bigneſſe, whoſe barke is full of little bunnies or hillie welts, as is the rinde of the Citron, which is in like manner yellow when it is ripe.

4 The fourth Pompion doth very much differ from the others in form: the ſtalks, leaues, and floures are like thoſe of the reſt: but the fruit is not long or round, but altogether broad, and in a manner flat like vnto a ſhield or buckler; thicker in the middle, thinner in the compaſſe, and curled or bumped in certaine places about the edges, like the rugged or vneuen barke of the Pomecitron; the which rinde is very ſoft, thin, and white: the meat within is meetely hard and dureable. The ſeed is greater than that of the common Cucumber, in forme and colour all one.

‡ *Macocks Virginiani, ſive Pepo Virginianus.*
The Virginian Macocke, or Pompion.

‡ This hath rough cornered ſtraked trailing branches proceeding from the roor, eight or nine foot long, or longer, and thoſe againe diuided into other branches of a blackiſh greene colour, trailing, ſpreading, or running alongſt the earth, couering a great deale of ground, ſending forth broad cornered rough leaues, on great groſſe, long, rough, hairy foot-ſtalks, like and fully as big as the leaues of the common Pompion, with claſping tendrels and great broad ſhriueled yellow floures alſo like thoſe of the common Pompion: the fruit ſucceedeth, growing alongſt the ſtalkes, commonly not neere the root, but towards the vpper part or toppes of the branches, ſomewhat round, not extending in length, but flat like a bowle, but not ſo bigge as an ordinarie bowle, beeing ſeldome foure inches broad, and three inches long, of a blackiſh greene colour when it is ripe. The ſubſtance or eatable part is of a yellowiſh white colour, containing in the middeſt a great deale of pulpe or ſoft matter, wherein the ſeed lyeth in certaine rowes alſo, like the common Pompion, but ſmaller. The root is made of many whitiſh branches, creeping far abroad in the earth, and periſh at the firſt approch of Winter.

3 *Pepo maximus compreſſus.* The great flat bottommed Pompion.

4 *Pepo maximus clypeatus.* The great buckler Pompion.

5 *Pepo Indicus minor rotundus.*
The ſmall round Indian Pompion.

6 *Pepo Indicus anguloſus.*
The cornered Indian Pompion.

Melones aquatici edules Virginiani.
The Virginian Water-Melon.

This Melon or Pompion is like and fully as bigge as the common Pompion, in ſpreading, running, creeping branches, leaues, floures, and claſping tendrels: the fruit is of a very blackiſh greene colour, and extendeth it ſelfe in length neere foure inches long, and three inches broad, no bigger nor longer than a great apple, and grow alongſt the branches forth of the boſomes of the leaues, not farre from the root euen to the toppes of the branches, containing a ſubſtance, pulpe, and flat ſeed, like the ordinary Pompion: the root is whitiſh, and diſperſeth it ſelfe verie farre abroad in the earth, and periſheth about the beginning of VVinter. October the tenth, 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

All theſe Melons or Pompions be garden plants: they ioy beſt in a fruitfull ſoile, and are common in England; except the laſt deſcribed, which is as yet a ſtranger.

¶ *The Time.*

They are planted at the beginning of Aprill: they floure in Auguſt: the fruit is ripe in September.

¶ *The Names.*

The great Melon or Pompion is named in Greeke πέπων: in Latine likewiſe *Pepo*: The fruits of them all when they be ripe are called by a common name in Greeke, πέπονες: in Engliſh, Millions or Pompion. Whereupon certaine Phyſitions, ſaith *Galen*, haue contended, that this fruit ought to be called σικύωνες, that is to ſay in Latine, *Pepo Cucumeralis*, or Cucumber Pompion. *Pliny* in his ninth booke the fifth Chapter writeth, that *Cucumeres* when they exceed in greatneſſe are named *Pepones*: it is called in High Dutch, **Pluker**: in Low Dutch, **Pepoenen**: in French, *Pompons*.

¶ *The Temperature and Vertues.*

All the Melons are of a cold nature, with plenty of moiſture: they haue a certaine clenſing qualitie, by meanes whereof they prouoke vrine, and do more ſpeedily paſſe through the bodie than do either the Gourd, Citrull, or Cucumber, as *Galen* hath written A

The pulpe of the Pompion is neuer eaten raw, but boiled. For ſo it doth more eaſily deſcend, making the belly ſoluble. The nouriſhment which commeth hereof is little, thin, moiſt and cold, (bad, ſaith *Galen*) and that eſpecially when it is not well digeſted: by reaſon whereof it maketh a man apt and readie to fall into the diſeaſe called the Cholericke Paſſion, and of ſome the Felonie. B

The ſeed clenſeth more than the meat, it prouoketh vrine, and is good for thoſe that are troubled with the ſtone of the kidnies. C

The fruit boiled in milke and buttered, is not onely a good wholeſome meat for mans body, but being ſo prepared, is alſo a moſt phyſicall medicine for ſuch as haue an hot ſtomacke, and the inward parts inflamed. D

The fleſh or pulpe of the ſame ſliced and fried in a pan with butter, is alſo a good and wholſome meat: but baked with apples in an ouen, it doth fil the body with flatuous or windie belchings, and is food vtterly vnwholeſome for ſuch as liue idlely; but vnto robuſtious and ruſtick people nothing hurteth that filleth the belly. E

CHAP. 346. *Of Wilde Pompions.*

¶ *The Deſcription.*

1 AS there is a wilde ſort of Cucumbers, of Melons, Citruls and Gourds, ſo likewiſe there be certaine wilde Pompions, that be ſo of their owne nature. Theſe bring forth rough ſtalks, ſet with ſharp thorny prickles. The leaues be likewiſe rough: the floures yellow as be thoſe of the garden Melon, but euery part is leſſer. The fruit is thicke, round, and ſharp pointed, hauing a hard greene rinde. The pulpe or meat whereof, and the middle pith, with the ſeed are like thoſe of the garden Pompion, but very bitter in taſte.

2 The ſecond is like vnto the former, but it is altogether leſſer, wherein conſiſteth the difference.

1 *Pepo maior ſylueſtris.*
The great wilde Pompion.

2 *Pepo minor ſylueſtris.*
The ſmall wilde Pompion.

¶ *The Place.*

Theſe Melons do grow wilde in Barbarie, Africa, and moſt parts of the Eaſt and Weſt Indies. They grow not in theſe parts except they be ſowne.

¶ *The Time.*

Their time of flouring and flouriſhing anſwereth that of the garden Pompion.

¶ *The Names.*

Although the Antient Phyſitions haue made no mention of theſe plants, yet the thing it ſelfe doth ſhew, that there be ſuch, and ought to be called in Greeke πέπονες ἄγριοι: in Latine, *Pepones ſylueſters:* in Engliſh, wilde Melons or Pompions.

¶ *The Temperature.*

Like as theſe wilde Melons be altogether of their owne nature very bitter, ſo be they alſo of temperature hot and drie, and that in the later end of the ſecond degree. They haue likewiſe a clenſing facultie, not inferior to the wilde Cucumbers.

¶ *The Vertues.*

A The wine, which when the pith and ſeed is taken forth, is powred into the rinde, and hath remained ſo long therein till ſuch time as it becommeth bitter, doth purge the belly, and bringeth forth flegmaticke and cholerick humors. To be briefe, the iuice hereof is of the ſame operation that the wilde Cucumber is of; and being dried it may be vſed in ſtead of *Elaterium*, which is the dried iuice of the wilde Cucumber.

Chap. 347. *Of Gourds.*

¶ *The Kindes.*

THere be diuers ſorts of Gourds, ſome wilde, and others tame of the garden; ſome bringing forth fruit like vnto a bottle; others long, bigger at the end, keeping no certaine forme or faſhion; ſome greater, others leſſer. ‡ I will onely figure and deſcribe two or three of the chiefeſt, and ſo paſſe ouer the reſt, becauſe each one vpon the firſt ſight of them knowes to what kinde to referre them. ‡

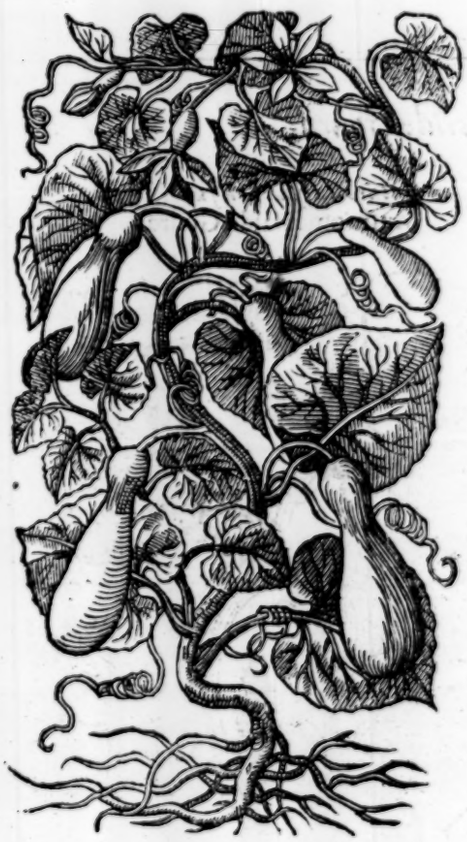
¶ *The*

¶ *The Deſcription.*

1. THe Gourd bringeth forth very long ſtalkes as be thoſe of the Vine, cornered and parted into diuers branches, which with his claſping tendrels taketh hold and clymeth vpon ſuch things as ſtand neere vnto it: the leaues be very great, broad, and ſharpe pointed, almoſt as great as thoſe of the Clot-Burre, but ſofter, and ſomewhat couered as it were with a white freeſe, as be alſo the ſtalkes and branches, like thoſe of the mariſh Mallow: the floures be white, and grow forth from the boſome of the leaues: in their places come vp the fruit, which are not all of one faſhion, for oftentimes they haue the forme of flagons or bottles, with a great large belly and a ſmall necke. The Gourd (ſaith *Pliny, lib. 19. cap.* ;.) groweth into any forme or faſhion that you would haue it, either like vnto a wreathed Dragon, the leg of a man, or any other ſhape, according to the mould wherein it is put whileſt it is young: being ſuffered to clime vpon any Arbour where the fruit may hang, it hath beene ſeene to be nine foot long, by reaſon of his great weight which hath ſtretched it out to the length. The rinde when it is ripe is verie hard, wooddy, and of a yellow colour: the meate or inward pulpe is white, the ſeed long, flat, pointed at the top, broad below, with two peakes ſtanding out like hornes, white within, and ſweet in taſte.

2 The ſecond differeth not from the precedent in ſtalkes, leaues, or floures: the fruit hereof is for the moſt part faſhioned like a bottle or flagon, wherein eſpecially conſiſteth the difference.

1 *Cucurbita anguina.*
Snakes Gourd.



2 *Cucurbita lagenaria.*
Bottle Gourds.

¶ *The Place.*

The Gourds are cheriſhed in the gardens of theſe cold regions rather for pleaſure than for profit: in the hot countries where they come to ripeneſſe there are ſometimes eaten, but with ſmall delight; eſpecially they are kept for the rindes, wherein they put Turpentine, Oyle, Hony, and alſo ſerue them for pales to fetch water in, and many other the like vſes.

¶ *The Time.*

They are planted in a bed of horſe-dung in April, euen as we haue taught in the planting of cucumbers: they flouriſh in Iune and Iuly; the fruit is ripe in the end of Auguſt.

¶ *The Names.*

The Gourd is called in Greeke Κολόκυνθα ἥμερος: in Latine, *Cucurbita edulis, Cucurbita ſatiua*: of *Pliny*, *Cucurbita*

Cucurbita Cameraria, becauſe it climeth vp, and is a couering for arbours and walking places, and banqueting houſes in gardens: he calleth the other which climeth not vp, but lyeth crawling on the ground, *Cucurbita plebeia*: in Italian, *Zucca*: in Spaniſh, *Calabazza*: in French, *Courge*: in high Dutch, **Kurbs**: in low-Dutch, **Cauwoozden**: in Engliſh, Gourds.

¶ *The Temperature.*

The meate or inner pulpe of the Gourd is of temperature cold and moiſt, and that in the ſecond degree.

¶ *The Vertues.*

A The iuyce being dropped into the eares with oyle of roſes is good for the paine thereof proceeding of a hot cauſe.

B The pulpe or meate mitigateth all hot ſwellings, if it be laid thereon in manner of a pultis, and being vſed in this manner it taketh away the head-ache and the inflammation of the eyes.

C The ſame Author affirmeth, that a long Gourd or elſe a Cucumber being laid in the cradle or bed by the young infant whileſt it is aſleepe and ſicke of an ague, it ſhall be very quickely made whole.

D The pulpe alſo is eaten ſodden, but becauſe it hath in it a wateriſh and thinne iuyce, it yeeldeth ſmall nouriſhment to the body, and the ſame cold and moiſt; but it eaſily paſſeth thorow, eſpecially being ſodden, which by reaſon of the ſlipperineſſe and moiſtneſſe alſo of his ſubſtance mollifieth the belly.

E But being baked in an ouen or fried in a pan it loſeth the moſt part of his naturall moiſture, and therefore it more ſlowly deſcendeth, and doth not mollifie the belly ſo ſoone.

F The ſeed allayeth the ſharpneſſe of vrine, and bringeth downe the ſame.

Chap. 348. *Of the wilde Gourd.*

1 *Cucurbita lagenaria ſylueſtris.*
Wilde Bottle Gourd.

2 *Cucurbita ſylueſtris fungiformis.*
Muſhrome wilde Gourd.

¶ *The*

¶ *The Deſcription*

1 THere is beſides the former ones a certaine wilde Gourd: this is like the garden Gourd in clymbing ſtalkes, claſping tendrels, and ſoft leaues, and as it were downy; all and euerie one of which things being farre leſſe: this alſo clymbeth vpon Arbours and banquetting houſes: the fruit doth repreſent the great bellied Gourd, and thoſe that be like vnto bottles in formie, but in bigneſſe it is very farre inferiour; for it is ſmall, and ſcarſe ſo great as an ordinarie Quince, and may be held within the compaſſe of a mans hand: the outward rinde at the firſt is greene, afterwards it is as hard as wood, and of the colour thereof: the inner pulpe is moiſt, and very full of iuyce, in which lieth the ſeed. The whole is as bitter as Coloquintida, which hath made ſo many errors, one eſpecially, in taking the fruit Coloquintida for the wilde Gourd.

2 The ſecond wilde Gourd hath likewiſe many trailing branches and claſping tendrels, wherwith it taketh hold of ſuch things as be neere vnto it: the leaues be broad, deepely cut into diuers ſections, like thoſe of the Vine, ſoft and very downy, whereby it is eſpecially knowne to be one of the Gourds: the floures are very white, as are alſo thoſe of the Gourds. The fruit ſucceedeth, growing to a round forme, flat on the top like the head of a Muſhrome, whereof it tooke his ſyrname.

¶ *The Place.*

They grow of themſelues wilde in hot regions; they neuer come to perfection of ripeneſſe in theſe cold countries.

¶ *The Time.*

The time anſwereth thoſe of the garden.

¶ *The Names.*

The wilde Gourd is called in Greeke κολοκυνθὶς ἀγρία: in Latine, *Cucurbita ſyluęſtris*, or wilde Gourd. *Pliny, lib.* 20. *cap.* 3. affirmeth, that the wilde Gourd is named of the Grecians, σίκυος, which is hollow, an inch thicke, not growing but among ſtones, the iuyce whereof being taken is very good for the ſtomacke. But the wilde Gourd is not that which is ſo deſcribed; for it is aboue an inch thicke, neither is it hollow, but full of iuyce, and by reaſon of the extreme bitterneſſe offenſiue to the ſtomacke.

Some alſo there be that take this for Coloquintida, but they are far deceiued; for Colocynthis is the wilde Citrull Cucumber, whereof we haue treated in the chapter of Citruls.

¶ *The Temperature.*

The wilde Gourd is as hot and dry as Coloquintida, that is to ſay, in the ſecond degree.

¶ *The Vertues.*

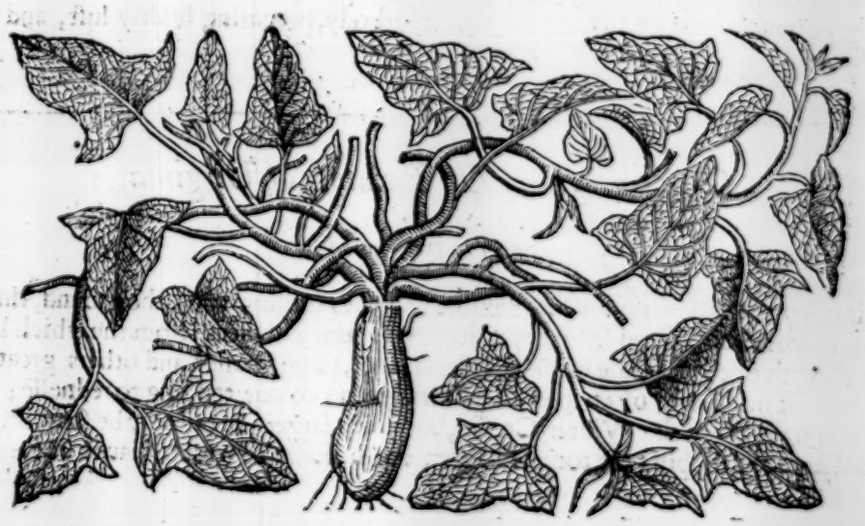
The wilde Gourd is extreme bitter, for which cauſe it openeth and ſcoureth the ſtopped paſſa- A
ges of the body; it alſo purgeth downwards as do wilde Melons.

Moreouer, the wine which hath continued all night in this Gourd likewiſe purgeth the belly 3
mightily, and bringeth forth cholericke and flegmaticke humors.

Chap. 349. *Of Potato's.*

Siſarum Peruvianum, ſiue Batata Hiſpanorum.

Potatus, or Potato's.



¶ *The Deſcription.*

THis Plant (which is called of ſome *Siſarum Peruvianum*, or Skyrrets of Peru) is generally of vs called Potatus, or Potatoes. It hath long rough flexible branches trailing vpon the ground like vnto Pompions; whereupon are ſet greene three cornered leaues, very like vnto thoſe of the wilde Cucumber. There is not any that haue written of this plant haue ſaid any thing of the floures: therefore I refer their deſcription vnto thoſe that ſhall hereafter haue further knowledge of the ſame. Yet haue I had in my garden diuers roots that haue flouriſhed vnto the firſt approch of Winter, and haue growne vnto a great length of branches, but they brought not forth any floures at all; whether becauſe the Winter cauſed them to periſh before their time of flouring, or that they be of nature barren of floures, I am not certaine. The roots are many, thicke, and knobbie, like vnto the roots of Peionies, or rather of the white Aſphodill, ioyned together at the top into one head, in maner of the Skyrrit, which being diuided into diuers parts and planted, do make a great increaſe, eſpecially if the greateſt roots be cut into diuers goblets, and planted in good and fertile ground.

¶ *The Place.*

The Potatoes grow in India, Barbarie, Spaine, and other hot regions; of which I planted diuers roots (that I bought at the Exchange in London) in my garden, where they flouriſhed vntil Winter, at which time they periſhed and rotted.

¶ *The Time.*

It flouriſheth vnto the end of September: at the firſt approch of great froſts the leaues together with the roots and ſtalkes do periſh.

¶ *The Names.*

Cluſius calleth it *Battata*, *Camotes*, *Amotes*, and *Ignames*: in Engliſh, Potatoes, Potatus, and Potades.

¶ *The Temperature.*

The leaues of Potatoes are hot and dry, as may euidently appeare by the taſte. The roots are of a temperate qualitie.

¶ *The Vertues.*

A The Potato roots are among the Spaniards, Italians, Indians, and many other nations common and ordinarie meate; which no doubt are of mighty and nouriſhing parts, and do ſtrengthen and comfort nature; whoſe nutriment is as it were a meane betweene fleſh and fruit, but ſomwhat windie; but being toſted in the embers they loſe much of their windineſſe, eſpecially being eaten ſopped in wine.

B Of theſe roots may be made conſerues no leſſe toothſome, wholeſome, and dainty than of the fleſh of Quinces: and likewiſe thoſe comfortable and delicate meats called in ſhops *Morſelli*, *Placentulæ*, and diuers other ſuch like.

C Theſe Roots may ſerue as a ground or foundation whereon the cunning Confectioner or Sugar-Baker may worke and frame many comfortable delicate Conſerues, and reſtoratiue ſweete meates.

D They are vſed to be eaten roſted in the aſhes. Some when they be ſo roſted infuſe them and ſop them in Wine; and others to giue them the greater grace in eating, doe boyle them with prunes, and ſo eate them. And likewiſe others dreſſe them (being firſt roſted) with Oyle, Vineger, and ſalt, euerie man according to his owne taſte and liking. Notwithſtanding howſoeuer they bee dreſſed, they comfort, nouriſh, and ſtrengthen the body, procuring bodily luſt, and that with greedineſſe.

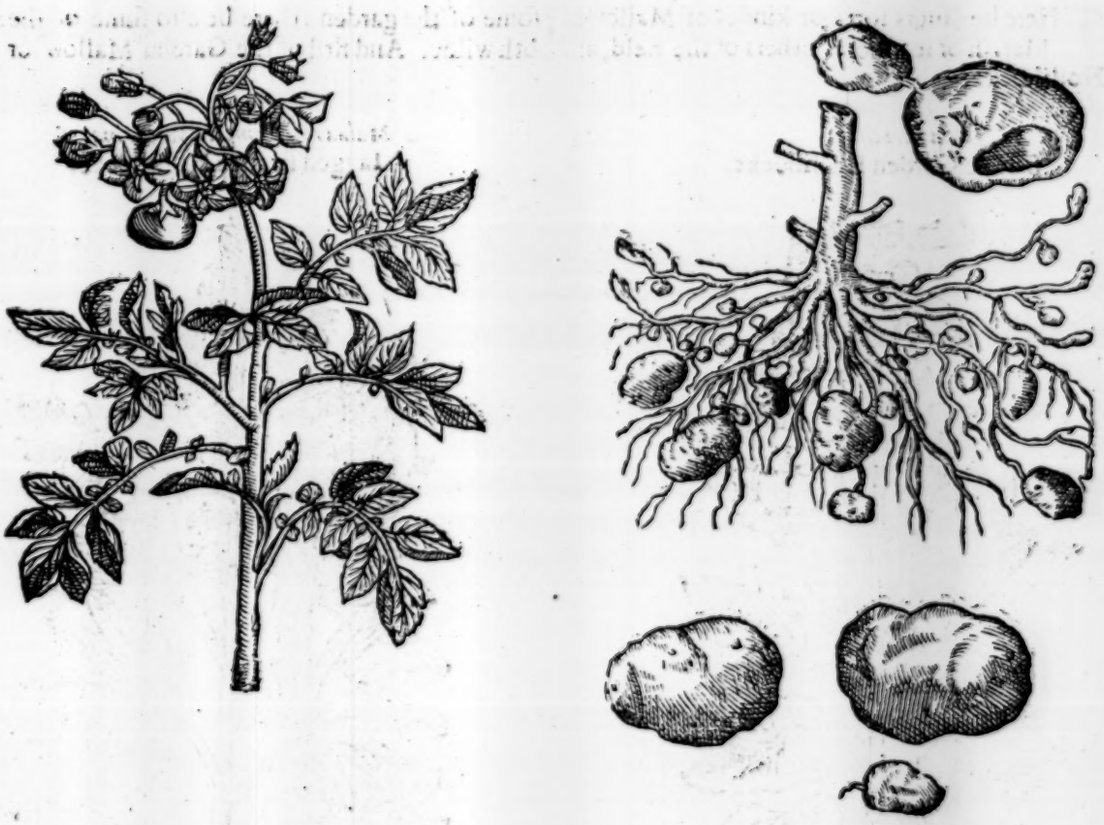
Chap. 350. *Of Potatoes of Virginia.*

¶ *The Deſcription.*

VIrginia Potato hath many hollow flexible branches trailing vpon the ground, three ſquare, vneuen, knotted or kneed in ſundry places at certaine diſtances: from the which knots commeth forth one great leafe made of diuers leaues, ſome ſmaller, and others greater, ſet together vpon a fat middle rib by couples, of a ſwart greene colour tending to redneſſe; the whole leafe reſembling thoſe of the Winter-Creſſes, but much larger; in taſte at the firſt like graſſe, but afterward ſharpe and nipping the tongue. From the boſome of which leaues come forth long round

round ſlender foot-ſtalkes, whereon do grow very faire & pleaſant floures, made of one entire whole leafe, which is folded or plaited in ſuch ſtrange ſort, that it ſeemeth to be a floure made of fiue ſundry ſmall leaues, which cannot eaſily be perceiued except the ſame be pulled open. The whole floure is of a light purple colour, ſtriped downe the middle of euery fold or welt with a light ſhew of yellowneſſe, as if purple and yellow were mixed together. in the middle of the floure thruſteth forth a thicke flat pointall yellow as gold, with a ſmall ſharpe greene pricke or point in the middeſt thereof. The fruit ſucceedeth the floures, round as a ball, of the bigneſſe of a little Bulleſſe or wilde plum, greene at the firſt, and blacke when it is ripe; wherein is contained ſmall white ſeed leſſer than thoſe of Muſtard. The root is thicke, fat, and tuberous, not much differing either in ſhape, colour, or taſte from the common Potatoes, ſauing that the roots hereof are not ſo great nor long; ſome of them are as round as a ball, ſome ouall or egge-faſhion; ſome longer, and others ſhorter: the which knobby roots are faſtened vnto the ſtalkes with an infinite number of threddie ſtrings.

Battata Virginiana, ſiue Virginianorum, & Pappus:
Virginian Potatoes.



¶ *The Place.*

It groweth natnrally in America, where it was firſt diſcouered, as reports *C. Cluſius*, ſince which time I haue receiued roots hereof from Virginia, otherwiſe called Norembega, which grow and proſper in my garden as in their owne natiue countrey.

¶ *The Time.*

The leaues thruſt forth of the ground in the beginning of May: the floures bud forth in Auguſt. The fruit is ripe in September.

¶ *The Names.*

The Indians do call this plant *Pappus*, meaning the roots: by which name alſo the common Potatoes are called in thoſe Indian countries. We haue the name proper vnto it mentioned in the title. Becauſe it hath not onely the ſhape and proportion of Potatoes, but alſo the pleaſant taſte and vertues of the ſame, we may call it in Engliſh, Potatoes of America or Virginia.

‡ *Cluſius* queſtions whether it be not the *Arachidna* of *Theophraſtus*. *Bauhine* hath referred it to the Night ſhades, and calleth it *Solanum tuberoſum Eſculentum*, and largely figures and deſcribes it in his *Prodromus, pag.* 89. ‡

¶ *The*

¶ *The Temperature and Vertues.*

A The temperature and vertues be referred vnto the common Potatoes, being likewiſe a food, as alſo a meate for pleaſure, equall in goodneſſe and wholeſomeneſſe vnto the ſame, being either roſted in the embers, or boyled and eaten with oyle, vineger, and pepper, or dreſſed any other way by the hand of ſome cunning in cookerie.

B ‡ *Bauhine* ſaith, That he heard that the vſe of theſe roots was forbidden in Bourgondy (where they call them Indian Artichokes) for that they were perſuaded the too frequent vſe of them cauſed the leproſie. ‡

Chap. 351.

Of the Garden Mallow called Hollihocke.

¶ *The Kindes.*

THere be diuers ſorts or kindes of Mallowes; ſome of the garden: there be alſo ſome of the Mariſh or ſea ſhore; others of the field, and both wilde. And firſt of the Garden Mallow or Hollihocke.

1 *Malua hortenſis.*
Single Garden Hollihocke.

2 *Maluaroſea ſimplex peregrina.*
Iagged ſtrange Hollihocke.

¶ *The Deſcription.*

1 THe tame or garden Mallow bringeth forth broad round leaues of a whitiſh greene colour, rough, and greater than thoſe of the wilde Mallow. The ſtalke is ſtraight, of the height of foure or ſix cubits; whereon do grow vpon ſlender foot-ſtalks ſingle floures not much vnlike to the wilde Mallow, but greater, conſiſting only of fiue leaues, ſometimes white or red, now and then of a deepe purple colour, varying diuerſly, as Nature liſt to play with it: in their places groweth vp a round knop like a little cake, compact or made vp of a multitude of flat ſeeds like little cheeſes. The root is long, white, tough, eaſily bowed, and groweth deepe in the ground.

2 The

3 *Malua purpurea multiplex.*
Double purple Hollihocke.

2 The ſecond being a ſtrange kinde of Hollihocke hath likewiſe broad leaues, rough and hoarie, or of an ouerworne ruſſet colour, cut into diuers ſections euen to the middle ribbe, like thoſe of Palma Chriſti. The floures are very ſingle, but of a perfect red colour, wherein conſiſteth the greateſt difference. ‡ And this may be called *Malua roſea ſimplex peregrina folio Ficus.* Iagged ſtrange Hollihocke. ‡

3 The double Hollihocke with purple floures hath great broad leaues, confuſedly indented about the edges, and likewiſe toothed like a ſaw. The ſtalke groweth to the height of foure or fiue cubits. The floures are double, and of a bright purple colour.

4 The Garden Hollihocke with double floures of the colour of ſcarlet, groweth to the height of fiue or ſix cubits, hauing many broad leaues cut about the edges. The ſtalke and root is like the precedent. ‡ This may be called *Multea hortenſis rubra multiplex,* Double red Hollihockes, or Roſe mallow. ‡

5 The tree mallow is likewiſe one of the Hollihockes; it bringeth forth a great ſtalke of the height of ten or twelue foot, growing to the forme of a ſmall tree, whereon are placed diuers great broad leaues of a ruſſet greene colour, not vnlike to thoſe of the great Clot Burre Docke, deepely indented about the edges. The floures are very great and double as the greateſt Roſe, or double Peiony, of a deep red colour tending to blackneſſe. The roote is great, thicke, and of a wooddy ſubſtance, as is the reſt of the plant. ‡ This may be called *Malua hortenſis atrorubente multiplici flore.* ‡

¶ *The Place.*

Theſe Hollihockes are ſowne in gardens, almoſt euery where, and are in vaine ſought elſe where.

¶ *The Time.*

The ſecond yeere after they are ſowne they bring forth their floures in Iuly and Auguſt, when the ſeed is ripe the ſtalke withereth, the root remaineth and ſendeth forth new ſtalkes, leaues and floures, many yeres after.

¶ *The Names.*

The Hollihocke is called in Greeke, μολόχη: of diuers, *Roſa vltramarina,* or outlandiſh Roſe, and *Roſa hyemalis,* or winter Roſe. And this is that Roſe which *Pliny* in his 21. book, 4. chapter writes to haue the ſtalke of a mallow, and the leaues of a pot-herbe, which they cal *Moſcenton:* in high Dutch, **Garten pappelen:** in low Dutch, **Winter Roosen:** in French, *Roſe d' outre mer:* in Engliſh, Hollihocke, and Hockes.

¶ *The Temperature.*

The Hollihocke is meetely hot, and alſo moiſt, but not ſo much as the wilde Mallow: it hath likewiſe a clammie ſubſtance, which is more manifeſt in the ſeed and root, than in any other part.

¶ *The Vertues.*

The decoction of the floures, eſpecially thoſe of the red, doth ſtop the ouermuch flowing of the monthly courſes, if they be boiled in red wine. A

The roots, leaues, and ſeeds ſerue for all thoſe things for which the wilde Mallowes do, which are more commonly and familiarly vſed. B

CHAP. 352. *Of the wilde Mallowes.*

¶ *The Deſcription.*

1 THe wilde Mallow hath broad leaues ſomewhat round and cornered, nickt about the edges, ſmooth, and greene of colour: among which riſe vp many ſlender tough ſtalkes,

clad with the like leaues,but ſmaller. The floures grow vpon little footſtalkes of a reddiſh colour mixed with purple ſtrakes, conſiſting of fiue leaues,faſhioned like a bell: after which commeth vp a knap or round button, like vnto a flat cake, compact of many ſmall ſeeds. The root is white, tough, and full of a ſlimie juice, as is all the reſt of the plant.

2 The dwarfe wilde Mallow creepeth vpon the ground: the ſtalkes are ſlender and weake, yet tough and flexible. The leaues be rounder,and more hoary than the other. The floures are ſmall and of a white colour.

3 The criſpe or curled Mallow, called of the vulgar ſort French Mallowes,hath many ſmall vpright ſtalkes, growing to the height of a cubit, and ſometimes higher; whereon do grow broad leaues ſomewhat round and ſmooth,of a light greene color, plaited or curled about the brims like a ruffe. The floures be ſmall and white. The root periſheth when it hath perfected his ſeed.

1 *Malua ſyluestris.*
The field Mallow.

2 *Malua ſyluestris pumila.*
The wilde dwarfe Mallow.

4 The Veruaine Mallow hath many ſtraight ſtalkes, whereon doe grow diuers leaues deepely cut and jagged euen to the middle rib, not vnlike to the leaues of Veruaine, whereof it tooke his name: among which come forth faire and pleaſant floures like vnto thoſe of the common Mallow in forme, but of a more bright red colour, mixed with ſtripes of purple, which ſetteth forth the beautie. The root is thicke, and continueth many yeeres. ‡ This is ſometimes though more rarely found with white floures. ‡

‡ 5 This annuall Mallow,called by *Cluſius*, *Maluatrimeſtris*, is very like our common Mallow ſending vp ſlender branched ſtalkes ſome three foot high; the bottome leaues are round,thoſe on the ſtalkes more ſharpe pointed, greene aboue,and whiter vnderneath, the floures conſiſt of fiue leaues of a light carnation colour, the ſeed is like that of the ordinary mallow,but ſmaller; and ſuch alſo is the root which periſhes euery yeere as ſoon as the ſeed is ripe: it is ſowne in ſome gardens, and growes wilde in Spaine. ‡

¶ *The Place.*

The two firſt mallowes grow in vntoiled places among pot-herbes, by high waies, and the borders of fields.

The French mallow is an excellent pot-herbe, for the which cauſe it is ſowne in gardens, and is not to be found wilde that I know of.

The

3 *Malua criſpa.*
The French curled Mallow.

‡ 5 *Malua æſtiua Hiſpanica.*
The Spaniſh Mallow.

4 *Malua verbenaca.*
Veruaine Mallow.

The Veruaine Mallow groweth not euerie where: it growes on the ditch ſides on the left hand of the place of execution by London, called Tyborn: alſo in a field neere vnto a village fourteene miles from London called Buſhey, on the backe-ſide of a Gentlemans houſe named Mr. *Robert Wylbraham*: likewiſe amongſt the buſhes and hedges as you go from London to a bathing place called the Old Foord; and in the buſhes as you go to Hackny a village by London, in the cloſes next the town, and in diuers other places, as at Baſſingburne in Hartfordſhire, three miles from Roiſton.

‡ Mr. *Goodyer* found the Veruain Mallow with white floures growing plentifully in a cloſe neere Maple-durham in Hampſhire, called Aldercrofts. ‡

¶ *The Time.*

Theſe wilde Mallowes do floure from Iune till Sommer be well ſpent: in the meane time their ſeed alſo waxeth ripe.

¶ *The Names.*

The wilde Mallow is called in Latine *Malua ſylueſtris*: in Greeke, Μαλαχὴ ἀγρία, or χαροπὴ: and ἄκεσις, as though they ſhould ſay a mitigator of paine: of ſome, *Oſiriaca*: in high-Dutch, **Pappelin**: in Low-Dutch, **Maluwe**, and **kreſkens cruit**: in Engliſh, Mallow.

The Veruaine Mallow is called of *Dioſcorides*, *Alcea*: in Greeke, Ἀλκέα: of ſome, *Herba Hungarica*, and *Herba Simeonis*, or Simons Mallow: in Engliſh, Veruaine Mallow, and iagged Mallow.

The name of this herbe *Malua* ſeemeth to come from the Hebrewes, who call it in their tongue מלוח *Malluach*, of the ſaltneſſe, becauſe the Mallow groweth in ſaltiſh and old ruinous places, as in dung-hills and ſuch like, which in moſt aboundant manner yeeldeth forth Salt-peter and ſuch like matter: for מלח *Melach* ſignifieth ſalt, as the Learned know. I am perſuaded that the Latine word *Malua* commeth from the Chaldee name *Mallucha*, the gutturall letter ח, *Ch*, being left out for good ſounds ſake: ſo that it were better in this word *Malüa* to reade *u* as a vowell, than as a conſonant: which words are vttered by the learned Doctor *Rabbi Dauid Kimhi*, and ſeeme to carrie a great ſhew of truth: in Engliſh it is called Mallow; which name commeth as neere as may be to the Hebrew word.

¶ *The Temperature.*

The wilde Mallowes haue a certaine moderate and middle heate, and moiſtneſſe withall: the iuyce thereof is ſlimie, clammie, or gluing, the which are to be preferred before the garden Mallow or Hollihocke, as *Diphilus Siphinus* in *Athenæus* doth rightly thinke; who plainely ſheweth, that the wilde Mallow is better than that of the garden: although ſome do prefer the Hollihocke, whereunto we may not conſent, neither yet yeeld vnto *Galen*, who is partly of that minde, yet ſtandeth he doubtfull: for the wilde Mallow without controuerſie is fitter to be eaten, and more pleaſant than thoſe of the garden, except the French Mallow, which is generally holden the wholſommeſt, and amongſt the pot-herbes not the leaſt commended by *Heſiod*: of whoſe opinion was *Horace*, writing in his ſecond Ode of his *Epodon*,

——— *& graui*
Maluæ ſalubres corpori.

The Mallow (ſaith *Galen*) doth nouriſh moderately, ingendreth groſſe bloud, keepeth the bodie ſoluble, and looſeth the belly that is bound. It eaſily deſcendeth, not onely becauſe it is moiſt, but alſo by reaſon it is ſlimy.

¶ *The Vertues.*

A The leaues of Mallowes are good againſt the ſtinging of Scorpions, Bees, Waſps, and ſuch like: and if a man be firſt anointed with the leaues ſtamped with a little oyle, he ſhal not be ſtung at all, *Dioſcorides* ſaith.

B The decoction of Mallowes with their roots drunken are good againſt all venome and poyſon, if it be incontinently taken after the poyſon, ſo that it be vomited vp againe.

C The leaues of Mallowes boyled till they be ſoft and applied, do mollifie tumors and hard ſwellings of the mother, if they do withall ſit ouer the fume thereof, and bathe themſelues therewith.

D The decoction vſed in cliſters is good againſt the roughneſſe and fretting of the guts, bladder, and fundament.

E The roots of the Veruaine Mallow do heale the bloudy flix and inward burſtings, being drunke with wine and water, as *Dioſcorides* and *Paulus Ægineta* teſtifie.

Chap. 353. *Of Marſh Mallow.*

¶ *The Deſcription.*

1 Marſh Mallow is alſo a certaine kinde of wilde Mallow: it hath broad leaues, ſmall toward the point, ſoft, white, and ſleeſed or cottoned, and ſleightly nicked about the edges: the ſtalkes be round and ſtraight, three or foure foot high, of a whitiſh gray colour; whereon do grow floures like vnto thoſe of the wilde Mallowes, yet not red as they are, but commonly white, or of a very light purple colour out of the white: the knop or round button wherein the ſeeds lie is like that of the firſt wilde Mallow. The root is thicke, tough, white within, and containeth in it a clammy and ſlimy iuyce.

† 2 This ſtrange kinde of Mallow is holden amongſt the beſt writers to be a kinde of marſh Mallow: ſome excellent Herbariſts haue ſet it downe for *Sida Theophraſti*, wherto it doth not fully anſwer: it hath ſtalks two cubits high, wheron are ſet without order many broad leaues hoarie and whitiſh, not vnlike thoſe of the other marſh Mallow: the floures conſiſt of fiue leaues, and are larger than thoſe of the marſh Mallow, and of a purple colour tending to redneſſe: after which there come round bladders of a pale colour, in ſhape like the fruit or ſeeds of round *Ariſtochia*, or Birthwort, wherein is contained round blacke ſeed. The root is thicke and tough, much like that of the common Mallow.

3 This

1 *Althæa Ibiſcus.*
Marſh Mallow.

2 *Althæa paluſtris.*
Water Mallow.

3 *Althæa Arboreſcens.*
Tree Mallow.

4 *Althæa frutex Cluſij.*
Shrubbed Mallow.

‡ 5 *Alcea fruticoſa cannabina.*
Hempe-leaued Mallow.

3 This wilde Mallow is likewiſe referred vnto the kinds of marſh Mallow, called generally by the name of *Althæa*, which groweth to the form of a ſmal hedge tree, approching neerer to the ſubſtance or nature of wood than any of the other; wherewith the people of Olbia and Narbone in France doe make hedges, to ſeuer or diuide their gardens and vineyards (euen as we doe with quicke-ſets of priuet or thorne) which continueth long: the ſtalke whereof groweth vpright, very high, comming neere to the Willow in woodineſſe and ſubſtance. The floures grow alongſt the ſame, in faſhion and colour of the common wild mallow.

4 The ſhrubby mallow riſeth vp like vnto a hedge buſh, and of a wooddy ſubſtance, diuiding it ſelfe into diuers tough and limber branches, couered with a barke of the colour of aſhes; whereupon do grow round pointed leaues, ſomewhat nickt about the edges, very ſoft, not vnlike to thoſe of the common marſh mallow, and of an ouerworne hoary colour. The floures grow at the top of the ſtalks, of a purple colour, conſiſting of fiue leaues, very like to the common wilde mallow, and the ſeed of the marſh mallow.

5 We haue another ſort of mallow, called of *Pena, Alcea fruticoſior pentaphylla*: it bringeth forth in my garden many twiggy branches, ſet vpon ſtiffe ſtalkes of the bigneſſe of a mans thumbe, growing to the height of ten or twelue foot: whereupon are ſet very many leaues deepely cut euen to the middle rib, like vnto the leaues of hempe: the floures and ſeeds are like vnto the common mallow: the root is exceeding great, thicke, and of a wooddy ſubſtance. ‡ *Cluſius* calls this *Alcea fruticoſa cannabino folio*: and it is with good reaſon thought to be the *Cannabis ſylueſtris* deſcribed by *Dioſcorides*, *lib.* 3. *cap.* 166. ‡

¶ *The Place.*

The common marſh mallow groweth very plentifully in the marſhes both on the Kentiſh and Eſſex ſhore alongſt the riuer of Thames, about Woolwych, Erith, Greenhyth, Grauеſend, Tilburie, Lee, Colcheſter, Harwich, and in moſt ſalt marſhes about London: being planted in gardens it proſpereth well, and continueth long.

The ſecond groweth in the moiſt and fenny places of Ferraria, betweene Padua in Italy, and the riuer Eridanus.

The others are ſtrangers likewiſe in England: notwithſtanding at the impreſſion hereof I haue ſowen ſome ſeeds of them in my garden, expecting the ſucceſſe.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt: the root ſpringeth forth afreſh euery yeare in the beginning of March, which are then to be gathered, or in September.

¶ *The Names.*

The common marſh mallow is called in Greeke Ἀλθαία, and ἰβίσκος: the Latines retaine the names *Althæa* and *Ibiſcus*: in ſhops, *Biſmalua*, and *Maluauiſcus*; as though they ſhould ſay *Malua Ibiſcus*: in high-Dutch, **Ibiſch**: in low-Dutch, **witte Maluwe**, and **witten Hemſt**: in Italian and Spaniſh, *Maluaniſco*: in French, *Guimaulue*: in Engliſh, marſh mallow, mooriſh mallow, and white mallow.

The reſt of the mallowes retaine the names expreſſed in their ſeuerall titles.

¶ *The Temperature.*

Marſh mallow is moderately hot, but drier than the other mallowes: the roots and ſeeds hereof are more dry, and of thinner parts, as *Galen* writeth; and likewiſe of a digeſting, ſoftning, or mollifying nature.

¶ *The*

¶ *The Vertues.*

The leaues of Marſh Mallow are of the power to digeſt, mitigate paine, and to concoct. A

They be with good effect mixed with fomentations and pulteſſes againſt paines of the ſides, of B the ſtone, and of the bladder, in a bath alſo they ſerue to take away any manner of paine.

The decoction of the leaues drunke doth the ſame, which doth not only aſſwage paine which C proceedeth of the ſtone, but alſo is very good to cauſe the ſame to deſcend more eaſily, and to paſſe forth.

The roots and ſeeds are profitable for the ſame purpoſe: moreouer the decoction of the roots D helpeth the bloudy flix, yet not by any binding qualitie, but by mitigating the gripings and fretings thereof: for they doe not binde at all, although *Galen* otherwiſe thought, but they cure the bloudy flix, by hauing things added vnto them, as the roots of Biſtort, Tormentill, the floures and rindes of Pomegranates and ſuch like.

The mucilage or ſlimie iuice of the roots, is mixed very effectually with all oils, ointments, and E plaiſters that ſlacken and mitigate paine.

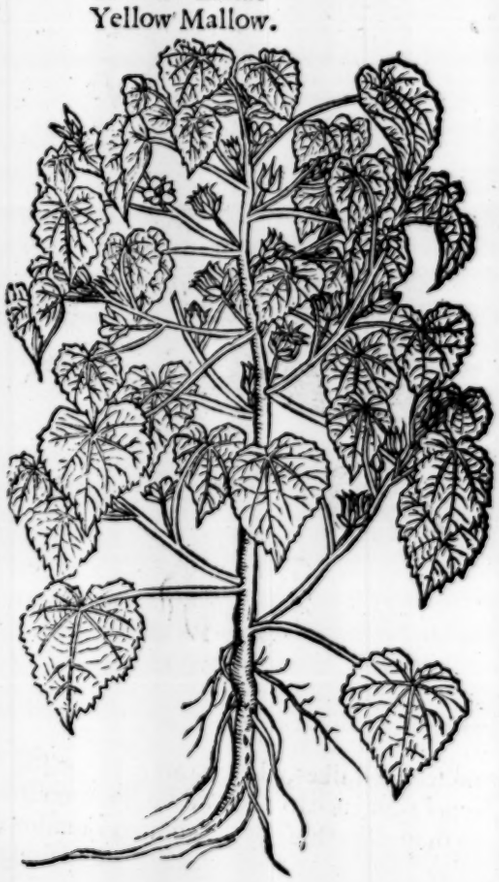
The roots boiled in wine, and the decoction giuen to drinke, expell the ſtone and grauell, helpe F the bloudy flix, ſciatica, crampes, and conuulſions.

The roots of Marſh Mallows, the leaues of common Mallowes, and the leaues of Violets, boiled G in water vntill they be verie ſoft, and that little water that is left drained away, ſtamped in a ſtone morter, adding thereto a certaine quantitie of Fenugreeke, and Lineſeed in pouder; the root of the blacke Bryonie, and ſome good quantitie of Barrowes greaſe, ſtamped altogether to the forme of a pultis, and applied very warme, mollifie and ſoften Apoſtumes and hard ſwellings, ſwellings in the ioints, and ſores of the mother: it conſumeth all cold tumors, blaſtings, and windie outgrowings; it cureth the rifts of the fundament; it comforteth, defendeth, and preſerueth dangerous greene wounds from any manner of accidents that may happen thereto, it helpeth digeſtion in them, and bringeth old vlcers to maturation.

The ſeeds dried and beaten into pouder and giuen to drinke, ſtoppeth the bloudy flix and laske, H and all other iſſues of bloud.

CHAP. 354. *Of the yellow Lillie.*

Althæa Lutea.
Yellow Mallow.



¶ *The Deſcription.*

THe yellow Mallow riſeth vp with a round ſtalke, ſomething hard or wooddie, three or foure cubits high, couered with broad leaues ſomething round, but ſharpe pointed, white, ſoft, ſet with very fine haires like to the leaues of gourds, hanging vpon long tender footſtalks: from the boſome of which leaues come forth yellow floures, not vnlike to thoſe of the common Mallow in forme: the knops or ſeed veſſels are blacke, crooked, or wrinckled, made vp of many ſmall cods, in which is black ſeed: the root is ſmall, and dieth when it hath perfected his ſeed.

¶ *The Place.*

The ſeed hereof is brought vnto vs from Spaine and Italy: we doe yearely ſow it in our gardens, the which ſeldom or neuer doth bring his ſeed to ripeneſſe: by reaſon whereof, we are to ſeeke for ſeeds againſt the next yeare.

¶ *The Time.*

It is ſowne in the midſt of Aprill, it brings forth his floures in September.

¶ *The Names.*

Some thinke this to be *Abutilon*: whereupon that agreeth which *Auicen* writeth, that it is like to the Gourd, that is to ſay in leaſe, and to be named *Abutilon*, and *Arbutilon*: diuers take

take it to be that *Althæa* or Marſh Mallow, vnto which *Theophraſtus* in his ninth booke of the Hiſtorie of Plants doth attribute *Florem μάλιον*, or a yellow floure: for the floure of the common Marſh Mallow is not yellow, but white; yet may *Theophraſtus* his copie, which in diuers places is faultie, and hath many emptie and vnwritten places, be alſo faultie in this place; therefore it is hard to ſay, that this is *Theophraſtus* marſh Mallow, eſpecially ſeeing that *Theophraſtus* ſeemeth alſo to attribute vnto the root of Marſh Mallow ſo much ſlime, as that water may bee thickened therewith, which the roots of common Marſh Mallow can very well doe: but the root of *Abutilon* or yellow Mallow not at all: it may be called in Engliſh, yellow Mallow, and *Auicen* his Mallow.

¶ *The Temperature.*

The temperature of this Mallow is referred vnto the Tree-mallow.

¶ *The Vertues.*

A *Auicen* ſaith, that *Abutilon* or yellow Mallow, is held to be good for greene wounds, and doth preſently glew together, and perfectly cure the ſame.

B The ſeed drunke in wine preuaileth mightily againſt the ſtone.

C *Bernardus Paludanus* of Anchuſen reporteth, that the Turks do drinke the ſeed to prouoke ſleepe and reſt.

Chap. 355. *Of Venice Mallow, or Good-night at Noone.*

1 *Alcea Peregrina.*
Venice Mallow.

2 *Sabdarifa.*
Thornie Mallow.

¶ *The Deſcription.*

† 1 THe Venice mallow riſeth vp with long, round, feeble ſtalkes, whereon are ſet vpon long ſlender foot-ſtalkes, broad iagged leaues, deepely cut euen to the middle rib: amongſt which come forth very pleaſant and beautifull floures, in ſhape like thoſe of the common mallow, ſomething

‡ 3 *Alcea Ægyptia.*
The Ægyptian Codded Mallow.

ſomething white about the edges, but in the middle of a fine purple: in the middeſt of this floure ſtandeth forth a knap or peſtel, as yellow as gold: it openeth it ſelfe about eight of the clocke, and ſhutteth vp againe at noone, about twelue a clock when it hath receiued the beams of the Sun, for two or three houres, whereon it ſhould ſeeme to reioice to look, and for whoſe departure, being then vpon the point of declenſion, it ſeemes to grieue, and ſo ſhuts vp the floures that were open, and neuer opens them againe; whereupon it might more properly be called *Malva horaria*, or the Mallow of an houre: and this *Columella* ſeemeth to call *Moloche*, in this verſe;

——*Et Moloche, Prono ſequitur quæ vertice ſolem.*

The ſeed is contained in thicke rough bladders, whereupon *Dodonæus* calleth it *Alcea Veſicaria*: within theſe bladders or ſeed veſſels are contained blacke ſeed, not vnlike to thoſe of *Nigella Romana*. The root is ſmall and tender, & periſheth when the ſeed is ripe, and muſt be increaſed by new and yearely ſowing of the ſeed, carefully reſerued.

2 Thorn Mallow riſeth vp with one vpright ſtalk of two cubits high, diuiding it ſelfe into diuers branches, whereupon are placed leaues deeply cut to the middle rib, and likewiſe ſnipt about the edges like a ſaw, in taſte like Sorrel the floures for the moſt part thruſt forth of the trunke or body of the ſmall ſtalke, compact of fiue ſmall leaues, of a yellowiſh colour; the middle part whereof is of a purple tending to redneſſe: the husk or cod wherein the floure doth ſtand is ſet or armed with ſharpe thornes: the root is ſmall, ſingle, and moſt impatient of our cold clymate, inſomuch that when I had with great induſtrie nouriſhed vp ſome plants from the ſeed, and kept them vnto the midſt of May; notwithſtanding one cold night chancing among many, hath deſtroied them all.

‡ 3 This alſo is a ſtranger cut leaued Mallow, which *Cluſius* hath ſet forth by the name of *Alcea Ægyptia*: and *Proſper Alpinus* by the title of *Bammia*: the ſtalke is round, ſtraight, green, ſome cubit and halfe high: vpon which without order grow leaues at the bottome of the ſtalk, like thoſe of Mallow, cornered and ſnipt about the edges; but from the middle of the ſtalke to the top they are cut in with fiue deep gaſhes like as the leaues of the laſt deſcribed: the floures grow forth by the ſides of the ſtalke, in forme and colour like thoſe of the laſt mentioned, to wit, with fiue yellowiſh leaues: after theſe follow long thicke fiue cornered hairy and ſharpe pointed ſeed veſſels, containing a ſeed like *Orobus*, couered with a little downineſſe: this growes in Egypt, where they eat the fruit thereof as we do Peaſe and Beanes: *Alpinus* attributes diuers vertues to this plant, agreeable to thoſe of the common Marſh-mallow. ‡

¶ *The Place.*

The ſeeds hereof haue been brought out of Spaine and other hot countries. The firſt proſpereth well in my garden from yeare to yeare.

¶ *The Time.*

They are to be ſowne in the moſt fertill ground and ſunnie places of the garden, in the beginning of May, or in the end of Aprill.

¶ *The Names.*

Their names haue beene ſufficiently touched in their ſeueral deſcriptions. The firſt may be called in Engliſh, Venice-mallow, Good-night at noone, or the Mallow flouring but an houre: of *Matthiolus* it is called *Hypecoon*, or Rue Poppie, but vnproperly.

¶ *The Temperature and Vertues.*

There is a certaine clammie iuice in the leaues of the Venice Mallow, whereupon it is thought A

to

to come neere vnto the temperature of the common Mallow, and to be of a mollifying facultie: but his vſe in Phyſicke is not yet knowne, and therefore can there be no certaintie affirmed.

Chap. 356. *Of Cranes-bill.*

¶ *The Kindes.*

THere be many kindes of Cranes-bil, whereof two were known to *Dioſcorides*, one with the knobby root, the other with the Mallow leafe.

Geranium Columbinum.
Doues foot, or Cranes-bill.

¶ *The Deſcription.*

DOues-foot hath many hairy ſtalks, trailing or leaning toward the ground, of a browniſh color, ſomewhat kneed or iointed; whereupon do grow rough leaues of an ouerworne green colour, round, cut about the edges, and like vnto thoſe of the common Mallow: amongſt which come forth the floures of a bright purple color: after which is the ſeed, ſet together like the head and bil of a bird; wherupon it was called Cranes-bill, or Storks-bill, as are alſo all the other of his kinde. The root is ſlender, with ſome fibres annexed thereto.

‡ 2 There is another kinde of this with larger ſtalkes and leaues, alſo the leaues are more deeply cut in and diuided, and the floures are either of the ſame colour as thoſe of the common kinde, or elſe ſomewhat more whitiſh. This may be called *Geranium columbinum maius diſſectis foliis*, Great Doues foot.

3 To this kinde may alſo fitly be referred the *Geranium Saxatile* of *Thalius*: the root is ſmal and threddy, the leaues are ſmoother, redder, more bluntly cut about the edges, and tranſparent than thoſe of the firſt deſcribed, yet round, and otherwiſe like them: the floures are ſmall and red, and the bills like thoſe of the former. Maſter *Goodyer* found it growing plentifully on the bankes by the high way leading from Gilford towards London, neere vnto the Townes end. ‡

¶ *The Place.*

It is found neere to common high waies, deſart places, vntilled grounds, and ſpecially vpon mud walls almoſt euery where.

¶ *The Time.*

It ſpringeth vp in March and Aprill: floureth in May, and bringeth his ſeede to ripeneſſe in Iune.

¶ *The Names.*

It is commonly called in Latine, *Pes Columbinus*: in High Dutch, **Scarter kraut**: in Low Dutch, **Dupuen voet**: in French, *Pied de Pigeon*: hereupon it may be called *Geranium Columbinum*. in Engliſh, Doues-foot, and Pigeons-foot: of *Dioſcorides*, *Geranium alterum*: of ſome, *Pulmonia*, and *Gruina*.

¶ *The Temperature.*

Doues foot is cold and ſomewhat drie, with ſome aſtriction or binding, hauing power to ſoder or ioine together.

¶ *The Vertues.*

A It ſeemeth, ſaith my Author, to be good for greene and bleeding wounds, and aſſwageth inflammations or hot ſwellings.

The

The herbe and roots dried, beaten into moſt fine pouder, and giuen halfe a ſpoonfull faſting, and B
the like quantitie to bedwards in red wine, or old claret, for the ſpace of one and twentie daies to-
gether, cureth miraculouſly ruptures or burſtings, as my ſelfe hane often prooued, whereby I haue
gotten crownes and credit: if the ruptures be in aged perſons, it ſhall be needfull to adde thereto
the powder of red ſnailes (thoſe whithout ſhels) dried in an ouen, in number nine, which fortifi-
the herbs in ſuch ſort, that it neuer faileth, although the rupture be great and of long continuance:
it likewiſe profiteth much thoſe that are wounded into the body, and the decoction of the herbe
made in wine, preuaileth mightily in healing inward wounds, as my ſelfe haue likewiſe proued.

CHAP. 357. *Of Herbe Robert.*

Geranium Robertianum.
Herbe Robert.

¶ *The Deſcription.*

HErbe Robert bringeth forth ſlender weake and brittle ſtalks, ſomewhat hairie, and of a reddiſh colour, as are oftentimes the leaues alſo, which are iagged and deepely cut, like vnto thoſe of Cheruile, of a moſt loathſome ſtinking ſmell. The floures are of a moſt bright purple colour; which being paſt, there follow certaine ſmal heads, with ſharpe beaks or bils like thoſe of birds: the root is ſmall and threddie.

¶ *The Place.*

Herbe Robert groweth vpon old walls, as wel thoſe made of bricke and ſtone, as thoſe of mud or earth: it groweth likewiſe among rubbiſh, in the bodies of trees that are cut downe, and in moiſt and ſhadowie ditch banks.

¶ *The Time.*

It floureth from Aprill till Sommer be almoſt ſpent: the herbe is green in winter alſo, and is hardly hurt with cold.

¶ *The Names.*

It is called in high Dutch, **Ruprechts kraut:** in low Dutch, **Robrechts kruit:** and thereupon it is named in Latine, *Ruberta*, and *Roberti herba: Ruellius* calleth it *Robertiana*; and we, *Robertianum:* of *Tabernamontanus*, *Rupertianum:* in Engliſh, Herbe Robert. Hee that conferreth this Cranes bill with *Dioſcorides* his third *Sideritis* ſhall plainely perceiue, that they are both one, and that this is moſt apparently *Sideritis* 3. *Dioſcoridis*; for *Dioſcorides* ſetteth downe three *Sideritides*, one with the leafe of Horehound; the next with the leafe of Fearne; and the third groweth in walls and Vineyards: the natiue ſoile of Herbe Robert agree thereunto, and likewiſe the leaues, being like vnto Cheruile, and not vnlike to thoſe of Corianders, according to *Dioſcorides* deſcription.

¶ *The Temperature.*

Herbe Robert is of temperature ſomewhat cold: and yet both ſcouring and ſomewhat binding, participating of mixt faculties.

¶ *The Vertues.*

It is good for wounds and vlcers of the dugs & ſecret parts; it is thought to ſtanch bloud, which A
thing *Dioſcorides* doth attribute to his third *Sideritis:* the vertue of this, ſaith he, is applied to heale vp bloudy wounds.

CHAP.

Chap. 358. *Of knobbed Cranes-bill.*

Geranium tuberoſum.
Knobbie Cranes-bill.

¶ *The Deſcription.*

THis kinde of Cranes-bill hath many flexible branches, weake and tender, fat, and full of moiſture, wheron are placed very great leaues cut into diuers ſmall ſections or diuiſions, reſembling the leaues of the tuberous *Anemone*, or Wind-floure, but ſomewhat greater, of an ouerworn greeniſh colour: among which come forth long foot-ſtalks, whereon do grow faire floures, of a bright purple colour, and like vnto the ſmalleſt brier Roſe in forme: which being paſt, there ſucceed ſuch heads and beaks as the reſt of the Cranes-bill haue: the root is thick, bumped or knobbed, which we call tuberous.

¶ *The Place.*

This kinde of Cranes-bill is a ſtranger in England, notwithſtanding I haue it growing in my garden.

¶ *The Time.*

The time anſwereth the reſt of the Cranes-bills.

¶ *The Names.*

Cranes bill is called in Greeke Γεράνιον: in Latine, *Gruinalis*, commonly *Roſtrum Gruis*, or *Roſtrum Ciconiæ*: of the likeneſſe of a Cranes-bill, or ſtorkes-bill: of ſome, *Acus moſcata*: but that name doth rather belong to another of this kind: it is alſo called *Acus Paſtoris*: in Italian, *Roſtro di grua*: in French, *Bec de Grue*: in Spaniſh, *Pico di Ciquena, pico del grou*: in High Dutch **Storckenſchnable**: in Low Dutch, **Oieuoets beck**: in Engliſh, Storks-bill, Cranes-bill, Herons-bill, and Pincke-needle: this is alſo called for diſtinctions ſake, *Geranium tuberoſum*, and *Geranium bulboſum*: it is likewiſe *Geranium primum Dioſcoridis* or *Dioſcorides* his firſt Cranes-bill.

¶ *The Temperature.*

The roots of this Cranes-bill haue a little kinde of heat in them.

¶ *The Vertues.*

A *Dioſcorides* ſaith that the roots may be eaten, and that a dram weight of them drunk in wine doth waſte and conſume away the windineſſe of the Matrix.

B Alſo *Pliny* affirmeth, that the root hereof is ſingular good for ſuch as after weakneſſe craue to be reſtored to their former ſtrength.

C The ſame Author affirmeth that the weight of a dram of it drunke in wine three times in a day, is excellent good againſt the Ptiſicke, or conſumption of the lungs.

Chap. 359. *Of Muſked Cranes-bill.*

¶ *The Deſcription.*

MVsked Cranes-bil hath many weake and feeble branches trailing vpon the ground, whereon doe grow long leaues, made of many ſmaller leaues, ſet vpon a middle rib, ſnipt or cut about the edges, of a pleaſant ſweete ſmell, not vnlike to that of Muske: among which come forth the floures ſet vppon tender foote-ſtalkes, of a red colour, compact of fiue ſmall leaues apiece: after which appeare ſmall heads and pointed beakes or bills like the other kindes of Cranes bills: the root is ſmall and threddy.

¶ *The*

Geranium moschatum.
Musked Cranes bill.

¶ *The Place.*

It is planted in Gardens for the sweet smell that the whole plant is possessed with, ‡ but if you rub the leaues and then smell to them, you shall finde them to haue a sent quite contrary to the former. ‡

¶ *The Time.*

It floureth and flourisheth all the sommer long.

¶ *The Names.*

It is called *Myrrhida Plinij Rostrum Ciconiæ, Arcus moschata*, in shops, and *Acus pastoris*, and likewise *Geranium moschatum*: in English, Musked Storkes bill, and Cranes bill, *Muschatum*, and of the vulgar sort Muschata, and also Pickneedle.

¶ *The Temperature.*

This Cranes bill hath not any of his faculties found out or knowne: yet it seemeth to be colde and a little dry, with some astriction or binding.

¶ *The Vertues.*

The vertues are referred vnto those of Doues foot, and are thought of *Dioscorides* to be good for greene and bloudy wounds, and hot swellings that are newly begun. A

CHAP. 360. *Of Crow-foot Cranes-bill, or* Gratia Dei.

¶ *The Description.*

1 CRowfoot Cranes bill hath many long and tender branches tending to redneſſe, ſet with great leaues deepely cut or jagged, in forme like those of the fielde Crowfoot, whereof it tooke his name; the floures are pretty large, and grow at the top of the stalkes vpon tender footstalkes, of a perfect blew colour: which being past, there succeed such heads, beakes, and bils as the other Cranes bils.

I haue in my garden another sort of this Cranes bill, bringing forth very faire white floures, which maketh it to differ from the precedent; in other respects there is no difference at all.

‡ 2 This which is the *Geranium 2. Batrachiodes minus* of *Clusius* hath large stalkes and leaues, and those very much diuided or cut in; the stalkes also are diuided into sundry branches, which vpon long footstalkes carry floures like in shape, but lesse than those of the formerly described, and not blew, but of a reddish purple colour, hauing ten threds and a pointall comming forth of the middle of the floure; the beakes or bils which are the seed stand vpright, and hang not downe their points as most others do. The root is large and liues many yeares.

3 The stalkes of this are stiffe, greene, and hairy, diuided at their tops into sundry branches which end in long footstalkes, vpon which grow floures commonly by couples, and they consist of fiue leaues apiece, and these of a darke red colour. The leaues are large, soft, and hairy, diuided into six or seuen parts, and snipt about the edges; the roots are large and lasting. It is kept with vs in gardens, and floures in May. *Clusius* calls it *Geranium 1. pullo flore.*

4 This also hath stalkes and leaues much like those of the last described, but somewhat lesse: the florues are as large as those of the last described, but of a more light red, and they are conteined in thicker and shorter cups, and succeeded by shorter seeds or bills, and are commonly of a sweet muske-like smell: The root is very long, red, and lasting. It floures in the middest of May, and is

† 1 *Geranium Batrachioides.*
Crow-foot Cranes-bill.

2 *Geranium Batrachioides alterum.*
Small Crow-foot Cranes-bill.

‡ 3 *Geranium Batrachioides pullo flore.*
Duskie Cranes-bill.

4 *Geranium Batrachioides longius radicatum.*
‡ Long rooted Cranes-bill.

called by *Geſner*, *Geranium montanum*: by *Dodonæus*, *Geranium batrachioides alterum*: and by *Lobell*, *Geranium batrachioides longius radicatum*. ‡

¶ *The Place.*

Theſe Cranes bils are wilde of their owne nature, and grow in barren places, and in vallies rather than in mountaines; both of them do grow in my garden.

¶ *The Time.*

They floure, flouriſh, and grow greene moſt part of the Summer.

¶ *The Names.*

It is called in Greeke, βατραχοειδὲς, and *Geranium batrachioides*, which name it taketh from the likeneſſe of Crowfoot: of ſome it is called *Ranunculus cæruleus*, or blew Crowfoot: *Fuchſius* calleth it **Gottes gnad**, that is in Latine, *Gratia Dei*: in Engliſh alſo Gratia dei, blew Cranes bill, or Cranes bill with the blew floures, or blew Crowfoot Cranes bill.

¶ *The Temperature.*

The Temperature is referred to the other Cranes bils.

¶ *The Vertues.*

None of theſe plants are now in vſe in Phyſicke; yet *Fuchſius* ſaith, that Cranes bill with the blew floure is an excellent thing to heale wounds.

Chap. 361. *Of Candy Cranes bill.*

1 *Geranium Creticum.*
Candy Cranes bill.

2 *Geranium Malacoides.*
Baſtard Candy Cranes bill.

¶ *The Deſcription.*

1 THe Cranes bill of Candie hath many long tender ſtalks, ſoft, and full of iuice: diuiding it ſelfe into diuers branches, whereon are ſet great broad leaues, cut, or jagged in diuers

ſections or cuts: among which come forth flowers compoſed of fiue leaues apiece, of a bleuiſh or watchet colour, in the middle part whereof come forth a few chiues, and a ſmall pointell of a purpliſh colour: the head and beake is like to the reſt of the Cranes bills, but greater: the root dieth when it hath perfected his ſeed.

2 This Cranes-bill, being a baſtard kinde of the former, hath long ſlender branches growing to the height of two or three cubits, ſet about with very great leaues, not vnlike to thoſe of Hollihocks, but ſomewhat leſſer, of an ouerworne greene colour: among which riſe vp little foot-ſtalks, on the ends whereof do grow ſmall floures, leſſer than thoſe of the precedent, and of a murrey colour: the head and ſeeds are like alſo, but much leſſer: the roots doe likewiſe die at the firſt approch of Winter.

¶ *The Place.*

Theſe are ſtrangers in England, except in the gardens of ſome Herbariſts: they grow in my garden very plentifully.

¶ *The Time.*

The time anſwereth the reſt of the Cranes-bils, yet doth that of Candie floure for the moſt part with me in May.

¶ *The Names.*

There is not more to be ſaid of the names than hath been remembred in their ſeueral titles: they may be called in Engliſh, Cranes-bils, or Storkes-bils.

¶ *The Temperature.*

Their temperature anſwereth that of Doues-foot.

¶ *The Vertues.*

A Their faculties in working are equall to thoſe of Doues-foot, and vſed for the ſame purpoſes, (& rightly) ſpecially being vſed in wound drinks, for the which it doth far excel any of the Cranes bils, and is equall with any other herbe whatſoeuer for the ſame purpoſe.

Chap. 362. *Of diuers wilde Cranes-bills.*

¶ *The Kindes.*

THere be diuers ſorts or kindes of Cranes-bils which haue not been remembred of the antient, nor much ſpoken of by the later writers, all which I meane to comprehend vnder this chapter, making as it were of them a Chapter of wilde Cranes-bils, although ſome of them haue place in our London gardens, and that worthily, eſpecially for the beautie of the floures: their names ſhall be expreſſed in their ſeueral titles, their natures and faculties are referred to the other Cranes-bils, or if you pleaſe to a further conſideration.

¶ *The Deſcription.*

1 SPotted Cranes-bill, or Storkes-bill, the which *Lobel* deſcribeth in the title thus, *Geranium Fuſcum flore liuido purpurante, & medio Candicante*, whoſe leaues are like vnto Crow-foot (beeing a kinde doubtleſſe of Cranes bill, called *Gratia Dei*) of an ouerworne duſtie colour, and of a ſtrong ſauour, yet not altogether vnpleaſant: the ſtalkes are drie and brittle, at the tops whereof doe grow pleaſant floures of a darke purple colour, the middle part of them tending to whiteneſſe: from the ſtile or pointel thereof, commeth forth a tuft of ſmall purple hairy threds. The root is thick and very brittle, lifting it ſelfe forth of the ground, inſomuch that many of the ſaid roots lie aboue the ground naked without earth, euen as the roots of Floure-de-luces doe.

2 Of theſe wilde ones I haue another ſort in my garden, which *Cluſius* in his Pannonicke obſeruations hath called *Geranium Hæmatoides*, or ſanguine Cranes bill: and *Lobel*, *Geranium Gruinum*, or *Gruinale*: it hath many flexible branches creeping vpon the ground: the leaues are much like vnto Doues foot in forme, but cut euen to the middle rib: the floures are like thoſe of the ſmall wilde mallow, and of the ſame bigneſſe, of a perfect bright red colour, which if they be ſuffered to grow

1 *Geranium maculatum ſiue fuſcum.*
Spotted Cranes bill.

2 *Geranium ſanguinarium.*
Bloudy Cranes bill.

3 *Geranium Cicutæ folio inodorum.*
Vnſauorie fielde Cranes-bill.

5 *Geranium Violaceum.*
Violet Storkes-bill.

grow and ſtand vntill the next day, will be a murry colour; and if they ſtand vnto the third day, they will turne into a deep purple tending to blewneſſe; their changing is ſuch, that you ſhall finde at one time vpon one branch floures like in forme, but of diuers colours. The root is thicke, and of a wooddie ſubſtance.

3 This wilde kinde of musked Cranes bill, being altogether without ſauour or ſmell, is called *Myrrhida inodorum*, or *Geranium arvenſe inodorum*, which hath many leaues ſpred flat vpon the ground, euery leafe made of diuers ſmaller leafes, and thoſe cut or iagged about the edges, of no ſmel at all: amongſt which riſe vp ſlender branches, whereon doe grow ſmall floures of a light purple colour: the root is long and fibrous.

4 This is alſo one of the wilde kindes of Cranes-bills, agreeing with the laſt deſcribed in each reſpect, except the floures, for as the other hath purple floures, ſo this plant bringeth forth white floures, other difference there is none at all.

5 The Cranes-bill with violet coloured floures, hath a thicke wooddie root, with ſome few ſtrings annexed thereto: from which riſe immediatly forth of the ground diuers ſtiffe ſtalks, which diuide themſelues into other ſmall branches, whereupon are ſet confuſedly broad leaues, made of three leaues apiece, and thoſe iagged or cut about the edges: the floures grow at the top of the branches of a perfect Violet colour, whereof it tooke his name: after which come ſuch beakes or bils as the other of his kinde.

‡ The figure that was put vnto this Deſcription is the ſame with *Geranium Robertianum*, and therefore I thought it not much amiſſe to put it here againe. ‡

6 I haue likewiſe another ſort that was ſent me from *Robinus* of Paris, whoſe figure was neuer ſet forth, neither deſcribed of any: it bringeth from a thicke tough root, with many branches of a browniſh colour: wherupon do grow leaues not vnlike to thoſe of Gratia Dei, but not ſo deeply cut, ſomewhat cornered, and of a ſhining greene colour: the floures grow at the top of the tender branches, compoſed of ſixe ſmall leaues, of a bright ſcarlet colour.

¶ *The Place.*

The third and fourth of theſe Cranes-bills growe of themſelues about old VValls, and about the borders of fields, VVoods and copſes; and moſt of the reſt wee haue growing in our gardens.

¶ *The Time.*

Their time of flouring and ſeeding anſwereth the reſt of the Cranes bills.

¶ *The Names.*

Their ſeuerall titles ſhall ſerue for their names, referring what might haue been ſaid more to a further conſideration.

¶ *The Nature and Vertues.*

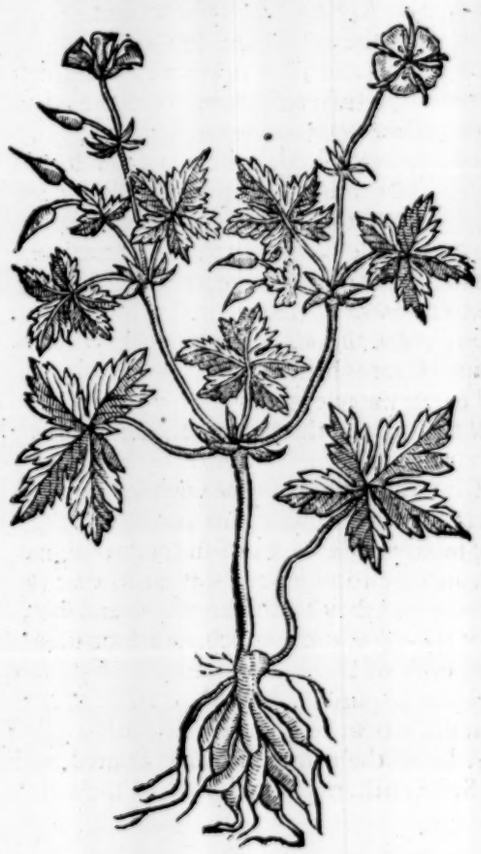
A There hath not as yet any thing beene found either of their temperature or faculties, but may be referred vnto the other of their kinde.

‡ Chap. 363. *Of certaine other Cranes-bills.*

¶ *The Deſcription.*

‡ 1 THis which *Cluſius* receiued from Doctour *Thomas Pennie* of London, and ſets forth by the ſame title as you finde it here expreſt, hath a root conſiſting of ſundry long and ſmall bulbes, and which is fibrous towards the top: the ſtalke is a cubit high, ioynted, and red neere vnto the roote, and about the ioints: out of each of theſe ioyntes come two leaues which are faſtened vnto ſomewhat long foot-ſtalkes, and diuided into fiue parts, which alſo are ſnipt about theedges: out of each of which ioints by the ſetting on the foot-ſtalkes

‡ 1 *Geranium bulboſum Pennæi.*
Pennies bulbous Cranes bill.



‡ 2 *Geranium nodoſum, Plateau.*
Knotty Cranes bill.

‡ 3 *Geranium argenteum Alpinum.*
Siluer leaued Mountaine Cranes bill.

foot-ſtalkes come forth fiue little ſharpe pointed leaues: the floures grow by couples vpon the tops of the ſtalkes, and are of a reddiſh purple colour. It growes wilde in Denmark; whence Dr. *Turner* brought it, and beſtowed it vpon Dr. *Penny* before mentioned.

2 This hath ſtalks ſome foot high, iointed, and of a purpliſh colour: vpon which grow leaues diuided into three parts; but thoſe below are cut into fiue, and both the one and the other are ſnipt about the edges: the floures are compoſed of fiue reddiſh purple leaues of a pretty largeneſſe, with a reddiſh pointall in the middle; and falling, the ſeed follows, as in other plants of this kind: the root is knotty, and ioynted, with ſome fibres: it floures in May, and ſo continueth a great part of the Sommer after. *Cluſius* calls this *Geranium 5. nodoſum, Plateau.* This ſomtimes is found to carry tuberous excreſcences vpon the ſtalkes, toward the later end of Sommer; whence *Plateau* diſtinguiſhed it from the other, but afterwards found it to be the ſame: and *Cluſius* alſo figures and deſcribeth this later variety by the name of *Geranium 6. tuberiferum Plateau.*

3 The root of this is ſome two handfuls long,

long, blacke without, and white within, and towards the top diuided into ſundry parts; whence put forth leaues couered ouer with a fine ſiluer downe; and they are diuided into fiue parts, each of which againe is diuided into three others, and they are faſtned to long ſlender and round foot-ſtalkes: the floures grow vpon foot-ſtalkes ſhorter than thoſe of the leaues; the floures in colour and ſhape are like thoſe of the Veruaine Mallow, but much leſſe; and after it is vaded there followes a ſhort bill, as in the other plants of this kinde. It floures in Iuly, and growes vpon the Alps, where *Pona* found it, and firſt ſet it forth by the name of *Geranium Alpinum longius radicatum.*

4 The ſtalkes of this pretty Cranes bill are ſome foot or better high, whereon grow leaues parted into fiue or ſix parts like thoſe of the *Geranium fuſcum*, but of a lighter greene colour: the floures are large, compoſed of fiue thin and ſoone fading leaues of a whitiſh colour, all ouer intermixt with fine veines of a reddiſh colour, which adde a great deale of beauty to the floure: for theſe veines are very ſmall, and curiouſly diſperſed ouer the leaues of the floure. It floures in Iune, and is preſerued in diuers of our gardens; ſome cal it *Geran. Romanum ſtriatum:* in the *Hortus Eſſetenſis* it is ſet forth by the name of *Geranium Anglicum variegatum. Bauhine* calls it *Geranium batrachiodes flore variegato.* We may call it Variegated or ſtriped Cranes bill.

5 There is of late brought into this kingdome, and to our knowledge, by the induſtry of M^r. *Iohn Tradeſcant*, another more rare and no leſſe beautifull than any of the former; and he had it by the name of *Geranium Indicum noctù odoratum:* this hath not as yet beene written of by any that I know; therefore I will giue you the deſcription thereof, but cannot as yet giue you the figure, becauſe I omitted the taking thereof the laſt yeare, and it is not as yet come to his perfection. The leaues are larger, being almoſt a foot long, compoſed of ſundry little leaues of an vnequal bignes, ſet vpon a thicke and ſtiffe middle rib; and theſe leaues are much diuided and cut in, ſo that the whole leafe ſomewhat reſembles that of *Tanacetum inodorum:* and they are thicke, greene, and ſomewhat hairy: the ſtalke is thicke, and ſome cubit high; at the top of each branch, vpon foot-ſtalkes ſome inch long grow ſome eleuen or twelue floures, and each of theſe floures conſiſteth of fiue round pointed leaues of a yellowiſh colour, with a large blacke purple ſpot in the middle of each leafe, as if it were painted, which giues the floure a great deale of beauty, and it alſo hath a good ſmell. I did ſee it in floure about the end of Iuly, 1632. being the firſt time that it floured with the owner thereof. We may fitly call it Sweet Indian Storks bill, or painted Storks bill: and in Latine, *Geranium Indicum odoratum flore maculato.* ‡

Chap. 364. *Of Sanicle.*

Sanicula, ſiue Diapenſia. Sanicle.

¶ *The Deſcription.*

Sanicle hath leaues of a blackiſh greene colour, ſmooth and ſhining, ſomewhat round, diuided into fiue parts like thoſe of the Vine, or rather thoſe of the maple: among which riſe vp ſlender ſtalkes of a browne colour, on the tops whereof ſtand white moſſie floures: in their places come vp round ſeed, rough, cleauing to mens garments as they paſſe by, in manner of little burs: the root is blacke, and full of threddie ſtrings.

¶ *The Place.*

It groweth in ſhadowie woods and copſes almoſt euerie where: it ioyeth in a fat and fruitful moiſt ſoile.

¶ *The Time.*

It floureth in May and Iune: the ſeed is ripe in Auguſt: the leaues of the herbe are greene all the yeare, and are not hurt with the cold of Winter.

¶ *The Names.*

It is commonly called *Sanicula*; of diuers, *Diapenſia:* in high and low Dutch, **Sanikel:** in French, *Sanicle:* in Engliſh, Sanickle, or Sanikel: it is ſo called, *à ſanandis vulneribus*, or of healing of wounds, as *Ruellius* ſaith: there be alſo other

other Sanicles, ſo named of moſt Herbariſts, as that which is deſcribed by the name of *Dentaria*, or Coral-wort, and likewiſe *Auricula vrſi*, or Beares eare, which is a kind of Cowſlip; and likewiſe another ſet forth by the name of *Sanicula guttata*, whereof we haue entreated among the kindes of Beares eares.

¶ *The Temperature.*

Sanicle as it is in taſte bitter, with a certaine binding qualitie; ſo beſides that it cleanſeth, and by the binding faculty ſtrengthneth, it is hot and dry, and that in the ſecond degree, and after ſome Authors, hot in the third degree, and aſtringent.

¶ *The Vertues.*

The iuyce being inwardly taken is good to heale wounds.

The decoction of it alſo made in wine or water is giuen againſt ſpitting of bloud, and the bloudie flix: alſo foule and filthy vlcers be cured by being bathed therewith. The herbe boyled in water, and applied in manner of a pulteſſe, doth diſſolue and waſte away cold ſwellings: it is vſed in potions which are called Vulnerarie potions, or wound drinkes, which maketh whole and ſound all inward wounds and outward hurts: it alſo helpeth the vlcerations of the kidnies, ruptures, or burſtings. A

CHAP. 365. *Of Ladies Mantle, or great Sanicle.*

Alchimilla.
Lyons foot, or Ladies mantle.

¶ *The Deſcription.*

LAdies mantle hath many round leaues, with fiue or ſix corners finely indented about the edges, which before they be opened are plaited and folded together, not vnlike to the leaues of Mallowes, but whiter, and more curled: among which riſe vp tender ſtalks ſet with the like leaues but much leſſer: on the tops whereof grow ſmall moſſie floures cluſtering thicke together, of a yellowiſh greene colour. The ſeed is ſmall and yellow, incloſed in greene husks. The root is thicke, and full of threddy ſtrings.

¶ *The Place.*

It groweth of it ſelfe wilde in diuers places, as in the towne paſtures of Andouer, and in many other places in Barkſhire and Hampſhire, in their paſtures and copſes, or low woods, and alſo vpon the banke of a mote that incloſeth a houſe in Buſhey called Bourn hall, fourteen miles from London, and in the high-way from thence to Watford, a ſmall mile diſtant from it.

¶ *The Time.*

It floureth in May and Iune: it flouriſheth in Winter as well as in Sommer.

¶ *The Names.*

It is called of the later Herbariſts *Alchimilla*: and of moſt, *Stellaria*, *Pes Leonis*, *Pata Leonis*, and *Sanicula maior*: in high-Dutch, **Synnauw**, and **Onſer Frauwen mantel**: in French, *Pied de Lion*: in Engliſh, Ladies mantle, great Sanicle, Lyons foot, Lyons paw; and of ſome, Padelyon.

¶ *The Temperature.*

Ladies mantle is like in temperature to little Sanicle, yet is it more drying and more binding.

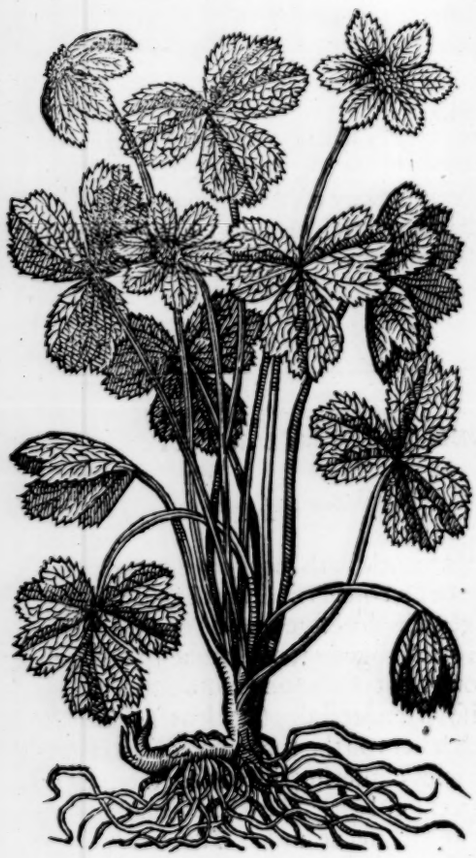
¶ *The Vertues.*

It is applied to wounds after the ſame manner that the ſmaller Sanicle is, being of like efficacie: it ſtoppeth bleeding, and alſo the ouermuch flowing of the naturall ſickneſſe: it keeps downe maidens paps or dugs, and when they be too great or flaggy it maketh them leſſer or harder. A

CHAP.

Chap. 366. *Of Neeſe-wort Sanicle.*

Elleborine Alpina.
Neeſewort Sanicle.



¶ *The Deſcription.*

When I made mention of *Helleborus albus*, I did alſo ſet downe my cenſure concerning *Elleborine*, or *Epipactis*: but this *Elleborine* of the Alpes I put in this place, becauſe it approcheth neerer vnto Sanicle and *Ranunculus*, as participating of both: it groweth in the mountaines and higheſt parts of the Alpiſh hills, and is a ſtranger as yet in our Engliſh gardens. The root is compact of many ſmall twiſted ſtrings like black Hellebor: from thence ariſe ſmall tender ſtalkes, ſmooth, and eaſie to bend; in whoſe tops grow leaues with fiue diuiſions, ſomewhat nickt about the edges like vnto Sanicle: the floures conſiſt of ſix leaues ſomewhat ſhining, in taſte ſharp, yet not vnpleaſant. This is the plant which *Pena* found in the forreſt of Eſens, not farre from Iupiters mount, and ſets forth by the name of *Alpina Elleborine Saniculæ & Ellebori nigri facie.*

¶ *The Nature and Vertues.*

I haue not as yet found any thing of his nature or vertues.

Chap. 367. *Of Crow-feet.*

¶ *The Kindes.*

There be diuers ſorts or kinds of theſe pernitious herbes comprehended vnder the name of *Ranunculus*, or Crowfoot, whereof moſt are very dangerous to be taken into the body, and therefore they require a very exquiſite moderation, with a moſt exact and due manner of tempering, not any of them are to be taken alone by themſelues, becauſe they are of moſt violent force, and therefore haue the greater need of correction.

The knowledge of theſe plants is as neceſſarie to the Phyſitian as of other herbes, to the end they may ſhun the ſame, as *Scribonius Largus* ſaith, and not take them ignorantly: or alſo, if neceſſitie at any time require, that they may vſe them, and that with ſome deliberation and ſpeciall choice, and with their proper correctiues. For theſe dangerous Simples are likewiſe many times of themſelues beneficiall, and oftentimes profitable: for ſome of them are not ſo dangerous, but that they may in ſome ſort, and oftentimes in fit and due ſeaſon profit and do good, if temperature and moderation be vſed: of which there be foure kindes, as *Dioſcorides* writeth; one with broad leaues, another that is downy, the third very ſmall, and the fourth with a white floure: the later herbariſts haue obſerued alſo many moe: all theſe may be brought into two principall kindes, ſo that one be a garden or tame one, and the other wilde; and of theſe ſome are common, and others rare, or forreigne. Moreouer, there is a difference both in the roots and in the leaues; for one hath a bumped or knobby root, another a long leafe as Speare-wort: and firſt of the wilde or field Crowfeet, referring the Reader vnto the end of the ſtocke and kindred of the ſame, for the temperature and vertues.

1 *Ranunculus pratenſis, etiamque hortenſis.*
Common Crow-foot.

2 *Ranunculus ſurrectis cauliculis.*
Right Crow-foot.

3 *Ranunculus aruorum.*
Crowfoot of the fallowed field.

4 *Ranunculus Alpinus albus.*
White mountaine Crow-foot.

¶ The

¶ *The Deſcription.*

1 THe common Crow-foot hath leaues diuided into many parts, commonly three, ſometimes fiue, cut here and there in the edges, of a deepe greene colour, in which ſtand diuers white ſpots: the ſtalkes be round, ſomething hairie, ſome of them bow downe toward the ground, and put forth many little roots, whereby it taketh hold of the ground as it traileth along: ſome of them ſtand vpright, a foot high or higher; on the tops whereof grow ſmall floures with fiue leaues apiece, of a yellow glittering colour like gold: in the middle part of theſe floures ſtand certaine ſmall threds of like colour: which being paſt, the ſeeds follow, made vp in a rough ball: the roots are white and threddy.

2 The ſecond kinde of Crow-foot is like vnto the precedent, ſauing that his leaues are fatter, thicker, and greener, and his ſmall twiggy ſtalkes ſtand vpright, otherwiſe it is like: of which kind it chanced, that walking in the field next to the Theatre by London, in the company of a worſhipfull merchant named M^r. *Nicolas Lete*, I found one of this kinde there with double floures, which before that time I had not ſeene.

¶ *The Place.*

They grow of themſelues in paſtures and medowes almoſt euery where.

¶ *The Time.*

They floure in May and many moneths after.

¶ *The Names.*

Crow-foot is called of *Lobel*, *Ranunculus pratenſis*: of *Dodonæus*, *Ranunculus hortenſis*, but vnproperly: of *Pliny*, *Polyanthemum*, which he ſaith diuers name *Batrachion*: in high-Dutch, **Schmalkbluom**: in low Dutch, **Boter bloemen**: in Engliſh, King Kob, Gold cups, Gold knobs, Crowfoot, and Butter-floures.

¶ *The Deſcription.*

3 The third kinde of Crow-foot, called in Latine *Ranunculus aruorum*, becauſe it growes commonly in fallow fields where corne hath beene lately ſowne, and may be called Corne Crow-foot, hath for the moſt part an vpright ſtalke of a foot high, which diuides it ſelfe into other branches: whereon do grow fat thicke leaues very much cut or iagged, reſembling the leaues of Sampire, but nothing ſo greene, but rather of an ouerworne colour. The floures grow at the top of the branches, compact of fiue ſmall leaues of a faint yellow colour: after which come in place cluſters of rough and ſharpe pointed ſeeds. The root is ſmall and threddy.

4 The fourth Crow-foot, which is called *Ranunculus Alpinus*, becauſe thoſe that haue firſt written thereof haue not found it elſewhere but vpon the Alpiſh mountains (notwithſtanding it groweth in England plentifully wilde, eſpecially in a wood called Hampſted Wood, and is planted in gardens) hath diuers great fat branches two cubits high, ſet with large leaues like the common Crow-foot, but greater, of a deepe greene colour, much like to thoſe of the yellow Aconite, called *Aconitum luteum Ponticum*. The floures conſiſt of fiue white leaues, with ſmall yellow chiues in the middle, ſmelling like the floures of May or Haw-thorne, but more pleaſant. The roots are greater than any of the ſtocke of Crow-feet.

¶ *The Place and Time.*

Their place of growing is touched in their deſcription: their time of flouring and ſeeding anſwereth the other of their kindes.

¶ *The Names.*

The white Crow-foot of the Alps and French mountaines is the fourth of *Dioſcorides* his deſcription; for he deſcribeth his fourth to haue a white floure: more hath not bin ſaid touching the names, yet *Tabern.* calls it *Batrachium album*: in Engliſh, white Crow-foot.

¶ *The Deſcription.*

5 Among the wilde Crow-feet there is one that is ſyrnamed *Illyricus*, which brings forth ſlender ſtalks, round, and of a meane length: whereupon doe grow long narrow leaues cut into many long gaſhes, ſomthing white, and couered with a certaine downineſſe: the floures be of a pale yellow colour: the root conſiſteth of many ſmall bumpes as it were graines of corne, or little long bulbes growing cloſe together like thoſe of Pilewort. It is reported, that it was firſt brought out of Illyria into Italy, and from thence into the Low-Countries: notwithſtanding we haue it growing very common in England. ‡ But only in gardens that I haue ſeene. ‡

6 The ſixth kinde of Crow-foot, called *Ranunculus bulboſus*, or Onion rooted Crow-foot, and round rooted Crow-foot, hath a round knobby or onion-faſhioned root, like vnto a ſmall Turnep, and of the bigneſſe of a great Oliue: from the which riſes vp many leaues ſpred vpon the ground, like thoſe of the field Crow-foot, but ſmaller, and of an ouerworne greene colour: amongſt which riſe vp ſlender ſtalkes of the height of a foot: whereupon do grow floures of a feint yellow colour. ‡ This growes wilde in moſt places, and floures at the beginning of May. ‡

¶ *The*

¶ *The Place.*

It is alſo reported to be found not only in Illyria and Sclauonia, but alſo in the Iſland Sardinia, ſtanding in the Midland, or Mediteranian ſea.

¶ *The Names.*

This Illyrian Crowfoot is named in Greeke σίαμον ἄγριον, that is, *Apium ſylueſtre*, or wilde Smallage: alſo *Herba Sardoa*: it may be, ſaith my Author, that kinde of Crowfoot called *Apium riſus*, and γελοτοφύλλις; and this is thought to be that *Golotophillis*, of which *Pliny* maketh mention in his 24. booke, 17. chap. which being drunke, ſaith he, with wine and myrrh, cauſeth a man to ſee diuers ſtrange ſights, and not to ceaſe laughing till he hath drunke Pine apple kernells with Pepper in wine of the Date tree, (I thinke he would haue ſaid vntill he be dead) becauſe the nature of laughing Crowfoot is thought to kill laughing, but without doubt the thing is cleane contrary; for it cauſeth ſuch conuulſions, cramps and wringings of the mouth and jawes, that it hath ſeemed to ſome that the partyes haue dyed laughing, whereas in truth they haue died in great torment.

5 *Ranunculus Illyricus.*
Crowfoot of Illyria.

6 *Ranunculus bulboſus.*
Roundrooted Crowfoot.

¶ *The Deſcription.*

7 The ſeuenth kinde of Crowfoot, called *Auricomus* of the golden lockes wherewith the floure is thrummed, hath for his root a great buſh of blackiſh hairy ſtrings; from which ſhoote forth ſmall jagged leaues, not much vnlike to Sanicle, but diuided onely into three parts, yet ſometimes into fiue; among which riſe vp branched ſtalkes of a foot high, whereon are placed the like leaues but ſmaller, ſet about the top of the ſtalkes, whereon do grow yellow floures, ſweet ſmelling, of which it hath been called *Ranunculus dulcis*, *Tragi*, or *Tragus* his ſweet Crowfoot. ‡ It growes in medowes and about the ſides of woods, and floures in Aprill. ‡

† 8 Frogge Crowfoot, called of *Pena*, *Aconitum Batrachioides*: of *Dodonæus*, *Batrachion Apulei*, is that formerly deſcribed in the fourth place, whereto this is much alike, but that the ſtalkes and leaues are larger, as alſo the floures, which are white: the root is tough and threddy.

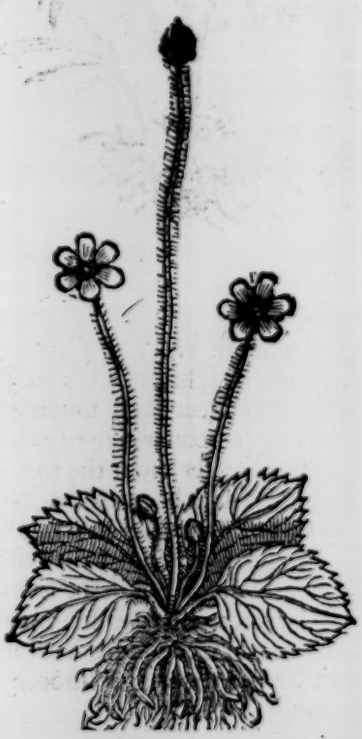
9 The ninth Crowfoote hath many graſſie leaues, of a deepe greene tending to blewneſſe, ſomewhat long, narrow and ſmooth, very like vnto thoſe of the ſmall Biſtort, or Snakeweed:

7 *Ranunculus auricomus.*
Golden-haired Crow-foot.

† 8 *Ranunculus Aconiti folio.*
Frog Crow-foot.

9 *Ranunculus graminens Lobelij.*
Graſſie Crow-foot.

10 *Ranunculus Autumnalis Cluſij.*
Winter Crow-foot.

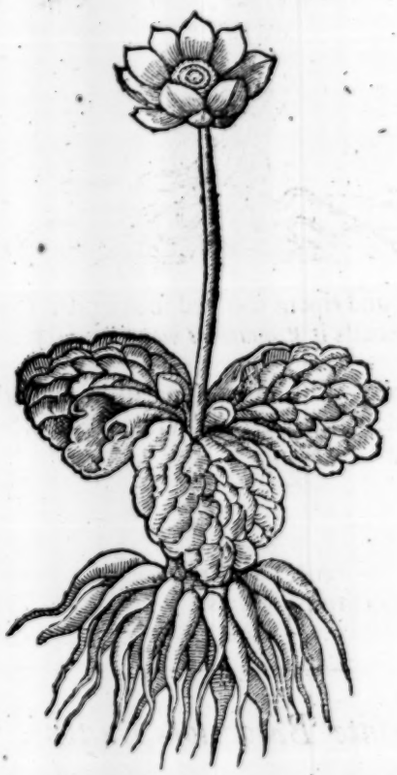


among which riſe vp ſlender ſtalkes, bearing at the top ſmall yellow floures like the other Crow-feet: the root is ſmall and threddy. ‡ There is a variety of this hauing double floures; and I haue giuen you the figure thereof in ſtead of the ſingle that was formerly in this place. ‡

10 The Autumne or Winter Crow-foot hath diuers broad leaues ſpred vpon the ground, ſnipt about the edges, of a bright ſhining greene colour on the vpper ſide, and hoary vnderneath, full of ribs or ſinewes as are thoſe of Plantaine, of an vnpleaſant taſte at the firſt, afterward nipping the tongue: among which leaues riſe vp ſundry tender foot-ſtalkes, on the tops whereof ſtand yellow floures conſiſting of ſix ſmall leaues apiece: after which ſucceed little knaps of ſeed like to a dry or withered ſtraw-berry. The root is compact of a number of limber roots, rudely thruſt together in manner of the Aſphodill.

11 The Portugall Crow-foot hath many thicke clogged roots faſtned vnto one head, very like thoſe of the yellow Aſphodill: from which riſe vp three leaues, ſeldome more, broad, thicke, and puffed vp in diuers places, as if it were a thing that were bliſtered, by meanes whereof it is very vneuen. From the middle of which leaues riſeth vp a naked ſtalke, thicke, fat, very tender, but yet fragile, or eaſie to breake: on the end whereof ſtandeth a faire ſingle yellow floure, hauing in the middle a naked rundle of a gold yellow tending to a Saffron colour.

11 *Ranunculus Luſitanicus Cluſij.*
Portugall Crow-foot.



12 *Ranunculus globoſus.*
Locker Gowlons, or Globe Crowfoot.

12 The Globe Crow-foot hath very many leaues deepely cut and iagged, of a bright greene colour like thoſe of the field Crow-foot: among which riſeth vp a ſtalke, diuided toward the top into other branches, furniſhed with the like leaues of thoſe next the ground, but ſmaller: on the tops of which branches grow very faire yellow floures, conſiſting of a few leaues folded or rolled vp together like a round ball or globe: whereupon it was called *Ranunculus globoſus*, or the Globe Crow-foot, or Globe floure: which being paſt, there ſucceed round knaps, wherein is blackiſh ſeed. The root is ſmall and threddy.

‡ 13 This hath large leaues like thoſe of the laſt deſcribed, but rough and hairy: the ſtalk is ſome foot high: the floures are pretty large, compoſed of fiue white ſharpiſh pointed leaues. It floures in Iuly, and growes in the Alps: it is the *Ranunculi montani* 2. *ſpecies altera* of *Cluſius*.

14 This other hath leaues not vnlike thoſe of the precedent, and ſuch ſtalkes alſo; but the floures conſiſt of 5 round leaues, purpliſh beneath; the edges of the vpper ſide are of a whitiſh purple, & the reſidue wholly white, with many yellow threds in the middle: it grows in the mountain

‡ 13 *Ranunculus hirſutus Alpinus flo. albo.*
Rough white floured mountaine Crow-foot.

‡ 14 *Ranunculus montanus hirſutus purpureus.*
Rough purple floured mountain Crowfoot.

Iura, againſt the city of Geneua, whereas it floures in Iune, and ripens the ſeed in Auguſt. *Cluſius* had the figure and deſcription hereof from Dr. *Penny*, and he calls it *Ranunculus montanus* 3. ‡

¶ *The Place.*

The twelfth kind of Crowfoot groweth in moſt places of York-ſhire and Lancaſhire, and other bordering ſhires of the North countrey, almoſt in euery medow, but not found wilde in theſe Southerly or Weſterly parts of England that I could euer vnderſtand of.

¶ *The Time.*

It floureth in May and Iune: the ſeed is ripe in Auguſt.

¶ *The Names.*

The Globe floure is called generally *Ranunculus globoſus:* of ſome, *Flos Trollius*, and *Ranunculus Alpinus:* in Engliſh, Globe Crow-foot, Troll floures, and Lockron gowlons.

Chap. 368. *Of Double yellow and white Batchelors Buttons.*

¶ *The Deſcription.*

1 THe great double Crow-foot or Batchelors button hath many iagged leaues of a deepe greene colour: among which riſe vp ſtalkes, whereon do grow faire yellow floures exceeding double, of a ſhining yellow colour, oftentimes thruſting forth of the middeſt of the ſaid floures one other ſmaller floure: the root is round, or faſhioned like a Turnep; the form whereof hath cauſed it to be called of ſome S. Anthonies Turnep, or Rape Crow-foot. The ſeed is wrapped in a cluſter of rough knobs, as are moſt of the Crow-feet.

2 The double yellow Crow-foot hath leaues of a bright greene colour, with many weake branches trailing vpon the ground; whereon do grow very double yellow floures like vnto the precedent, but altogether leſſer. The whole plant is likewiſe without any manifeſt difference, ſauing that theſe floures do neuer bring forth any ſmaller floure out of the middle of the greater, as the other doth, and alſo hath no Turnep or knobby root at all, wherein conſiſts the greateſt difference.

3 The

† *Ranunculus maximus Anglicus.*
Double Crow-foot, or Batchelors buttons.

2 *Ranunculus dulcis multiplex.*
Double wilde Crow-foot.

3 *Ranunculus albus multiflorus.*
Double white Crow-foot.

3 The white double Crow-foot hath many great leaues deeply cut with great gaſhes, and thoſe ſnipt about the edges. The ſtalks diuide themſelues into diuers brittle branches, on the tops whereof do grow very double floures as white as ſnow, and of the bigneſſe of our yellow Batchelors button. The root is tough, limber, and diſperſeth it ſelfe farre abroad, whereby it greatly increaſeth.

¶ *The Place.*

The firſt and third are planted in gardens for the beauty of the floures, and likewiſe the ſecond, which hath of late beene brought out of Lancaſhire vnto our London gardens, by a curious gentleman in the ſearching forth of Simples, M^r. *Thomas Hesketh*, who found it growing wilde in the towne fields of a ſmal village called Hesketh, not farre from Latham in Lancaſhire.

¶ *The Time.*

They floure from the beginning of May to the end of Iune.

¶ *The Names.*

Dioſcorides hath made no mention hereof; but *Apuleius* hath ſeparated the firſt of theſe from the others, intreating of it apart, and naming it by a peculiar name *Batrachion*; whereupon it is alſo called *Apuleij Batrachion*, or *Apuleius* Crow-foot.

It is commonly called *Rapum D. Anthonij*, or Saint Anthonies Rape: it may be called in Engliſh, Rape Crow-foot: it is called generally about London, Batchelors buttons, and double Crow-foot: in

Dutch, **S. Anthony Rapkin.** ‡ Theſe names and faculties properly belong to the *Ranunculus bulboſus*, deſcribed in the ſixt place of the laſt chapter; and alſo to the firſt double one here deſcribed; for they vary little but in colour, and the ſingleneſſe and doubleneſſe of their floures. ‡

The third is called of *Lobel, Ranunculus niueus polyanthos:* of *Tabern. Ranunculus albus multiflorus:* in Engliſh, Double white Crow-foot, or Batchelors buttons.

¶ *The Temperature.*

Theſe plants do bite as the other Crow-feet do.

¶ *The Vertues.*

A The chiefeſt vertue is in the root, which being ſtamped with ſalt is good for thoſe that haue a plague ſore, if it be preſently in the beginning tied to the thigh, in the middle between the groin or flanke and the knee: by meanes whereof the poyſon and malignitie of the diſeaſe is drawn from the inward parts, by the emunctorie or clenſing place of the flanke, into thoſe outward parts of leſſe account: for it exulcerateth and preſently raiſeth a bliſter, to what part of the body ſoeuer it is applied. And if it chance that the ſore hapneth vnder the arme, then it is requiſite to apply it to the arme a little aboue the elbow. My opinion is, that any of the Crow-feet will do the ſame: my reaſon is, becauſe they all and euery of them do bliſter and cauſe paine, whereſoeuer they be applied, and paine doth draw vnto it ſelfe more paine; for the nature of paine is to reſort vnto the weakeſt place, and where it may finde paine; and likewiſe the poyſon and venomous qualitie of that diſeaſe is to reſort vnto that painefull place.

B *Apuleius* ſaith further, That if it be hanged in a linnen cloath about the necke of him that is lunaticke, in the waine of the moone, when the ſigne ſhall be in the firſt degree of *Taurus* or *Scorpio*, that then he ſhall forthwith be cured. Moreouer, the herbe *Batrachion* ſtamped with vineger, root and all, is vſed for them that haue blacke skars or ſuch like marks on their skins, it eats them out, and leaues a colour like that of the body.

† The figure that formerly was in the firſt place of this chapter was the double one mentioned in the ſecond deſcription of the foregoing chapter, whereto you may finde a double floure expreſt by the ſide of the figure.

Chap. 369. *Of Turkie or Aſian Crow-feet.*

1 *Ranunculus ſanguineus multiplex.*
The double red Crow-foot.

‡ 2 *Ranunculus Aſiaticus flo. pleno miniato.*
The double Aſian skarlet Crow-foot.

‡ 3 *Ranunculus Aſiaticus flore pleno prolifero.*
The double buttoned ſcarlet Aſian Crow-foot.

4 *Ranunculus Tripolitanus.*
Crow-foot of Tripolie.

‡ 5 *Ranunculus grumoſa radice ramoſus.*
Branched red Aſian Crow-foot.

‡ 6 *Ranunculus Aſiaticus grumoſa radice flo. albo.*
White floured Aſian Crow-foot.

‡ 7 *Ranunculus Aſiaticus grumoſa radice flore flavo vario.*
Aſian Crow-foot with yellow ſtriped floures.

¶ *The Deſcription.*

1 THe double red Crow-foot hath a few leaues riſing immediatly forth of the ground, cut in the edges with deepe gaſhes, ſomewhat hollow, and of a bright ſhining green colour. The ſtalk riſeth vp to the height of a foot, ſmooth and very brittle, diuiding it ſelfe into other branches, ſometimes two, ſeldome three: whereon do grow leaues confuſedly, ſet without order: the floures grow at the tops of the ſtalks, very double, and of great beauty, of a perfect ſcarlet colour, tending to redneſſe. The root is compact of many long tough roots, like thoſe of the yellow Aſphodill.

‡ 2 Of this kinde there is alſo another, or other the ſame better expreſt; for *Cluſius* the author of theſe neuer ſee the former, but makes it onely to differ, in that the floures are of a ſanguine colour, and thoſe of this of a kinde of ſcarlet, or red lead colour.

3 This differs nothing from the former, but that it ſends vp another floure ſomewhat leſſer, out of the middle of the firſt floure, which happens by the ſtrength of the root, and goodneſſe of the ſoile where it is planted. ‡

4 The Crow-foot of Tripolis or the ſingle red *Ranunculus* hath leaues at the firſt comming vp like vnto thoſe of Groundſwell: among which riſeth vp a ſtalke of the height of halfe a cubit, ſomwhat hairy, wheron grow broad leaues deeply cut, euen to the middle rib, like thoſe of the common Crow-foot, but greener: the floure groweth at the top of the ſtalke, conſiſting of fiue leaues, on the outſide of a darke ouerworne red colour, on the inſide of a red lead colour, bright and ſhining, in ſhape like the wilde corne Poppie: the knop or ſtile in the middle which containeth the ſeede is garniſhed or bedeckt with very many ſmall purple thrummes tending to blackneſſe: the root is as it were a roundell of little bulbes or graines like thoſe of the ſmall Celandine or Pilewoort.

‡ 5 There be diuers other Aſian Crow-feet which *Cluſius* hath ſet forth, and which grow in the moſt part in the gardens of our prime Floriſts, and they differ little in their roots, ſtalkes, or leaues, but chiefely in the floures; wherefore I will onely briefely note their differences, not thinking it pertinent to ſtand vpon whole deſcriptions, vnleſſe they were more neceſſary: this firſt differs from the fourth in that the ſtalkes are diuided into ſundry branches, which beare like, but leſſe floures than thoſe which ſtand vpon the main ſtalke: the colour of theſe differs not from that of the laſt deſcribed.

6 This is like the laſt deſcribed, but the floures are of a pure white colour, and ſometimes haue a few ſtreaks of red about their edges.

7 This in ſtalkes and manner of growing is like the precedent: the ſtalke ſeldome parting it ſelfe into branches; but on the top thereof it carries a faire floure conſiſting commonly of round topped leaues of a greeniſh yellow colour, with diuers red veines here and there diſperſed and running alongſt the leaues, with ſome purple thrums, and a head ſtanding vp in the middle as in the former. ‡

¶ *The Place.*

The firſt groweth naturally in and about Conſtantinople, and in Aſia on the further ſide of Boſphorus, from whence there hath been brought plants at diuers times, and by diuers perſons, but they haue periſhed by reaſon of their long iourney, and want of skill of thoſe bringers, that haue ſuffered them to lie in a box or ſuch like ſo long, that when we haue receiued them they haue been as dry as ginger; notwithſtanding *Cluſius* ſaith he receiued a plant freſh and greene, the which a domeſtical theefe ſtole forth of his garden. My Lord and Maſter the right Honorable the Lord Treaſurer

ſurer had diuers plants ſent him from thence which were drie before they came, as aforeſaid. The other groweth in Aleppo and Tripolis in Syria naturally, from whence we haue receiued plants for our gardens, where they flouriſh as in their owne countrey.

¶ *The Time.*

They bring forth their pleaſant floures in May and Iune, the ſeed is ripe in Auguſt.

¶ *The Names.*

The firſt is called *Ranunculus Conſtantinopolitanus:* Of *Lobel, Ranunculus ſanguineus multiplex, Ranunculus Bizantinus, ſive Aſiaticus:* in the Turkiſh tongue, *Torobolos, Catamer laile:* in Engliſh, the double red Ranunculus, or Crow-foot.

The fourth is called *Ranunculus Tripolitanus,* of the place from whence it was firſt brought into theſe parts: of the Turks, *Tarobolos Catamer,* without that addition *laile:* which is a proper word to all floures that are double.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the other Crow-feet, whereof they are thought to be kindes.

Chap. 370. *Of Speare-woort, or Bane-woort.*

¶ *The Deſcription.*

1 Speare-woort hath an hollow ſtalke full of knees or ioynts, whereon do grow long leaues, a little hairy, not vnlike thoſe of the willow, of a ſhining green colour: the floures are very large, and grow at the tops of the ſtalks, conſiſting of fiue leaues of a faire yellow colour, verie like to the field gold cup, or wilde Crow-foot: after which come round knops or ſeed veſſels, wherein is the ſeed: the root is contract of diuers bulbes or long clogs, mixed with an infinite number of hairy threds.

1 *Ranunculus flammeus maior.*
Great Speare-woort.

2 *Ranunculus flammeus minor.*
The leſſer Speare-woort.

2 The

2 The common Spearewoort being that which we haue called the leſſer, hath leaues, floures, and ſtalks like the precedent, but altogether leſſer: the roote conſiſteth of an infinite number of threddie ſtrings.

3 *Ranunculus flammeus ſerratus.*
Iagged Speare-woort.

4 *Ranunculus paluſtris rotundifolius.*
Mariſh Crow-foot, or Speare-worts.

3 Iagged Speare-woort hath a thicke fat hollow ſtalke, diuiding it ſelfe into diuers branches, whereon are ſet ſomtimes by couples two long leaues, ſharp pointed, & cut about the edges like the teeth of a ſaw. The floures grow at the top of the branches, of a yellow colour, in form like thoſe of the field Crowfoot: the root conſiſteth of a number of hairy ſtrings.

4 Marſh Crow-foot, or Speare-woort (whereof it is a kinde, taken of the beſt approued authors to be the true *Apium riſus*, though diuers thinke that *Pulſatilla* is the ſame: of ſome it is called *Apium hæmorrhoidarum*) riſeth forth of the mud or wateriſh mire from a threddie root, to the height of a cubit, ſometimes higher. The ſtalke diuideth it ſelfe into diuers branches, whereupon doe grow leaues deeply cut round about like thoſe of Doues-foot, and not vnlike to the cut Mallow, but ſomewhat greater, and of a moſt bright ſhining green colour: the floures grow at the top of the branches, of a yellow colour, like vnto the other water Crow-feet.

¶ *The Place.*

They grow in moiſt and dankiſh places, in brinkes or water courſes, and ſuch like places almoſt euery where.

¶ *The Time.*

They floure in May when other Crow-feet do.

¶ *The Names.*

Speare-woort is called of the later Herbariſts *Flammula*, and *Ranunculus Flammeus*; of *Cordus*, *Ranunculus* πλατύφυλλος, or broad leaued Crow-foot: of others, *Ranunculus longifolius*, or long leafed Crow foot: in Low Dutch, **Egelcoolen**: in Engliſh, Speare-Crowfoot, Speare-woort, and Banewoort, becauſe it is dangerous and deadly for ſheep; and that if they feed of the ſame it inflameth their liuers, fretteth and bliſtereth their guts and intrails.

¶ *The Temperature of all the Crowfeet.*

Speare-woort is like to the other Crow-feet in facultie, it is hot in the mouth or biting, it exulcerateth

cerateth and raiſeth bliſters, and being taken inwardly it killeth remedileſſe. Generally all the Crow-feet, as *Galen* ſaith, are of a very ſharpe or biting qualitie, inſomuch as they raiſe bliſters with paine: and they are hot and drie in the fourth degree.

¶ *The Vertues of all the Crowfeet.*

The leaues or roots of Crowfeet ſtamped and applied vnto any part of the body, cauſeth the skin to ſwell and bliſter, and raiſeth vp wheales, bladders, cauſeth ſcars, cruſts, and ouglie vlcers: it is laid vpon cragged warts, corrupt nailes, and ſuch like excreſcences, to cauſe them to fall away. A

The leaues ſtamped and applied vnto any peſtilentiall or plague ſore, or carbuncle, ſtaieth the ſpreading nature of the ſame, and cauſeth the venomous or peſtilentiall matter to breath forth, by opening the parts and paſſages in the skin. B

It preuaileth much to draw a plague ſore from the inward parts, being of danger, vnto other remote places further from the heart, and other of the ſpirituall parts, as hath beene declared in the deſcription. C

Many do vſe to tie a little of the herbe ſtamped with ſalt vnto any of the fingers, againſt the pain of the teeth; which medicine ſeldome faileth; for it cauſeth greater paine in the finger than was in the tooth, by the meanes whereof, the greater paine taketh away the leſſer. D

Cunning beggers do vſe to ſtampe the leaues, and lay it vnto their legs and arms, which cauſeth ſuch filthy vlcers as we daily ſee (among ſuch wicked vagabonds) to moue the people the more to pittie. E

The kinde of Crowfoot of Illyria, being taken to be *Apium riſus* of ſome, yet others thinke *Aconitum Batrachioides* to be it. This plant ſpoileth the ſences and vnderſtanding, and draweth together the ſinewes and muſcles of the face in ſuch ſtrange manner, that thoſe who beholding ſuch as died by the taking hereof, haue ſuppoſed that they died laughing; ſo forceably hath it drawne and contracted the nerues and ſinewes, that their faces haue been drawne awry, as though they laughed, whereas contrariwiſe they haue died with great torment. F

‡ CHAP. 371. *Of diuers other Crowfeet.*

‡ 1 *Ranunculus Creticus latifolius.*
Broad leaued Candy Crowfoot:

‡ 2 *Ranunculus folio Plantaginis.*
Plantaine leaued Crowfoot.

¶ *The*

¶ *The Deſcription.*

‡ 1 THe roots of this are ſomwhat like thoſe of the Aſian *Ranunculus*: the leaues are verie large & roundiſh, of a light green colour, cut about the edges, & here and there deeply diuided: the ſtalke is thicke, round, and ſtiffe, diuided into two or three branches; at the ſetting on of which grow longiſh leaues a little nickt about the end: the floures are of an indifferent bigneſſe, and conſiſt of fiue longiſh round pointed leaues, ſtanding a little each from other, ſo that the green points of the cups ſhew themſelues between them: there are yellow threds in the middle of theſe floures, which commonly ſhew themſelues in Februarie, or March. It is found only in ſome gardens, and *Cluſius* onely hath ſet it forth by the name we here giue you.

2 This alſo that came from the Pyrenæan hills is made a Denizen in our gardens: it hath a ſtalke ſome foot high, ſet with neruous leaues, like thoſe of Plantaine, but thinner, and of the colour of Woad, and they are ſomething broad at their ſetting on, and end in a ſharpe point: at the top of the ſtalke grow the floures; each conſiſting of fiue round ſlender pure white leaues, of a reaſonable bigneſſe, with yellowiſh threds and a little head in the middle: the root is white and fibrous. It floures about the beginning of May. *Cluſius* alſo ſet forth this by the title of *Ranunculus Pyrenæus albo flore*.

3 The ſame Author hath alſo giuen vs the knowledge of diuers other plants of this kinde, and this hee calls *Ranunculus montanus* 1. It hath many round leaues, here and there deeply cut in, and ſnipt about the edges, of a darke greene colour, and ſhining, pretty thicke, and of a very hot taſte: amongſt which riſes vp a ſlender, ſingle, and ſhort ſtalke, bearing a white floure made of fiue little leaues with a yellowiſh thrum in the middle: which falling, the ſeeds grow cluſtering together as in other plants of this kinde: the root is white and fibrous.

‡ 3 *Ranunculus montanus flo. minore.*
Mountain Crowfoot with the leſſer floure.

‡ 4 *Ranunculus montanus flore maiore.*
Mountain Crowfoot with the bigger floure.

4 This alſo is nothing elſe but a varietie of the laſt deſcribed, and differs from it in that the floures are larger, and it is ſometimes found with them double. Both theſe grow on the tops of the Alpes, and there they floure as ſoone as the ſnow is melted away, which is vſually in Iune: but brought into gardens they floure very early, to wit, in Aprill.

5 The leaues of this are cut or diuided into many parts, like thoſe of Rue, but ſofter, & greener (whence *Cluſius* names it *Ranunculus Rutæ folio*) or not much vnlike thoſe of Coriander (whereupon

Pona

‡ 5 *Ranunculus præcox rutaceo folio.*
Rue leaued Crowfoot.

‡ 6 *Ranunculus Præcox Thalictri folio.*
Columbine Crowfoot.

‡ 7 *Ranunculus parvus echinatus.*
Small rough headed Crowfoot.

Pona calls it *Ranunculus Coriandri folio*:) amongſt or ratherbefore theſe comes vp a ſtalk ſome hand full high,bearing at the top thereof one floure of a reaſonable bigneſſe: on the outſide before it be throughly open of a pleaſing red color, but white within,compoſed of twelue or more leaues.

6 This hath a ſtalke ſome foot high,ſmall and reddiſh,whereon grow ſundry leaues like thoſe of the greater *Thalictrum*, or thoſe of Columbines, but much leſſe,and of a bitter taſte: out of the boſomes of theſe leaues come the floures at each ſpace one,white,and conſiſting of fiue leaues apiece: which falling, there ſucceed two or three little hornes containing a round reddiſh ſeed: the root is fibrous,white,very bitter, and creepes here and there,putting vp new ſhoots. It growes in diuers woods of Auſtria, and floures in Aprill, and the ſeed is ripe in May,or Iune. *Cluſius* calls it *Ranunculus præcox* 2. *Thalietri folio.* It is the *Aquilegia minor Daleſchampij* in the *Hiſt. Lugd.*

7 This which (as *Cluſius* ſaith) ſome call the *Ranunculus* of *Apuleius*, hath alſo a fibrous root, with ſmall leaues diuided into three parts, & cut about the edges, and they grow vpon ſhort foot-ſtalkes; the ſtalkes are ſome two handfulls high, commonly leaning on the ground, and on them grow ſuch leaues as the former: and out of their boſomes come little foot-ſtalks carrying floures of a pale yellow color,made of fiue leaues apiece,

which follow there ſucced fiue or ſix ſharpe pointed rough cods, conteining ſeed almoſt like that of the former. ‡

Chap. 372. *Of Woolfes-bane.*

¶ *The kindes.*

There be diuers ſorts of Wolfes-bane: whereof ſome bring forth flowers of a yellow colour; others of a blew, or tending to purple: among the yellow ones there are ſome greater, others leſſer; ſome with broader leaues, and others with narrower.

1 *Thora Valdenſis.*
Broad leafed VVolfes-bane.

2 *Thora montis Baldi, ſive Sabaudica.*
Mountaine VVolfes-bane.

¶ *The Deſcription.*

1 THe firſt kinde of *Aconite*, of ſome called *Thora*, others adde therto the place where it groweth in great abundance, which is the Alps, and call it *Thora Valdenſium*. This plant tooke his name of the Greek word θόος, ſignifying corruption, poiſon, or death, which are the certaine effects of this pernicious plant: for this they vſe very much in poiſons, and when they meane to infect their arrow heads, the more ſpeedily and deadly to diſpatch the wilde beaſts, which greatly annoy thoſe mountaines of the Alpes: to which purpoſe alſo it is brought into the Mart-townes neere vnto thoſe places to be ſold vnto the hunters, the iuice thereof beeing prepared by preſſing forth, and ſo kept in hornes and hoofes of beaſts, for the moſt ſpeedie poiſon of all the *Aconites*, for an arrow touched therewith, leaueth the wound vncureable (if it but onely fetch bloud where it entereth in) except that round about the wound the fleſh bee ſpeedily cut away in great quan-

argueth alſo that *Matthiolus* hath vnproperly called it *Pſeudoaconitum*, that is, falſe or baſtard Aconite; for without queſtion there is no worſe or more ſpeedie venome in the world, nor no Aconite or toxicall plant comparable hereunto. And yet let vs conſider the fatherly care and prouidence of God, who hath prouided a conquerour and triumpher ouer this plant ſo venomous, namely his *Antigoniſt*, *Antithora*, or to ſpeake in ſhorter and fewer ſyllables, *Anthora*, which is the very antidote or remedie againſt this kinde of Aconite. The ſtalke of this plant is ſmall and ruſhie, very ſmooth, two or three handfulls high: whereupon do grow two, three, or foure leaues, ſeldome more, which be ſomething hard, round, ſmooth, of a light greene colour tending to blewneſſe, like the colour of the leaues of Woad, nicked in the edges. The floures grow at the top of the ſtalkes, of a yellow colour, leſſer than thoſe of the field Crowfoot, otherwiſe alike: in the place therof groweth a knop or round head, wherein is the ſeed: the root conſiſteth of nine or ten ſlender clogs, with ſome ſmall fibers alſo, and they are faſtened together with little ſtrings vnto one head, like thoſe of the white Aſphodill.

2 Wolfes-bane of the mount Baldus hath one ſtalke, ſmooth and plaine, in the middle whereof come forth two leaues and no more, wherein it differeth from the other of the Valdens, hauing likewiſe three or foure ſharpe pointed leaues, narrow and ſomewhat iagged at the place where the ſtalke diuideth it ſelfe into ſmaller branches; whereon do grow ſmall yellow floures like the precedent, but much leſſer.

¶ *The Place.*

Theſe venomous plants doe grow on the Alpes, and the mountaines of Sauoy and Switzerland: the firſt grow plentifully in the countrey of the Valdens, who inhabite part of thoſe mountaines towards Italie. The other is found on Baldus, a mountaine of Italy. They are ſtrangers in England.

¶ *The Time.*

They floure in March and Aprill, their ſeed is ripe in Iune.

¶ *The Names.*

This kinde of Aconite or Wolfes-bane is called *Thora*, *Taura*, and *Tura*, it is ſurnamed *Valdenſis*, that it may differ from *Napellus*, or Monkes hood, which is likewiſe named *Thora*.

Auicen maketh mention of a certaine deadly herbe in his fourth booke, ſixt Fen. called *Farſiun*; it is hard to affirme this ſame to be *Thora Valdenſis*.

‡ *Geſner* iudges this to be the *Aconitum pardalianches* of *Dioſcorides*, and herein is followed by *Bauhine*. ‡

¶ *The Temperature and Vertues.*

The force of theſe Wolfes-banes, is moſt pernicious and poiſonſome, and (as it is reported) A exceedeth the malice of *Napellus*, or any of the other Wolfes-banes, as we haue ſaid.

They ſay that it is of ſuch force, that if a man eſpecially, and then next any foure footed beaſt B be wounded with an arrow or other inſtrument dipped in the iuice hereof, they die within halfe an houre after remedileſſe.

† There were formerly foure figures in this chapter, with as many deſcriptions, though the plants figured and deſcribed were but two, to which number they are now reduced. The two former, which were by the names of *Thora Valdenſis mas* and *fœmina*, thus diſtincted, the male had only two large round leaues, and the female foure. The other two being alſo of one plant are more deeply cut in vpon the top of the leaues, which are fewer and leſſer than thoſe of the former.

CHAP. 373. *Of Winter Wolfes-bane.*

¶ *The Deſcription.*

THis kinde of Aconite is called *Aconitum hyemale Belgarum*, of *Dodonæus*, *Aconitum luteum minus*: in Engliſh, VVolfes-bane, or ſmal yellow wolfes-bane, whoſe leaues come forth of the ground in the dead time of winter, many times bearing the ſnow vpon their heads of his leaues and floures; yea the colder the weather is, and the deeper that the ſnow is, the fairer and larger is the floure, and the warmer that the weather is, the leſſer is the floure, and worſe coloured: theſe leaues I ſay come forth of the ground immediatly from the root, with a naked, ſoft, and ſlender ſtem, deeply cut or iagged on the leaues, of an exceeding faire greene colour, in the midſt of which commeth forth a yellow floure, in ſhew or faſhion like vnto the common field Crow-foot: after which follow ſundry cods full of browne ſeeds like the other kindes of Aconites: the root is thicke, tuberous, and knottie, like to the kindes of Anemone.

Aconitum hyemale.
Winter Woolfes-bane.

A

¶ *The Place.*

It groweth vpon the mountaines of Germany: we haue great quantitie of it in our London gardens.

¶ *The Time.*

It floureth in Ianuarie; the ſeed is ripe in the end of March.

¶ *The Names.*

It is called *Aconitum hyemale*, or *Hibernum*, or winter Aconite: that it is a kinde of Aconite or Woolfs-bane, both the form of the leaues and cods, and alſo the dangerous faculties of the herbe it ſelfe do declare.

It is much like to *Aconitum Theophraſti*: which he deſcribeth in his ninth booke, ſaying, it is a ſhort herbe hauing no [illegible], or ſuperfluous thing growing on it, and is without branches as this plant is: the roote, ſaith he, is like to [illegible], or to a nut, or els to [illegible], a dry fig, onely the leafe ſeemeth to make against it, which is nothing at all like to that of Succorie, which he compareth it vnto.

¶ *The Temperature and Vertues.*

This herbe is counted to be very dangerous and deadly, hot and drie in the fourth degree, as *Theoph.* in plaine words doth teſtifie concerning his owne Aconite; for which he ſaith that there was neuer found his Antidote or remedie: whereof *Athenæus* and *Theopompus* write, that this plant is the moſt poiſonous herb of all others, which moued *Ouid* to ſay *Quæ quia naſcuntur dura vivacia cautè:* notwithſtanding it is not without his peculiar vertues. *Ioachimus Camerarius* now liuing in Noremberg ſaith, the water dropped into the eies ceaſeth the pain and burning: it is reported to preuaile mightily againſt the bitings of ſcorpions, and is of ſuch force, that if the ſcorpion paſſe by where it groweth and touch the ſame, preſently he becommeth dull, heauy, and ſenceleſſe, and if the ſame ſcorpion by chance touch the white Hellebor, he is preſently deliuered from his drowſineſſe.

Chap. 374. *Of Mithridate Woolfes-bane.*

¶ *The Deſcription.*

This plant called *Anthora*, being the antidote againſt the poiſon of *Thora*, *Aconite* or wolfes bane, hath ſlender hollow ſtalkes, very brittle, a cubit high, garniſhed with fine cut or iagged leaues, very like to *Nigella Romana*, or the common Larkes ſpurre, called *Conſolida Regalis:* at the top of the ſtalkes doe grow faire flowers, faſhioned like a little helmet, of an ouerworne yellow colour; after which come ſmall blackiſh cods, wherein is conteined blacke ſhining ſeed like thoſe of Onions: the root conſiſteth of diuers knobs or tuberous lumpes, of the bigneſſe of a mans thumbe.

¶ *The Place.*

This plant which in Greeke we may terme [illegible]: groweth abundantly in the Alps, called *Rhetici*, in Sauoy, and in Liguria. The Ligurians of Turin, and thoſe that dwell neere the lake Lemane, haue found this herbe to be a preſent remedy againſt the deadly poiſon of the herb *Thora* and the reſt of the Aconites, prouided that when it is brought into the garden there to be kept for Phyſicks vſe, it muſt not be planted neere to any of the Aconites: for through his attractiue qualitie, it will

draw

Anthora ſive Aconitum ſalutiferum.
Wholſome Wolfes-bane.

draw vnto it ſelf the maligne and venomous poiſon of the Aconite, whereby it will become of the like qualitie, that is, to become poiſonous likewiſe: but being kept far off, it retaineth his owne naturall qualitie ſtill.

¶ *The Time.*

It floureth in Auguſt, the ſeed is ripe in the end of September.

¶ *The Names.*

The inhabitants of the lake of Geneua, & the Piemontoiſe do call it *Anthora*, and the common people *Anthoro*. *Auicen* calleth a certaine herbe which is like to Monks hood, as a remedy againſt the poiſon thereof, by the name of *Napellus Moyſis*, in the 500 chap. of his ſecond booke, and in the 745. chap. he ſaith, that *Zedoaria* doth grow with *Napellus* or Monkes hood, and that by reaſon of the neereneſſe of the ſame, the force and ſtrength thereof is dulled and made weaker, and that it is a treacle, that is, a counterpoiſon againſt the Viper, Monks hood, & all other poiſons: and hereupon it followeth, that it is not only *Napellus Moyſis*, but alſo *Zedoaria Auicennæ*: notwithſtanding the Apothecaries do ſell another *Zedoaria* differing from *Anthora*, which is a root of a longer forme, which not without cauſe is thought to be *Auicens* and *Serapio's Zerumbeth*, or *Zurumbeth*.

It is called *Anthora*, as though they ſhould ſay *Antithora*, becauſe it is an enemie to *Thora*, and a counterpoiſon to the ſame. *Thora* and *Anthora*, or *Tura* and *Antura*, ſeeme to be new words, but yet they are vſed in *Marcellus Empericus*, an old writer, who teacheth a medicine to be made of *Tura* and *Antura* againſt the pin and web in the eies: in Engliſh, yellow Monks-hood, yellow Helmet floure, and Aconites Mithridate.

¶ *The Vertues.*

The root of *Anthora* is wonderfull bitter, it is an enemie to all poiſons; it is good for purgations; for it voideth by the ſtoole both waterie and ſlimie humours, killeth and driueth forth all manner of wormes of the belly. A

Hugo Solerius ſaith, that the roots of *Anthora* do largely purge, not onely by the ſtoole, but alſo by vomite: and that the meaſure thereof is taken to the quantitie of *Faſelus* (which is commonly called a beane) in broth or wine, and is giuen to ſtrong bodies. B

Antonius Guanerius doth ſhew in his treatie of the plague, the ſecond difference, the third chapter, that *Anthora* is of great force, yea and that againſt the plague: and the root is of like vertues, giuen with Dittanie, which I haue ſeene, ſaith he, by experience: and he further ſaith, it is an herbe that groweth hard by that herbe *Thora*, of which there is made a poiſon, wherewith they of Sauoy and thoſe parts adiacent do enuenome their arrowes, the more ſpeedily to kill the wilde Goats, and other wilde beaſts of the Alpiſh mountaines. And this root *Anthora* is the *Bezoar* or counterpoiſon to that *Thora*, which is of ſo great a venome, as that it killeth all liuing creatures with his poiſonſome qualitie: and thus much *Guanerius*. C

Simon Ianuenſis hath alſo made mention of *Anthora*, and *Arnoldus Villanouanus* in his treatie of poiſons: but their writings do declare that they did not well know *Anthora*. D

CHAP. 375. *Of yellow Wolfes-bane.*

¶ *The Deſcription.*

THe yellow kinde of Wolfes-bane called *Aconitum luteum Ponticum*, or according to *Dodonæus Aconitum Lycoctonon luteum maius*: in Engliſh, yellow Wolfes-bane, whereof this our age hath found out ſundry ſorts not knowne to *Dioſcorides*, although ſome of the ſorts ſeeme to ſtand

Aconitum lutcum Ponticum.
Yellow Woolfesbane.

indifferent betweene the kindes of *Ranunculus*, *Helleborus*, and *Napellus:*) this yellow kinde I ſay hath large ſhining greene leaues faſhioned like a vine, and of the ſame bigneſſe, deepely indented or cut, not much vnlike the leaues of *Geranium Fuſcum*, or blacke Cranes-bill: the ſtalkes are bare or naked, not bearing his leaues vpon the ſame ſtalkes, one oppoſite againſt another, as in the other of his kinde: his ſtalkes grow vp to the height of three cubits, bearing very fine yellow floures, fantaſtically faſhioned, and in ſuch manner ſhaped, that I can very hardly deſcribe them vnto you. They are ſomewhat like vnto the helmet Monkes hood, open and hollow at one end, firme and ſhut vp at the other: his roots are many, compact of a number of threddy or blacke ſtrings, of an ouerworne yellow colour, ſpreading far abroad euery way, folding themſelues one within another very confuſedly. This plant groweth naturally in the darke hillie forreſts, and ſhadowie woods, which are not trauelled nor haunted, but by wilde and ſauage beaſts, and is thought to be the ſtrongeſt and next vnto *Thora* in his poiſoning qualitie, of all the reſt of the Aconites, or Woolfes banes; inſomuch that if a few of the floures be chewed in the mouth, and ſpit forth againe preſently, yet forthwith it burneth the jawes and tongue, cauſing them to ſwell, and making a certaine ſwimming or giddineſſe in the head. This calleth to my remembrance an hiſtory of a certaine Gentleman dwelling in Lincolneſhire, called *Mahewe*, the true report whereof my very good friend Mr. *Nicholas Belſon*, ſometimes fellow of Kings Colledge in Cambridge, hath deliuered vnto me: Mr. *Mahewe* dwelling in Boſton, a ſtudent in Phyſicke, hauing occaſion to ride through the Fennes of Lincolneſhire, found a root that the hogs had turned vp, which ſeemed vnto him very ſtrange and vnknowne, for that it was in the ſpring before the leaues were out,: this he taſted, and it ſo inflamed his mouth, tongue, and lips, that it cauſed them to ſwell very extreamely, ſo that before he could get to the towne of Boſton he could not ſpeake, and no doubt had loſt his life if that the Lord God had not bleſſed thoſe good remedies which preſently he procured and vſed. I haue here thought good to expreſſe this hiſtory, for two eſpeciall cauſes; the firſt is, that ſome induſtrious and diligent obſeruer of nature may be prouoked to ſeeke forth that venemous plant, or ſome of his kindes: for I am certainely perſuaded that it is either the *Thora Valdenſium*, or *Aconitum luteum*, whereof this gentleman taſted, which two plants haue not at any time been thought to grow naturally in England: the other cauſe is, for that I would warne others to beware by that gentlemans harme. ‡ I am of opinion that this root which Mr. *Mahewe* taſted was of the *Ranunculus flammeus maior*, deſcribed in the firſt place of the 370. chapter aforegoing; for that growes plentifully in ſuch places, and is of a very hot taſte and hurtfull qualitie. ‡

¶ *The Place.*

The yellow Woolfes bane groweth in my garden, but not wilde in England, or in any other of theſe Northerly regions.

¶ *The Time.*

It floureth in the end of Iune, ſomewhat after the other Aconites.

¶ *The Names.*

This yellow Woolfes-bane is called of *Lobel*, *Aconitum luteum Ponticum*, or Ponticke Woolfesbane. There is mention made in *Dioſcorides* his copies of three Woolfes-banes, of which the hunters vſe one, and Phyſitions the other two. *Marcellus Virgilius* holdeth opinion that the vſe of this plant is vtterly to be refuſed in medicine.

¶ *The Temperature and Vertues.*

A The facultie of this Aconite, as alſo of the other Woolfes-banes, is deadly to man, and likewiſe to all other liuing creatures.

It

It is vſed among the hunters which ſeek after wolues, the iuyce whereof they put into raw fleſh, which the wolues deuoure, and are killed. B

Chap. 376.

Of other Wolfes-banes and Monkes-hoods.

¶ *The Deſcription.*

1 THis kinde of Wolfes-bane (called *Aconitum Lycoctonum*: and of *Dodonæus*, *Aconitum Lycoctonon flore Delphinij*, by reaſon of the ſhape and likenes that the floure hath with *Delphinium*, or Larkes-ſpur: and in Engliſh it is called blacke Wolfes-bane) hath many large leaues of a very deepe greene or ouerworne colour, very deepely cut or iagged: among which riſeth vp a ſtalke two cubits high; whereupon do grow floures faſhioned like a hood, of a very ill fauoured blewiſh colour, and the thrums or threds within the hood are blacke: the ſeed is alſo blacke and three cornered, growing in ſmall husks: the root is thicke and knobby.

† 1 *Aconitum lycoctonon flore Delphinij.*
Larks-heele Wolfes-bane.

† 2 *Aconitum lycoctonon cæruleum parvum.*
Small blew Wolfes-bane.

2 This kinde of Wolfes-bane, called *Lycoctonon cæruleum parvum, facie Napelli*: in Engliſh ſmall Wolfes-bane, or round Wolfes-bane, hath many ſlender brittle ſtalkes two cubits high, beſet with leaues very much iagged, and like vnto *Napellus*, called in Engliſh, Helmet-floure. The floures do grow at the top of the ſtalkes, of a blewiſh colour, faſhioned alſo like a hood, but wider open than any of the reſt: the cods and ſeed are like vnto the other: the root is round and ſmall, faſhioned like a Peare or ſmall Rape or Turnep: which moued the Germanes to call the ſame **Rapen bloc-men**, which is in Latine, *Flos rapaceus*: in Engliſh, Rape-floure.

3 This kinde of Wolfes-bane, called *Napellus verus*, in Engliſh, Helmet-floure, or the great Monkes-hood, beareth very faire and goodly blew floures in ſhape like an helmet; which are ſo beautifull, that a man would thinke they were of ſome excellent vertue, but *non eſt ſemper fides habenda fronti*. This plant is vniuerſally knowne in our London gardens and elſewhere; but naturally

it

it groweth in the mountaines of Rhetia, and in ſundry places of the Alps, where you ſhall find the graſſe that groweth round it eaten vp with cattell, but no part of the herbe it ſelfe touched, except by certain flies, who in ſuch aboundant meaſure ſwarme about the ſame that they couer the whole plant: and (which is very ſtrange) although theſe flies do with great delight feed hereupon, yet of them there is confected an Antidote or moſt auailable medicine againſt the deadly bite of the ſpider called *Tarantala*, or any other venomous beaſt whatſoeuer; yea, an excellent remedie not onely againſt the Aconites, but all other poyſons whatſoeuer. The medicine of the foreſaid flies is thus made: Take of the flies which haue fed themſelues as is aboue mentioned, in number twentie, of *Ariſtolochia rotunda*, and bole Armoniack, of each a dram.

4 There is a kinde of Wolfes-bane which *Dodonæus* reports he found in an old written Greeke booke in the Emperors Librarie at Vienna, vnder the the title of *Aconitum lycoctonum*, that anſwereth in all points vnto *Dioſcorides* his deſcription, except in the leaues. It hath leaues (ſaith hee) like vnto the Plane tree, but leſſer, and more full of iags or diuiſions; a ſlender ſtalke as Ferne, of a cubit high, bearing his ſeed in long cods: it hath blacke roots in ſhape like Creauiſes. Hereunto agreeth the Emperors picture in all things ſauing in the leaues, which are not ſo large, nor ſo much diuided, but notched or toothed like the teeth of a ſaw.

3 *Napellus verus cæruleus.*
Blew Helmet-floure, or Monks-hood.

‡ 4 *Aconitum lycoctonum ex Cod. Cæſareo.*

‡ 5 Beſides theſe mentioned by our Author there are ſundry other plants belonging to this pernitious Tribe, whoſe hiſtorie I will briefely runne ouer: The firſt of theſe is that which *Cluſius* hath ſet forth by the name of *Aconitum lycoctonum flo. Delphinij Sileſiacum*: it hath ſtalks ſome two or three cubits high, ſmooth and hollow, of a greeniſh purple colour, and couered with a certaine mealineſſe: the leaues grow vpon long ſtalks, being rough, and faſhioned like thoſe of the yellow Wolfes bane, but of a blacker colour: the top of the ſtalke ends in a long ſpike of ſpurre-floures, which before they be open reſemble locuſts or little Lyzards, with their long and crooking tailes; but opening they ſhew fiue leaues, two on the ſides, two below, and one aboue, which ends in a crooked taile or horne: all theſe leaues are wrinckled, and purple on their outſides, but ſmooth, and of an elegant blew within. After the floures are paſt ſucceed three ſquare cods, as in other Aconites, wherein is contained an vnequall browniſh wrinckled ſeed: the root is thicke, black, and tuberous. This growes naturally in ſome mountaines of Sileſia, and floures in Iuly and Auguſt.

6 The

‡ 5 *Aconitum lycoct. hirſutum flo. Delphinÿ.*
Rough Larks-heele Wolfes-bane.

‡ 6 *Aconitum violaceum.*
Violet coloured Monks hood.

‡ 7 *Aconitum purpureum Neubergenſe.*
Purple Monks-hood of Newburg.

‡ 8 *Aconitum maximum Iudenbergenſe.*
Large floured Monks-hood.

6 The leaues of this are ſomwhat like, yet leſſe than thoſe of our common Monks-hood, blackiſh on the vpper ſide and ſhining. The ſtalke is ſome cubit and halfe high, firme, full of pith, ſmooth, and ſhining; diuided towards the top into ſome branches carrying few floures, like in forme to thoſe of the vulgar Monks-hood, of a moſt elegant and deepe violet colour: the ſeeds are like the former, and roots round, thicke, and ſhort, with many fibres. It growes vpon the hils nigh Saltsburg, where it floures in Iuly: but brought into gardens it floures ſooner than the reſt of this kinde, to wit in May. *Cluſius* calls this *Aconitum lycoctonum* 4. *Tauricum*.

7 This hath leaues broader than thoſe of our ordinarie Monks-hood, yet like them: the ſtalke is round, ſtraight, and firme, and of ſome three cubits height, and oft times toward the top diuided into many branches, which carry their floures ſpike-faſhion, of a purple colour, abſolutely like thoſe of the common ſort, but that the thrummie matter in the middeſt of the floures is of a duskier colour. The root and reſt of the parts are like thoſe of the common kinde: it growes naturally vpon the Styrian Alpes, whereas it floures ſomewhat after the common kinde, to wit, in Iuly. *Cluſius* hath it by the name of *Aconitum lycoctonum* 5. *Neubergenſe*.

‡ 9 *Aconitum maximum nutante coma.*
Monkes-hood with the bending or nodding head.

8 The leaues of this are alſo diuided into fiue parts, and ſnipt about the edges, and doe very much reſemble thoſe of the ſmal Wolfs-bane deſcribed in the ſecond place, but that the leaues of that ſhine, when as theſe do not: the ſtalke is two cubits high, not very thicke, yet firme and ſtraight, of a greeniſh purple colour; and at the top carries fiue or ſix floures, the largeſt of all the Monks-hoods, conſiſting of foure leaues, as in the reſt of this kind, with a very large helmet ouer them, being ſometimes an inch long, of an elegant bleuiſh purple color: the ſeed-veſſels, ſeeds, and roots are like the reſt of this kinde. This growes on Iudenberg, the higheſt hill of all Stiria, and floures in Auguſt; in gardens about the end of Iuly. *Cluſius* names it *Aconitum Lycoct. 9. Iudenbergenſe*.

9 This riſes vp to the height of three cubits, with a ſlender round ſtalke which is diuided into ſundry branches, and commonly hangs downe the head; whence *Cluſius* cals it *Aconitum lycoctonum* 8. *coma nutante*. The floures are like thoſe of the common Monks-hood, but of ſomewhat a lighter purple colour. The leaues are larger and long, and much more cut in or diuided than any of the reſt. The roots, ſeeds, and other particles are not vnlike thoſe of the reſt of this kinde. ‡

¶ *The Place.*

Diuers of theſe Wolfs-banes grow in ſome gardens, except *Aconitum lycoctonon*, taken forth of the Emperors booke.

¶ *The Time.*

Theſe plants do floure from May vnto the end of Auguſt.

¶ *The Names.*

The firſt is *Lycoctoni ſpecies*, or a kinde of Wolfes-bane, and is as hurtfull as any of the reſt, and called of *Lobel*, *Aconitum flore Delphinij*, or Larke-ſpur Wolfes-bane. *Auicen* ſpeaketh hereof in his ſecond booke, and afterwards in his fourth booke, Fen. 6. the firſt Treatiſe; hauing his reaſons why and wherefore he hath ſeparated this from *Canach adip*, that is to ſay, the Wolfes ſtrangler, or the Wolfes-bane.

The later and barbarous Herbariſts call the third Wolfes bane in Latine *Napellus*, of the figure and ſhape of the roots of *Napus*, or *Nauet*, or Nauew gentle: it is likewiſe *Aconiti lycoctoni ſpecies*, or a kinde of Wolfes-bane: alſo it may be called *Toxicum*; for *Toxicum* is a deadly medicine wherewith the Hunters poyſon their ſpeares, darts, and arrowes, that bring preſent death: ſo named of arrowes which the Barbarians call *Toxcumata*, and *Toxa*. *Dioſcorides* ſetting downe the ſymptomes

or

or accidents cauſed by *Toxicum*, together with the remedies, reckoneth vp almoſt the verie ſame that *Auicen* doth concerning *Napellus*: notwithſtanding *Auicen* writes of *Napellus* and *Toxicum* ſeuerally; but not knowing what *Toxicum* is, as he himſelfe confeſſeth: ſo that it is not to be maruelled, that hauing written of *Napellus*, he ſhould afterward entreat againe of *Toxicum*.

¶ *The Nature and Vertues.*

All theſe plants are hot and dry in the fourth degree, and of a moſt venomous qualitie.

The force and facultie of Wolfes-bane is deadly to man and all kindes of beaſts: the ſame was tried of late in Antwerpe, and is as yet freſh in memorie, by an euident experiment, but moſt lamentable; for when the leaues hereof were by certaine ignorant perſons ſerued vp in ſallads, all that did eate thereof were preſently taken with moſt cruell ſymptomes, and ſo died. A

The ſymptomes that follow thoſe that do eate of theſe deadly herbes are theſe; their lips and tongues ſwell forthwith, their eyes hang out, their thighes are ſtiffe, and their wits are taken from them, as *Auicen* writeth in his fourth booke. The force of this poyſon is ſuch, that if the points of darts or arrowes be touched with the ſame, it bringeth deadly hurt to thoſe that are wounded therewith. B

Againſt ſo deadly a poyſon *Auicen* reckoneth vp certaine remedies, which helpe after the poyſon is vomited vp; and among theſe he maketh mention of the Mouſe (as the copies euery where haue it) nouriſhed and fed vp with *Napellus*, which is altogether an enemie to the poyſonſome nature thereof, and deliuereth him that hath taken it from all perill and danger. C

Antonius Guanerius of Pauia, a famous phyſition in his age, in his treaty of poyſons is of opinion, that it is not a mouſe that *Auicen* ſpeakes of, but a fly: for he telleth of a certaine Philoſopher that did very carefully and diligently make ſearch after this Mouſe, and neither could find at any time either Mouſe, or the root of Wolfes-bane gnawne or bitten, as he had read; but in ſearching he found many flies feeding on the leaues, which the ſame Philoſopher tooke, and made of them an Antidote or counterpoyſon, which he found to be good and effectuall againſt other poyſons, but eſpecially the poyſon of Wolfes-bane. D

This compoſition conſiſteth of two ounces of *Terra lemnia*, as many of the berries of the Bay tree, and the like weight of Mithridate, 24 of the flies that haue taken their repaſt vpon Wolfes-bane, of honey and oyle Oliue a ſufficient quantitie. E

The ſame opinion that *Guanerius* is of, *Petrus Pena* and *Matthias de Lobel* doe alſo hold; who affirme, that there was neuer ſeene at any time any Mouſe feeding thereon, but that there be Flies which reſort vnto it by ſwarmes, and feed not onely vpon the floures, but on the herbe alſo. F

¶ *The Danger.*

There hath beene little heretofore ſet downe concerning the vertues of the Aconites, but much might be ſaid of the hurts that haue come hereby, as the wofull experience of the lamentable example at Antwerpe, yet freſh in memorie, doth declare, as we haue ſaid.

† The figure that was in the firſt place formerly was of the *Aconitum luteum Ponticum*; and that in the ſecond place was of a *Napellus*.

Chap. 377. *Of blacke Hellebore.*

¶ *The Deſcription.*

1 THe firſt kinde of blacke Hellebor *Dodonæus* ſetteth forth vnder this title *Veratrum nigrum*; and it may properly be called in Engliſh, blacke Hellebor, which is a name moſt fitly agreeing vnto the true and vndoubted blacke Hellebor, for the kindes and other ſorts hereof which hereafter follow are falſe and baſtard kindes thereof. This plant hath thicke and fat leaues of a deepe greene colour, the vpper part whereof is ſomewhat bluntly nicked or toothed, hauing ſundry diuiſions or cuts; in ſome leaues many, in others fewer, like vnto the female Peony, or *Smyrnium Creticum*. It beareth Roſe faſhioned floures vpon ſlender ſtems, growing immediately out of the ground an handfull high, ſomtimes very white, and oftentimes mixed with a little ſhew of purple: which being vaded, there ſucceed ſmall huskes full of blacke ſeeds: the roots are many, with long blacke ſtrings comming from one head.

2 The ſecond kinde of blacke Hellebor, called of *Pena*, *Helleboraſtrum*; and of *Dodonæus*, *Veratrum ſecundum* (in Engliſh, baſtard Hellebor) hath leaues much like the former, but narrower and blacker, each leafe being much iagged or toothed about the edges like a ſaw. The ſtalkes grow to the height of a foot or more, diuiding themſelues into other branches toward the top; whereon do grow floures not much vnlike to the former in ſhew, ſaue that they are of a greeniſh herby colour. The roots are ſmall and threddy, but not ſo blacke as the former.

3 The

1 *Helleborus niger verus.*
The true blacke Hellebor.

2 *Helleboraſtrum.*
Wilde blacke Hellebor.

3 *Helleboraſter maximus.*
The great Ox-heele.

4 *Conſiligo Ruellij, & Seſamoides magnum Cordi.*
Setter-wort, or Beare-foot.

3 The third kinde of blacke Hellebor, called of *Pena*, *Helleboraſter maximus*, with this addition, *flore & ſemine prægnans*, that is, full both of floures and ſeed, hath leaues ſomewhat like the former wilde Hellebor, ſaue that they be greater, more iagged, and deepely cut. The ſtalks grow vp to the height of two cubits, diuiding themſelues at the top into ſundry ſmall branches, whereupon grow little round and bottle-like hollow greene floures; after which come forth ſeeds which come to perfect maturitie and ripeneſſe. The root conſiſteth of many ſmall blacke ſtrings, inuolued or wrapped one within another very intricately.

4 The fourth kinde of blacke Hellebor (called of *Pena* and *Lobel*, according to the deſcription of *Cordus* and *Kuellius*, *Seſamoides magnum*, and *Conſiligo*: in Engliſh, Ox-heele, or Settter-woort; which names are taken from his vertues in curing Oxen and ſuch like cattell, as ſhall be ſhewed afterward in the names thereof) is ſo well knowne vnto the moſt ſort of people by the name of Beare-foot, that I ſhall not haue cauſe to ſpend much time about the deſcription. ‡ Indeed is was not much needfull for our Author to deſcribe it, for it was the laſt thing he did; for both theſe two laſt are of one plant, both figures and deſcriptions: the former of theſe figures expreſſing it in floure, and the later in ſeed: but the former of our Author was with ſomewhat broader leaues, and the later with narrower. ‡

¶ *The Place.*

Theſe Hellebors grow vpon rough and craggy mountains: the laſt growes wilde in many woods and ſhadowie places in England: we haue them all in our London gardens.

¶ *The Time.*

The firſt floureth about Chriſtmaſſe, if the Winter be milde and warme: the others later:

¶ *The Names.*

It is agreed among the later writers, that theſe plants are *Veratra nigra*: in Engliſh, blacke Hellebor: in Greeke, μέλας ἐλλέβορος: in Italian, *Elleboro nero*: in Spaniſh, *Verde gambre negro*: of diuers, *Melampodium*, becauſe it was firſt found by *Melampos*, who was firſt thought to purge therewith *Prætus* his mad daughters, and to reſtore them to health. *Dioſcorides* writeth, that this man was a ſhepheard: others, a Sooth-ſayer. In high Dutch it is called **Chriſtwurtz**, that is, Chriſts herbe, or Chriſtmaſſe herbe: in low Dutch, **Heylich kerſt crupt**, and that becauſe it floureth about the birth of our Lord Ieſus Chriſt.

The third kinde was called of *Fuchſius*, *Pſeudohelleborus*, and *Veratrum nigrum adulterinum*, which is in Engliſh, falſe or baſtard blacke Hellebor. Moſt name it *Conſiligo*, becauſe the husbandmen of our time do herewith cure their cattell, no otherwiſe than the old Farriers or horſe-leeches were wont to do, that is, they cut a ſlit or hole in the dew-lap, as they terme it (which is an emptie skin vnder the throat of the beaſt) wherein they put a piece of the root of Setterwort or Beare-foot, ſuffering it there to remaine for certaine dayes together: which manner of curing they do call Settering of their cattell, and is a manner of rowelling, as the ſaid Horſe-leeches doe their horſes with horſe haire twiſted, or ſuch like, and as in Surgerie we do vſe with ſilke, which in ſtead of the word *Seton*; a certaine Phyſitian called it by the name Rowell; a word very vnproperly ſpoken of a learned man, becauſe there would be ſome difference betwixt men and beaſts. This manner of ſettering of cattell helpeth the diſeaſe of the lungs, the cough, and wheeſing. Moreouer, in the time of peſtilence or murraine, or any other diſeaſes affecting cattell, they put the root into the place aforeſaid, which draweth vnto it all the venomous matter, and voideth it forth at the wound. The which *Abſyrtus* and *Hierocles* the Greeke Horſe-leeches haue at large ſet downe. And it is called in Engliſh, Beare-foot, Setter-wort, and Setter-graſſe.

The ſecond is named in the German tongue, **Lowſzkraut**, that is, *Pediculoris*, or Lowſie graſſe: for it is thought to deſtroy and kill lice, and not onely lice but ſheepe and other cattell: and may be reckoned among the Beare-feet, as kindes thereof.

¶ *The Temperature.*

Blacke Hellebor, as *Galen* holdeth opinion, is hotter in taſte than the white Hellebor: in like manner hot and dry in the third degree.

¶ *The Vertues.*

Black Hellebor purgeth downwards flegme, choler, and alſo melancholy eſpecially, and all melancholy humors, yet not without trouble and difficultie: therfore it is not to be giuen but to robuſtious and ſtrong bodies, as *Meſues* teacheth. A purgation of Hellebor is good formad and furious men, for melancholy, dull, and heauy perſons, for thoſe that are troubled with the falling ſickneſs, for lepers, for them that are ſicke of a quartane Ague, and briefely for all thoſe that are troubled with blacke choler, and moleſted with melancholy. A

The manner of giuing it (meaning the firſt blacke Hellebor) ſaith *Actuarius* in his firſt booke, is three ſcruples, little more or leſſe. B

It is giuen with wine of raiſins or oxymel, but for pleaſantnes ſake ſome ſweet and odoriferous C

ſeeds muſt be put vnto it: but if you would haue it ſtronger, adde thereunto a grain or two of Scamonie. Thus much *Actuarius*.

D The firſt of theſe kindes is beſt, then the ſecond; the reſt are of leſſe force.

E The roots take away the morphew and blacke ſpots in the skin, tetters, ring-wormes, leproſies, and ſcabs.

F The root ſodden in pottage with fleſh, openeth the bellies of ſuch as haue the dropſie.

G The root of baſtard Hellebor, called among our Engliſh women Beare-foot, ſteeped in wine and drunken, looſeth the belly euen as the true blacke Hellebor, and is good againſt all the diſeaſes whereunto blacke Hellebor ſerueth, and killeth wormes in children.

H It doth his operation with more force and might, if it be made into pouder, and a dram thereof be receiued in wine.

I The ſame boyled in water with Rue and Agrimony, cureth the jaundice, and purgeth yellow ſuperfluities by ſiege.

K The leaues of baſtard Hellebor dried in an ouen, after the bread is drawne out, and the pouder thereof taken in a figge or raiſin, or ſtrawed vpon a piece of bread ſpred with honey and eaten, killeth wormes in children exceedingly.

Chap. 378. *Of Dioſcorides his blacke Hellebor.*

Aſtrantia nigra, ſiue Veratrum nigrum Dioſcoridis, Dod.
Blacke Maſter-worts, or *Dioſcorides* his blacke Hellebor.

¶ *The Deſcription.*

THis kinde of blacke Hellebor, ſet forth by *Lobel* vnder the name of *Aſtrantia nigra*, agreeth very well in ſhape with the true *Aſtrantia*, which is called *Imperatoria*: neuertheles by the conſent of *Dioſcorides* and other Authors, who haue expreſſed this plant for a kinde of *Veratrum nigrum*, or blacke Hellebor, it hath many blackiſh green leaues parted or cut into foure or fiue deepe cuts, after the maner of the vine leafe very like vnto thoſe of Sanicle, both in greennes of colour, and alſo in proportion. The ſtalke is euen, ſmooth, and plain: at the top wherof grow floures it little tufts or vmbels, ſet together like thoſe of Scabious, of a whitiſh light greene colour, daſhed ouer as it were with a little darke purple: after which come the ſeed like vnto *Carthamus* or baſtard Saffron. The roots are many blackiſh threds knit to one head or maſter root.

¶ *The Place.*

Blacke Hellebor is found in the mountains of Germany, and in other vntilled and rough places: it proſpereth in gardens.

Dioſcorides writeth, That blacke Hellebor groweth likewiſe in rough and dry places: and that is the beſt which is taken from ſuch like places; as that (ſaith hee) which is brought out of Anticyra a city in Greece. It groweth in my garden.

¶ *The Time.*

This blacke Hellebor flowreth not in Winter, but in the Sommer moneths. The herb is green all the yeare thorow.

¶ *The Names.*

It is called of the later Herbariſts, *Aſtrantia nigra*: of others, *Sanicula fœmina*: notwithſtanding it differeth much from *Aſtrantia*, an herbe which is alſo named *Imperatoria*, or Maſter-wort. The vulgar people call it Pellitorie of Spaine, but vntruly: it may be called blacke Maſter-wort, yet doubtleſſe a kinde of Hellebor, as the purging facultie doth ſhew: for it is certaine, that diuers experienced phyſitians can witneſſe, that the roots hereof do purge melancholy and other humors,

and

and that they themſelues haue perfectly cured mad melancholy people being purged herewith. And that it hath a purging qualitie, *Conradus Geſnerus* doth likewiſe teſtifie in a certaine Epiſtle written to *Adolphus Occo*, in which he ſheweth, that *Aſtrantia nigra* is almoſt as ſtrong as white Hellebor, and that he himſelfe was the firſt that had experience of the purging facultie thereof by ſiege: which things confirme that it is *Dioſcorides* his blacke Hellebor.

Dioſcorides hath alſo attributed to this plant all thoſe names that are aſcribed to the other black Hellebors. He ſaith further, that the ſeed thereof in Anticyra is called *Seſamoides*, the which is vſed to purge with, if ſo be that the Text be true, and not corrupted. But it ſeemeth not to be altogether perfect; for if *Seſamoides*, as *Pliny* ſaith, and the word it ſelfe doth ſhew, hath his name of the likeneſſe of *Seſamum*, the ſeed of this blacke Hellebor ſhall vnproperly be called *Seſamoides*; being not like that of *Seſamum*, but of *Cnicus* or baſtard Saffron. By theſe proofes we may ſuſpect, that theſe words are brought into *Dioſcorides* from ſome other Author.

¶ *The Temperature and Vertues.*

The faculties of this plant we haue already written to be by triall found like to thoſe of the other blacke Hellebor: notwithſtanding thoſe that are deſcribed in the former chapter are to be accounted of greater force. A

† This whole Chapter (as moſt beſides) was out of *Dodonæus*, who, *Pempt. 3. lib. 2. cap. 30.* labours to proue this plant to be the true blacke Hellebor of *Dioſcorides*. There was alſo another deſcription thruſt by our Author into this chapter, being of the *Perſicaria ſiliquoſa* or *Noli me tangere* formerly deſcribed in the fourth place of the 114 Chap. pag. 446.

Chap. 379. *Of Herbe Chriſtopher.*

Chriſtophoriana.
Herbe Chriſtopher.

¶ *The Deſcription.*

Although Herbe Chriſtopher be none of the Binde-weeds, or of thoſe plants that haue need of ſupporting or vnderpropping, wherewith it may clime or rampe, yet becauſe it beareth grapes, or cluſters of berries, it might haue been numbred among the Ἀμπελοι, or thoſe that grow like Vines. It brings forth little tender ſtalkes a foot long, or not much longer; whereupon do grow ſundry leaues ſet vpon a tender foot-ſtalke, which do make one leafe ſomewhat iagged or cut about the edges, of a light greene colour: the floures grow at the top of the ſtalks, in ſpokie tufts conſiſting of four little white leaues apiece: which being paſt, the fruit ſucceeds, round, ſomwhat long, and blacke when it is ripe, hauing vpon one ſide a ſtreaked furrow or hollowneſſe growing neere together as doe the cluſters of grapes. The root is thicke, blacke without, and yellow within like Box, with many trailing ſtrings anexed therto, creeping far abroad in the earth, whereby it doth greatly increaſe, and laſteth long.

¶ *The Place.*

Herbe Chriſtopher groweth in the North parts of England, neere vnto the houſe of the right worſhipfull Sir *William Bowes*. I haue receiued plants thereof from *Robinus* of Paris, for my garden, where they flouriſh.

¶ *The Time.*

It floureth and flouriſheth in May and Iune, and the fruit is ripe in the end of Sommer.

¶ *The Names.*

It is called in our age *Chriſtophoriana*, and *S. Chriſtophori herba*: in Engliſh, Herbe Chriſtopher: ſome there be that name it *Coſtus niger*: others had rather haue it *Aconitum bacciferum*: it hath no likenes at all nor affinitie with *Coſtus*, as the ſimpleſt may perceiue that do know both. But doubtleſſe it is of the number of the Aconites, or Wolfs-banes, by reaſon of the deadly and pernicious qualitie that it hath, like vnto Wolfes-bane, or Leopards-bane.

¶ *The Temperature.*

The temperature of Herbe Chriſtopher anſwereth thoſe of the Aconites, as we haue ſaid.

¶ *The Vertues.*

I finde little or nothing extant in the antient or later writers, of any one good propertie wherewith any part of this plant is poſſeſſed: therefore I wiſh thoſe that loue new medicines to take heed that this be none of them, becauſe it is thought to be of a venomous and deadly qualitie.

Chap. 380. *Of Peionie.*

¶ *The Kindes.*

There be three Peionies, one male, and two females, deſcribed by the Antients: the later writers haue found out foure more; one of the female kinde, called *Paonia pumila*, or dwarfe Peonie; and another called *Paonia promiſcua ſiue neutra*, Baſtard, Miſ-begotten, or neither of both, but as it were a plant participating of the male and female; one double Peionie with white floures, and a fourth kinde bearing ſingle white floures.

1 *Paonia mas.*
Male Peionie.

Paonia mas cum ſemine.
Male Peionie in ſeed.

¶ *The Deſcription.*

1 The firſt kinde of Peionie (being the male, called *Paonia mas*: in Engliſh, Male Peiony) hath thicke red ſtalkes a cubit long: the leaues be great and large, conſiſting of diuers leaues growing or ioyned together vpon one ſlender ſtemme or rib, not much vnlike the leaues of the

the Wall-nut tree both in faſhion and greatneſſe: at the top of the ſtalkes grow faire large red floures very like roſes, hauing alſo in the midſt yellow threds or thrums like them in the roſe called *Anthera*: which being vaded and fallen away, there come in place three or foure great cods or huskes, which do open when they are ripe; the inner part of which cods is of a faire red colour, wherein is contained blacke ſhining and poliſhed ſeeds as big as a peaſe, and betweene euery black ſeed is couched a red or crimſon ſeed, which is barren and empty. The root is thicke, great, and tuberous, like vnto the common Peionie.

2 There is another kinde of Peionie, called of *Dodonæus, Pæonia fœmina prior*: of *Lobel, Pæonia fœmina*: in Engliſh, female Peonie, which is ſo well knowne vnto all that it needeth not any deſcription.

3 The third kinde of Peionie (which *Pena* ſetteth forth vnder the name *Pæonia fœmina polyanthos*: *Dodonæus, Pæonia fœmina multiplex*: in Engliſh, Double Peionie) hath leaues, roots, and floures like the common female Peionie, ſaue that his leaues are not ſo much iagged, and are of a lighter greene colour: the roots are thicker and more tuberous, and the floures much greater, exceeding double, of a very deep red colour, in faſhion very like the great double roſe of Prouince, but greater and more double.

2 *Pæonia fœmina.*
Female Peionie.

3 *Pæonia fœmina multiplex.*
Double red Peionie.

4 There is found another ſort of the double Peionie, not differing from the precedent in ſtalke, leaues, or roots: this plant bringeth forth white floures, wherein conſiſteth the difference.

5 There is another kinde of Peionie (called of *Dodonæus, Pæonia fœmina altera*: but of *Pena, Pæonia promiſcua, ſiue neutra*: in Engliſh, Maiden or Virgin Peiony) that is like to the common Peiony, ſauing that his leaues and floures are much leſſe, and the ſtalks ſhorter: it beareth red floures and ſeed alſo like the former.

6 We haue likewiſe in our London gardens another ſort bearing floures of a pale whitiſh colour, very ſingle, reſembling the female wilde Peiony, in other reſpects like the double white Peiony, but leſſer in all the parts thereof.

‡ 7 *Cluſius* by ſeed ſent him from Conſtantinople had two other varieties of ſingle Peionies; the one had the leaues red when they came out of the ground; and the floure of this was of a deep red colour: the other had them of a whitiſh greene, and the floures of this were ſomewhat larger, and of a lighter colour. In the leaues & other parts they reſembled the common double Peiony. ‡

4 *Pæonia fœmina polyanthos flore albo.*
The double white Peionie.

‡ 5 *Pæonia promiſcua.*
Maiden Peionie.

‡ 6 *Pæonia fœmina pumila.*
Dwarfe female Peionie.

‡ 7 *Pæonia Byzantina.*
Turkiſh Peionie.

¶ *The Place.*

All the ſorts of Peionies do grow in our London gardens, except that double Peiony with white floures, which we do expect from the Low-countries of Flanders.

The male Peionie groweth wilde vpon a cony berry in Betſome, being in the pariſh of South-fleet in Kent, two miles from Grauel-end, and in the ground ſomtimes belonging to a farmer there called *Iohn Bradley*.

‡ I haue been told that our Author himſelfe planted that Peionie there, and afterwards ſeemed to finde it there by accident: and I do beleeue it was ſo, becauſe none before or ſince haue euer ſeen or heard of it growing wild ſince in any part of this Kingdome. ‡

¶ *The Time.*

They floure in May: the ſeed is ripe in Iuly.

¶ *The Names.*

The Peionie is called in Greeke παιωνία: in Latine alſo *Pæonia*, and *Dulcifida*: in ſhops, *Pionia*: in high Dutch, **Peonien blumen**: in low Dutch, **Maſt bloemen**: in French, *Pinoine*: in Spaniſh, *Roſa del monte*: in Engliſh, Peionie: it hath alſo many baſtard names, as *Roſa fatuina*, *Herba Caſtæ*: of ſome, *Lunaris*, or *Lunaria Pæonia*: becauſe it cureth thoſe that haue the falling ſickneſſe, whom ſome men call *Lunaticos*, or Lunaticke. It is called *Idæus Dactylus*: which agreeth with the female Peionie; the knobbie roots of which be like to *Dactyli Idæi*, and *Dactyli Idæi* are certaine precious ſtones of the forme of a mans finger, growing in the Iſland of Candie: it is called of diuers *Aglaophotis*, or brightly ſhining, taking his name of the ſhining and glittering graines, which are of the colour of ſcarlet.

There be found two *Aglaophotides*, deſcribed by *Ælianus* in his 14. booke; one of the ſea, in the 24. Chapter: the other of the earth, in the 27. chapter. That of the ſea is a kinde of *Fucus*, or ſea moſſe, which groweth vpon high rocks, of the bigneſſe of Tamariſk, with the head of Poppy; which opening in the Sommer Solſtice doth yeeld in the night time a certain fierie, and as it were ſparkling brightneſſe or light.

That of the earth, ſaith he, which by another name is called *Cynoſpaſtus*, lieth hid in the day time among other herbes, and is not knowne at all, and in the night time it is eaſily ſeene: for it ſhineth like a ſtar, and glittereth with a fierie brightneſſe.

And this *Aglaophotus* of the earth, or *Cynoſpaſtus*, is *Pæonia*; for *Apulcius* ſaith, that the ſeedes or graines of Peionie ſhine in the night time like a candle, and that plenty of it is in the night ſeaſon found out and gathered by the ſhepheards. *Theophraſtus* and *Pliny* do ſhew that Peionie is gathered in the night; which *Ælianus* alſo affirmeth concerning *Aglaophotis*.

This *Aglaophotus* of the earth, or *Cynoſpaſtus*, is called of *Ioſephus* the writer of the Iewes warre, in his ſeuenth booke, 25. chapter, *Baaras*, of the place wherein it is found; which thing is plaine to him that conferreth thoſe things which *Ælianus* hath written of *Aglaophotis* of the earth, or *Cynoſpaſtus*, with thoſe which *Ioſephus* hath ſet downe of *Baaras*: for *Ælianus* ſaith, that *Cynoſpaſtus* is not plucked vp without danger, and that it is reported how he that firſt touched it, not knowing the nature thereof, periſhed. Therefore a ſtring muſt be faſtned to it in the night, and a hungrie dog tied thereto, who being allured by the ſmell of roſted fleſh ſet towards him, may plucke it vp by the rootes. *Ioſephus* alſo writeth, that *Baara* doth ſhine in the euening like the day ſtar, and that they who come neere, and would plucke it vp, can hardly do it, except that either a womans vrine, or her menſes be poured vpon it, and that ſo it may be pluckt vp at the length.

Moreouer, it is ſet downe by the ſaid Author, as alſo by *Pliny* and *Theophraſtus*, that of neceſſitie it muſt be gathered in the night; for if any man ſhall pluck off the fruit in the day time, being ſeene of the VVood-pecker, he is in danger to looſe his eies; and if he cut the root, it is a chance if his fundament fall not out. The like fabulous tale hath been ſet forth of Mandrake, the which I haue partly touched in the ſame chapter. But all theſe things be moſt vaine and friuolous: for the root of Peionie, as alſo the Mandrake, may be remoued at any time of the yeare, day or houre whatſoeuer.

But it is no maruell, that ſuch kindes of trifles, and moſt ſuperſtitious and wicked ceremonies are found in the books of the moſt antient writers; for there were many things in their time verie vainly feined and cogged in for oſtentation ſake, as by the Egyptians and other counterfeit mates, as *Pliny* doth truly teſtifie: an imitator of whom in times paſt, was one *Andreas* a Phyſition, who, as *Galen* ſaith, conueied into the art of Phyſick, lies and ſubtill deluſions. For which cauſe *Galen* commanded his Schollers to refraine from the reading of him, and of all ſuch like lying and deceitfull ſycophants. It is reported that theſe herbes tooke the name of Peionie, of *Pæus*, of that excellent Phyſition of the ſame name, who firſt found out and taught the knowledge of this herbe vnto poſteritie.

¶ *The*

¶ *The Temperature.*

The root of Peionie, as *Galen* ſaith, doth gently binde with a kinde of ſweetneſſe: and hath alſo ioined with it a certaine bitteriſh ſharpneſſe: it is in temperature not very hot, little more than meanly hot; but it is drie, and of ſubtill parts.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the root of the Male Peionie being dried, is giuen to women that be not well clenſed after their deliuerie, being drunke in Mead or honied water to the quantitie of a bean; for it ſcowreth thoſe plants, appeaſeth the griping throwes and torments of the belly, and bringeth downe the deſired ſickneſſe.

B *Galen* addeth, that it is good for thoſe that haue the yellow iaundiſe, and pain in the kidnies and bladder, it clenſeth the liuer and kidnies that are ſtopped.

C It is found by ſure and euident experience made by *Galen*, that the freſh root tied about the necks of children, is an effectuall remedie againſt the falling ſickneſſe; but vnto thoſe that are growne vp in more yeares, the root thereof muſt alſo be miniſtred inwardly.

D It is alſo giuen, ſaith *Pliny*, againſt the diſeaſe of the minde. The root of the male Peionie is preferred in this cure.

E Ten or twelue of the red berries or ſeeds drunke in wine that is ſomething harſh or ſower, and red, do ſtay the inordinate flux, and are good for the ſtone in the beginning.

F The blacke graines (that is the ſeed) to the number of fifteene taken in wine or mead, helpes the ſtrangling and paines of the matrix or mother, and is a ſpeciall remedie for thoſe that are troubled in the night with the diſeaſe called *Ephialtes* or night Mare, which is as though a heauy burthen were laid vpon them, and they oppreſſed therewith, as if they were ouercome by their enemies, or ouerpreſt with ſome great weight or burthen; and they are alſo good againſt melancholicke dreames.

G Syrrup made of the floures of Peionie helpeth greatly the falling ſickneſſe: likewiſe the extraction of the roots doth the ſame.

Chap. 381. *Of toothed Violets or Corall woorts.*

1 *Dentaria Bulbifera.*
Toothed Violet.

2 *Dentaria Coralloides radice, ſive Dent. Enneaphyllos.*
The Corall toothed Violet.

¶ *The*

3 *Dentaria Heptaphyllos Cluſij.*
The ſeuen leafed toothed Violet.

4 *Dentaria Pentaphyllos Cluſij.*
Fiue leafed toothed Violet.

‡ 5 *Dentaria Pentaphyllos altera.*
The other fiue leaued Corall-wort.

¶ *The Deſcription.*

1 THe firſt kinde of *Dentaria* (called in Latine *Dentaria baccifera*: of *Dodonæus*, *Dentaria prior*: in Engliſh, Dogs tooth violet) hath a tuberous and knobbie root, toothed, or as it were kneed like vnto the crags of Corall, of an vnpleaſant ſauor, and ſomewhat ſharp in taſte: from which ſpring forth certaine ſmall and ſlender ſtalkes a foot high, which haue leaues verie much cut or iagged, like vnto thoſe of Hempe, of the forme and faſhion of Aſhen leaues: at the top of the ſtalkes doe grow ſmall white floures, in ſhape like *Viola matronales*, that is, Queenes Gilofloures, or rather like ſtocke-Gilloſloures, of a white yellow colour, laid ouer with a light ſprinkling of purple: among which come forth ſmall knobs growing vpon the ſtalks among the leaues, ſuch as are to be ſeen vpon the *Chimiſts Martagon*, which being ripe, do fall vpon the ground, whereof many other plants are ingendred.

2 The ſecond kinde of Dogs-tooth violet bringeth forth ſmall round ſtalks, firm and ſtiffe, a foot high, beſet with leaues much broader, rounder, and greener than the former, bearing at the top many little floures conſiſting of foure ſmall leaues, of a pale herbie colour, which beeing paſt, there ſucceed long and ſlender coddes

ſomewhat

ſomewhat like the cods of Queenes Gilloſloures, wherein is contained ſmall blackiſh ſeed: the root is like the former, but not in euery reſpect much reſembling Corall, yet white and tuberous notwithſtanding.

3 The third kinde of Dogs-tooth Violet is called of *Cluſius*, *Dentaria heptaphyllos*, that is, conſiſting of ſeuen leaues faſtened vpon one rib, ſinew, or ſmall ſtem: of *Lobel* with this title, *Alabaſtrites altera*, or *Dentaria altera*: but *Cordus* calleth it *Coralloides altera*: in Engliſh, Corall violet; it hath ſtalkes, floures, and roots like vnto the firſt of his kinde, ſauing that the floures are much fairer, and white of colour, and the roots haue a greater reſemblance of Corall than the other.

4 The fourth kinde of Dogs-tooth violet, called in Engliſh Codded violet (which *Cluſius* ſetteth forth vnder the title *Dentaria Matthioli Pentaphyllos*; which *Pena* doth alſo expreſſe vnder the title of *Nemoralis alpina Herbariorum Alabaſtrites*; *Cordus* calleth it *Coralloides*, and may very well bee called in Engliſh Cinkfoile violet) hath leaues ſo like the greater Cinkfoile, that it is hard to know one from another; therefore it might very well haue been reckoned among the herbes called *Pentaphylla*, that is, fiue leaued herbes. This plant groweth in the ſhadowie forreſt about Turin, and the mountain Sauena called Calcaris, and by the Rhene not far from Baſill. The ſtalks grow to the height of a cubit, beſet with a tuft of floures at the top like to that of the firſt, but of a deeper purple colour: which being vaded, there ſucceed long and flat cods like vnto Rocket, or the great Celandine, wherein is contained a ſmall ſeed. All the whole plant is of a hot and bitter taſte. The roots are like vnto Corall, of a pale whitiſh colour: the leaues are rough and harſh in handling, and of a deep greene colour.

‡ 5 *Cluſius* giues vs another varietie of *Dentaria pentaphyllos*, whoſe roots are more vneuen and knobby than the laſt deſcribed: the ſtalke is ſome foot high: the leaues fiue vpon a ſtalke, but not ſo rough, nor of ſo deep a greene as thoſe of the former; yet the floures are of a deep purple colour, like thoſe of the laſt deſcribed. ‡

¶ *The Place.*

They grow on diuers ſhadowie and darke hills. *Valerius Cordus* writeth, that they are found about the foreſt Hercinia, not far from Northuſium, moſt plentifully, in a fat ſoile that hath quaries of ſtone in it. The firſt I haue in my garden.

¶ *The Time.*

They floure eſpecially in Aprill and May: the ſeed commeth to perfection in the end of Auguſt.

¶ *The Names.*

The toothed Violet, or after ſome, Dogs-tooth violet, is commonly called *Dentaria*: of *Cordus*, *Coralloides*, of the root that is in forme like to Corall. *Matthiolus* placeth it *inter Solidagines & Symphyta*, among the Conſounds and Comfries. Wee had rather call them *Viola Dentaria*, of the likeneſſe the floures haue with Stocke-gilloſloures. They may be called in Engliſh, Toothed Violets, or Corall-woorts.

¶ *The Temperature and Vertues.*

A I haue read of few or no vertues contained in theſe herbes, ſauing thoſe which ſome women haue experienced to be in the firſt kinde thereof, and which *Matthiolus* aſcribeth vnto *Pentaphylla dentaria* the fourth kinde, in the fourth booke of his Commentaries vpon *Dioſcorides*, and in the chap. conterning *Symphytum*, where he ſaith that the root is vſed in drinkes which are made againſt *Enterocele* and inward wounds, but eſpecially thoſe wounds and hurts which haue entred into the hollowneſſe of the breſt.

Chap. 382. *Of Cinkefoile, or fiue finger Graſſe.*

¶ *The Deſcription.*

1 THe firſt kinde of Cinkfoile is ſo common and ſo vniuerſally knowne, that I thinke it a needleſſe trauell to ſtand about the deſcription. ‡ It hath many long ſlender ſtalks, lying ſpred vpon the ground, out whereof grow leaues made of fiue longiſh ſnipt leaues faſtened to one long foot-ſtalke: the floures alſo grow vpon the like foot-ſtalks, and are compoſed of fiue yellow leaues. The root is pretty large, of a reddiſh colour, and round; but dried, it becomes ſquare. ‡

2 The ſecond kinde of Cinkfoile or Quinquefoile hath round and ſmal ſtalks of a cubit high; the leaues are large, and very much iagged about the edges, very like the common Cinkfoile: the floures grow at the top of the ſtalks, in faſhion like the common kind, but much greater, and of a pale or bleake yellow or elſe whitiſh colour: the root is blacke without, and full of ſtrings annexed thereto, and of a wooddie ſubſtance.

Quinquefolium vulgare.
Common Cinkfoile.

† 2 *Quinquefolium maius rectum.*
Great vpright Cinkfoile.

3 *Pentaphyllum purpureum.*
Purple Cinkfoile.

4 *Pentaphyllum rubrum paluſtre.*
Marſh Cinkfoile.

5 *Pentaphyllum petrosum, Heptaphyllum Clusij.*
Stone Cinkfoile.

† 6 *Pentaphyllon supinum Potentillæ facie.*
Siluerweed Cinkfoile.

7 *Quinquefolium Tormentillæ facie.*
Wall Cinkfoile.

8 *Pentaphyllum Incanum.*
Hoarie Cinkfoile.

† 3 The third kinde of Cinkefoile hath leaues like thoſe of the laſt deſcribed, and his floures are of a purple colour; which being paſt, there ſucceedeth a round knop of ſeed like a Strawberry before it be ripe: the ſtalkes are creeping vpon the ground: the root is of a wooddy ſubſtance, full of blacke ſtrings appendant thereto. ‡ This differs not from the laſt deſcribed, but in the colour of the floures. ‡

4 The fourth kinde of Cinkefoile is very like vnto the other, eſpecially the great kinde: the ſtalkes are a cubit high, and of a reddiſh colour: the leaues conſiſt of fiue parts, ſomewhat ſnipt about the edges: the floures grow at the tops of the ſtalkes like vnto the other Cinkefoiles, ſauing that they be of a darke red colour: the root is of a wooddy ſubſtance, with ſome fibres or threddy ſtrings hanging thereat.

9 *Pentaphyllum incanum minus repens.*
Small hoary creeping Cinkefoile.

10 *Quinquefolium ſyluaticum majus flo. albo.*
Wood Cinkefoile, with white floures.

5 The fifth kinke of Cinkefoile groweth vpon the cold mountaines of Sauoy, and in the vallie of Auſtenſie, and in Narbone in France, and (if my memory faile not) I haue ſeen the ſame growing vpon Beeſton caſtle in Cheſhire: the leaues hereof are few, and thinne ſet, conſiſting of fiue parts like the other Cinkefoiles, oftentimes ſix or ſeuen ſet vpon one foot-ſtalke, not ſnipt about the edges as the other, but plaine and ſmooth; the leafe is of a ſhining white ſiluer colour, very ſoft and ſhining: the floures grow like ſtarres, vpon ſlender ſtalkes by tufts and bunches, of a white colour, and ſometimes purple, in faſhion like the floures of *Alchimilla*, or Ladies mantle; the root is thicke and full of ſtrings, and of a browne purple colour.

‡ 6 This plant, whoſe figure our Author formerly gaue for *Fragaria ſterilis*, & in his deſcription confounded with it, to auoid confuſion, I thinke fit to giue you here amongſt the Cinkefoiles, and in that place the *Fragaria ſterilis*, as moſt agreeable thereto. This ſeemes to challenge kindred of three ſeuerall plants, that is, Cinkefoile, Tormentill, and Siluer-weed, for it hath the vpper leaues, the yellow floures, creeping branches, and root of Cinkefoile, but the lower leaues are of a darke greene, and grow many vpon one middle rib like thoſe of Siluer-weed; the fruit is like an vnripe Strawberry. *Lobel* calls this *Pentaphyllum ſupinum Tormentilæ facie*: and *Tabernamontanus*, *Quinquefolium fragiferum repens.* ‡

7 The ſeuenth kinde of Cinkefoile, *Pena* that diligent ſearcher of Simples found in the Alpes of Rhetia, nere Clauena, and at the firſt ſight ſuppoſed it to be a kinde of *Tormentilla*, or *Pentaphyllum*,

taphyllum, ſaue that it had a more threddy root, rather like *Geranium*; it is of a darke colour outwardly, hauing ſome ſweet ſmell, repreſenting *Garyophyllata* in the ſauor of his roots: in leaues and floures it reſembles Cinkefoile and Tormentill, and in ſhape of his ſtalkes and roots *Auens* or *Garyophyllata*, participating of them all: notwithſtanding it approcheth neereſt vnto the Cinkefoiles, hauing ſtalkes a foot high, whereupon grow leaues diuided into fiue parts, and jagged round about the edges like the teeth of a ſaw, hauing the pale yellow floures of *Pentaphyllum* or *Tormentilla*; within which are little moſſie or downy threddes, of the colour of ſaffron, but leſſer than the common Auens.

8 The eighth kinde of Cinkefoile (according to the opinion of diuers learned men, who haue had the view thereof, and haue iudged it to be the true *Leucas* of *Dioſcorides*, agreeable to *Dioſcorides* his deſcription) is all hoary, whereupon it tooke the addition *Incanum*. The ſtalkes are thicke, wooddy, and ſomewhat red, wrinckled alſo, and of a browne colour; which riſe vnequall from the root, ſpreading themſelues into many branches, ſhadowing the place where it groweth, beſet with thicke and notched leaues like *Scordium*, or water Germander, which according to the iudgment of the learned is thought to be of no leſſe force againſt poiſon than *Pentaphyllon*, or *Tormentilla*, being of an aſtringent and drying quality. Hereupon it may be that ſome trying the force hereof, haue yeelded it vp for *Leucas Dioſcoridis*. This rare plant I neuer found growing naturally, but in the hollowneſſe of the peakiſh mountaines, and dry grauelly vallies.

‡ 11 *Quinquefolium ſyluaticum minus flo. albo.*
Small white floured wood Cinkefoile.

‡ 12 *Quinquefolium minus flo. aureo.*
Small golden floured Cinkefoile.

‡ 9 This hath the like creeping purple branches as the laſt deſcribed: the leaues are narrower, more hairy and deeper cut in: the floures are alſo of a more golden colour, in other reſpects they are alike. ‡

† 10 The wood Cinkefoile hath many leaues ſpred vpon the ground, conſiſting of fiue parts; among which riſe vp other leaues, ſet vpon very tall foot-ſtalkes, and long in reſpect of thoſe that did grow by the ground, and ſomewhat ſnipt about the ends, and not all alongſt the edges. The floures grow vpon ſlender ſtalkes, conſiſting of fiue white leaues. The root is thicke, with diuers fibres comming from it.

‡ 11 This alſo from ſuch a root as the laſt deſcribed ſends forth many ſlender branches not creeping, but ſtanding vpright, and ſet with little hoary leaues, ſnipt onely at the ends, like as thoſe

‡ 13 *Pentaphyllum fragiferum.*
Strawberry Cinkfoile.

thoſe of the laſt deſcribed: the tops of the branches carry pretty white floures like thoſe of the laſt deſcribed, whereof it ſeems to be a kinde, yet leſſe in each reſpect.

12 This from a blacke and fibrous root ſends forth creeping branches, ſet with leaues like the common Cinkfoile, but leſſe, ſomewhat hoary and ſhining; the ſtalks are ſome handfull high, and on their tops carry large floures in reſpect of the ſmalneſſe of the plant, and theſe of a faire golden colour, with ſaffron coloured threds in their middle: the ſeedes grow after the manner of other Cinkfoiles: this floures in Iune, and it is *Cluſius* his *Quinquefolium 3. aureo flore.* ‡

13 There is one of the mountain Cinkfoiles that hath diuers ſlender brittle ſtalks, riſing immediatly out of the ground; whereupon are ſet by equall diſtances certain iagged leaues, not vnlike to the ſmalleſt leaues of Auens: the floures are white and grow at the top, hauing in them threds yellow of colour, and like to the other Cinkfoiles, but altogether leſſer. The root is thicke, tough, and of a wooddie ſubſtance. ‡ The ſeedes grow cluſtering together like little Strawberries, whence *Cluſius* calls it *Quinquefolium fragiferum.* ‡

¶ *The Place.*

They grow in low and moiſt medowes, vpon banks and by high waies ſides: the ſecond is onely to be found in gardens.

The third groweth in the woods of Sauena and Narbon, but not in England: The fourth groweth in a marſh ground adioining to the land called Bourne ponds, halfe a mile from Colcheſter; from whence I brought ſome plants for my garden, where they flouriſh and proſper well.

The fifth groweth vpon Beeſtone caſtle in Cheſhire: the ſixth vpon bricke and ſtone wals about London, eſpecially vpon the bricke wall in Liuer-lane.

The place of the ſeuenth and eight is ſet forth in their deſcriptions.

¶ *The Time.*

Theſe plants do floure from the beginning of May to the end of Iune.

¶ *The Names.*

Cinkfoile is called in Greeke πεντάφυλλον: in Latine, *Quinquefolium*: the Apothecaries vſe the Greek name *Pentaphyllon*: and ſometime the Latine name. There be very many baſtard names, wherewith I will not trouble your eares: in High Dutch, **Junff fingerkraut**: in Low Dutch, **Vijff vinger kruijt**: in Italian, *Cinquefoglio*: in French, *Quinte fueille*: in Spaniſh, *Cinco en rama*: in Engliſh, Cinkfoile, Fiue finger Graſſe, Fiue leaued graſſe, and Sinkfield.

¶ *The Temperature.*

The roots of Cinkfoile, eſpecially of the firſt, do vehemently drie, and that in the third degree, but without biting: for they haue very little apparant heat or ſharpneſſe.

¶ *The Vertues.*

The decoction of the roots of Cinkfoile drunke, cureth the bloudy flixe, and all other fluxes of the belly, and ſtancheth all exceſſiue bleeding. A

The iuice of the roots while they be yong and tender, is giuen to be drunke againſt the diſeaſes of the liuer and lungs, and all poiſon. B

The ſame drunke in Mead or honied water, or wine wherein ſome pepper hath been mingled, cureth the tertian or quartaine feuers: and being drunken after the ſame manner for thirty daies together, it helpeth the falling ſickneſſe. C

The leaues vſed among herbes appropriate for the ſame purpoſe, cureth ruptures and burſtings of the rim, and guts falling into the cods. D

E The iuice of the leaues drunken doth cure the Iaundice, and comforteth the ſtomacke and liuer.

F The decoction of the roots held in the mouth doth mitigate the paine of the teeth, ſtaieth putrifaction, and all putrified vlcers of the mouth, helpeth the inflammations of the almonds, throat, and the parts adioining, it ſtaieth the laske, and helpeth the bloudy flix.

G The root boiled in vineger is good againſt the ſhingles, appeaſeth the rage of fretting ſores, and cankerous vlcers.

H It is reported, that foure branches hereof cureth quartaine agues, three tertians, and one branch quotidians: which things are moſt vaine and friuolous, as likewiſe many other ſuch like, which are not onely found in *Dioſcorides*, but alſo in other Authors, which we willingly withſtand.

I *Ortolpho Morolto* a learned Phyſition, commended the leaues being boiled with water, and ſome *Lignum vitæ* added therto, againſt the falling ſickneſſe, if the patient be cauſed to ſweat vpon the taking thereof. He likewiſe commendeth the extraction of the roots againſt the bloudy flix.

† Our Author formerly in his deſcription, title, and place of growing mentioned that plant which he figured, and is yet kept in the ſecond place; and in the firſt place he figured the common Cinke-foile, and made mention of it, yet without deſcription in the ſecond. That which formerly was in the ſixth place, by the name of *Pentaphyllum lupinum*, was the ſame with that in the fifth place.

Chap. 383. *Of Setfoile, or Tormentill.*

Tormentilla.
Setfoile.

¶ *The Deſcription.*

THis herbe Tormentill or Setfoile is one of the Cinkfoiles, it brings forth many ſtalks ſlender, weake, ſcarſe able to lift it ſelfe vp, but rather lieth downe vpon the ground: the leaues be leſſer than Cinkefoile, but moe in number, ſomtimes fiue, but commonly ſeuen, whereupon it tooke his name Setfoile, which is ſeuen leaues, and thoſe ſomewhat ſnipt about the edges: the floures grow on the toppes of ſlender ſtalkes, of a yellow colour, like thoſe of the Cinkfoiles. The root is blacke without, reddiſh within, thicke, tuberous, or knobbie.

¶ *The Place.*

This plant loueth woods and ſhadowie places, and is likewiſe found in paſtures lying open to the Sun, almoſt euery where.

¶ *The Names.*

It floureth from May, vnto the end of Auguſt.

¶ *The Names.*

It is called of the later Herbariſts *Tormentilla*: ſome name it after the number of the leaues *Heptaphyllon*, and *Septifolium*: in Engliſh, Setfoile and Tormentill: in high-Dutch, **Birkwurtz**: moſt take it to be *Chryſogonon*; whereof *Dioſcorides* hath made a briefe deſcription.

¶ *The Temperature.*

The root of Tormentill doth mightily dry, and that in the third degree, and is of thin parts: it hath in it very little heat, and is of a binding quality.

¶ *The Vertues.*

A Tormentill is not only of like vertue with Cinkefoile, but alſo of greater efficacie: it is much vſed againſt peſtilent diſeaſes: for it ſtrongly reſiſteth putrifaction, and procureth ſweate.

The

The leaues and roots boiled in wine, or the iuice thereof drunken prouoketh ſweat, and by that B
means driueth out all venome from the heart, expelleth poiſon, and preſerueth the bodie in time of
peſtilence from the infection thereof, and all other infectious diſeaſes.

The roots dried made into pouder and drunke in wine doth the ſame. C

The ſame pouder taken as aforeſaid, or in the water of a Smiths forge, or rather the water where- D
in hot ſteele hath been often quenched of purpoſe, cureth the laske and bloudy flix, yea although
the patient haue adioined vnto his ſcouring a grieuous feuer.

It ſtoppeth the ſpitting of bloud, piſſing of bloud, and all other iſſues of bloud, as well in men as E
women.

The decoction of the leaues and rootes, or the iuice thereof drunke, is excellent good for all F
wounds, both outward and inward: it alſo openeth and healeth the ſtoppings of the liuer and lungs,
and cureth the iaundice.

The root beaten into pouder, tempered or kneaded with the white of an egge and eaten, ſtaieth G
the deſire to vomite, and is good againſt choler and melancholie.

Chap. 384. *Of wilde Tanſie or Siluer-weed.*

Argentina.
Siluerweed, or wilde Tanſie.

¶ *The Deſcription.*

Wilde Tanſie creepeth along vpon the ground with fine ſlender ſtalkes and claſping tendrels: the leaues are long made vp of many ſmall leaues, like vnto thoſe of the garden Tanſie, but leſſer; on the vpper ſide greene, and vnder very white. The floures be yellow, and ſtand vpon ſlender ſtems, as doe thoſe of Cinkfoile,

¶ *The Place.*

It groweth in moiſt places neere vnto high waies and running brookes euery where.

¶ *The Time.*

It floureth in Iune and Iuly.

¶ *The Names.*

The later Herbariſts do call it *Argentina*, of the ſiluer drops that are to be ſeene in the diſtilled water therof when it is put into a glaſſe, which you ſhall eaſily ſee rowling and tumbling vp and downe in the bottome; ‡ I iudge it rather ſo called of the fine ſhining Siluer coloured leaues. ‡ It is likewiſe called *Potentilla*: of diuers, *Agrimonia ſyluestris*, *Anſerina*, and *Tanacetum ſyluestre*: in High Dutch, **Genſerich**: in Low Dutch, **Ganſerick**: in French, *Argentine*: in Engliſh, Wilde Tanſie, and Siluerweed.

¶ *The Temperature.*

It is of temperature moderatly cold, and dry almoſt in the third degree, hauing withall a binding facultie.

¶ *The Vertues.*

Wilde Tanſie boiled in wine and drunk, ſtoppeth the laske and bloudy flix, and all other flux of A
bloud in man or woman.

The ſame boiled in water and ſalt and drunke, diſſolueth clotted and congealed bloud in ſuch B
as are hurt or bruiſed with falling from ſome high place.

The decoction hereof made in water, cureth the vlcers and cankers of the mouth, if ſome honie C
and allom be added thereto in the boiling.

Wilde Tanſie hath many other good vertues, eſpecially againſt the ſtone, inward wounds, and D
wounds of the priuie or ſecret parts, and cloſeth vp all greene and freſh wounds.

E The diſtilled water taketh away freckles, ſpots, pimples in the face and Sun-burning; but the herbe laid to infuſe or ſteepe in white wine is far better: but the beſt of all is to ſteepe it in ſtrong white wine vinegre, the face being often bathed or waſhed therewith.

Chap. 385. *Of Auens, or Herbe Bennet.*

1 *Caryophyllata.*
Auens or herbe Bennet.

2 *Caryophyllata montana.*
Mountaine Auens.

¶ *The Deſcription.*

1 THe common Auens hath leaues not vnlike to Agrimony, rough, blackiſh, and much clouen or deepely cut into diuers gaſhes: the ſtalke is round and hairy, a foot high, diuiding it ſelfe at the top into diuers branches, whereupon do grow yellow floures like thoſe of Cinkefoile or wilde Tanſie: which being paſt, there follow round rough reddiſh hairy heads or knops ful of ſeed, which being ripe wil hang vpon garments as the Burs doe. The root is thicke, reddiſh within, with certaine yellow ſtrings faſtened thereunto, ſmelling like vnto Cloues or like vnto the roots of Cyperus.

2 The Mountain Auens hath greater and thicker leaues than the precedent, rougher, and more hairie, not parted into three, but rather round, nicked on the edges: among which riſeth vp ſlender ſtalkes, whereon doe grow little longiſh ſharpe pointed leaues: on the toppe of each ſtalke doth grow

3 *Caryophyllata Alpina pentaphyllea.*
Fiue leaued Auens.

‡ 4 *Caryophyllata montana purpurea.*
Red floured mountaine Auens.

‡ 5 *Caryophyllata Alpina minima.*
Dwarfe mountaine Auens.

grow one floure greater than that of the former, which conſiſteth of fiue little leaues as yellow as gold: after which growes vp the ſeeds among long hairy threds. The root is long, growing aſlope, ſomewhat thicke, with ſtrings anexed thereto.

3 Fiue finger Auens hath many ſmall leaues ſpred vpon the ground, diuided into fiue parts, ſomewhat ſnipt about the edges like Cinkefoile, whereof it tooke his name. Among which riſe vp ſlender ſtalkes diuided at the top into diuers branches, whereon do grow ſmall yellow floures like thoſe of Cinkefoile: the root is compoſed of many tough ſtrings of the ſmell of Cloues, which makes it a kind of Auens; otherwiſe doubtles it muſt of neceſſitie be one of the Cinkfoiles

‡ 4 This hath ioynted ſtringy roots ſome finger thick, from whence riſe vp many large and hairy leaues, compoſed of diuers little leaues, with larger at the top, and theſe ſnipt about the edges like as the common Auens: amongſt theſe leaues grow vp ſundry ſtalkes ſome foot or better high, whereon grow floures hanging downe their heads, and the tops of the ſtalkes and cups of the floures are commonly of a purpliſh colour: the floures themſelues are of a pretty red colour, and are of diuers ſhapes, and grow diuers wayes; which hath beene the reaſon that *Cluſius* and others haue iudged them ſeuerall plants, as may be ſeene is *Cluſius* his Workes, where he giues you the floures, which you here finde expreſt, for a different kind. Now ſome of theſe floures, euen the greater part of them grow with fiue red round pointed leaues, which neuer lie faire open, but only ſtand ſtraight out, the middle part being filled with a hairy matter and yellowiſh threds: other-ſome conſiſt of ſeuen, eight, nine, or more leaues; and ſome againe lie wholly open, with greene leaues growing cloſe vnder the cup of the floure, as you may ſee them repreſented in the figure; and ſome few now and then may be found compoſed of a great many little leaues thick thruſt together, making a very double floure. After the floures are falne come ſuch hairy heads as in other plants of this kinde, amongſt which lies the ſeed. *Geſner* calls this *Geum riuale: Thalius, Caryophyllata maior purpurea: Camerarius, Caryophyllata aquatica: Cluſius, Caryophyllata montana prima, & tertia.*

5 The root of this is alſo thicke, fibrous, and whitiſh; from which ariſe many leaues three fingers high, reſembling thoſe of Agrimonie, the little leaues ſtanding directly oppoſite each againſt other, ſnipt about the edges, hairy, a little curld, and of a deepe greene colour: out of the midſt of thoſe, vpon a ſhort ſtalk growes commonly on ſingle floure of a gold-yellow colour, much like the mountaine Auens deſcribed in the ſecond place. It floures at the beginning of Iuly, and groweth vpon the Alpes. *Pona* was the firſt that deſcribed it, and that by the name of *Caryophyllata Alpina omnium minima.* ‡

¶ *The Place.*

Theſe kindes of Auens are found in high mountaines and thicke woods of the North parts of England: we haue them in our London gardens, where they flouriſh and encreaſe infinitely.

‡ The red floured mountaine Auens was found growing in Wales by my much honoured friend M^r. *Thomas Glynn*, who ſent ſome plants thereof to our Herbariſts, in whoſe gardens it thriueth exceedingly. ‡

¶ *The Time.*

They floure from the beginning of May to the end of Iuly.

¶ *The Names.*

Auens is called *Caryophyllata*, ſo named of the ſmell of Cloues which is in the roots, and diuers call it *Sanamunda*, *Herba benedicta*, and *Nardus ruſtica*: in high-Dutch, **Benedicten wortz**: in French, *Galiot*: of the Wallons, *Gloria filia*: in Engliſh, Auens, and herbe Benet: it is thought to be *Geum Plinij*, which moſt do ſuſpect, by reaſon he is ſo briefe. *Geum*, ſaith *Pliny, lib. 26. cap. 7.* hath little ſlender roots, blacke, and of a good ſmell.

The other kinde of Auens is called of the later Herbariſts, *Caryophyllata montana*, Mountaine Auens: it might agree with the deſcription of *Baccharis*, if the floures were purple tending to whiteneſſe; which as we haue ſaid are yellow, and likewiſe differ in that, that the roots of Auens ſmell of Cloues, and thoſe of *Baccharis* haue the ſmell of Cinnamon.

¶ *The Temperature.*

The roots and leaues of Auens are manifeſtly dry, and ſomething hot, with a kinde of ſcouring qualitie.

¶ *The Vertues.*

A The decoction of Auens made in wine is commended againſt cruditie or rawneſſe of the ſtomacke, paine of the Collicke, and the biting of venomous beaſts.

B The ſame is likewiſe a remedie for ſtitches and griefe in the ſide, for ſtopping of the liuer; it concocteth raw humours, ſcoureth away ſuch things as cleaue to the intrals, waſteth and diſſolueth winde, eſpecially being boyled with wine: but if it be boyled with pottage or broth it is of great efficacie, and of all other pot-herbes is chiefe, not onely in phyſicall broths, but commonly to be vſed in all.

C The leaues and roots taken in this manner diſſolue and conſume clottered blood in any inward

part

part of the body; and therfore they are mixed with potions which are drunk of thoſe that are bruiſed, that are inwardly broken, or that haue fallen from ſome high place.

The roots taken vp in Autumne and dried, do keep garments from being eaten with moths, and F make them to haue an excellent good odour, and ſerue for all the phyſicall purpoſes that Cinkefoiles do.

Chap. 386. *Of Straw-berries.*

¶ *The Kindes.*

THere be diuers ſorts of Strawberries; one red, another white, a third ſort greene, and likewiſe a wilde Straw-berrie, which is altogether barren of fruit.

1 *Fragaria & Fraga.*
Red Straw-berries.

2 *Fragaria & Fraga ſubalba.*
White Straw-berries.

¶ *The Deſcription.*

1 THe Straw-berry hath leaues ſpred vpon the ground, ſomewhat ſnipt about the edges, three ſet together vpon one ſlender foot-ſtalke like the Trefoile, greene on the vpper ſide, and on the nether ſide more white: among which riſe vp ſlender ſtems, whereon do grow ſmall floures, conſiſting of fiue little white leaues, the middle part ſomwhat yellow, after which commeth the fruit, not vnlike to the Mulberrie, or rather the Raſpis, red of colour, hauing the taſte of wine, the inner pulpe or ſubſtance whereof is moiſt and white, in which is contained little ſeeds: the root is threddy, of long continuance, ſending forth many ſtrings, which diſperſe themſelues far abroad, whereby it greatly increaſeth.

2 Of theſe there is alſo a ſecond kinde, which is like to the former in ſtems, ſtrings, leaues, and floures. The fruit is ſomething greater, and of a whitiſh colour, wherein is the difference.

There is another ſort, which brings forth leaues, floures, and ſtrings like the other of his kinde. The fruit is green when it is ripe, tending to redneſſe vpon that ſide that lieth to the Sun, cleauing faſter

faſter to the ſtemmes, and is of a ſweeter taſte, wherein onely conſiſteth the difference.

† 3 *Fragaria minime veſca, ſiue ſterilis.* Wilde or barren Straw-berry.

‡ There is alſo kept in our gardens (onely for varietie) another Strawberrie which in leaues and growing is like the common kinde; but the floure is greeniſh, and the fruit is harſh, rough, and prickely, being of a greeniſh colour, with ſome ſhew of redneſſe. Mr. *Iohn Tradeſcant* hath told me that he was the firſt that tooke notice of this Straw-berry, and that in a womans garden at Plimouth, whoſe daughter had gathered and ſet the roots in her garden in ſtead of the common Straw-berry: but ſhe finding the fruit not to anſwer her expectation, intended to throw it away: which labor he ſpared her, in taking it and beſtowing it among the louers of ſuch varieties, in whoſe gardens it is yet preſerued. This may be called in Latine, *Fragaria fructu hiſpido*, The prickly Straw-berry. ‡

† 3 This wild Strawberry hath leaues like the other Straw-berry, but ſomewhat leſſe, and ſofter, ſlightly indented about the edges, and of a light greene colour: among which riſe vp ſlender ſtems bearing ſuch floures as the common Straw-berries doe, but leſſer, which doe wither away, leauing behinde a barren or chaffie head, in ſhape like a Straw-berrie, but of no worth or value: the root is like the others.

¶ *The Place.*

Straw-berries do grow vpon hills and vallies, likewiſe in woods and other ſuch places that be ſomewhat ſhadowie: they proſper well in Gardens, the firſt euery where, the other two more rare, and are not to be found ſaue only in gardens.

‡ The barren one growes in diuers places, as vpon Blacke heath, in Greenwich parke, &c. ‡

¶ *The Time.*

The leaues continue greene all the yeare: in the Spring they ſpred further with their ſtrings, and floure afterward: the berries are ripe in Iune and Iuly. ‡ The barren one floures in April and May, but neuer carries any berries. ‡

¶ *The Names.*

The fruit or berries are called in Latine by *Virgil* and *Ouid*, *Fraga*: neither haue they any other name commonly knowne: they are called in high-Dutch **Erdbeeren**: in low-Dutch, **Eertbeſſen**: in French, *Fraiſes*: in Engliſh, Strawberries.

¶ *The Temperature.*

The leaues and roots do coole and dry, with an aſtriction or binding quality: but the berries be cold and moiſt.

¶ *The Vertues.*

A The leaues boyled and applied in manner of a pultis taketh away the burning heate in wounds: the decoction thereof ſtrengthneth the gummes, faſtneth the teeth, and is good to be held in the mouth, both againſt the inflammation or burning heate thereof, and alſo of the almonds of the throat: they ſtay the ouermuch flowing of the bloudy flix, and other iſſues of bloud.

B The berries quench thirſt, and do allay the inflammation or heate of the ſtomack: the nouriſhment which they yeeld is little, thin, and wateriſh, and if they happen to putrifie in the ſtomacke, their nouriſhment is naught.

C The diſtilled water drunke with white Wine is good againſt the paſſion of the heart, reuiuing the ſpirits, and making the heart merry.

D The diſtilled water is reported to ſcoure the face, to take away ſpots, and to make the face faire and ſmooth; and is likewiſe drunke with good ſucceſſe againſt the ſtone in the kidnies.

E The leaues are good to be put into Lotions or waſhing waters, for the mouth and the priuie parts.

The

The ripe Straw-berries quench thirſt, coole heat of the ſtomack, and inflammation of the liuer, take away (if they be often vſed) the redneſſe and heate of the face. F

† That figure which formerly was in this place, and ſome part of the deſcription were (as I haue formerly noted) of the *Pentaphyllum ſupinum Potentilla ſerit*, which you may finde deſcribed amongſt the Cinkfoiles in the ſixth place.

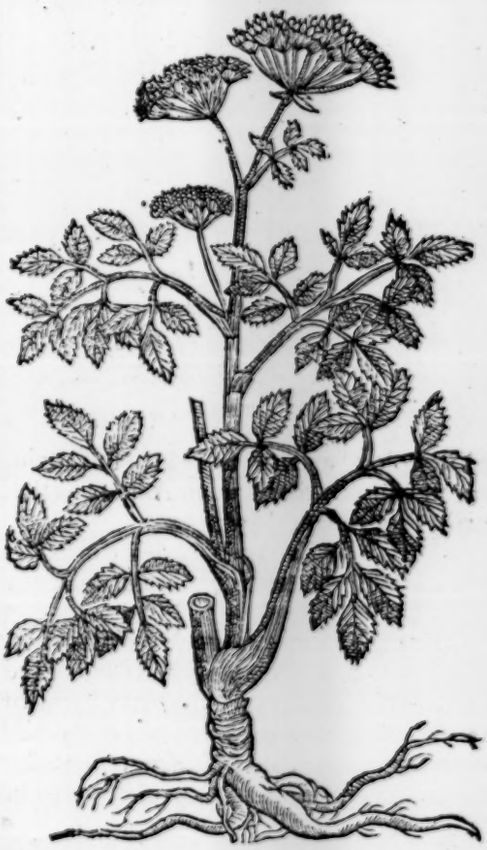
CHAP. 387. *Of Angelica.*

¶ *The Kindes.*

THere be diuers kindes of Angelica's; the garden Angelica, that of the water, and a third ſort wilde growing vpon the land.

1 *Angelica ſatiua.*
Garden Angelica.

2 *Angelica ſyluestris.*
Wilde Angelica.



¶ *The Deſcription.*

1 COncerning this plant Angelica there hath bin heretofore ſome contention and controuerſie; *Cordus* calling it *Smyrnium*: ſome later writers, *Coſtus niger*: but to auoid cauill, the controuerſie is ſoone decided, ſith it and no other doth aſſuredly retaine the name *Angelica*. It hath great broad leaues, diuided againe into other leaues, which are indented or ſnipt about much like to the vppermoſt leaues of *Sphondylium*, but lower, tenderer, greener, and of a ſtronger ſauor: among which leaues ſpring vp the ſtalkes, very great, thicke, and hollow, ſixe or ſeuen foot high, ioynted or kneed: from which ioynts proceed other armes or branches, at the top whereof grow tufts of whitiſh floures like Fennell or Dill: the root is thicke, great, and oilous, out of which iſſueth, if it be cut or broken, an oylie liquor: the whole plant, as well leaues, ſtalkes, as roots, are of a reaſonable pleaſant ſauour, not much vnlike *Petroleum*.

There is another kinde of true Angelica found in our Engliſh gardens (which I haue obſerued) being like vnto the former, ſauing that the roots of this kinde are more fragrant, and of a more aromaticke ſauor, and the leaues next the ground of a purpliſh red colour: and the whole plant leſſer.

2 The

‡ 3 *Archangelica.*
Great wilde Angelica.

2 The wilde Angelica, which ſeldome growes in gardens, but is found to grow plentifully in water ſoken grounds and cold moiſt medowes, is like to that of the garden, ſaue that his leaues are not ſo deepely cut or iagged; they be alſo blacker and narrower: The ſtalkes are much ſlenderer and ſhorter, and the floures whiter: the root much ſmaller, and hath more threddy ſtrings appendant thereunto, and is not ſo ſtrong of ſauour by a great deale.

3 *Matthiolus* and *Geſner* haue made mention of another kinde of Angelica, but we are very ſlenderly inſtructed by their inſufficient deſcriptions: notwithſtanding for our better knowledge and more certain aſſurance I muſt needs record that which my friend M^r. *Bredwell* related to me concerning his ſight thereof, who found this plant growing by the mote which compaſſeth the houſe of M^r. *Munke* of the pariſh of Iuer, two miles from Colbrook; and ſince that I haue ſeene the ſame in low fenny and marſhy places of Eſſex, about Harwich. This plant hath leaues like vnto the garden Angelica, but ſmaller, and fewer in number, ſet vpon one rib a great ſtalke, groſſe and thicke, whoſe ioynts and that ſmall rib whereon the leafe growes are of a reddiſh colour, hauing many long branches comming forth of an husk or caſe, ſuch as is in the common garden Parſnep: the floures doe grow at the top of the branches, and are of a white colour, and tuft faſhion: which being paſt, there ſucceed broad long and thicke ſeeds, longer and thicker than garden Angelica: the root is great, thicke, white, of little ſauour, with ſome ſtrings appendant thereto.

‡ This of our Authors deſcription ſeemes to agree with the *Archangelica* of *Lobel*, *Dodonæus*, and *Cluſius*; wherefore I haue put their figure to it. ‡

¶ *The Place.*

The firſt is very common in our Engliſh gardens: in other places it growes wilde without planting; as in Norway, and in an Iſland of the North called Iſland, where it groweth very high. It is eaten of the inhabitants, the barke being pilled off, as we vnderſtand by ſome that haue trauelled into Iſland, who were ſometimes compelled to eate hereof for want of other food; and they report that it hath a good and pleaſant taſte to them that are hungry. It groweth likewiſe in diuers mountaines of Germanie, and eſpecially of Bohemia.

¶ *The Time.*

They floure in Iuly and Auguſt, whoſe roots for the moſt part do periſh after the ſeed is ripe: yet haue I with often cutting the plant kept it from ſeeding, by which meanes the root and plant haue continued ſundry yeares together.

¶ *The Names.*

It is called of the later age *Angelica*: in high-Dutch, **Angelick, Bzuſtwurtz**, or **des heiligben Geyſt wurtzel**, that is, *Spiritus ſancti radix*, the root of the holy Ghoſt, as witneſſeth *Leonhartus Fuchſius*: in low-Dutch, **Angeliſka**: in French, *Angelic*: in Engliſh alſo Angelica.

It ſeemeth to be a kind of *Laſerpitium*; for if it be compared with thoſe things which *Theophraſtus* at large hath written concerning *Silphium* or *Laſerpitium*, in his ſixth booke of the hiſtorie of plants, it ſhall appeare to be anſwerable thereunto. But whether wild *Angelica* be that which *Theophraſtus* calleth *Magydaris*, that is to ſay, another kinde of *Laſerpitium*, we leaue to be examined and conſidered of by the learned Phyſitians of our London Colledge.

¶ *The Temperature.*

Angelica, eſpecially that of the garden, is hot and dry in the third degree; therefore it openeth, attenuateth or maketh thin, digeſteth, and procureth ſweat.

¶ *The*

¶ *The Vertues.*

The roots of garden Angelica is a singular remedy against poison, and against the plague, and all infections taken by euill and corrupt aire; if you do but take a peece of the root and hold it in your mouth, or chew the same between your teeth, it doth most certainely driue away the pestilentiall aire, yea although that corrupt aire haue possessed the hart, yet it drieth it out again by vrine and sweat, as Rue and Treacle, and such like *Antipharmaca* do. A

Angelica is an enemy to poisons: it cureth pestilent diseases if it by vsed in season: a dram weight of the pouder hereof is giuen with thin wine, or if the feuer be vehement, with the distilled water of *Cardaus benedictus*, or of *Tormentill*; and with a little vineger, and by it selfe also, or with Treacle of Vipers added. B

It openeth the liuer and spleene: draweth downe the termes, driueth out or expelleth the secondine. C

The decoction of the root made in wine, is good against the cold shiuering of agues. D

It is reported that the root is auaileable against witchcraft and inchantments, if a man carry the same about them, as *Fuchsius* saith. E

It attenuateth and maketh thin, grosse and tough flegme: the root being vsed greene, and while it is full of juice, helpeth them that be asthmaticke, dissoluing and expectorating the stuffings therein, by cutting off and clensing the parts affected, reducing the body to health againe; but when it is dry it worketh not so effectually. F

It is a most singular medicine against surfeting and loathsomenesse to meate: it helpeth concoction in the stomacke, and is right beneficiall to the hart: it cureth the bitings of mad dogges, and all other venomous beasts. G

The wilde kindes are not of such force in working, albeit they haue the same vertues attributed vnto them. H

Chap. 388. *Of Masterworts and herbe* Gerard.

1 *Imperatoria.*
Masterwoorts.

2 *Herba Gerardi.*
Herbe Gerard, or Aish-weed.

¶ *The Deſcription.*

1 *Imperatoria* or Maſterwoort hath great broad leaues not much vnlike wilde Angelica, but ſmaller, and of a deeper greene colour, in ſauor like Angelica, and euery leafe diuided into ſundry other little leaues: the tender knotted ſtalkes are of a reddiſh colour, bearing at the top round ſpokie tufts with white floures: the ſeed is like the ſeed of Dill: the root is thicke, knotty and tuberous, of a good ſauour, and hot or biting vpon the tongue, which hath mooued the vnskilfull to call it Pellitory of Spaine, but very vnfitly and vntruely.

2 *Herba Gerardi*, which *Pena* doth alſo call *Imperatoria* and *Oſtruthium*: the Germaines *Podagraria*, that is, Gout-woort: in Engliſh, herbe Gerard, or wilde Maſterwoot, and in ſome places after *Lyte*, Aſhweed, is very like the other in leaues, floures, and roots, ſauing that they be ſmaller, growing vpon long ſtems: the roots tenderer, whiter, and not ſo thicke or tuberous. The whole plant is of a reaſonable good ſauour, but not ſo ſtrong as Maſterwoort.

¶ *The Place.*

Imperatoria groweth in darke woods and deſarts; in my Garden and ſundry others very plentifully.

Herbe Gerard groweth of it ſelfe in gardens without ſetting or ſowing, and is ſo fruitfull in his increaſe, that where it hath once taken root, it will hardly be gotten out againe, ſpoiling and getting euery yeere more ground, to the annoying of better herbes.

¶ *The Time.*

They floure from the beginning of Iune to the beginning of Auguſt.

¶ *The Names.*

Imperatoria, or *Aſtrantia*, is called in Engliſh, Maſterwoort, or baſtard Pellitory of Spaine.

Herba Gerardi is called in Engliſh, Herb Gerard, Aiſhweed, and Goutwoort: in Latine alſo *Podagraria Germanica*.

¶ *The Nature.*

Imperatoria, eſpecially the root, is hot and dry in the third degree. The wilde *Imperatoria*, or herbe Gerard, is almoſt of the ſame nature and quality, but not ſo ſtrong.

¶ *The Vertues.*

A *Imperatoria* is not onely good againſt all poiſon, but alſo ſingular againſt all corrupt and naughty aire and infection of the peſtilence, if it be drunken with wine.

B The roots and leaues ſtamped, diſſolue and cure peſtilentiall carbuncles and botches, and ſuch other apoſtumations and ſwellings, being applied thereto.

C The root drunke in wine cureth the extreme and rigorous cold fits of agues, and is good againſt the dropſie, and prouoketh ſweat.

D The ſame taken in manner aforeſaid, comforteth and ſtrengthneth the ſtomack, helpeth digeſtion, reſtoreth appetite, and diſſolueth all ventoſities or windineſſe of the ſtomacke and other parts.

E It greatly helpeth ſuch as haue taken great ſquats, bruſes, or falls from ſome high place, diſſoluing and ſcattering abroad congealed and clotted bloud within the body: the root with his leaues ſtamped and laid vpon the members infected, cureth the bitings of mad dogs, and of all other venomous beaſts.

F Herbe Gerard with his roots ſtamped, and laid vpon members that are troubled or vexed with the gout, ſwageth the paine, and taketh away the ſwellings and inflammation thereof, which occaſioned the Germaines to giue it the name *Podagraria*, becauſe of his vertues in curing the gout.

G It cureth alſo the Hemorrhoids, if the fundament be bathed with the decoction of the leaues and roots, and the ſoft and tender ſodden herbes laid thereon very hot.

H Falſe Pellitory of Spaine attenuateth or maketh thin, digeſteth, prouoketh ſweate and vrine, concocteth groſſe and colde humors, waſteth away windineſſe of the entrailes, ſtomacke and matrix: it is good againſt the collicke and ſtone.

I One dram of the root in pouder giuen certaine daies together, is a remedy for them that haue the dropſie, and alſo for thoſe that are troubled with convulſions, cramps, and the falling ſickneſſe.

K Being giuen with wine before the fit come, it cureth the quartaine ague, and is a remedy againſt peſtilent diſeaſes.

L The ſame boiled in ſharpe or ſower wine, eaſeth the tooth-ach, if the mouth be waſhed therewith very hot.

M Being chewed it draweth forth water and flegme out of the mouth (which kinde of remedies in Latine are called *Apophlegmatiſmi*) and diſburdeneth the braine of phlegmaticke humours, and are likewiſe vſed with good ſucceſſe in apoplexies, drowſie ſleepes, and other like infirmities.

Chap.

Chap. 389.

Of Hercules Wound-wort, or All-heale.

¶ *The Kindes.*

Panax is of ſundry kindes, as witneſſeth *Theophraſtus* in his ninth booke; one groweth in Syria, and likewiſe other three, that is to ſay, *Chironium*, *Heraclium*, and *Æſculapium*; or *Chirons* All-heale, *Hercules* All-heale, and *Æſculapius* All-heale. Beſides theſe there is one *Platyphyllon*, or broad leafed; ſo that in *Theophraſtus* there are ſix kindes of *Panax*: but *Dioſcorides* deſcribeth only three, *Horacleum*, *Aſclepium*, and *Chironium*: whereunto we haue added another ſort, whoſe vertues wee found out by meanes of a husbandman, and for that cauſe haue named it *Panax Coloni*, or Clownes wort.

1 *Panax Heracleum.*
Hercules All-heale.

2 *Panax Heracleum maius.*
Hercules great Wound-wort.

¶ *The Deſcription.*

1 Hercules All-heale or Wound-wort hath many broad leaues ſpread vpon the ground, very rough and hairy, of an ouerworne greene colour, and deepely cut into diuers ſections like thoſe of the Cow Parſenep, and not vnlike to the fig leaues: among the which riſeth vp a very ſtrong ſtalke couered ouer with a rough hairineſſe, of the height of foure or fiue cubits. Being wounded it yeeldeth forth a yellow gummie iuyce, as doth euery part of the plant, which is that precious gum called *Opopanax*: at the top of which ſtalks ſtand great tufts or vmbels of yellowiſh floures, ſet together in ſpoky rundles like thoſe of Dill, which turn into ſeed of a ſtraw colour, ſharpe and hot in taſte, and of a pleaſing ſauour: the root is very thicke, fat, and full of iuyce, and of a white colour.

2 The great Wound-wort, which the Venetians nouriſh in their gardens, hath great large leaues ſomewhat rough or hairie, conſiſting of diuers ſmall leaues ſet together vpon a middle rib, which make one entire leaſe ioyned together in one, whereof each collaterall or ſide leaſe is long,

and ſharpe pointed: among which riſeth vp a knotty ſtalke three or foure cubits high, diuiding it ſelfe into diuers branches; on the tops whereof do grow ſpokie tufts or rundles like the precedent, but the floures are commonly white: the ſeed is flat and plaine: the root long, thicke, and white, which being broken or wounded, yeeldeth forth liquor like that of the former, of a hot and biting taſte.

¶ *The Place.*

Theſe plants grow in Syria; the firſt of them alſo in my garden: but what *Panax* of Syria is, *Theophraſtus* doth not expreſſe. *Pliny* in his 12 booke, Chap. 26. ſaith, that the leaues are round, and of a great compaſſe: but it is ſuſpected that theſe are drawne from the deſcription of Hercules Panax.

Broad leafed Panax is thought to be the great Centory: for *Pliny* witneſſeth, that Panax which *Chiron* found out is ſyrnamed *Centaurium*, Centorie.

Matthiolus ſaith it growes of it ſelfe in the tops of the hills Apennini, in the Cape Argentaria, in the ſea coaſts of Siena, and it is cheriſhed in the gardens of Italy: but he cannot affirme, That the liquor hereof is gathered in Italy; for the liquor *Opopanax* which is ſold in Venice is brought, ſaith he, out of Alexandria a city in Egypt: it groweth alſo in Syria, Boœtia, and in Phocide, cities of Arcadia.

¶ *The Time.*

They floure and flouriſh from the firſt of May vnto the end of September.

¶ *The Names.*

That which is is called πάναξ in Greeke, is likewiſe named *Panax* in Latine: and that *Panax Heraclium* which *Dioſcorides* ſetteth downe is called in Latine, *Panax Heraculanum*, or *Herculeum*, or Hercules Panax: it may be called in Engliſh, Hercules his Wound-wort or All-heale, or Opopanax wort, of the Greeke name.

¶ *The Temperature.*

The barke of the root of Hercules Wound-wort is hot and dry, yet leſſe than the iuyce, as *Galen* teacheth.

¶ *The Vertues.*

A The ſeed beat to pouder and drunke in Wormwood wine is good againſt poyſon, the biting of mad dogs, and the ſtinging of all manner of venomous beaſts.

B The leaſe or root ſtamped with honey, and brought to the forme of an Vnguent or Salue, cureth wounds and vlcers of great difficultie, and couereth bones that are bare or naked without fleſh.

Chap. 390. *Of Clownes Wound-wort or All-heale.*

¶ *The Deſcription.*

Clownes All-heale, or the Husbandmans Wound-wort, hath long ſlender ſquare ſtalks of the height of two cubits, furrowed or chamfered along the ſame as it were with ſmall gutters, and ſomewhat rough or hairy: whereupon are ſet by couples one oppoſite to another, long rough leaues ſomewhat narrow, bluntly indented about the edges like the teeth of a ſaw, of the forme of the leaues of Speare-mint, and of an ouerworne greene colour: at the top of the ſtalkes grow the floures ſpike faſhion, of a purple colour mixed with ſome few ſpots of white, in forme like to little hoods. The root conſiſteth of many ſmall threddy ſtrings, whereunto are annexed or tied diuers knobby or tuberous lumpes, of a white colour tending to yellowneſſe: all the whole plant is of an vnpleaſant ſauour like *Stachys* or ſtinking Hore-hound. ‡ The root in the Winter time and the beginning of the Spring is ſomewhat knobby tuberous, and ioynted, which after the ſtalkes grow vp become flaccide and hollow, and ſo the old ones decay, and then it putteth forth new ones. ‡

¶ *The Place.*

It groweth in moiſt medowes by the ſides of ditches, and likewiſe in fertile fields that are ſomwhat moiſt, almoſt euery where; eſpecially in Kent about South-fleet, neere to Graueſend, and likewiſe in the medowes by Lambeth neere London.

¶ *The Time.*

It floureth in Auguſt, and bringeth his ſeed to perfection in the end of September.

¶ *The Names.*

That which hath bin ſaid in the deſcription ſhall ſuffice touching the names, as well in Latine as Engliſh.

‡ This

Panax Coloni.
Clownes All-heale.

‡ This plant by *Geſner* was called *Stachys paluſtris*, and *Betonica fœtida*, and thought to be of the kinde of *Herba Iudaica*, or *Sideritis*; to which indeed I ſhould, and *Thalius* hath referred it, calling it *Sideritis 1. grauis odoris: Cæſalpinus* calls it *Tertiola*; and giues this reaſon, *quod Tertianas ſanet*, becauſe it cures Tertians. *Tabernamontan.* called it *Stachys aquatica*, whoſe figure with a deſcription our Authour in the former edition gaue, *pag.* 565. by the name of *Marrubium aquaticum acutum*; yet (as it ſeemeth) either not knowing, or forgetting what he had formerly done, he here againe ſetteth it forth as a new thing, vnder another title: but the former figure of *Tabern.* being in my iudgment the better, I haue here giuen you, with addition of the iointed tuberous roots as they are in Winter: yet by the Caruers fault they are not altogether ſo exquiſitely expreſt as I intended. ‡

¶ *The Temperature.*

This plant is hot in the ſecond degree, and dry in the firſt.

¶ *The Vertues.*

The leaues hereof ſtamped with *Axungia* or hogs greaſe, and applied vnto greene wounds in manner of a pulteſſe, healeth them in ſhort time, and in ſuch abſolute manner, that it is hard for any that haue not had the experience thereof to beleeue: for being in Kent about a Patient, it chanced that a poore man in mowing of Peaſon did cut his leg with a ſithe, wherein he made a wound to the bones, and withall very large and wide, and alſo with great effuſion of bloud; the poore man crept vnto this herbe, which he bruiſed with his hands, and tied a great quantity of it vnto the wound with a piece of his ſhirt, which preſently ſtanched the bleeding, and ceaſed the paine, inſomuch that the poore man preſently went to his dayes worke againe, and ſo did from day to day, without reſting one day vntill he was perfectly whole; which was accompliſhed in a few dayes, by this herbe ſtamped with a little hogs greaſe, and ſo laid vpon in manner of a pulteſſe, which did as it were glew or ſoder the lips of the wound together, and heale it according to the firſt intention, as we terme it, that is, without drawing or bringing the wound to ſuppuration or matter; which was fully performed in ſeuen dayes, that would haue required forty dayes with balſam it ſelfe. I ſaw the wound, and offered to heale the ſame for charitie; which he refuſed, ſaying that I could not heale it ſo well as himſelfe: a clowniſh anſwer I confeſſe, without any thankes for my good will; whereupon I haue named it Clownes Wound-wort, as aforeſaid. Since which time my ſelfe haue cured many grieuous wounds, and ſome mortall, with the ſame herbe; one for example done vpon a Gentleman of Grayes Inne in Holborne, Mr. *Edmund Cartwright*, who was thruſt into the lungs, the wound entring in at the lower part of the *Thorax*, or the breſt-blade, euen through that cartilaginous ſubſtance called *Mucronata Cartilago*, inſomuch that from day to day the frothing and puffing of the lungs did ſpew forth of the wound ſuch excrements as it was poſſeſſed of, beſides the Gentleman was moſt dangerouſly vexed with a double quotidian feuer; whom by Gods permiſſion I perfectly cured in very ſhort time, and with this Clownes experiment, and ſome of my foreknowne helpes, which were as followeth. A

First I framed a ſlight vnguent hereof thus: I tooke foure handfulls of the herbe ſtamped, and put them into a pan, whereunto I added foure ounces of Barrowes greaſe, halfe a pinte of oyle Oliue, wax three ounces, which I boyled vnto the conſumption of the iuyce (which is known when the ſtuffe doth not bubble at all) then did I ſtraine it, putting it to the fire againe, adding thereto two ounces of Turpentine, the which I ſuffered to boyle a little, reſeruing the ſame for my vſe. B

The which I warmed in a ſawcer, dipping therein ſmall ſoft tents, which I put into the wound, defending the parts adioyning with a plaiſter of *Calcitheos*, relented with oyle of roſes: which manner of dreſſing and preſeruing I vſed euen vntill the wound was perfectly whole: notwithſtanding once in a day I gaue him two ſpoonfulls of this decoction following. C

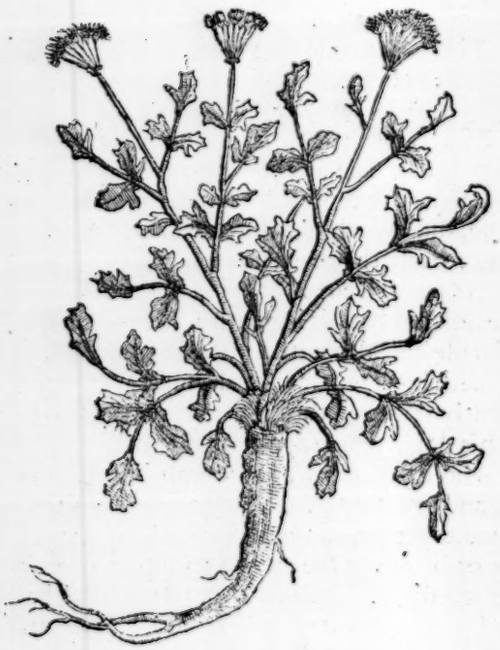
I tooke a quart of good Claret Wine, wherein I boyled an handfull of the leaues of *Solidago Saracenica*, D

Saracenica, and Saracens Conſound, or foure ounces of honey, whereof I gaue him in the morning two ſpoonfulls to drinke in a ſmall draught of wine tempered with a little Sugar.

E In like manner I cured a Shoo-makers ſeruant in Holburne, who intended to deſtroy himſelfe for cauſes knowne vnto many now liuiug: but I deemed it better to couer the fault, than to put the ſame in print, which might moue ſuch a graceleſſe fellow to attempt the like: his attempt was thus; Firſt, he gaue himſelfe a moſt mortall wound in the throat, in ſuch ſort, that when I gaue him drinke it came forth at the wound, which likewiſe did blow out the candle: another deep and grieuous wound in the breſt with the ſaid dagger, and alſo two others in *Abdomine* or the nether belly, ſo that the *Zirbus* or fat, commonly called the caule, iſſued forth, with the guts likewiſe: the which mortall wounds, by Gods permiſſion, and the vertues of this herbe, I perfectly cured within twenty dayes: for the which the name of God be praiſed.

Chap. 391. *Of Magydare, or Laſer-wort.*

† *Laſerpitium.*
Laſer-wort.



¶ *The Deſcription.*

It ſeemeth that neither *Dioſcorides* nor yet *Theophraſtus* haue euer ſeene *Laſerpitium*, *Sagapenum*, or any other of the gummiferous roots, but haue barely and nakedly ſet downe their iudgments vpon the ſame, either by heare-ſay, or by reading of other mens Workes. Now then ſeeing the old Writers be vnperfect herein, it behoooueth vs in this caſe to ſearch with more diligence the truth hereof; and the rather, for that very few haue ſet forth the true deſcription of that Plant which is called *Laſerpitium*, that is indeed the true *Laſerpitium*, from the roots whereof flow that ſap or liquor called *Laſer*. This plant, as *Pena* and *Lobel* themſelues ſay, was found out not far from the Iſles which *Dioſcorides* calls Stœchades, ouer againſt Maſſilia, among ſundry other rare plants. His ſtalke is great and thicke like Ferula, or Fennell gyant: The leaues are like vnto the common Smallage, and of an vnpleaſant ſauour. The floures grow at the top of the ſtalkes, tuft-faſhion like Ferula or Fennell: which being paſt, there ſucceed broad and flat ſeeds like Angelica, of a good ſauour, and of the colour of Box. The roots are many, comming from one head or chiefe root, and are couered ouer with a thicke and fat barke. Theſe roots and ſtalkes being ſcarified or cut, there floweth out of them a ſtrong liquor, which being dried is very medicinable, and is called *Laſer*.

¶ *The Place.*

There be ſundry ſorts of Laſer, flowing from the roots and ſtalkes of *Laſerpitium*, the goodneſſe or qualitie whereof varieth according to the countrey or clymate wherein the plant groweth. For the beſt groweth vpon the high mountaines of Cyrene and Africa, and is of a pleaſant ſmell: in Syria alſo, Media, Armenia, and Lybia; the liquour of which plant growing in theſe places is of a moſt ſtrong and deteſtable ſauour. *Lobel* reporteth, that *Iacobus Rainaudus* an Apothecarie of Maſſilia was the firſt that made it knowne, or brought the plants thereof to Montpellier in France, vnto the learned *Rondeletius*, who right well beholding the ſame, concluded, that of all the kindes of Ferula that he had euer ſeene, there was not any ſo anſwerable vnto the true *Laſerpitium* as this onely plant.

¶ *The Time.*

This Plant floureth in Montpellier about Midſommer.

¶ *The*

¶ *The Names.*

It is called in Latine *Laſerpitium*: in Engliſh, Laſerwoort, and Magydare: the gum or liquour that iſſueth out of the ſame is called *Laſer*, but that which is gathered from thoſe plants that doe grow in Media and Syria, is called *Aſa fœtida*.

¶ *The Nature.*

Laſerpitium eſpecially the root, is hot and drie in the third degree: *Laſer* is alſo hot and drie in the third degree, but it exceedeth much the heate of the leaues, ſtalkes, and rootes of *Laſerpitium*.

¶ *The Vertues.*

The root of *Laſerpitium* well pounded, or ſtamped with oile, ſcattereth clotted bloud, taketh away blacke and blew markes that come of bruiſes or ſtripes, cureth and diſſolueth the Kings-euill, and all hard ſwellings and botches, the places being annointed or plaiſtered therewith. A

The ſame root made into a plaiſter with the oile of Ireos and wax, doth both aſſwage and cure the Sciatica, or gout of the hip or huckle bone. B

The ſame holden in the mouth and chewed, doth aſſwage the tooth-ache; for they are ſuch roots as draw from the braine a great quantite of humors. C

The liquour or gum of *Laſerpitium*, eſpecially the *Laſer* of Cyrene broken and diſſolued in water and drunken, taketh away the hoarſeneſſe that commeth ſuddenly: and being ſupt vp with a reare egge, cureth the cough: and taken with ſome good broth or ſupping, is good againſt an old pleuriſie. D

Laſer cureth the iaundies and dropſie, taken with dried figs: alſo being taken in the quantitie of a ſcruple, with a little pepper and Myrrhe, is very good againſt ſhrinking of ſinewes, and members out of ioint. E

The ſame taken with honie and vineger, or the ſyrrup of vineger, is very good againſt the falling ſickneſſe. F

It is good againſt the flux of the belly comming of the debilitie and weakneſſe of the ſtomacke (called in Latine *Cœliacus morbus*) if it be taken with raiſons of the Sun. G

It driueth away the ſhakings and ſhiuerings of agues, being drunke with wine, pepper, & white Frankincenſe. Alſo there is made an electuarie thereof called *Antidotus ex ſucco Cyrenaico*, which is a ſingular medicine againſt feuer quartaines. H

It is excellent againſt the bitings of all venomous beaſts, and venomous ſhot of darts or arrowes, not onely taken inwardly, but alſo applied outwardly vpon wounds. I

It bringeth to maturation, and breaketh all peſtilentiall impoſthumes, botches and carbuncles, being applied thereto with Rue, Salt-peter, and honie: after the ſame manner it taketh away corns after they haue been ſcarified with a knife. K

Being laied to with Copperas and Verdigreaſe, it taketh away all ſuperfluous outgrowings of the fleſh, the Polypus that happeneth in the noſe, and all ſcruuie mangineſſe. L

If it be applied with vineger, pepper and wine, it cureth the naughtie ſcurfe of the head, and falling off of the haire. M

The gum or liquour of *Laſerpitium* which groweth in Armenia, Lybia, and ſundry other places, is that ſtinking and lothſome gum called of the Arabian Phyſitions *Aſa* and *Aſſa*, as alſo with vs in ſhoppes *Aſa fœtida*: but the *Laſerpitium* growing in Cyrene is the beſt, and of a reaſonable pleaſant ſmell, and is called *Laſer* to diſtinguiſh and make difference betweene the two iuices; though *Aſa fœtida* be good for all purpoſes aforeſaid, yet is it not ſo good as *Laſer* of Cyrene: it is good alſo to ſmell vnto, and to be applied vnto the nauels of women vexed with the choking, or riſing of the mother. N

† That figure which formerly was in this place, was of the common Louage deſcribed in the following chapter.

CHAP. 392. *Of common Louage.*

¶ *The Deſcription.*

ANtient writers haue added vnto this common kinde of Louage, a ſecond ſort, yet knowing that the plant ſo ſuppoſed is the true *Siler montanum*, and not *Leuiſticum*, though others haue alſo deemed it *Laſerpitium*. Theſe two ſuppoſitions are eaſily anſwered, ſith they bee ſundrie kindes of plants, though they be very neere in ſhape and faculties one vnto another. This plant being

† *Leuiſticum vulgare.*
Common Louage.

being our common garden Louage, hath large and broad leaues, almoſt like to ſmallage. The ſtalks are round, hollow and knottie, 3. cubits high, hauing ſpoky tufts, or buſhy rundles; and at the top of the ſtalks of a yellow colour, a round, flat, and browne ſeed, like the ſeede of Angelica: the root is long and thicke, and bringeth forth euery yeare new ſtems.

¶ *The Place.*

The right *Leuiſticum* or Louage groweth in ſundry gardens, and not wild (as far as I know) in England.

¶ *The Time.*

Louage floureth moſt commonly in Iuly and Auguſt.

¶ *The Names.*

It is called in Latine *Leuiſticum*: and by ſome, *Liguſticum*: of other ſome, *Siler montanum*, but not truly: in High Dutch, **Libſtockel**: in French, *Liuiſche*: in Low Dutch, **Lauetſe**: in Engliſh, Louage.

¶ *The Nature.*

This plant is hot and drie in the third degree.

¶ *The Vertues.*

The roots of Louage are very good for all inward diſeaſes, driuing away ventoſities or windineſſe, eſpecially of the ſtomacke.

The ſeed thereof warmeth the ſtomack, helpeth digeſtion; wherefore the people of Gennes in times paſt did vſe it in their meates, as wee doe pepper, according to the teſtimonie of *Ant. Muſa.*

C The diſtilled water of Louage cleareth the ſight, and putteth away all ſpots, lentils, freckles, and redneſſe of the face, if they be often waſhed therewith.

† The figure which was here was of the *Siler montanum*, or *Seſeli Officinarum.*

Chap. 393. *Of Cow Parſnep.*

¶ *The Deſcription.*

THis plant *Sphondylium* groweth in all Countries, and is knowne by the name of wilde Parſnep or Sphondylium, whereunto it effectually anſwereth, both in his grieuous and ranke ſauour, as alſo in the likeneſſe of the root, wereupon it was called *Sphondylium*; and of the Germanes, *Acanthus*, but vntruly: the leaues of this plant are long and large, not much vnlike the leaues of wilde Parſnep, or *Panax Heracleum*; deepely notched or cut about the edges like the teeth of a ſaw, and of an ouerworne greene colour. The floures grow in tufts or rundles, like vnto wilde Parſneps: the root is like to Henbane: this herbe in each part thereof hath an euill ſauour, and differeth from the right *Acanthium*, not onely in faculties, but euen in all other things.

¶ *The Place.*

This plant groweth in fertile moiſt medowes, and feeding paſtures, very commonly in all parts of England, or elſewhere, in ſuch places as I haue trauelled.

¶ *The Time.*

Sphondylium floureth in Iune and Iuly.

¶ *The Names.*

It is called in Greek σφονδύλιον: in Latine likewiſe *Sphondylium*: the in ſhops of High and Low Germanie

† *Sphondylium.*
Cow Parſnep.

many *Branca vrſina*, who vnaduiſedly in times paſt haue vſed it in clyſters, in ſtead of Brancke Vrſine, and thereupon haue named it **Berneclaw:** in Engliſh, Cow Parſnep, medow Parſnep, and Madnep.

¶ *The Nature.*

Cow Parſnep is of a manifeſt warm complexion.

¶ *The Vertues.*

The leaues of this plant do conſume and diſſolue cold ſwellings if they be bruiſed and applied thereto. A

The people of Polonia and Lituania vſe to make drinke with the decoction of this herbe, and leuen or ſome other thing made of meale, which is vſed in ſtead of beere and other ordinarie drinke. B

The ſeede of Cow parſnep drunken, ſcoureth out flegmaticke matter through the guts, it healeth the iaundice, the falling ſickneſſe, the ſtrangling of the mother, and them that are ſhort winded. C

Alſo if a man be falne into a dead ſleepe, or a ſwo ne, the fume of the ſeed will waken him ag anne. D

If a phrenticke or melancholicke mans head bee annointed with oile wherein the leaues and roots haue beene ſodden, it helpeth him very much, and ſuch as be troubled with the head-ache and the lethargie, or ſickneſſe called the forgetfull euill. E

† The figure formerly was of the *Paſtinaca ſylueſtris*, or *Elaphoboſcum* of Tabernæmontanus, and the figure that ſhould haue beene here was afterwards vnder the title of *Hippoſelinum*.

CHAP. 394. *Of Herbe Frankincenſe.*

¶ *The Deſcription.*

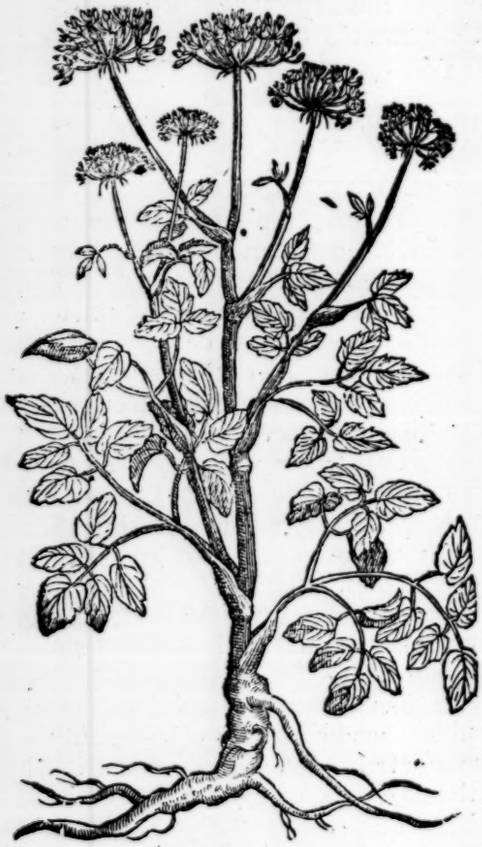
1 THere hath beene from the beginning diuers plants of ſundry kindes, which men haue termed by this glorious name *Libanotis*, onely in reſpect of the excellent and fragrant ſmell which they haue yeelded vnto the ſences of man, ſomewhat reſembling Frankincenſe. The ſent and ſmell *Dioſcorides* doth aſcribe to the root of this firſt kinde, which bringeth forth a long ſtalk with ioints like Fennell, whereon grow leaues almoſt like Cheruill or Hemlocks, ſauing that they be greater, broader, and thicker: at the top of the ſtalkes grow ſpokie taſſels bearing whitiſh floures, which do turne into ſweet ſmelling ſeed, ſomewhat flat, and almoſt like the ſeed of Angelica. The root is blacke without, and white within, hairie aboue, at the parting of the root and ſtalke like vnto *Meum* or *Peucedanum*, and ſauoreth like vnto Roſine, or Frankincenſe.

2 The ſecond kinde of *Libanotis* hath alſo a ſtraight ſtalke, full of knots and ioints: the leaues are like vnto Smallage: the floures grow in taſſels like vnto the former, and bring forth great, long and vneuen ſeed, of a ſharpe taſte: the root is like the former, and ſo is the whole plant very like, but leſſer.

3 The third kinde of *Libanotis* differeth ſomewhat from the others in forme and ſhape, yet it agreeth with them in ſmell, which in ſome ſort is like Frankinſence: the leaues are whiter, longer, and rougher than the leaues of Smallage: the ſtalks do grow to the height of two cubits, bearing at the top the ſpokie tufts of Dill, ſomewhat yellow: the root is like the former, but thicker, neither wanteth it hairie taſſels at the top of the root; which the others alſo haue, before rehearſed.

4 I can-

1 *Libanotis Theophraſti maior.*
Great herbe Frankinſence.



2 *Libanotis Theophraſti minor.*
Small herbe Frankinſence.

3 *Libanotis Theophraſti nigra.*
Blacke herbe Frankinſence.

4 *Libanotis Galeni, Cachrys verior.*
Roſemarie Frankincenſe.

4 I cannot finde among all the plants called *Libanotides*, any one more agreeable to the true and right *Libanotis* of *Dioscorides* than this herbe, which ariseth vp to the height of fiue or six cubits with the cleere shining stalks of *Ferula*; diuiding it selfe from his knottie ioints into sundry arms or branches, set full of leaues like Fennell, but thicker and bigger, and fatter than the leaues of *Cotula fœtida*, of a grayish greene colour, bearing at the top of the stalks the tufts of *Ferula*, or rather of Carrots, full of yellow floures: which being past there succeedeth long flat seed like the seed of the Ash tree, smelling like Rosin, or Frankincense, which being chewed filleth the mouth with the tast of Frankincense, but sharper: all the rest of the plant is tender, and somewhat hot, but not vnpleasant: the plant is like vnto *Ferula*, and aboundeth with milke as *Ferula* doth, of a reasonable good sauour.

¶ *The Place.*

I haue the two last kindes growing in my garden; the first and second grow vpon the high Deserts and mountaines of Germanie.

¶ *The Time.*

These herbs do floure in Iuly and August.

¶ *The Names.*

This herbe is called in Greeke λιβανωτὶς, because their roots do smell like incense, which is called in Greeke λίβανος: in Latine, *Rosmarinus*; the first may be Englished great Frankincense Rosemarie; the second small Frankincense Rosemarie; M^r. *Lite* calleth the third in English, blacke Hart-root, the fourth white Hart-root: the seed is called *Cachrys* or *Cauchrys*.

¶ *The Nature.*

These herbes with their seeds and roots are hot and drie in the second degree, and are of a digesting, dissoluing, and mundifying qualitie.

¶ *The Vertues.*

The leaues of *Libanotis* pounded, stoppe the fluxe of the Hemorrhoides or piles, and supple the swellings and inflammations of the fundament called *Condilomata*, concoct the swellings of the throat called *Strum*, and ripen botches that will hardly bee brought to suppuration or to ripenesse. A

The iuice of the leaues and roots mixed with honie, and put into the eies, doth quicken the sight, and cleereth the dimnesse of the same. B

The seed mingled with honie, doth scoure and clense rotten vlcers, and being applied vnto cold and hard swellings consumeth and wasteth them. C

The leaues and roots boiled vntill they be soft, and mingled with the meale of Darnell and vineger, asswageth the paine of the gout, if they be applied thereto. D

Moreouer being receiued in wine and pepper, it helpeth the iaundice, and prouoketh sweat, and being put into oile and vsed as an ointment, it cureth ruptures also. E

It purgeth the disease called in Greeke λέπρα: in Latine, *Vitiligo*, or *Impetigo*, that is, the white spottines of the skin, chaps, or rifts in the palms of the hands and soles of the feet, and by your patience cousin german to the scab of Naples, transported or transferred into France, and prettily well sprinkled ouer our Northern coasts. F

When the seed of *Libanotis* is put into receits, you must vnderstand, that it is not meant of the seed of Cachris, because it doth with his sharpenesse exasperate or make rough the gullet; for it hath a very heating qualitie, and doth drie very vehemently, yea this seed being taken inwardly, or the herbe it selfe, causeth to purge vpward and downeward very vehemently. G

CHAP. 395. *Of Corianders.*

¶ *The Description.*

1 THe first or common kinde of Coriander is a very stinking herbe, smelling like the stinking worme called in Latine *Cimex*: it hath a round stalke full of branches, two foot long. The leaues are of a faint greene colour, very much cut or iagged: the leaues that grow lowest, and spring first, are almost like the leaues of Cheruill or Parsley, but those which come forth afterward, and grow vpon the stalks, are more iagged, almost like the leaues of Fumitorie, though a great deale smaller, tenderer, and more iagged. The floures are white, and do grow in round tassels like vnto Dill. The seed is round, hollow within, and of a pleasant sent and sauour when it is drie. The root is hard, and of a woodie substance, which dieth when the fruit is ripe, and soweth it selfe from

ſiom yeare to yeare, whereby it mightily increaſeth.

1 *Coriandrum.*
Coriander.

‡ 2 *Coriandrum alterum minus odorum.*
Baſtard Coriander.

2 There is a ſecond kinde of Coriander very like vnto the former, ſauing that the bottome leaues and ſtalks are ſmaller: the fruit thereof is greater, and growing together by couples, it is not ſo pleaſant of ſauour nor taſte, being a wilde kinde thereof, vnfit either for meat or medicine.

¶ *The Place.*

Coriander is ſowne in fertile fields and gardens, and the firſt doth come of it ſelfe from time to time in my garden, though I neuer ſowed the ſame but once.

¶ *The Time.*

They floure in Iune and Iuly, and deliuer their ſeed in the end of Auguſt.

¶ *The Names.*

The firſt is called in Latine *Coriandrum*: in Engliſh, Corianders. The ſecond, *Coriandrum alterum*, wilde Corianders.

¶ *The Temperature.*

The greene and ſtinking leaues of Corianders are of complexion cold and dry, and very naught, vnwholeſome and hurtfull to the body.

The drie and pleaſant well ſauouring ſeede is warme, and very conuenient to ſundrie purpoſes.

¶ *The Vertues.*

A Coriander ſeed prepared and couered with ſugar, as comfits, taken after meat cloſeth vp the mouth of the ſtomacke, ſtaieth vomiting, and helpeth digeſtion.

B The ſame parched or roſted, or dried in an ouen, and drunk with wine, killeth and bringeth forth wormes, ſtoppeth the laske, and bloudy flix, and all other extraordinarie iſſues of bloud.

The manner how to prepare Coriander, both for meat and medicine.

C Take the ſeed well and ſufficiently dried, whereupon poure ſome wine and vineger, and ſo leaue them to infuſe or ſteepe foure and twentie houres, then take them forth and drie them, and keepe them for your vſe.

D The greene leaues of Coriander boiled with the crums of bread or barly meale, conſumeth all hot

hot ſwellings and inflammations: and with Beane meale diſſolueth the Kings euill, wens, and hard lumpes.

The iuice of the leaues mixed and laboured in a leaden mortar, with Ceruſe, Litharge of ſiluer, vineger, and oile of Roſes, cureth S. Anthonies fire, and taketh away all inflammations whatſoeuer. F

The iuice of the greene Coriander leaues, taken in the quantitie of foure dragmes, killeth and poiſoneth the body. G

The ſeeds of Coriander prepared with ſugar, preuaile much againſt the gout, taken in ſome ſmall quantitie before dinner vpon a faſting ſtomacke, and after dinner the like without drinking immediately after the ſame, or in three or foure houres. Alſo if the ſame be taken after ſupper it preuaileth the more, and hath more ſuperiority ouer the diſeaſe. H

Alſo if it be taken with meate faſting, it cauſeth good digeſtion, and ſhutteth vp the ſtomacke, keepeth away fumes from riſing vp out of the ſame: it taketh away the ſounding in the eares, drieth vp the rheume, and eaſeth the ſquinancy. I

Chap. 396. *Of Parſley.*

Apium hortenſe.
Garden Parſley.

¶ *The Deſcription.*

1 THe leaues of garden Parſley are of a beautiful greene, conſiſting of many little ones faſtned together, diuided moſt commonly into three parts, and alſo ſnipt round about the edges; the ſtalke is aboue one cubit high, ſlender, ſomething chamfered, on the top whereof ſtand ſpoked rundles, bringing forth very fine little floures, and afterwards ſmall ſeeds ſomewhat of a fiery taſte: the root is long and white, and good to be eaten.

2 There is another garden Parſley in taſte and vertue like vnto the precedent: the onely difference is, that this plant bringeth forth leaues very admirably criſped or curled like fannes of curled feathers, whence it is called *Apium criſpum, ſiue multifidum*; Curl'd Parſley.

‡ 3 There is alſo kept in ſome gardens another Parſley called *Apium ſiue Petroſelinum Virginianum*, or Virginian Parſly, it hath leaues like the ordinary, but rounder, and of a yellowiſh greene colour, the ſtalkes are ſome three foot high, diuided into ſundry branches whereon grow vmbels of whitiſh floures: the ſeeds are like, but larger than thoſe of the common Parſley, and when they are ripe they commonly ſow themſelues, and the old roots die, and the young ones beare ſeed the ſecond yeere after there ſowing. ‡

¶ *The Place.*

It is ſowne in beds in gardens; it groweth both in hot and cold places, ſo that the ground be either by nature moiſt, or be oftentimes watered: for it proſpereth in moiſt places, and is delighted with water, and therefore it naturally commeth vp neere to fountaines or ſprings: *Fuchſius* writeth that it is found growing of it ſelfe in diuers fenny grounds in Germany.

¶ *The Time.*

It may be ſowne betime, but it ſlowly commeth vp: it may oftentimes be cut and cropped: it bringeth forth his ſtalkes the ſecond yeere: the ſeeds be ripe in Iuly or Auguſt.

¶ *The Names.*

Euery one of the Parſleyes is called in Greeke [illegible] but this is named, [illegible] that is to ſay, *Apium hortenſe*: the Apothecaries and common Herbariſts name it *Petroſelinum*: in high Dutch,

Peterſilgen: in low Dutch, **Trimen Peterſelie:** in French, *du Perſil:* in Spaniſh, *Perexil Iuliuera*, and *Salſa:* in Italian, *Petroſello:* in Engliſh, Perſele, Parſely, common Parſley, and garden Parſley. Yet is it not the true and right *Petroſelinum* which groweth among rockes and ſtones, whereupon it tooke his name, and whereof the beſt is in Macedonia: therefore they are deceiued who thinke that garden Parſley doth not differ from ſtone Parſley, and that the onely difference is, for that Garden Parſley is of leſſe force than the wilde; for wilde herbes are more ſtrong in operation than thoſe of the garden.

¶ *The Temperature.*

Garden Parſley is hot and dry, but the ſeed is more hot and dry, which is hot in the ſecond degree, and dry almoſt in the third: the root is alſo of a moderate heate.

¶ *The Vertues.*

A The leaues are pleaſant in ſauces and broth, in which beſides that they giue a pleaſant taſte, they be alſo ſingular good to take away ſtoppings, and to prouoke vrine: which thing the roots likewiſe do notably performe if they be boiled in broth: they be alſo delightfull to the taſte, and agreeable to the ſtomacke.

B The ſeeds are more profitable for medicine; they make thinne, open, prouoke vrine, diſſolue the ſtone, breake and waſte away winde, are good for ſuch as haue the dropſie, draw downe menſes, bring away the birth, and after-birth: they be commended alſo againſt the cough, if they be mixed or boiled with medicines made for that purpoſe: laſtly they reſiſt poiſons, and therefore are mixed with treacles.

C The roots or the ſeeds of any of them boiled in ale and drunken, caſt forth ſtrong venome or poiſon, but the ſeed is the ſtrongeſt part of the herbe.

D They are alſo good to be put into clyſters againſt the ſtone or torments of the guts.

Chap. 367: *Of water Parſley, or Smallage.*

Eleoſelinum, ſiue Paludapium.
Smallage.

¶ *The Deſcription.*

Smallage hath greene ſmooth and glittering leaues, cut into very many parcels, yet greater and broader than thoſe of common Parſley: the ſtalkes be chamfered and diuided into branches, on the tops whereof ſtand little white floures; after which doe grow ſeeds ſomething leſſer than thoſe of common Parſley: the roote is faſtened with many ſtrings.

¶ *The Place.*

This kinde of Parſley delighteth to grow in moiſt places, and is brought from thence into gardens. ‡ It growes wilde abundantly vpon the bankes in the ſalt marſhes of Kent and Eſſex. ‡

¶ *The Time.*

It flouriſhes when the garden Parſley doth, and the ſtalke likewiſe commeth vp the next yeere after it is ſowne, and then alſo it bringeth forth ſeeds which are ripe in Iuly and Auguſt.

¶ *The Names.*

It is called in Greeke Ἐλεοσέλινον: of *Gaza*, *Paludapium*: in ſhops, *Apium*, abſolutely without any addition: in Latine, *Paluſtre Apium*, and *Apium ruſticum:* in high Dutch, **Epfich:** in low Dutch, **Eppe**, and of diuers **Ioffrouwmerck:** in Spaniſh and Italian, *Apio:* in French, *de L'ache:* in Engliſh, Smallage, Marſh Parſley, or water Parſley.

¶ *The Temperature.*

This Parſley is like in temperature and vertues to that of the garden, but it is both hotter and drier,

drier, and of more force in most things: this is seldome eaten, neither is it counted good for sauce, but it is very profitable for medicine.

¶ *The Vertues.*

The juice thereof is good for many things, it clenseth, openeth, attenuateth or maketh thin; it A
remooueth obstructions, and prouoketh vrine, and therefore those syrrups which haue this mixed with them, as that which is called *Syrupus Bizantinus*, open the stoppings of the liuer and spleene, and are a remedy for long lasting agues, whether they be tertians or quartains, and all other which proceed both of a cold cause and also of obstructions or stoppings, and are very good against the yellow jaundise.

The same juice doth perfectly cure the malicious and venomous vlcers of the mouth, and of the B
almonds of the throat with the decoction of Barly and *Mel Rosarum*, or hony of Roses added, if the parts be washed therewith: it likewise helpeth all outward vlcers and foule wounds: with hony it is profitable also for cankers exulcerated, for although it cannot cure them, yet it doth keep them from putrifaction, and preserueth them from stinking: the seed is good for those things for which that of the Garden Parsley is: yet is not the vse thereof so safe, for it hurteth those that are troubled with the falling sickenesse, as by euident proofes it is very well knowne.

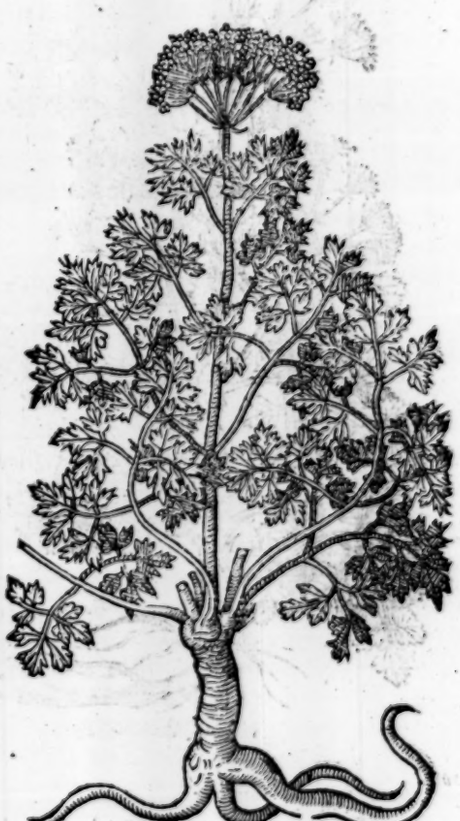
Smallage, as *Pliny* writeth, hath a peculiar vertue against the biting of venomous spiders. C

The juice of Smallage mixed with hony and beane floure, doth make an excellent mundificatiue for old vlcers and malignant sores, and staieth also the weeping of the cut or hurt sinewes in simple members, which are not very fatty or fleshie, and bringeth the same to perfect digestion. D

The leaues boiled in hogs grease, and made into the forme of a pultis, take away the paine of E
felons and whitlowes in the fingers, and ripen and heale them.

CHAP. 398. *Of Mountaine Parsley.*

† *Oreoselinum.*
Mountaine Parsley.



¶ *The Description.*

THe stalke of mountaine Parsley, as *Dioscorides* writeth, is a span high, growing from a slender root; vpon which are branches and little heads like those of Hemlock, yet much slenderer: on which stalkes do grow the seed, which is long, of a sharpe or biting taste, slender, and of a strong smell, like vnto Cumin: but we can not find that this kinde of Mountaine Parsley is knowne in our age: the leaues of this we here giue are like those of common parsley, but greater and broader, consisting of many slender footstalkes fastened vnto them; the stalke is short, the floures on the spoked tufts be white; the seed small: the root is white, and of a meane length or bigneſſe, in taste somewhat biting and bitterish, and of a sweet smell.

¶ *The Place.*

† *Dioscorides* writeth, that mountaine Parsley groweth vpon rockes and mountaines. And *Dodonæus* affirmeth that this herbe described growes on the hills which diuide Silesia from Morauia, called in times past the counntrey of the Marcomans: also it is said to be found on other mountaines and hills in the North parts of England.

¶ *The Names.*

The Grecians doe name it of the mountaines [illegible], which the Latines also for that cause doe call *Apium Montanum*, and *Montapium*: in English, mountaine Parsley: in Latine, *Apium*: but *Dioscorides* maketh *Petroselinum* or stone Parsley to differ from mountaine Parsley; for saith he,

we muſt not be deceiued, taking mountaine Parſley to be that which groweth on rockes: for rocke Parſley is another plant, of ſome it is called, **Ueelgutta**: in Latine, *Multibona*, (in Engliſh, much good:) for it is ſo named becauſe it is good, and profitable for many things: and this is not altogether vnproperly termed *Oreoſelinum*, or mountaine Parſley; for it groweth as we haue ſaid on mountaines, and is not vnlike to ſtone Parſley: the ſeed is not like to that of Cumin, for if it were ſo: who would deny it to be *Oreoſelinum*, or *Dioſcorides*, his mountaine Parſley.

¶ *The Temperature and Vertues.*

A *Oreoſelinum*, or mountaine Parſley is, as *Galen* ſaith, like in faculty vnto Smallage, but more effectuall; *Dioſcorides* writeth that the ſeed and root being drunke in wine prouoke vrine, bring downe the menſes, and that they are mixed with counterpoiſons, diuretick medicines, and medicines that are hot.

B The root of *Veelgutta*, or much good, is alſo hot and dry, and that in the later end of the ſecond degree, it maketh thin, it cutteth, openeth, prouoketh, breaketh the ſtone and expelleth it, openeth the ſtoppings of the liuer and ſpleene, and cureth the yellow jaundiſe: being chewed it helpeth the tooth-ach, and bringeth much water out of the mouth.

† This whole chapter was wholly taken from *Dodonæus Pempt. 4. lib. 4. cap. 3.* wherefore I haue giuen his figure, which was agreeable to the hiſtory, for the figure our Author here gaue, was of the *Selinum montanum pumilum*, farre different from this, as I ſhall hereafter ſhew you in the chap. of *Peucedanum*.

Chap. 399. *Of ſtone Parſley of Macedonie.*

† 1 *Petroſelinum Macedonium, Fuchſij.*
Baſtard ſtone Parſley.

† 2 *Petroſelinum Macedonicum verum.*
The true Parſley of Macedonia.

¶ *The Deſcription.*

OF ſtone Parſley very little is written of the old writers, *Dioſcorides* onely ſaith that this hath ſeed like to that of *Ameos*, but of a more pleaſant ſmell, ſharpe, aromaticall, or ſpiced: touching the forme of the leaues, the colour of the floures, and faſhion of the root

root he writeth nothing at all: and *Pliny* is more briefe; as for *Theophrastus* he doth not so much as name it, making mention onely of Parsley, Alexander, Smallage, and mountaine Parsley.

1 For stone Parsley *Leonhartus Fuchsius* hath set down a plant, hauing leaues not spred and cut after the manner of garden Parsley, but long, and snipped round about, made vp and fastened to a rib or stem in the midst, something like, but yet not altogether, to the first leaues of the lesser Saxifrage; the stalke is slender, and a cubit and a halfe high; the floures on the spokie tufts are white: the seed something blacke, like to that of Ameos, and garden Parsley, very sweet of smell, something sharpe or biting: the root is slender and full of strings.

2 *Lobel* also in stead of the right stone Parsley describeth another, which the Venetians call stone Parsley of Macedonia: this hath leaues like those of garden Parsley, or rather of the Venetian Saxifrage which is the blacke herbe Frankincense formerly described: the stalke is a cubit high; the spokie tufts something white: the seed small, quickely vading (as he saith) inferiour to that of garden Parsley in temperature and vertues: but whether this be the true and right stone Parsley, he addeth, he is ignorant.

¶ *The Place.*

It groweth on craggy rocks, and among stones: but the best in Macedonia, whereupon it beareth the surname *Macedonicum*, of Macedonia.

¶ *The Time.*

It floureth in the sommer moneths.

¶ *The Names.*

It is called in Greeke, πετραῖον, of the stony places where it groweth: in Latine, *Petrapium*, and *Petroselinum Macedonicum*: in English, stone Parsley: the Apothecaries know it not: they are farre deceiued that would haue the herbe which *Fuchsius* pictureth to be *Amomum*: for *Amomum* differeth from this, as it is very plaine by the description thereof in *Dioscorides*: but we hold this for the true stone Parsley, till such time as we may learne some other more like in leaues to the Parslies, and in seed, such as that of stone Parsley ought to be: and the very seed it selfe may cause vs to hold this opinion, being so agreeing to the description as no herbe more; for it is sharpe and biting, and of a sweeter smell than is that of Ameos, and of a more spicy sent; yet do not the leaues gainesay it, which though they haue not the perfect forme of other Parsleyes, yet notwithstanding are not altogether vnlike. ‡ The first of these is thought by *Anguillara*, *Turner*, *Gesner*, *Cordus*, and others, to be the *Sison* of *Dioscorides*, and *Tragus* calls it, *Amomum Germanicum*, and the seeds in shops retaine the name of *Sem. Amomi*. The second is thought by *Columna* to be the second *Daucus* of *Dioscorides*. ‡

¶ *The Temperature.*

The seed of stone Parsley which is most commonly vsed, is hot and dry, hauing withall a cutting quality.

¶ *The Vertues.*

It prouoketh vrine, and bringeth downe the floures: it is profitable against winde in the stomacke, and collicke gut, and gripings in the belly: for it is, as *Galen* saith, διουρον, that is to say, a waster or consumer of winde: it is a remedy against paine in the sides, kidnies, and bladder, it is also mixed in counterpoisons: *Dioscorides*. A

† The first figure that was formerly in this chapter should haue been in the second place, and that in the second place was of Alexanders, and should haue been put in the following chapter.

‡ CHAP. 400. *Of Corne Parsley, or Hone-wort.*

¶ *The Description.*

THis herbe commeth vp at the first from seed like Parsley, with two small long narrow leaues, the next that spring are two small round smooth leaues nickt about the edges, and so for two or three couples of leaues of the next growth there are such round leaues growing on a middle rib by couples, and one round one, also at the top; after as more leaues spring vp, so the fashion of them also change, that is to say, euery leafe hath about eight or nine small smooth greene leaues, growing on each side of a middle rib one opposite against another, and one growing by it selfe at the top, and are finely snipt or indented about the edges, in forme resembling those of *Sium odoratum Tragi*, but not so bigge, long, or at all browniſh; amongst which rise vp many small round straked stalkes or branches, about two foot long, now and then aboue twenty from one root, sometimes growing vpright, sometimes creeping not farre from the ground, joynted or kneed,

‡ *Selinum Sÿ folÿs.*
Honeworт.

and diuiding themſelues into very many branches, at euery joynt groweth one leaſe ſmaller than the former, which together with the lowermoſt periſh, ſo that there is ſeldome one greene leaſe to be ſeen on this herbe when the ſeed is ripe, the floures are white, and grow moſt commonly at the tops of the branches, ſometimes at moſt of the joynts euen from the earth, in vneuen or vnorderly vmbells, euery floure hauing fiue exceeding ſmall leaues, flat, and broad at the toppe, and in the middle very ſmall cheiues with purple tops, the whole floure not much exceeding the bigneſſe of a ſmall pins head, which being paſt there commeth vp in the place of euery floure two ſmall gray crooked ſtraked ſeeds, like Parſley ſeeds, but bigger, in taſte hot and aromaticall. The root is ſmall and whitiſh, with many threds not ſo big as Parſley roots. It beginneth to floure about the beginning of Iuly, & ſo continues flouring a long time; part of the ſeed is ripe in Auguſt, and ſome ſcarſe in the beginning of October, mean while ſome falleth wherby it renueth it ſelfe, and groweth with flouriſhing greene leaues all the winter.

I tooke the deſcription of this herbe the yeere, 1620. but obſerued it long before, not knowing any name for it: firſt I refered it to *Sium*, calling it, *Sium terreſtre*, and *Sium ſegetum & agrorum*; afterwards vpon ſight of *Selinum peregrinum primum Cluſii*, which in ſome reſpects reſembleth this herbe, I named it *Selinum Sÿ folÿs*; yet wanting an Engliſh name, at length about the yeere 1625. I ſaw Miſtris *Vrſula Leigh* (then ſeruant to Miſtris *Bilſon* of Mapledurham in Hampſhire, and now (5. *Marcÿ* 1632. wife to Maſter *William Mooring* Schoolemaſter of Petersfield, a Towne neere the ſaid Mapledurham) gather it in the wheate erſhes about Mapledurham aforeſaid (where in ſuch like grounds it ſtill groweth, eſpecially in clay grounds) who told me it was called Honewort, and that her Mother miſtris *Charitie Leigh* late of Brading in the Iſle of Wight deceaſed, taught her to vſe it after the manner heere expreſſed, for a ſwelling which ſhee had in her left cheeke, which for many yeeres would once a yere at the leaſt ariſe there, and ſwell with great heat, redneſſe, and itching, vntil by the vſe of this herbe it was perfectly cured, and roſe no more nor ſwelled, being now (5. *Martÿ* 1632) about twenty yeeres ſince, only the ſcar remaineth to this day. This ſwelling her mother called by the name of a Hone, but asking whether ſuch tumors werein the ſaid Iſle vſually called Hones ſhe could not tell, by reaſon ſhee was brought from Brading aforeſaid young, and not being aboue twelue yeeres old when ſhee vſed this medicine.

¶ *The Vertues.*

A Take one handfull of the greene leaues of this Honewort, and ſtampe them, put to it about halfe a pinte or more of beere, ſtraine it, and drinke it, and ſo continue to drinke the like quantity euery morning faſting till the ſwelling doth abate, which with or in her was performed in the ſpace of two weekes at the moſt. Auguſt, 18, 1620. *Iohn Goodyer.* ‡

Chap. 401. *Of Alexander.*

¶ *The Deſcription.*

THe leaues of Alexander are cut into many parcells like thoſe of Smallage, but they be much greater and broader, ſmooth alſo, and of a deepe greene colour: the ſtalke is thicke, oftentimes a cubit high: the floures be white, and grow vpon ſpokie tufts: the ſeed is thicke, long,

long, blacke ſomething bitter, and of an aromaticall or ſpicy ſmell: the root is thicke, blacke without, white within, like to a little Radiſh, and is good to be eaten. out of which being broken or cut, there iſſueth forth a juice that quickely waxeth thicke, hauing in it a ſharpe bitterneſſe, like in taſte vnto Myrrhe: which thing alſo *Theophraſtus* hath noted, there iſſueth out of it, ſaith he, a juice like Myrrhe.

† *Hippoſelinum.*
Alexanders.

¶ *The Place.*

Alexanders or great Parſley groweth in moſt places of England.

¶ *The Time.*

The ſeed waxeth ripe the ſecond yeere, in the Moneth of Auguſt.

¶ *The Names.*

It is called in Greeke, of the greatneſſe wherein, it excelleth the other Parſleyes ἱππομάρα. or Horſe Parſley; of *Gaza, Equapium*: it is alſo named *Olus atrum*, or the blacke pot-herbe; and of diuers *Syluestre Apium*, or wilde Parſley; of *Galen* and certaine others, σμύρνιον, by reaſon of the juice that iſſueth forth thereof, that is, as we haue ſaid, like vnto Myrrhe, which is called in Greeke σμύρνιον: there is alſo another *Smyrnium* of mount Aman, of which we do write in the 404. chapter: the Apothecaries cal it *Petroſelinum Macedonicum*: others, *Petroſelinum Alexandrinum*: the Germaines, **Groſz Epffich**: the Low-Country-men, **Peterſelie van Macedonien**: in Spaniſh, *Perexil Macedonico*: the French, and Engliſhmen, Alexandre, Alexanders.

¶ *The Temperature.*

The ſeed & root of Alexanders, are no leſſe hot and dry than are thoſe of the Garden Parſley, they cleanſe and make thinne, being hot and dry in the third degree.

¶ *The Vertues.*

Dioſcorides ſaith, that the leaues and ſtalkes are boiled and eaten, and dreſſed alone by themſelues, or with fiſhes: that they are preſerued raw in pickle: that the root eaten both raw and ſod, is good for the ſtomacke: the root hereof is alſo in our age ſerued to the table raw for a ſallade herbe. A

The ſeeds bring downe the floures, expell the ſecondine, breake and conſume winde, prouoke vrine, and are good againſt the ſtrangury: the decoction alſo of the root doth the ſame, eſpecially if it be made with wine. B

† The figure formerly here was of *Sphondylium*, and that belonging to this place was put in the foregoing chapter.

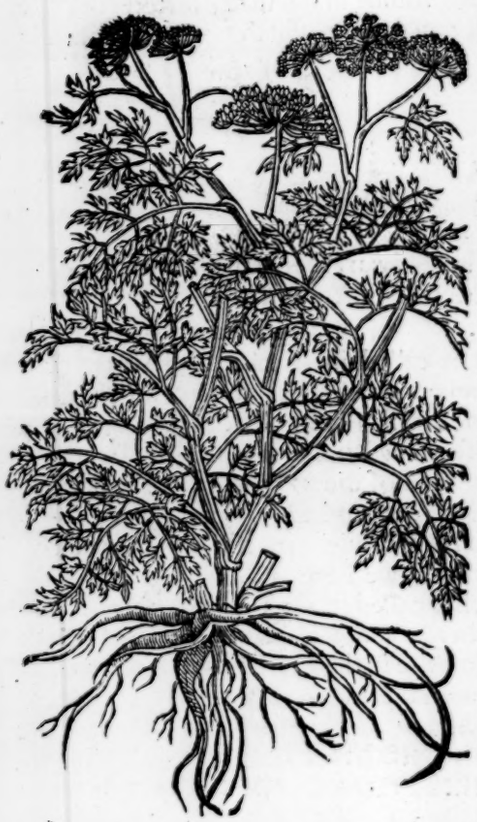
CHAP. 402. *Of wilde Parſley.*

¶ *The Deſcription.*

THis is like to the kindes of Parſleyes in the ſundry cuts of the leaues, and alſo in the bigneſſe; for they be broad and cut into diuers parcels: the ſtalkes are round, chamfered, ſet with certaine joints, hollow within, a cubit high or higher, two or three comming forth together out of one root, and in the nether part many times of a darke-reddiſh colour. The floures be white, and grow vpon ſpokie tufts: the ſeed is round, flat, like that of Dill: the root is white within, and diuided into many branches and ſtrings. This plant in what part ſoeuer it be cut or broken, yeeldeth forth a milky juice.

¶ *The*

† *Apium ſyluestre ſiue Thiſſelium.*
Wilde Parſley.



¶ *The Place.*

It is found by ponds ſides in moiſt and dankiſh places, in ditches alſo, hauing in them ſtanding waters, and oftentimes by old ſtockes of Alder trees.

‡ I haue not as yet obſerued this plant growing wilde with vs. ‡

¶ *The Time.*

It floureth and bringeth forth ſeed in Iune and Iuly.

¶ *The Nature.*

The ſhops of the Low countries haue miſcalled it in times paſt by the name of *Meum*, and vſed it for the right Mew, or Spiknel wort. The Germaines name it **Olſenich**: *Valerius Cordus*, *Olſenichium*: diuers in the Low-Countries call it **wilde Eppe**: that is to ſay in Latine, *Apium ſyluestre*, or wilde Parſley: and ſome, **water Eppe**: that is, *Hydroſelinon*, or *Apium aquatile*, water Parſley: and oftentimes is it named, as we haue already written, *Eleoſelinum*, and *Sium*. It may be more rightly termed in Latine, *Apium ſylueſtre*, and in Engliſh, wilde Parſley.

Dioſcorides hath made mention of wilde Parſley in the chapter of *Daucus* or wilde Carrot: and *Theophraſtus* in his ſeuenth booke, where he maketh the Parſleyes to differ both in leaues and ſtalkes, and ſheweth that ſome haue white ſtalkes, others purple, or elſe of ſundry colours, and that there is alſo a certaine wilde Parſley; for he ſaith that thoſe which haue the purple ſtalkes, and the ſtalkes of diuers colours, come neereſt of all to the wilde Parſley. And therefore ſeeing that *Olſenichium*, or wilde Parſley, hath the lower part of the ſtalke of a purpliſh colour, and like in leaues to Parſley, which in times paſt we thought good rather to call *Apium ſyluestre*, or wilde Parſley, than to erre with the Apothecaries, and to take it for Mew. And after when we now know that it was held to be *Thyſſelium Plinij*, and that we could alledge nothing to the contrary, we alſo ſetled our ſelues to be of their opinion; and the rather, becauſe the faculties are agreeable. *Thyſſelium*, ſaith *Pliny*, *lib.* 25. chapter 11. is not vnlike to Parſley: the root hereof purgeth flegme out of the head; which thing alſo the root of *Olſenichium* doth effectually performe, as we will forthwith declare. The name alſo is agreeable, for it ſeemeth to be called θυσσέλινον, becauſe it extendeth it ſelfe, in Greeke, θύειν, thorow θελσους, or mariſh places.

¶ *The Temperature.*

The root hereof is hot and dry in the third degree.

¶ *The Vertues.*

A The root being chewed, bringeth by the mouth flegme out of the head, and is a remedy for the tooth-ach, and there is no doubt but that it alſo makes thin, cutteth and openeth, prouoketh vrine, and bringeth downe the floures, and doth likewiſe no leſſe but more effectually performe thoſe things that the reſt of the Parſleyes do.

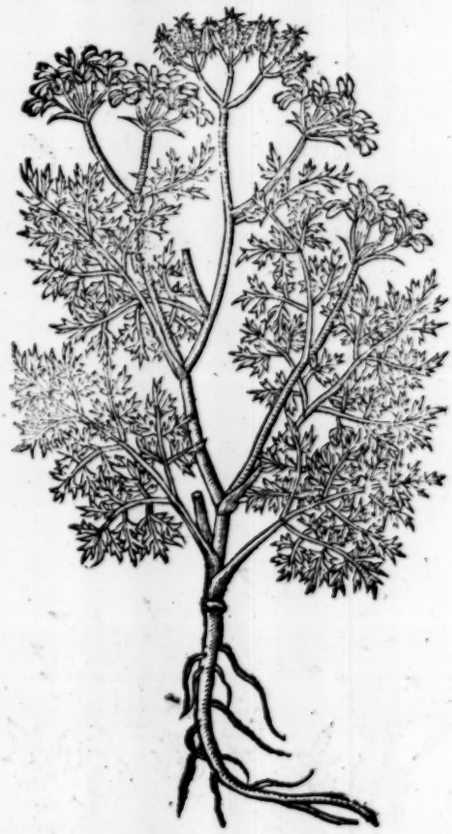
† The figure formerly put in this place was of the *Cerefolium ſylueſtre* of *Tabernamontanus*, whoſe hiſtory I intend hereafter to giue you.

Chap. 403. *Of baſtard Parſley.*

¶ *The Deſcription.*

1 THe firſt kinde of baſtard Parſley is a rough hairy herbe, not much vnlike to Carrots: the leaues are like to thoſe of Corianders, but parted into many ſmall jagges: at the top of the branches do grow ſhadowie vmbels, or ſpokie rundles, conſiſting of many ſmall white floures:

1 *Caucalis albis floribus.*
Baſtard Parſley with white floures.



‡ 2 *Caucalis Apij foliis flore rubro.*
Baſtard Parſley with red floures.

‡ 3 *Caucalis Peucedanij folio.*
Hogs Parſley

‡ 4 *Caucalis maior Cluſ.*
Great rough Parſley.

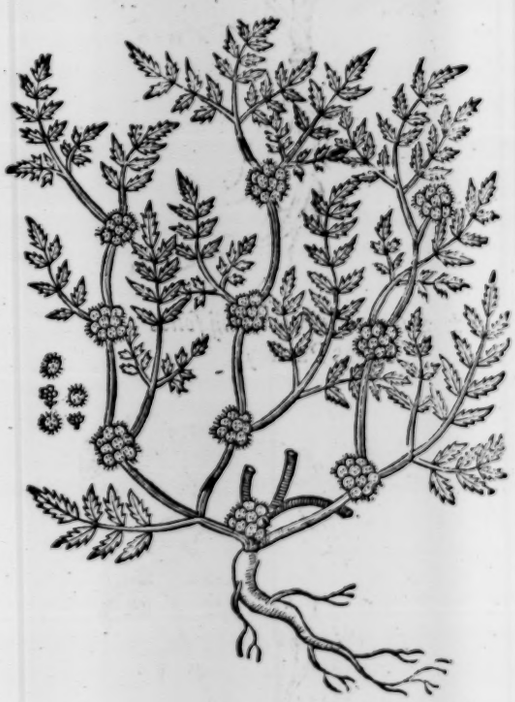
floures: the ſeed is long and rough, like the ſeed of Carrots, but greater: the root is ſtraight and ſingle, growing deepe into the ground, of a white colour, and in taſte like the Parſnep.

2 There is another ſort like vnto the former, ſauing that the leaues thereof are broader, and the floures are of a reddiſh colour: there hath great controuerſie riſen about the true determination of *Caucalis*, becauſe the Latine interpretation of *Dioſcorides* is greatly ſuſpected, conteining in it ſelfe much ſuperfluous matter, not pertinent to the hiſtory: but wee deeme that this plant is the true *Caucalis*, the notes ſet downe declare it ſo to be: the floures, ſaith he, are reddiſh: the ſeeds couered with a rough huske ſet about with prickles, which cleaue vnto garments that it toucheth, as doe Burs; which roughneſſe being pilled off, the ſeed appeares like vnto hulled Otes, not vnpleaſant in taſte, all which do ſhew it to be the ſame.

3 There is likewiſe another ſort that hath a long ſingle root, thrummed about the vpper end with many thrummy threds of a browne colour: from which riſeth vp diuers ſtalkes full of joynts or knees, couered with a ſheath or skinnie filme, like vnto that of *Meum*: the leaues are finely cut or jagged, reſembling the leaues of our Engliſh Saxifrage: the floures grow at the top of the ſtalkes in ſpoky rundles like Fennell: the ſeed is ſmall like that of Parſley.

‡ 5 *Caucalis minor floſculis rubentibus.*
Hedge Parſley.

‡ 6 *Caucalis nodoſa echinato ſemine.*
Knotted Parſley.



‡ 4 *Cluſius* vnder the name of *Caucalis maior* hath deſcribed and figured this, which hath many creſted ſtraight ſtalkes ſome two cubits high or more, which are diuided into ſundry branches, and at each joynt ſend forth large & winged leaues ſomewhat like thoſe of Angelica, but rougher, and of a darker greene; at the tops of the branches grow vmbels of whitiſh floures, being of ſomewhat a purpliſh or fleſh colour vnderneath; and theſe are ſucceeded by broad ſeed almoſt like thoſe of the Cow-Parſnep, but that they are rougher, and forked at the top, and prickly: the root is white, hard and wooddy. It floures in Iune, ripens the ſeed in Iuly and Auguſt, and then the root dyes, and the ſeed muſt be ſowne in September, and ſo it will come vp and continue greene all the winter.

5 Beſides theſe formerly deſcribed there are two others growing wilde with vs; the firſt of theſe, which I haue thought good to call Hedge, or field Parſley, (becauſe it growes about hedges, and in plowed fields very plentifully euery where) hath creſted hollow ſtalkes growing vp to ſome cubit and halfe high, whereon ſtand winged leaues made of ſundry little longiſh ones, ſet one

againſt

against another, snipt about the edges, and ending in a long and sharpe pointed leafe: these leaues as also the stalkes are somewhat rough and harsh, and of a darke greene color; the floures are small and reddish, and grow in little vmbels, and are succeeded by longish little rough seed of somewhat a strong and aromaticke taste and smell. It is an annuall plant, and floures commonly in Iuly, and the seeds are ripe in August. *Cordus* and *Thalius* call it *Daucoides minus*; and *Bauhine*, *Caucalis semine aspeo floscvlis svbrvbentibvs*. There is a bigger and lesser variety or sort of this plant, for you shall find it growing to the height of two cubits, with leaues and all the vpper parts answerable, and you may againe obserue it not to exceed the height of halfe a foot.

6 This other, which *Bauhine* hath first set forth in writing by the name of *Caucalis nodosa echinato semine*, hath a white and long root, from which it sends vp sundry small crested and rough branches which commonly lie along vpon the ground, and they are commonly of an vnequall length, some a cubit long, other-some scarse two handfulls: the leaues are small, rough, winged, and deeply jagged, and at the setting on of each leafe close to the stalkes vsually vpon very short foot-stalkes grow small little floures of colour white, or reddish, and made of fiue little leaues apeece: after these follow the seed, round, small and rough, and they grow close to the stalkes. It floures in Iune and Iuly, and growes wilde in sundry places, as in the fields, and vpon the bankes about S. Iames, and Pickadilla. *Fabius Columna* iudges it to be the true *Scandix* of the Antients. ‡

There is likewise one of these found in Spaine, called *Caucalis Hispanica*, like the first: but it is an annuall plant, which perishes at the first approach of winter, the which I haue sowne in my garden, but it perished before the seed was perfected.

¶ *The Place.*

These plants do grow naturally vpon rockes and stony grounds: we haue the first and the third in our pastures in most places of England: that with red floures is a stranger in England.

‡ I haue not heard that the third growes wilde with vs, but the second was found growing in the corne fields on the hilles about Bathe, by Mr. *Bowles*. ‡

¶ *The Time.*

They floure and flourish from May to the end of August.

¶ *The Names.*

Bastard Parsley is called in Greeke καυκαλὶς: in Latine also *Caucalis*: of some, *Daucus sylvestris*: among the bastard names of *Democritus*, βάκκαρις: in Latine, *Pes Gallinaceus*, *Pes Pulli*: the Egyptians name it *Seselis*: the country-men of Hetruria, *Petrosello saluatico*; in English, bastard Parsley, and Hennes foot.

¶ *The Temperature and Vertues.*

Dioscorides saith, that bastard Parsley is a pot-herbe which is eaten either raw or boiled, and prouoketh vrine. A

Pliny doth reckon it vp also among the pot-herbes: *Galen* addeth, that it is preserued in pickle for sallades in winter. B

The seed of bastard Parsley is euidently hot and dry, and that in the second degree: it prouoketh vrine, and bringeth downe the desired sickenesse: it dissolueth the stone, and driueth it forth. C

It taketh away the stoppings of the liuer, spleene, and kidnies: it cutteth and concocteth raw and flegmaticke humours: it comforteth a cold stomack, dissolueth winde, it quickneth the sight, and refresheth the heart, if it be taken fasting. D

Matthiolus in his Commentaries vpon *Dioscorides*, the second booke, attributeth vnto it many excellent vertues, to prouoke venery and bodily lust, and erection of the parts. E

† The figure which belonged to the third description in this chapter was formerly put for English Saxifrage.

Chap. 404. *Of Candy Alexanders.*

¶ *The Description.*

Dioscorides and *Pliny* haue reckoned *Smyrnium* among the kindes of Parsley, whose iudgements while this plant is young, and not growne vp to a stalke, may stand with very good reason, for that the young leaues next the ground are like to Parsley, but somewhat thicker and larger: among which riseth vp a stalke a cubit high, and somewhat more, garnished with round leaues, farre different from those next the ground, inclosing the stalke about like Thorow wax, or *Perfoliata*, which leaues are of a yellow colour, and do rather resemble the leaues of Fole-foot than Parsley:

Smyrnium Creticum.
Candy Alexander.

A

at the top of the ſtalkes doe grow round ſpokie tufts of a yellow color, after which commeth round and blacke ſeed like Coleworts, of a ſharpe and bitter taſte like Myrrhe: the root is white and thicke, contrary to the opinion of *Dodonæus*, who ſaith it is blacke without, but I ſpeake that which I haue ſeen and prooued.

¶ *The Place.*

Smyrnium groweth naturally vpon the hils and mountaines of Candy, and in my garden alſo in great plenty: alſo vpon the mountain Amanus in Cilicia.

¶ *The Time.*

Smyrnium floureth in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

This plant is called in Latine, *Smyrnium*: in Greeke, σμύρνιον in Cilicia, *Petroſelinum*, and as *Galen* teſtifieth, ſome haue called it, *Hippoſelinum agreſte*: in Engliſh, Candy Alexanders, or Thorow bored Parſley.

¶ *The Nature.*

Smyrnium is hot and dry in the third degree.

¶ *The Vertues.*

The leaues of *Smyrnium* diſſolue wens and hard ſwellings, dry vp vlcers and excoriations, and glew wounds together.

B The ſeeds are good againſt the ſtoppings of the ſpleene, kidnies, and bladder.

C Candy Alexanders hath force to digeſt and waſt away hard ſwellings, in other things it is like to garden Parſley, and ſtone Parſley, and therefore we vſe the ſeed heereof to prouoke the deſired ſickeneſſe, and vrine, and to helpe thoſe that are ſtuffed in the lungs, as *Galen* writeth.

D The root is hot, ſo is the herbe and ſeed, which is good to be drunke againſt the biting of ſerpents: it is a remedy for the cough, and profitable for thoſe that cannot take their breath vnleſſe they do ſit or ſtand vpright: it helpeth thoſe that can hardly make their water: the ſeed is good againſt the infirmity of the ſpleene or milt, the kidnies and bladder: it is likewiſe a good medicine for thoſe that haue the dropſie, as *Dioſcorides* writeth.

Chap. 405. *Of Parſneps.*

¶ *The Deſcription.*

1 THe leaues of the tame or Garden Parſneps are broad, conſiſting of many ſmall leaues faſtened to one middle rib like thoſe of the aſh tree: the ſtalke is vpright, of the height of a man: the floures ſtand vpon ſpokie tufts, of colour yellow; after which commeth the ſeed flat and round, greater than thoſe of Dil: the root is white, long, ſweet, and good to be eaten.

2 The wilde Parſnep is like to that of the Garden, in leaues, ſtalke, tuft, yellow floures, flat and round ſeed, but altogether leſſer: the root is ſmall, hard, wooddy, and not fit to be eaten.

¶ *The Place.*

The garden Parſnep requireth a fat and looſe earth, and that that is digged vp deepe.

The wilde Parſnep groweth in vntoiled places, eſpecially in the ſalt marſhes, vpon the bankes and borders of the ſame: the ſeed whereof being gathered and brought into the garden, and ſowed

in

1 *Paſtinaca latifolia ſatiua:*
Garden Parſneps.

2 *Paſtinaca latifolia ſylueſtris.*
Wilde Parſneps.

in fertill ground, do proue better roots, ſweeter and greater than they that are ſowne of ſeeds gathered from thoſe of the garden.

They floure in Iuly and Auguſt, and ſeed the ſecond yeare after they be ſowne.

¶ *The Names.*

The Herbariſts of our time do call the garden Parſneps *Paſtinaca ſatiua*, and *Paſtinaca*, and therefore wee haue ſurnamed it *Latifolia*, or broad leafed, that it may differ from the other garden Parſnep with narrow leaues, which is truly and properly called *Staphylinus*, that is, the garden Carrot. Some Phyſitions doubting, and not knowing to what herbe of the Antients it ſhould be referred, haue fained the wilde kinde hereof to be *Panacis ſpecies*, or a kind of Alheale: diuers haue named it *Baucia*; others, *Branca Leonina*, but if you diligently marke and confer it with *Elaphoboſcum* of *Dioſcorides*, you ſhal hardly finde any difference at all: but the plant called at Montpelier *Pabulum Ceruinum*: in Engliſh, Harts fodder, ſuppoſed there to be the true *Elaphoboſcum*, differeth much from the true notes thereof. Now *Baucia*, as *Iacobus Manlius* reporteth in *Luminari maiore*, is *Dioſcorides*, and the old Writers *Paſtinaca*, that is to ſay, *Tenuifolia*, or Carrot: but the old writers, and eſpecially *Dioſcorides* haue called this wilde Parſnep by the name of *Elaphoboſcum*: and wee doe call them Parſneps and Mypes.

¶ *The Temperature.*

The Parſnep root is moderately hot, and more drie than moiſt.

¶ *The Vertues.*

The Parſneps nouriſh more than doe the Turneps or the Carrots, and the nouriſhment is ſomewhat thicker, but not faultie nor bad; notwithſtanding they be ſomwhat windy: they paſſe through the bodie neither ſlowly nor ſpeedily: they neither binde nor looſe the belly: they prouoke vrine, and luſt of the bodie: they be good for the ſtomacke, kidneies, bladder, and lungs. A

There is a good and pleaſant food or bread made of the roots of Parſneps, as my friend M^r. *Plat* hath ſet forth in his booke of experiments, which I haue made no triall of, nor meane to do. B

The ſeed is hotter and drier euen vnto the ſecond degree, it moueth vrine, and conſumeth winde. C

D It is reported, ſaith *Dioſcorides*, that Deare are preſerued from bitings of Serpents, by eating of the herbe *Elaphoboſcum*, or wilde Parſnep, wherupon the ſeed is giuen with wine againſt the bitings and ſtingings of Serpents.

† Both the figures that formerly were in this chapter were of the Garden Parſnep; the firſt being that of *Lobel*, and the ſecond that of *Tabernamontanus*: that which ſhould haue beene in the ſecond place, was formerly put for *Splondylium*.

Chap. 406. *Of Skirrets.*

Siſarum. Skirrets.

¶ *The Deſcription.*

THe leaues of the Skirret do likewiſe conſiſt of many ſmall leaues faſtened to one rib, euerie particular one whereof is ſomething nicked in the edges, but they are leſſer, greener, and ſmoother than thoſe of the Parſnep. The ſtalks be ſhort, and ſeldome a cubit high; the floures in the ſpoked tufts are white, the roots be many in number, growing out of one head an hand bredth long, moſt commonly not a finger thick, they are ſweet, white, good to be eaten, and moſt pleaſant in taſte.

¶ *The Place and Time.*

This Skirret is planted in Gardens, and eſpecially by the root, for the greater and thicker ones being taken away, the leſſer are put into the earth againe: which thing is beſt to be done in March or Aprill, before the ſtalks come vp, and at this time the roots which be gathered are eaten raw, or boiled.

¶ *The Names.*

This herbe is called in Latin *Siſarum*, and alſo in Greeke σίσαρον; the Latines do likewiſe call it *Siſer*; and diuers of the later Herbariſts, *Seruillum* or *Cheruillum*, or *Seruilla*. the Germans name it **Sierlin**: *Tragus*, **Zam garten Rapunkelen**: in the Low-countries, **Suycker wortelen**, that is to ſay, Sugar roots, and oftentimes **Serillen**: in Spaniſh, *Cherinia*: in Italian, *Siſaro*: in French, *Cheruy*: in Engliſh, Skirret and Skirwort. And this is that *Siſer* or Skirret which *Tiberius* the Emperour commanded to be conueied vnto him from Gelduba a caſtle about the riuer of Rhene, as *Pliny* reporteth in *lib. 19. cap. 5.* The Skirret is a medicinable herb, and is the ſame that the foreſaid Emperour did ſo much commend, inſomuch that he deſired the ſame to be brought vnto him euery yeare out of Germanie. It is not, as diuers ſuppoſe, *Serapio* his *Secacul*, of which he hath written in his 89. chapter: for *Secacul* is deſcribed by the leafe of *Iulben*, that is to ſay, of the peaſe, as *Matthiolus Sylnaticus* expoundeth it: and it bringeth forth a black fruit of the bigneſſe of a Cich-peaſe, full of moiſture, and of a ſweet taſte, which is called *Granum Culcul*: But the Skirret hath not the leafe of the peaſe, neither doth it bring forth fruit like to the Ciche peaſe; whereupon it is manifeſt, that the Skirret doth very much differ from *Serapio* his *Secacul*: ſo farre is it from beeing the ſame.

¶ *The Nature and Vertues.*

A The roots of the Skirret be moderately hot and moiſt; they be eaſily concocted; they nouriſh meanly, and yeeld a reaſonable good iuice: but they are ſomething windie, by reaſon whereof they alſo prouoke luſt.

B They be eaten boiled, with vineger, ſalt, and a little oile, after the manner of a ſallad, and oftentimes they be fried in oile and butter, and alſo dreſſed after other faſhions, according to the skil of the cooke, and the taſte of the eater.

The

The women in Sueuia, ſaith *Hieronymus Heroldus*, prepare the roots hereof for their husbands, and C
know full well wherefore and why, &c.

The iuice of the roots drunke with goats milke ſtoppeth the laske. The ſame drunke with wine D
putteth away windineſſe out of the ſtomacke, and gripings of the belly, and helpeth the hicket or
yeoxing. They ſtir vp appetite, and prouoke vrine.

CHAP. 407. *Of Carrots.*

¶ *The Deſcription.*

1 THe leaues of the garden Carrots are of a deepe greene colour, compoſed of many fine Fennell-like leaues, very notably cut or iagged; among which riſeth vp a ſtalk ſtraight and round, foure cubits high, ſomwhat hairie and hollow, hauing at the top round ſpoked tufts, in which do grow little white floures: in their places commeth the ſeed, rough and hairie, of a ſweet ſmell when it is rubbed. The root is long, thicke and ſingle, of a faire yellow colour, pleaſant to be eaten, and very ſweet in taſte.

1 *Paſtinaca ſatiua tenuifolia.*
Yellow Carrot.

‡ 2 *Paſtinaca ſatiua atro-rubens.*
Red Carrot.

2 There is another kinde hereof like to the former in all parts, and differeth from it only in the colour of the root, which in this is not yellow, but of a blackiſh red colour.

¶ *The Place.*

Theſe Carrots are ſowne in the fields, and in gardens where other pot herbes are: they require a looſe and well manured ſoile.

¶ *The Time.*

They are to be ſowne in Aprill; they bring forth their floures and ſeed the yeare after they be ſowne.

¶ *The Names.*

The Carrot is properly called in Greeke [illegible], for that which we haue termed in Latine by the

name of *Paſtinaca latioris foly*, or the Garden Parſnep, is deſcribed of the old writers by another name: this Carrot is called in Latine likewiſe, *Paſtinaca ſativa*, but with this addition *tenuifolia*, that it may differ from the garden Parſnep with broad leaues, and white roots. *Theophraſtus* in the ninth booke of his hiſtorie of plants nameth this *Staphylinus*, or Carrot, σταφυλῖνος, and writeth that it groweth in Arcadia, and ſaith that the beſt is found in *Spartenſi Achaia*, but doubtleſſe he meant that *Daucus* which we call *Cretenſis*, that may be numbred among the Carrots: *Galen* in his booke of the faculties of Simple medicines doth alſo make it to be *Daucus*, but yet not ſimply *Daucus*; for he addeth alſo *Staphilinus* or *Paſtinaca*: in High Dutch it is called **Geel ruben**: in Low Dutch, **Geel Peen, Geel Pooten**, and **Geel Woztelen**: in French, *Carrotte*, and *Racine iaulne*: in Italian, *Paſtinaca*: in Spaniſh, *Canahoria*: in Engliſh, Yellow Carrots: the other is called red Carrot, and blacke Carrot.

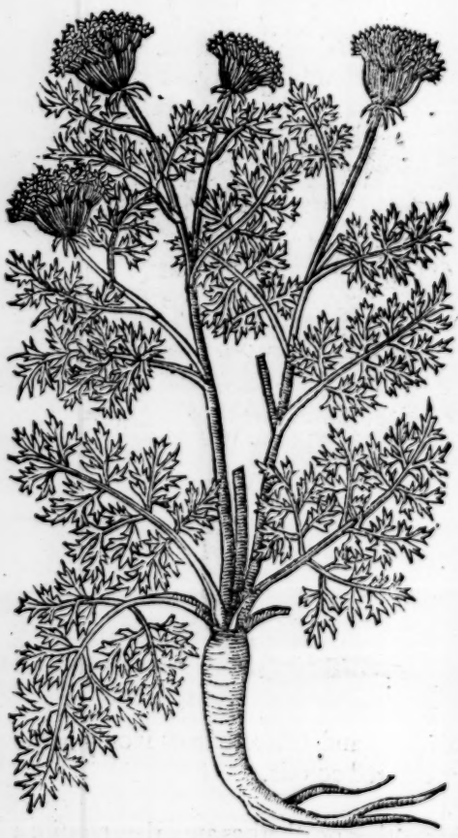
¶ *The Temperature and Vertues.*

A The root of the yellow Carrot is moſt commonly boiled with fat fleſh and eaten: it is temperately hot and ſomething moiſt. The nouriſhment which commeth thereof is not much, and not verie good: it is ſomething windie, but not ſo much as be the Turneps, and doth not ſo ſoon as they paſſe through the bodie.

B The red Carrot is of like facultie with the yellow. The ſeed of them both is hot and drie, it breaketh and conſumeth windineſſe, prouoketh vrine, as doth that of the wilde Carrot.

Chap. 408. *Of Wilde Carrot.*

Paſtinaca ſylueſtris tenuifolia.
Wilde Carrot, or Bees-neſt.



¶ *The Deſcription.*

THe leaues of the wilde Carrot are cut into diuers ſlender narrow parcels, very like vnto thoſe of the garden Carrots, but they be ſomewhat whiter, and more hairie: the ſtalks be likewiſe hairie and ſomewhat rough: the floures are little, and ſtand vpon broad ſpoked tuftes, of a white color, of which tuft of floures the middlemoſt part is of a deep purple: the whole tuft is drawn together when the ſeed is ripe, reſembling a birds neſt; whereupon it hath been named of ſome Birds-neſt: the root ſlender, and of a mean length.

¶ *The Place.*

It groweth of it ſelfe in vntoyled places, in fields, and in the borders thereof, almoſt euerie where.

¶ *The Time.*

It floures and flouriſhes in Iune and Iuly, the ſeed is ripe in Auguſt.

¶ *The Names.*

The wilde Carrot is called in Greeke σταφυλῖνος ἄγριος: in Latine, *Paſtinaca ſylueſtris tenuifolia*: in ſhops, *Daucus*: and it is vſed in ſtead of the true *Daucus*, and not amiſſe, nor vnprofitably: for *Galen* alſo in his time doth teſtifie that it was taken for *Daucus*, or baſtard Parſly, and is without doubt *Dauci ſylueſtris genus*, or a wilde kinde of baſtard Parſly, ſo called of *Theophraſtus*: in high Dutch it is named **Wild Paſtenen, Vogel neſt**: in Low Dutch, **Vogels neſt**, and **Wilde Caroten Crookens cruyt**: in French, *Paſtena de Sauvage*: in Engliſh, wilde Carrot, and after the Dutch, Birds-neſt, and in ſome places Bees-neſt.

Athenæus citing *Diphilus* for his Author, ſaith, that the Carrot is called φιλτρον, becauſe it ſerueth for loue matters; and *Orpheus*, as *Pliny* writeth, ſaid, that the vſe hereof winneth loue: which things be

be written of wilde Carrot, the root whereof is more effectuall than that of the garden, and containeth in it, as *Galen* ſaith, a certaine force to procure luſt.

¶ *The Temperature and Vertues.*

The ſeed of this wild Carrot, and likewiſe the root is hot and drie in the ſecond degree, and doth withall open obſtructions. A

The root boiled and eaten, or boiled with wine, and the decoction drunke, prouoketh vrine, expelleth the ſtone, bringeth forth the birth; it alſo procureth bodily luſt. B

The ſeed drunke bringeth downe the deſired ſickneſſe, it is good for them that can hardly make water, it breaketh and diſſolueth winde, it remedieth the dropſie, it cureth the collick and ſtone, being drunke in wine. C

It is alſo good for the paſſions of the mother, and helpeth conception: it is good againſt the bitings of all manner of venomous beaſts: it is reported, ſaith *Dioſcorides*, that ſuch as haue firſt taken of it are not hurt by them. D

CHAP. 409. *Of Candie Carrots.*

Daucus Cretenſis verus.
Candie Carrots.

¶ *The Deſcription.*

THis *Daucus Cretenſis*, being the true *Daucus* of *Dioſcorides*, doth not grow in Candy only, but is found vpon the mountaines of Germany, and vpon the hills and rockes of Iura about Geneua, from whence it hath beene ſent and conueied by one friendly Herbariſt vnto another, into ſundrie regions: it beareth leaues which are ſmall, and very finely iagged, reſembling either Fennel or wild Carrot: among which riſeth vp a ſtalke of a cubit high, hauing at the top white ſpokie tufts, and the floures of Dill: which being paſt, there come great plentie of long ſeed, well ſmelling, not vnlike the ſeed of Cumin, ſaue that it is whitiſh, with a certaine moſſineſſe, and a ſharpe taſte, and is in greater vſe than any part of the plant. The root alſo is right good in medicine, being leſſer than the root of a Parſnep, but hotter in taſte, and of a fragrant ſmell.

¶ *The Time.*

This floures in Iune and Iuly, his ſeed is ripe in Auguſt.

¶ *The Names.*

There is ſufficient ſpoken in the deſcription as touching the name.

¶ *The Nature.*

Theſe plants are hot and drie, eſpecially the ſeed of *Daucus Creticus*, which is hot and drie in the third degree: but the ſeed of the wilde Carrot is hot and drie in the ſecond degree.

¶ *The Vertues.*

The ſeed of *Daucus* drunken is good againſt the ſtrangurie, and painfull making of water, it preuaileth againſt the grauell and ſtone, and prouoketh vrine. A

It aſſwageth the torments and gripings of the belly, diſſolueth windines, cureth the collick, and ripeneth an old cough. B

The ſame beeing taken in VVine, is verie good againſt the bitings of beaſts, and expelleth poiſon. C

The ſeed of *Daucus Creticus* is of great efficacie and vertue being put into Treacle, Mithridate, or any antidotes, againſt poiſon or peſtilence. D

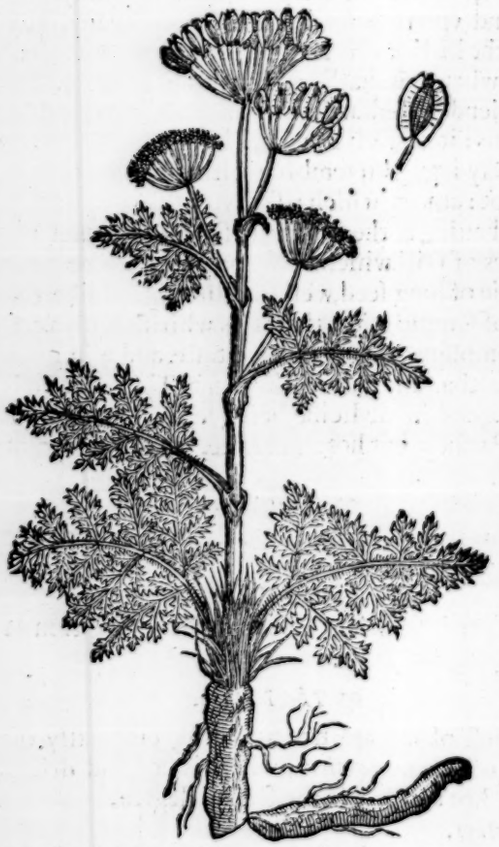
E The root thereof drunke in wine ſtoppeth the laske, and is alſo a ſoueraigne remedie againſt venome and poiſon.

Chap. 410. *Of ſtinking and deadly Carrots.*

¶ *The Deſcription.*

1 THe great ſtinking Carrot hath very great leaues, ſpread abroad like wings, reſembling thoſe of Fennell gyant (whereof ſome haue taken it to be a kinde, but vnproperly) of a bright greene colour, ſomewhat hairie: among which riſeth vp a ſtalk of the height of two cubits, and of the bigneſſe of a mans finger; hollow, and full of a ſpungious pith; whereupon are ſet at certaine ioints, leaues like thoſe next the ground, but ſmaller. The floures are yellow, ſtanding at the top of the ſtalkes in ſpokie rundles, like thoſe of Dill: after which commeth the ſeed, flat and broad like thoſe of the Parſnep, but much greater and broader. The root is thicke, garniſhed at the top with certaine capillaments or hairy threds, blacke without, white within, full of milkie iuice, of a moſt bitter, ſharpe, and lothſome taſte and ſmell, inſomuch that if a man do ſtand where the wind doth blow from the plant, the aire doth exulcerate and bliſter the face, and euery other bare or naked place that may be ſubiect to his venomous blaſt, and poiſonous qualitie.

1 *Thapſia latifolia Cluſij.*
Stinking Carrots.



2 *Thapſia tenuifolia.*
Small leafed ſtinking Carrot.

2 This ſmall kind of ſtinking or deadly Carrot is like to the laſt deſcribed in each reſpect, ſauing that the leaues are thinner and more finely minced or iagged, wherein conſiſts the difference.

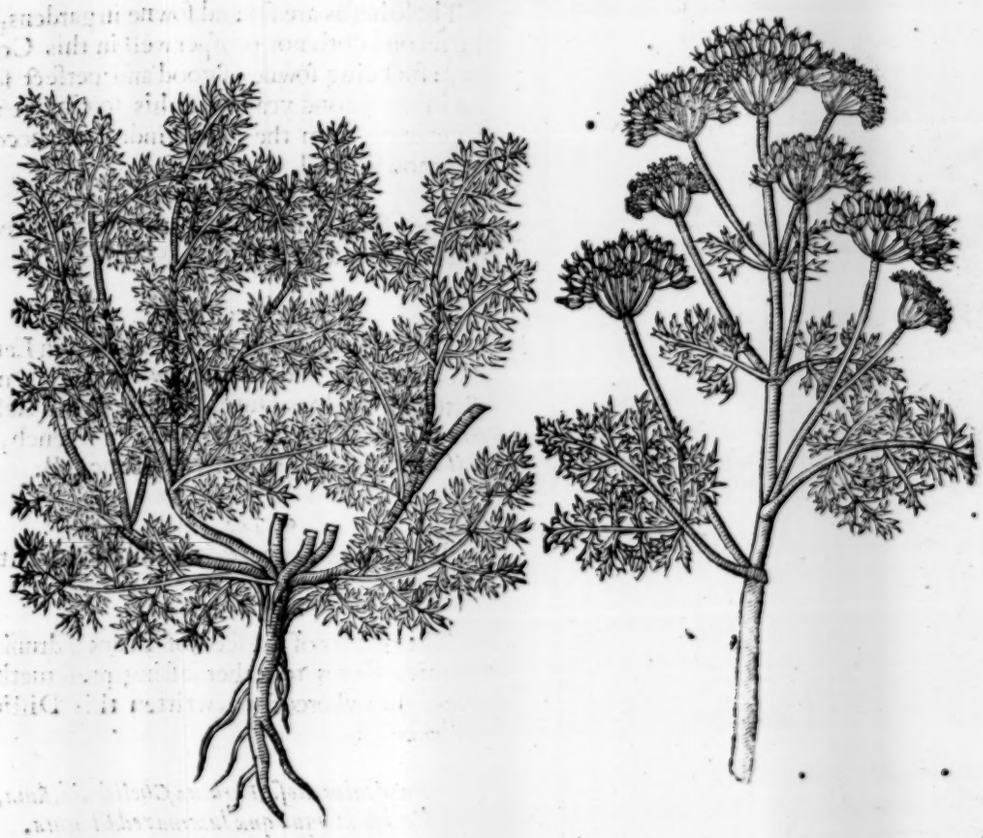
3 The common deadly Carrot is like vnto the precedent, ſauing that he doth more neerely reſemble the ſtalkes and leaues of the garden carrot, and is not garniſhed with the like buſh of haire about the top of the ſtalks: otherwiſe in ſeed, root, and euill ſmell, taſte and qualitie like.

¶ *The Place.*

Theſe pernicious plants delight in ſtonie hills and mountaines: they are ſtrangers in England.

¶ *The*

3 *Thapſia vulgaris.*
Deadly Carrots.



¶ *The Time.*

They floure in Auguſt, or ſomewhat after.

¶ *The Names.*

The French Phyſitians haue accepted the root of *Thapſia* for a kinde of Turbith, calling it *Turpetum Cineritium*; notwithſtanding vpon better conſideration they haue left the vſe thereof, eſpecially in purging, for it mightily hurteth the principall parts, and doth often cauſe cruell gripings in the guts and belly, with conuulſions and cramps: neuertheleſſe the venomous qualitie may bee taken away with thoſe correctiues which are vſed in mitigating the extreme heate and virulent qualitie of *Sarcocolla*, *Hammoniacum*, and *Turpetum*: but where there be ſo many wholeſome Simples, and likewiſe compounds, they are not to be vſed.

Of ſome it is called *Turpetum Griſeum*: it is called *Thapſia*, as ſome thinke, of the Iſland Thapſus, where it was firſt found; or as we deeme, of the likeneſſe it hath with Carrots.

Of the people of Sicilia and Apulia it is called *Ferulacoli*, where it doth grow in great aboundance.

¶ *The Temperature and Vertues.*

The temperature and faculties in working haue been touched in the deſcription, and likewiſe in the names.

CHAP. 411. *Of Fennell.*

¶ *The Deſcription.*

1 THe firſt kinde of Fennell, called in Latine *Fœniculum*: in Greeke, μάραθον, is ſo well knowne amongſt vs, that it were but loſt labour to deſcribe the ſame.

2 The ſecond kinde of Fennell is likewiſe well knowne by the name of Sweet Fennell, ſo called becauſe the ſeeds thereof are in taſte ſweet like vnto Anniſe ſeeds, reſembling the common Fennell, ſauing that the leaues are larger and fatter, or more oleous: the ſeed greater and whiter, and the whole plant in each reſpect greater.

¶ *The*

Fœniculum vulgare.
Common Fennell.

A

¶ *The Place.*

Theſe herbs are ſet and ſowne in gardens; but the ſecond doth not proſper well in this Countrey: for being ſowne of good and perfect ſeed, yet in the ſecond yeare after his ſowing it will degenerate from the right kinde, and become common Fennell.

¶ *The Time.*

They floure in Iune and Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

Fennell is called in Greeke Μάραθρον: in Latine, *Marathrum*, and *Fœniculum*: in high Dutch, **Fenckell:** in low-Dutch, **Venckell:** in Italian, *Finocchio:* in Spaniſh, *Hinoio:* in French, *Fenoil:* in Engliſh, Fennell, and Fenckell.

¶ *The Nature.*

The ſeed of Fennel is hot and dry in the third degree.

¶ *The Vertues.*

The pouder of the ſeed of Fennell drunke for certaine dayes together faſting preſerueth the eye-ſight: whereof was written this Diſtichon following:

Fœniculus, Roſa, Verbena, Chelidonia, Ruta,
Ex his fit aqua quæ lumina reddit acuta.

Of Fennell, Roſes, Veruain, Rue, and Celandine,
Is made a water good to cleere the ſight of eine.

B The greene leaues of Fenneil eaten, or the ſeed drunken made into a Ptiſan, do fill womens breſts with milke.

C The decoction of Fennell drunke eaſeth the paines of the kidnies, cauſeth one to auoid the ſtone, and prouoketh vrine.

D The roots are as effectuall, and not onely good for the intents aforeſaid, but againſt the dropſie alſo, being boyled in wine and drunken.

E Fennell ſeed drunke aſſwageth the paine of the ſtomacke, and wambling of the ſame, or deſire to vomit, and breaketh winde.

F The herbe, ſeed, and root of Fennell are very good for the lungs, the liuer, and the kidneyes, for it openeth the obſtructions or ſtoppings of the ſame, and comforteth the inward parts.

G The ſeed and herbe of ſweet Fennell is equall in vertues with Anniſe ſeed.

Chap. 412. *Of Dill.*

¶ *The Deſcription.*

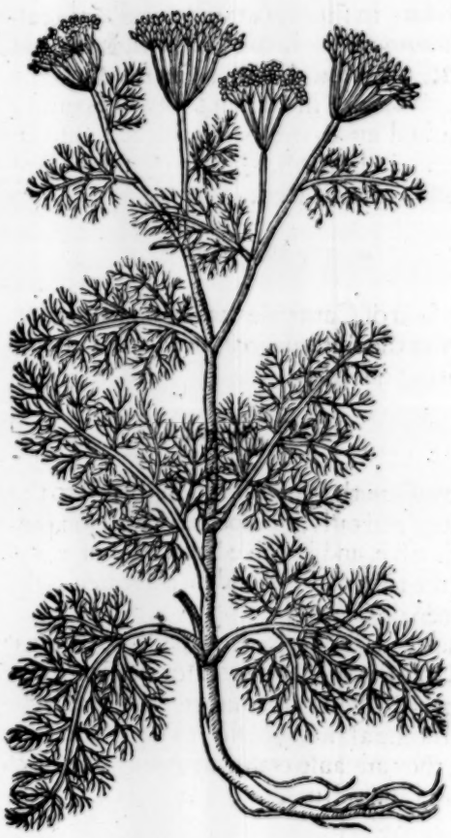
Dill hath a little ſtalke of a cubit high, round and ioynted; whereupon doe grow leaues verie finely cut, like to thoſe of Fennell, but much ſmaller: the floures be little and yellow, ſtanding in a ſpokie tuft or rundle: the ſeed is round, flat and thin: the whole plant is of a ſtrong ſmell: the root is threddy.

¶ *The Place.*

It is ſowne in gardens, and is alſo ſometimes found wilde.

¶ The

Anethum.
Dill.



¶ *The Time.*

It bringeth forth floures and ſeed in Auguſt.

¶ *The Names.*

Dil is called in Greek ἄνηθον: in Latine likewiſe *Anethum*, and *Anetum*: in high-Dutch, **Dyllen**: in low-Dutch, **Dille**: in Italian, *Anetho*: in Spaniſh, *Eneldo*: in French, *Anet*: in Engliſh, Dill, and Anet.

¶ *The Temperature.*

Dill, as *Galen* ſaith, is hot in the end of the ſecond degree, and dry in the beginning of the ſame, or in the end of the firſt degree.

¶ *The Vertues.*

The decoction of the tops of dried Dil, and likewiſe of the ſeed, being drunke, ingendreth milke in the breſts of nurſes, allayeth gripings and windineſſe, prouoketh vrine, increaſeth ſeed, ſtayeth the yeox, hicket, or hicquet, as *Dioſcorides* teacheth. A

The ſeed likewiſe if it be ſmelled vnto ſtayeth the hicket, eſpecially if it be boyled in wine, but chiefely if it be boyled in Wormewood Wine, or Wine and a few branches of Worme-wood, and Roſe leaues, and the ſtomacke bathed therewith. B

Galen ſaith, that being burnt and layd vpon moiſt vlcers, it cureth them, eſpecially thoſe in the ſecret parts, and likewiſe thoſe *ſub Præputio*, though they be old and of long continuance. C

Common oyle, in which Dill is boyled or ſunned, as we do oyle of Roſes, doth digeſt, mitigate paine, procureth ſleepe, bringeth raw and vnconcocted humors to perfect digeſtion, and prouoketh bodily luſt. D

Dill is of great force or efficacie againſt the ſuffocation or ſtrangling of the mother, if the woman do receiue the fume thereof being boyled in wine, and put vnder a cloſe ſtoole or hollow ſeat fit for the purpoſe. E

CHAP. 413. *Of Caruwaies.*

¶ *The Deſcription.*

CAruwaies haue an hollow ſtalke foure ſquare, of two cubits high, full of knots or ioynts; from which proceed ſundry other ſmall branches, ſet full of leaues very finely cut or iagged, like vnto thoſe of Carrots or Dill: at the top of the ſtalkes grow ſpokie white tufts like thoſe of Dill: after which commeth the ſeed, ſharpe in eating, yet of a pleaſant taſte: the root is like that of Parſley, often white, ſeldome yellow, and in taſte like vnto the Carrot.

¶ *The Place.*

It groweth almoſt euery where in Germanie and in Bohemia, in fat and fruitfull fields, and in medowes that are now and then ouer-run with water: it groweth alſo in Caria, as *Dioſcorides* ſheweth, from whence it tooke his name.

¶ *The Time.*

It floureth and ſeedeth from May to the end of Auguſt.

¶ *The*

Carum, ſiue Carcum.
Caruwaies.

¶ *The Names.*

It is called in Greeke καρον: in Latine, *Carum* and *Carcum*: in ſhops, *Carui*. *Simeon Zethy* calleth it *Carnabadion*: in high-Dutch, **Kym**, and **Kymmel**: in low-Dutch, **Caruy ſaet**: in French, *du Caruy*: in Italian, *Caro*: in Spaniſh, *Caraues*, and an article being ioyned vnto it, *Alkaraues*: in Engliſh, Caruwaie, and the ſeed is called Caruwaie ſeed.

¶ *The Temperature.*

The ſeed of Caruwaies, as *Galen* ſaith, is hot and dry in the third degree, and hath a moderate biting qualitie.

¶ *The Vertues.*

It conſumeth winde, it is delightfull to the ſtomacke and taſte, it helpeth concoction, prouoketh vrine, and is mixed with counterpoyſons: the root may be ſodden, and eaten as the Parſenep or Carrot is.

The ſeeds confected, or made with ſugar into Comfits, are very good for the ſtomacke, they helpe digeſtion, prouoke vrine, aſſwage and diſſolue all windineſſe: to conclude in a word, they are anſwerable to Aniſe ſeed in operation and vertues.

Chap. 414. *Of Anniſe.*

¶ *The Deſcription.*

1 THe ſtalke of Anniſe is round and hollow, diuided into diuers ſmall branches, ſet with leaues next the ground ſomewhat broad and round: thoſe that grow higher are more iagged, like thoſe of yong Parſley, but whiter: on the top of the ſtalkes do ſtand ſpokie rundles or tufts of white floures, and afterward ſeed, which hath a pleaſant taſte as euerie one doth know.

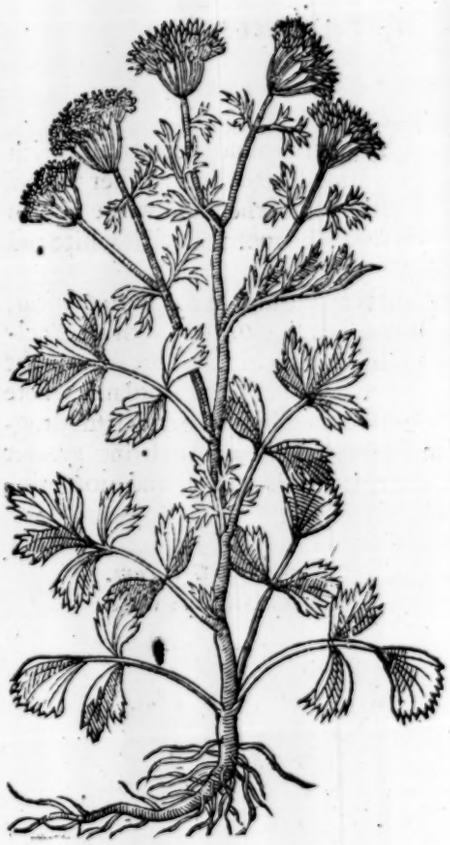
‡ 2 This other Anniſe (whoſe vmbels *Cluſius* had out of England from Maſter *Morgan* the Queenes Apothecarie, and *Iames Garret*; and which were brought from the Philippines by Mr. *Tho. Candiſh* in his voyage when he incompaſſed the world) is thus deſcribed by *Cluſius*: The vmbels were large, no leſſe than thoſe of the Archangelica, made of diuers thicke ſtiffe foot-ſtalks, each whereof carried not double ſeed as the common Anniſe, but more, in a round head ſome inch ouer, made of cods ſet ſtar-faſhion, ſix, 8, or more, of a dusky colour, wrinkled, diuided into two equall parts, and open aboue: moſt of theſe huskes were empty, yet ſome of them contained one ſmooth ſhining aſh-coloured ſeed, of the bigneſſe of that of *Orobus*; the taſte and ſmell was the ſame with our common Aniſe ſeed, wherefore they which ſent it to *Cluſius* called it Aniſe: yet in the place where it grew it was called *Damor*; for Mr. *Candiſh* had the name ſo written in the China characters, after their manner of writing. ‡

¶ *The Place.*

It groweth plentifully in Candy, Syria, Egypt, and other countries of the Eaſt. I haue often ſowne it in my garden, where it hath brought forth his ripe ſeed when the yeare hath fallen out to be temperate.

¶ *The*

1 *Aniſum.*
• Aniſe.



‡ 2 *Aniſum Indicum ſtellatum.*
Starry headed Aniſe..

¶ *The Time.*

It is to be ſowne in theſe cold regions in the moneth of May: the ſeed is ripe in Auguſt.

¶ *The Names.*

It is called in Latine *Aniſum:* in Greeke, Ἄνισον: in high-Dutch, **Aniſz:** in low-Dutch, **Aniſſaet:** in Italian, *Aniſo*: in Spaniſh, *Matahalua:* in French, *Anis:* in Engliſh, Aniſe, and Anniſe ſeed.

¶ *The Temperature.*

Galen writeth, That the ſeed of Aniſe is hot and dry in the third degree: after others, it is hot in the ſecond degree, and much leſſe than dry in the ſecond degree; for it ingendreth milke, which it could not do if it were very dry, as *Galen* in his chapter of Fennell doth whether hee will or no declare and teſtifie; in that it doth ingender milke, his opinion is that it is not hot aboue the firſt degree: which thing alſo may be in Aniſe ſeed, both by this reaſon, and alſo becauſe it is ſweet. Therefore to conclude, Aniſe ſeed is dry in the firſt degree, and hot in the ſecond.

¶ *The Vertues.*

The ſeed waſteth and conſumeth winde, and is good againſt belchings and vpbraidings of the ſtomacke, allayeth gripings of the belly, prouoketh vrine gently, maketh aboundance of milke, and ſtirreth vp bodily luſt: it ſtayeth the laske, and alſo the white flux in women. A

Being chewed it makes the breath ſweet, and is good for them that are ſhort winded, and quencheth thirſt, and therefore it is fit for ſuch as haue the dropſie: it helpeth the yeoxing or hicket, both when it is drunken or eaten dry: the ſmell thereof doth alſo preuaile very much. B

The ſame being dried by the fire and taken with honey clenſeth the breſt very much from flegmaticke ſuperfluities: and if it be eaten with bitter almonds it doth helpe the old cough. C

It is to be giuen to yong children and infants to eate which are like to haue the falling ſicknes, or to ſuch as haue it by patrimonie or ſucceſſion. D

It taketh away the Squinancie or Quincie (that is, a ſwelling in the throat) being gargled with honey, vineger, and a little Hyſſop gently boiled together. E

CHAP.

Chap. 414.

Of Biſhops Weed, Herbe-William, or Ameos.

¶ *The Deſcription.*

1 THe common Ameos, eſpecially with vs here in England, hath round greene ſtalks, with diuers boughes and branches, and large long leaues, diuided into diuers other narrow long and ſmall leaues, dented or ſnipt about the edges, hauing at the top of the ſtalke white floures in great ſpoky tufts, which bring forth a little ſharpe and bitter ſeed: the root thereof is white and threddie.

2 This excellent and aromaticall Ameos of Candy hath tufts and leaues like *Daucus Creticus*, and a root like vnto the garden Carrot, of a yellow colour, and hot ſeed like *Origanum*, of an excellent ſpicie ſauour or ſmell, growing in ſpoky tufts or roundles like *Carum*: it hath beene brought from Candy and Syria into Venice, and from Venice into France, Flanders, and England, where we haue often ſowne it; but without doubt we haue beene beguiled therein by the deceitful drug-maſters, who haue firſt boyled it, or vſed ſome other falſe and deceitfull deuice, to bring greater admiration vnto the Venice treacle, for the confection whereof this ſeed is a chiefe and moſt principall ingredient.

Ammi vulgare.
Common Biſhops-weed.

† 2 *Ammi Creticum.*
Candy Biſhops-weed.

3 There is another kinde of Ameos, which is an herbe very ſmall and tender, hauing ſtalkes a foot and a halfe high, very ſmall and tender, beſet with leaues like vnto Dill, finely iagged, and ſomewhat ſlender; and at the top of the ſtalkes grow little tufts or ſpokie white rundles, which afterwards do turne into ſmall gray ſeed, hot and ſharpe in taſte. The root is ſmall and ſlender.

¶ *The Place.*

Theſe plants do all grow in my garden, except *Ammi Creticum*, whereof hath beene ſufficiently ſpoken in the deſcription.

¶ *The*

‡ 3 *Ammi perpuſillum.*
Small Biſhops-weed.

¶ *The Time.*

They floure in Iune and Iuly, and yeeld their ſeed in the end of Auguſt.

¶ *The Names.*

The Grecians call it Ἄμμι: the Latines alſo *Ammi:* diuers call it *Cuminum Æthiopicum:* others, *Cuminum Regium*, or Comin Royall: in ſhops, *Ammios*, or *Ameos* in the Genitiue caſe: the Germanes, **Amey:** in Engliſh, Ameos, or Ammi: of ſome, Herbe-William, Bull-wort, and Biſhops-weed.

¶ *The Temperature.*

The ſeed of Ameos is hot and dry in the later end of the third degree.

¶ *The Vertues.*

It auaileth againſt gripings of the belly in making of vrine, againſt the bitings of ſerpents taken in wine, and alſo it bringeth downe the floures: being applied with honey it taketh away blacke and blew ſpots which come of ſtripes: the ſeed of *Siſon* doth alſo the like, for it is hot and dry, and that in the third degree; likewiſe of thin parts, prouoking vrine, and bringing downe the deſired ſickneſſe. A

The ſeed of Ameos is good to be drunken in wine againſt the biting of all manner of venomous beaſts, and hath power againſt all maner of poyſon & peſtilent feuers, or the plague, and is vſed in the correcting of Cantharides, whereby thoſe flies are made medicinable to be applied to the body without danger. B

Ameos brayed and mingled with honey ſcattereth congealed bloud, and putteth away blacke and blew markes which come by ſtripes or falls, if it be applied thereto in manner of a plaiſter. C

† The figure which was formerly in the ſecond place was of the *Hippomarathrum album* of Tabernæmontanus.

CHAP. 416. *Of Cheruill.*

¶ *The Deſcription.*

1 THe leaues of Cheruill are ſlender, and diuerſly cut, ſomething hairy, of a whitiſh green: the ſtalks be ſhort, ſlender, round, and hollow within, which at the firſt together with the leaues are of a whitiſh green, but tending to a red when the ſeeds are ripe: the floures be white, and grow vpon ſcattered tufts. The ſeed is long, narrow, ſlender, ſharpe pointed: the root is full of ſtrings.

‡ 2 There is found in Iune and Iuly, almoſt in euerie hedge, a certaine plant which *Tabernamont.* and *Bauhine* fitly cal *Chærophyllum*, or *Cerefolium ſylueſtre*, and the figure was vnfitly giuen by our Author for *Thyſſelinum:* It hath a whitiſh wooddy root, from which ariſe round red and hairy ſtalkes ſome two cubits high, ſometimes more, and oft times ſomewhat big and ſwolne about the ioynts, and they are not hollow but full of pith: toward the top it is diuided into ſundry branches, which on their tops carry vmbels of ſmall pure white little floures, which are ſucceeded by longiſh ſeeds. The leaues are vſually parted into three chiefe parts, and theſe againe ſubdiuided into fiue, and they are ſnipt about the edges, ſoft and hairy, of a darke greene or elſe reddiſh colour. It floureth in Iune and Iuly, and then ripens the ſeed. ‡

3 Great Cheruill hath large leaues deepely cut or iagged, in ſhew very like vnto Hemlocks, of a very good and pleaſant ſmell and taſte like vnto Cheruill, and ſomething hairy, which hath cauſed vs to call it ſweet Cheruill. Among theſe leaues riſeth vp a ſtalke ſomwhat creſted or furrowed, of the height of two cubits, at the top whereof grow ſpoky tufts or rundles with white

floures, which do turne into long browne creſted and ſhining ſeed, one ſeed being as big as foure Fennell ſeeds, which being greene do taſte like Aniſe ſeed. The root is great, thicke, and long, as big as *Enula Campana*, exceeding ſweet in ſmell, and taſting like vnto Aniſe ſeeds.

1 *Cerefolium vulgare ſatiuum.*
Common Cheruill.

† 2 *Cerefolium ſylueſtre.*
Hedge Cheruill.

‡ 4 There is found in ſome parts of the Alps, as about Geneua and in other places, another *Myrrhis*, which in the leaues and vmbels is like that of the laſt deſcribed, but the whole plant is leſſe; the ſeed is long, ſmall, ſmooth, and ſhaped like an Oat, and in taſte ſomewhat like that of the *Daucus Creticus*. *Lobel* hath this by the ſame name as we here giue it you.

5 About mud walls, high-wayes, and ſuch places, here about London, and in diuers other places, is found growing a ſmall plant, which in all things but the ſmell and height agrees with that referred to this kinde by *Fabius Columna*, and called *Myrrhis Æquicolorum noua*. The root hereof is ſmall and white, periſhing euery yeare when it hath perfected his ſeed: the ſtalks are ſlender, hollow, ſmooth, and not hairy, ſeldome exceeding the height of a cubit, or cubit and halfe; it is diuided into ſundry branches, vpon the ſides whereof againſt the ſetting on of the leaues, or out of their boſomes, grow forth the ſtalks, which carry vmbels of ſmall white floures: after which follow the ſeeds, growing two together, and theſe longiſh, rough, round, and hairy, about the bigneſſe of Aniſe ſeeds. The leaues are ſmall, and finely cut or diuided like thoſe of Hemlock, but of a whitiſh colour, and hairy: it comes vp in March, floures in May, and ripens his ſeed in Iune. In Italy they eate the yong leaues in ſallads, and call it wilde Cheruile: we may in Engliſh for diſtinctions ſake call it ſmall Hemlocke Cheruill.

6 To theſe we may fitly adde that plant which in the *hiſt. Lugd.* is called *Cicutaria alba*, and by *Camerarius*, *Cicutaria paluſtris*; for it floures at the ſame time with the laſt mentioned, and is found in floure and ſeed in May and Iune very frequently almoſt in all places; but afterwards his ſtalkes die downe, yet his roots liue, and the leaues are greene all the yeare. The root of this is very large, and diuided into ſundry parts, white alſo and ſpungie, of a pleaſing ſtrong ſmell, with a hot and biting taſte: the ſtalks grow vp in good ground to be ſome three cubits high, and they are hollow, ioynted, pretty thicke, greene, and much creſted, ſending forth of the boſomes of the leaues many branches, which vpon their tops carry vmbels compoſed of many white floures, each floure conſiſting of fiue little leaues, whereof the loweſt is twice as big as the reſt, the two ſide-ones leſſe, and the vppermoſt the leaſt of all. The leaues are large like thoſe of *Myrrhis*, but of a dark green colour,

and

and those that grow about the tops of the stalkes are commonly diuided into into three parts, and these subdiuided into sundry long sharpe pointed and snipt leaues like as in *Myrrhis*. The seeds grow two together, being longish, round, sharpe pointed, blacke, and shining. We may fitly terme this plant, wilde Cicely, for that it so much resembles the *Myrrhis* or garden Cicely, not onely in shape, but (if I be not deceiued) in vertues also. ‡

3 *Cerefolium magnum, siue Myrrhis.*
Great Cheruill or Myrrh.

‡ 4 *Myrrhis altera parua.*
Small sweet Cheruill.

¶ *The Place.*

The common Cheruill groweth in gardens with other pot-herbes: it prospers in a ground that is dunged and somewhat moist. The great sweet Cheruill groweth in my garden, and in the gardens of other men who haue been diligent in these matters.

¶ *The Time.*

These herbes do floure in May, and their seed is ripe in Iuly.

¶ *The Names.*

Cheruill is commonly called in Latine *Cerefolium*, and as diuers affirme, *Chærofolium*, with *o* in the second syllable. *Columella* nameth it *Charephyllium*, and it is thought to be so called because it delighteth to grow with many leaues, or rather in that it causeth ioy and gladnes: in high-Dutch, **Kotzelkraut:** in low-Dutch, **Keruell:** in Italian, *Cerefoglio:* in French, *Du Cerfueil.* in English, Cheruell, and Cheruill.

Myrrhis is also called *Myrrha*, taken from his pleasant sauour of Myrrh: of some, *Conila*, as it is found noted among the bastard names. It is also, by reason of the similitude it hath with Hemlocke, called by most late writers, *Cicutaria*. Of this, *Pliny* maketh mention, *lib.* 24. *cap.* 16. where he reporteth that it is called *Smyrrhiza:* in English it is called Cheruill, sweet Cheruill, or sweet Cicely.

¶ *The Temperature and Vertues.*

Cheruill is held to be one of the pot-herbes, it is pleasant to the stomacke and taste: it is of a temperate heate and moderate drinesse, but nothing so much as the Parsleyes. A

It prouoketh vrine, especially being boyled in wine, and applied hot to the share or nethermost part of the belly, and the wine drunke in which it was boyled. B

It hath in it a certaine windinesse, by meanes whereof it procureth lust. C

It is vsed very much among the Dutch people in a kinde of Loblolly or kotch-pot which they do eate, called Warmus. D

E The leaues of ſweet Cheruill are exceeding good, wholeſome, and pleaſant, among other ſallad herbs, giuing the taſte of Aniſe ſeed vnto the reſt.

F The root, ſaith *Galen*, is hot in the ſecond degree, hauing a thinneſſe of ſubſtance ioined with it.

G *Dioſcorides* teacheth, that the root drunke in wine is a remedie againſt the bitings of the venomous ſpiders called in Latine *Phalangia*; and that it bringeth downe the menſes and ſecondines; and being boyled and drunke it is good for ſuch as haue the ptyſick or conſumption of the lungs.

H The ſeeds eaten as a ſallad whileſt they are yet greene, with oyle, vineger, and pepper, exceed all other ſallads by many degrees, both in pleaſantneſſe of taſte, ſweetneſſe of ſmell, and wholſomneſſe for the cold and feeble ſtomacke.

I The roots are likewiſe moſt excellent in a ſallad, if they be boyled and after dreſſed as the cunning Cooke knoweth how better than my ſelfe: notwithſtanding I doe vſe to eate them with oile and vineger, being firſt boyled; which is very good for old people that are dull and without courage; it reioyceth and comforteth the heart, and increaſeth their luſt and ſtrength.

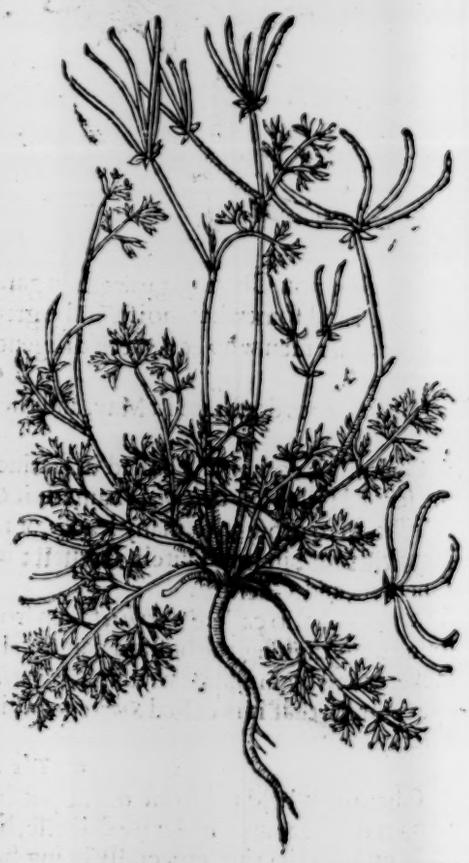
Chap. 417. *Of Shepheards needle or wilde Cheruill.*

¶ *The Deſcription.*

1 *Scandix*, or *Pecten Veneris*, doth not much differ in the quantitie of the ſtalks, leaues, and floures, from Cheruill; but *Scandix* hath no ſuch pleaſant ſmell as Cheruill hath: the leaues be leſſer, more finely cut, and of a browne greene colour: the floures grow at the top of the ſtalkes in ſmall white tufts; after which come vp long ſeeds very like vnto pack-needdles, orderly ſet one by another like the great teeth of a combe, whereof it tooke the name *Pecten Veneris*, or Venus combe, or Venus needle: the root is white, a finger long.

1 *Pecten Veneris, ſiue Scandix.*
Shepheards needle, or Venus combe.

‡ 2 *Scandix minor, ſiue Anthriſcus.*
Small Shepheards needle.



‡ 2 This from a ſlender long and whitiſh root ſends vp many ſmall leaues like thoſe of the laſt deſcribed, but of a pleaſing ſmell and taſte ſomething like that of the common Cheruill; amongſt theſe leaues grow vp ſlender ſtalks a little hairy, diuided into ſhort green and ſlender branches carrying little vmbels, conſiſting of fiue, ſix, ſeuen, or eight ſmal white floures, compoſed of fiue leaues apiece,

apiece, with a darke purpliſh chiue in the middle: the floures are ſucceeded by, or rather grow vpon long ſlender cods, which become ſome inch long, and reſemble thoſe of the laſt deſcribed. It floures in Iune, as *Cluſius* affirmeth, who giues vs the hiſtory of it; and he receiued it from *Honorius Bellus* out of Candy; who writes, that in the Spring time it is much vſed in ſallads, and deſired, for that it much excites to Venery. He alſo thinks this plant to be the *Anthriſcus* of *Pliny*, and by the ſame name *Cluſius* ſets it forth. *Columna* hath called it *Aniſo-marathrum*, becauſe the ſmell and taſte is betweene that of Aniſe and Fennell. ‡

¶ *The Place.*

It groweth in moſt corne fields in England, eſpecially among wheate and barley.

¶ *The Time.*

It floureth in May: the ſeed is ripe in Auguſt with corne.

¶ *The Names.*

The Latines call it *Scandix*, hauing borrowed that name of the Grecians, who call it σκάνδιξ: we finde among the baſtard words, that the Romans did call it *Scanaria*, and *Acula*, of the ſeed that is like vnto a needle. *Ruellius* deſcribeth it vnder the name *Pecten Veneris*: of others, *Acus Veneris*, and *Acus Paſtoris*, or Shepheards Needle, wilde Cheruill, and Ladies combe: in high-Dutch, **Naelde karnel**: This is that herbe (ſaith *Pliny*, *lib. 22. cap. 22.*) which *Ariſtophanes* obiected in ſport to the Poet *Euripides*, that his mother was wont to ſell no right pot-herbe but *Scandix*, or Shepheards needle; meaning, as I take it, *Viſnaga*, wherewith the Spaniards doe picke their teeth when they haue eaten no meate at all except a few oranges or ſuch a like trifle, called alſo *Scandix*.

¶ *The Temperature.*

Shepheards needle, ſaith *Galen*, is an herbe ſomewhat binding, and bitter in taſte, inſomuch that it is hot and dry either in the later end of the ſecond degree, or in the beginning of the third.

¶ *The Vertues.*

Dioſcorides ſaith it is eaten both raw and boyled, and that it is an wholeſome pot-herbe among A
the Greekes; but in theſe dayes it is of ſmall eſtimation or value, and taken but for a wilde Wort, as appeareth by *Ariſtophanes* taunting of *Euripides*, as aforeſaid.

The decoction thereof is good for the bladder, kidneyes, and liuer; but as I deeme hee meant B
Cheruill, when he ſet the ſame downe to be vſed in phyſicke.

CHAP. 418. *Of Tooth-picke Cheruill.*

¶ *The Deſcription.*

1 THe firſt of theſe Tooth-picke Cheruils beareth leaues like wilde Turneps, a round ſtalke furrowed, ioynted, blackiſh, and hairy, diuided into many branches, on the tops whereof grow ſpokie tufts, beſet round about with many ſmall leaues. The floures thereof are whitiſh: after commeth the the ſeed, which being once ripe do cluſter and are drawne together, in a round thicke tuft like a ſmall birds neſt, as be thoſe of the wilde Carrot; whoſe ſeeds whoſo toucheth, they will cleaue and ſticke to his fingers, by reaſon of the glutinous or ſlimie matter they are poſſeſſed with. The root is ſmall and whitiſh, bitter in taſte, as is all the reſt of the plant.

2 The Spaniſh Tooth-picke hath leaues, floures, and knobby ſtalkes like vnto wilde carrots, ſauing that the leaues are ſomewhat finer, cut or iagged thicker, and tenderer, but not rough or hairy at all as is the former, of a bitter taſte, and a reaſonable good ſmell: among which riſe vp buſhie rundles or ſpokie tufts like thoſe of the wilde Carrot or Birds neſt, cloſely drawne together when the ſeed is ripe; at what time alſo the ſharpe needles are hardned, fit to make Tooth-pickes and ſuch like, for which purpoſe they do very fitly ſerue.

¶ *The Place.*

Both of them grow in Syria, and moſt commonly in Cilicia: the later is to be found likewiſe in Spaine almoſt euery where; and I haue it likewiſe in my garden in great plentie.

¶ *The Time.*

They floure in my garden about Auguſt, and deliuer their ſeed in October.

¶ *The Names.*

That which the Grecians call σκάνδιξ, the Latines do likewiſe name *Gingidium*: and it is called in Syria *Lepidium*: yet is there another *Lepidium*. It is reported among the baſtard names to be called by the Romans, *Biſacutum*: of which name ſome ſhew remaines among the Syrians, who commonly call the later, *Gingidium*, *Viſnaga*: this is named in Engliſh, Tooth-picke Cheruill.

1 *Gingidium latifolium.*
Broad Tooth-picke Cheruill.

2 *Gingidium Hiſpanicum.*
Spaniſh Tooth-picke Cheruill.

¶ *The Temperature and Vertues.*

A There is, ſaith *Galen*, great increaſe of *Gingidium* in Syria, and it is eaten no otherwiſe than *Scandex* is with vs at Pergamum: it is, ſaith he, very wholeſome for the ſtomacke, whether it be eaten raw or boyled; notwithſtanding it is euident that it is a medicine rather than a nouriſhment. As it is bitter and binding, ſo is it likewiſe of a temperate heate and drineſſe. The heate is not very apparant, but it is found to be dry in the later end of the ſecond degree, as alſo the ſaid Author alledgeth in his diſcourſe of the faculties of ſimple medicines.

B *Dioſcorides* doth alſo write the ſame: This pot-herbe (ſaith he) is eaten raw, ſodden, and preſerued with great good to the ſtomacke; it prouoketh vrine, and the decoction thereof made with wine and drunke, is profitable to ſcoure the bladder, prouoketh vrine, and is good againſt the grauell and ſtone.

C The hard quills whereon the ſeeds do grow are good to cleanſe the teeth and gums, and do eaſily take away all filth and baggage ſticking in them, without any hurt vnto the gums, as followeth after many other Tooth-picks, and they leaue a good ſent or ſauor in the mouth.

Chap. 419. *Of Mede-ſweet, or Queene of the Medowes.*

¶ *The Deſcription.*

1 THis herbe hath leaues like thoſe of Agrimonie, conſiſting of diuers leaues ſet vpon a middle rib like thoſe of the Aſh tree, euery ſmall leafe ſleightly ſnipt about the edges, white on the inner ſide, and on the vpper ſide crumpled or wrinkled like vnto thoſe of the Elme Tree; whereof it tooke the name *Vlmaria*, of the ſimilitude or likeneſſe that the leaues haue with the Elme leaues. The ſtalke is three or foure foot high, rough, and very fragile or eaſie to bee broken, of a reddiſh purple colour: on the top whereof are very many little floures cluſtering and growing together, of a white colour tending to yellowneſſe, and of a pleaſant ſweete ſmell,

1 *Regina prati.*
Queene of the Medow.

ſmel, as are the leaues likewiſe: after which come the ſeeds, ſmall, crookedly turning or winding one with another, made into a fine little head. The root hath a ſweet ſmel, ſpreding far abroad, blacke without, and of a darkiſh red colour within.

‡ 2 There is alſo another which by *Fuchſius, Tragus, Lonicerus, Geſner*, and others, is called *Barba Capri*: it hath large wooddie rootes, leaues of the bigneſſe, and growing ſomewhat after the manner of the wild Angelica: the ſtalks are creſted, and diuided into ſundry branches, which carry long bending ſpikes or eares of white floures & ſeeds ſomewhat like thoſe of the common kinde. This floures at the ſame time as the former, and I haue not yet heard of it wilde with vs, but onely ſeene it growing with M^r. *Tradeſcant.* ‡

¶ *The Place.*

It groweth in the brinkes of waterie ditches and riuers ſides, and alſo in medowes: it liketh waterie and moiſt places, and groweth almoſt euery where.

¶ *The Time.*

It floureth and flouriſheth in Iune, Iuly, and Auguſt.

¶ *The Names.*

It is called of the later age *Regina prati*, & *Barba Capri*: of ſome, *Vlmaria, à foliorum Vlmi ſimilitudine*, from the likeneſſe it hath with the Elme tree leafe: in high Dutch, **Scilbart.** It is called *Barba Hirci*, which name belongeth to the plant which the Grecians do call *Tragopogon*: of *Anguillara, Potentilla maior*. It hath ſome likeneſſe with *Rhodora Plinij*, but yet we cannot affirme it to be the ſame. It is called in low Dutch **Reijnette**: in French, *Barbe de Cheure, Reine des Praiz*: in Engliſh, Meadeſ-ſweet, Medow-ſweet, and Queene of the medowes. *Camerarius* of Noremberg ſaith it is called of the Germanes his countrimen, **Wurme kraut**: becauſe the roots, ſaith he, ſeem to be eaten with wormes. I rather ſuppoſe they call it ſo, becauſe the antient hackny men and horſleaches do giue the decoction therof to their horſes and aſſes, againſt the bots and wormes, for the which it is greatly commended.

¶ *The Temperature.*

Mede-ſweet is cold and drie, with an euident binding qualitie adioined.

¶ *The Vertues.*

The root boiled, or made into pouder and drunke, helpeth the bloudy flix, ſtaieth the laske, and all other fluxes of bloud in man or woman. A

It is reported, that the floures boiled in wine and drunke, do take away the fits of a quartaine ague, and make the heart merrie. B

The leaues and floures farre excell all other ſtrowing herbes, for to decke vp houſes, to ſtraw in chambers, halls, and banqueting houſes in the ſommer time; for the ſmell thereof makes the heart merrie, delighteth the ſenſes: neither doth it cauſe head-ache, or lothſomeneſſe to meat, as ſome other ſweet ſmelling herbes do. C

The diſtilled water of the floures dropped into the eies, taketh away the burning and itching thereof, and cleareth the ſight. D

CHAP. 420. *Of Burnet Saxifrage.*

¶ *The Deſcription.*

1 THis great kinde of Pimpinell, or rather Saxifrage, hath great and long roots, faſhioned like a Parſnep, of an hot and biting taſte like Ginger: from which riſeth vp an hollow

ſtalke

ſtalke with ioints and knees two cubits high, beſet with large leaues, which do more neerely repreſent Smallage than Pimpernell, or rather the garden Parſnep. This plant conſiſteth of many ſmall leaues growing vpon one ſtem, ſnipt or dented about the edges like a ſaw: the floures do grow at the top of the ſtalkes in white round tufts: the ſeed is like the common Parſley, ſauing that it is hotter and biting vpon the tongue.

‡ There is a bigger and leſſer of this kinde, which differ little, but that the ſtalkes and veins of the leaues of the leſſer are of a purpliſh colour, and the root is hotter. Our Authour formerly gaue the figure of the leſſer in the ſecond place, in ſtead of that of *Bipinella*. ‡

1 *Pimpinella Saxifraga.*
Burnet Saxifrage.

† 2 *Bipinella, ſive Saxifraga minor.*
Small Burnet Saxifrage.

2 *Bipinella* is likewiſe a kinde of Burnet or Pimpinell, vpon which *Pena* hath beſtowed this addition *Saxifraga minor*: vnder which name *Saxifraga* are comprehended diuers herbs of diuers kinds, and the one very vnlike to the other: but that kinde of Saxifrage which is called *Hircina*, which is rough or hairie Saxifrage, of others *Bipinella*, is beſt knowne, and the beſt of all the reſt, like vnto the ſmall Burnet, or common Parſley, ſauing that it is void of haires, as may appeare by the old Latine verſe,

Pimpinella habet pilos, Saxifraga non habet villos.
Pimpinell hath haires ſome, but Saxifrage hath none.

Notwithſtanding, I haue found a kinde hereof growing in our paſtures adioining to London, the leaues whereof if you take and tenderly breake with your hands, you may draw forth ſmall threds, like the web of a ſpider, ſuch as you may draw from the leaues of Scabious. The ſtalke is hollow, diuiding it ſelfe from the ioints or knees, into ſundry other ſmall branches; at the top whereof doe grow ſmall tufts or ſpokie rundles, of a white colour: after which commeth the ſeed like to *Carui*, or Caruwaies, of a ſharpe taſte: the root is alſo ſharpe and hot in taſte.

¶ *The Place.*

Theſe plants do grow in drie paſtures and medowes in this countrey very plentifully.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

That which *Fuchſius* calleth *Pimpinella maior*, *Dodonæus* termeth *Saxifragia maior*, which kinde of Saxifrage doth more abſolutely anſwer the true *Phellandrium* of *Pliny*, than any other plant whatſoeuer:

ſoeuer: wherein the Phyſitions of Paris haue been deceiued, calling or ſuppoſing the medow Rue to be the right *Phellandrium*, whereunto it is not like either in ſhape or facultie: for it is nothing ſo effectuall in breaking the ſtone, or prouoking of vrine, as either of theſe plants, eſpecially *Pimpinella Hircina*, which is not ſo called, becauſe it hath any rammiſh ſmell of a goat, but becauſe practitioners haue vſed to feed goats with it, whoſe fleſh and bloud is ſingular good againſt the ſtone; but we rather take it to be named *Hircina*, of *Hercinia ſylua*, where it doth grow in great abundance, the ſauour of the herbe not being vnpleaſant, ſomewhat reſembling the ſmell and taſte of *Daucus*, *Liguſtrum*, and *Paſtinaca*: ſo to conclude, both theſe are called *Saxifragia*: the ſmaller is called of ſome *Petræſtadula*, *Bipinella*, and *Bipenula*: of *Baptiſta Sardus*, and alſo of *Leonardus Fuchſius*, *Pimpinella maior*: wherefore diuers call it *Pimpinella Saxifraga*: for there is alſo another *Pimpinella*, called *Pimpinella Sanguiſorba*: notwithſtanding the verſe before rehearſed ſheweth a difference betweene *Pimpinella* and *Saxifraga*: in high Dutch, it is called **Bibernel**: in Low Dutch, **Bauenaert**: in Engliſh the greater may be called great Saxifrage, and the other ſmall Saxifrage.

Bipinella is called *Saxifragia minor*: in Engliſh, Small Saxifrage, as *Pimpinella* is called great Saxifrage. ‡ *Columna* iudges it to be the *Tragium* of *Dioſcorides*. ‡

¶ *The Nature.*

Saxifrage of both kindes, with their ſeed, leaues, and roots, are hot and drie in the third degree, and of thin and ſubtill parts.

¶ *The Vertues.*

The ſeed and root of Saxifrage drunken with wine, or the decoction thereof made with wine, A
cauſeth to piſſe well, breaketh the ſtone in the kidnies and bladder, and is ſingular againſt the ſtrangurie, and the ſtoppings of the kidnies and bladder: whereof it tooke the name *Saxifragia*, or breake ſtone.

The iuice of the leaues of Saxifrage doth clenſe and take away all ſpots and freckles of the face, B
and leaueth a good colour.

The diſtilled water thereof mingled with ſome vineger in the diſtillation, cleareth the ſight, and C
taketh away all obſcuritie and darkneſſe of the ſame.

Chap. 421. *Of Burnet.*

1 *Pimpinella hortenſis.*
Garden Burnet.

2 *Pimpinella ſylueſtris.*
Wilde Burnet.

¶ *The*

¶ *The Kinds.*

Burnet of which we will intreat, doth differ from *Pimpinella*, which is alſo called *Saxifraga*. One of the Burnets is leſſer, for the moſt part growing in gardens, notwithſtanding it groweth in barren fieldes, where it is much ſmaller: the other greater, is altogither wilde.

¶ *The Deſcription.*

1 GArden Burnet hath long leaues made vp together of a great many vpon one ſtem, euery one whereof is ſomething round, nicked on the edges, ſomwhat hairie: among theſe riſeth a ſtalke that is not altogether without leaues, ſomething chamfered: vpon the tops whereof grow little round heads or knaps, which bring forth ſmall floures of a browne purple colour, and after them cornered ſeeds, which are thruſt vp together. The root is long: the whole plant doth ſmell ſomething like a Melon, or Cucumber.

2 Wilde Burnet is greater in all parts, it hath wider and bigger leaues than thoſe of the former: the ſtalke is longer, ſometimes two cubits high: the knaps are greater, of a darke purple colour, and the ſeed is likewiſe cornered and greater: the root longer, but this Burnet hath no pleaſant ſmell at all.

‡ 3 There is kept in ſome gardens another of this kinde, with very large leaues, ſtalkes, and heads, for the heads are ſome inch and halfe long, yet but ſlender conſidering the length, and the floures (as I remember) are of a whitiſh colour: in other reſpects it differs not from the precedent: it may fitly be called *Pimpinella ſanguiſorba hortenſis maxima*, Great Garden Burnet. ‡

¶ *The Place.*

The ſmall Pimpinell is commonly planted in gardens, notwithſtanding it doth grow wilde vpon many barren heaths and paſtures.

The great wilde Burnet groweth (as M^r. *Lyte* ſaith) in dry medowes about Viluord, and my ſelfe haue found it growing vpon the ſide of a cauſey which croſſeth the one halfe of a field, whereof the one part is earable ground, and the other part medow, lying between Paddington and Lyſſon green neere vnto London, vpon the high way.

¶ *The Time.*

They floure from Iune, vnto the end of Auguſt.

¶ *The Names.*

The later herbariſts doe call Burnet *Pimpinella ſanguiſorba*, that it may differ from the other, and yet it is called by ſeuerall names, *Sanguiſorba*, and *Sanguinaria*: *Geſner* had rather it ſhould be called *Peponella* of the ſmell of Melons or Pompions, to which it is like, as we haue ſaid: of others it is named *Pimpinella*, or *Bipennula*: of moſt men, *Solbaſtrella*: in High Dutch, **Kolbleskraut, Her Gots Bartlin, Blutkraut megelkraut:** in French, *Pimpenelle, Sanguiſorbe*: in Engliſh, Burnet. It agreeth *cum altera Dioſcoridis Sideritide*, that is to ſay, with *Dioſcorides* his ſecond Iron-woort: the leafe (and eſpecially that of the leſſer ſort) which we haue written to conſiſt of many nicks in the edges of the leaues, and this may be the very ſame which *Pliny* in his 24 book, chapter 17. reporteth to be named in Perſia, *Siſſitiepterus*, becauſe it made them merry; he alſo calleth the ſame *Protomedia*, and *Caſigneta*, and likewiſe *Dionyſionymphas*, for that it doth maruellouſly agree with wine, to which alſo this *Pimpinella* (as we haue ſaid) doth giue a pleaſant ſent: neither is that repugnant, that *Pliny* in another place hath written, *De Sideritibus*, of the Iron-woorts; for it often falleth out that he intreateth of one and the ſelfe ſame plant in diuers places, vnder diuers names: which thing then hapneth ſooner when the writers themſelues do not well know the plant, as that *Pliny* did not well know *Sideritis* or Iron-woort, it is eueu thereby manifeſt, becauſe he ſetteth not downe his owne opinion hereof, but other mens.

¶ *The Temperature.*

Burnet, beſides the drying and binding facultie that it hath, doth likewiſe meanly coole: and the leſſer Burnet hath likewiſe withall a certaine ſuperficiall, ſleight, and tempetate ſent, which when it is put into the wine it doth leaue behind it: this is not in the dry herbe, in the iuice, nor in the decoction.

¶ *The Vertues.*

A Burnet is a ſingular good herb for wounds (which thing *Dioſcorides* doth attribute to his ſecond Ironwoort) and commended of a number: it ſtancheth bleeding, and therefore it was named *Sanguiſorba*, as well inwardly taken, as outwardly applied.

B Either the iuice is giuen, or the decoction of the pouder of the drie leaues of the herbe, beeing bruiſed, it is outwardly applied, or elſe put among other externall medicines.

C It ſtaieth the laske and bloudy flix: it is alſo moſt effectuall to ſtop the monthly courſe.

D The leſſer Burnet is pleaſant to be eaten in ſallads, in which it is thought to make the heart merry and glad, as alſo being put into wine, to which it yeeldeth a certaine grace in the drinking.

The

The decoction of Pimpinell drunken, cureth the bloudy flix, the ſpitting of bloud, and all other fluxes of bloud in man or woman. F

The herbe and ſeed made into pouder, and drunke with wine, or water wherein iron hath beene quenched doth the like. G

The leaues of Pimpinell are very good to heale wounds, and are receiued in drinkes that are made for inward wounds. H

The leaues of Burnet ſteeped in wine and drunken, comfort the heart, and make it merry, and are good againſt the trembling and ſhaking thereof. I

Chap. 422. *Of Engliſh Saxifrage.*

¶ *The Deſcription.*

1 THis kinde of Saxifrage our Engliſh women Phyſitions haue in great vſe, and is familiarly knowne vnto them, vouchſafing that name vnto it of his vertues againſt the ſtone: it hath the leaues of Fennel, but thicker and broader, very like vnto *Seſeli pratenſe*, *Monſpelienſium* (which addition *Pena* hath beſtowed vpon this our Engliſh Saxifrage) among which riſeth vp a ſtalke, of a cubit high or more, bearing at the top ſpokie rundles beſet with whitiſh yellow floures: the root is thicke, blacke without, and white within, and of a good ſauour.

† 1 *Saxifraga Anglicana facie Seſeli pratenſis.*
Engliſh Saxifrage.

‡ 2 *Saxifraga Pannonica Cluſij.*
Auſtrian Saxifrage.

‡ 2 *Cluſius* hath ſet forth another plant not much different from this our common Saxifrage, and called it *Saxifraga Pannonica*, which I haue thought fit here to inſert: the leaus, ſaith he, are much ſhorter than thoſe of Hogs-Fennell, and ſomewhat like thoſe of Fumitorie: the ſtalkes are ſome foot high, ſlender, hauing ſome few ſmall leaues, and at the top carrying an vmbel of white floures: the root is not much vnlike that of Hogs-Fennel, but ſhorter and more acride; it is hairie at the top thereof

thereof, whence the ſtalkes and leaues come forth: it growes vpon ſome hils in Hungarie and Auſtria, and floures in Iuly. ‡

¶ *The Place.*

Saxifrage groweth in moſt fields and medowes euery where throughout this our kingdome of England.

¶ *The Time.*

It floureth from the beginning of May to the end of Auguſt.

¶ *The Names.*

Saxifraga Anglicana is called in our mother tongue Stone-breake or Engliſh Saxifrage: *Penn* and *Lobel* call it by this name *Saxifraga Anglicana:* for that it groweth more plentifully in England than in any other countrey.

¶ *The Nature.*

Stone-breake is hot and drie in the third degree.

¶ *The Vertues.*

A A decoction made with the ſeeds and roots of Saxifrage, breaketh the ſtone in the bladder and kidneies, helpeth the ſtrangurie, and cauſeth one to piſſe freely.

B The root of Stone-breake boiled in wine, and the decoction drunken, bringeth downe womens ſickneſſe, expelleth the ſecondine and dead childe.

C The root dried and made into pouder, and taken with ſugar, comforteth and warmeth the ſtomack, cureth the gnawings and griping paines of the belly.

D It helpeth the collicke, and driueth away ventoſities or windineſſe.

E Our Engliſh women vſe to put it in their running or rennet for cheeſe, eſpecially in Cheſhire (where I was borne) where the beſt cheeſe of this Land is made.

† I haue formerly Chap. 188. deliuered the hiſtory of the *Saxifraga maior* of *Matthiolus*, and *Saxifraga Antiquorum* of *Lobel*; not thinking that our Author had put their deſcriptions here amongſt the *Vmbelliferæ*, for if I had, I ſhould haue ſpared my labour there beſtowed, and haue giuen their figures here to the deſcriptions of our Author, which are now omitted. The figure formerly here was of the *Caucalis*, deſcribed in the third place of the 403 Chapter.

Chap. 423. *Of Siler Mountaine or baſtard Louage.*

† 1 *Siler montanum Officinarum.*
Baſtard Louage.

† 2 *Seſeli pratenſe Monſpelienſium.*
Horſe Fennell.

¶ *The*

¶ *The Deſcription.*

1 THe naturall plants of *Seſeli*, being now better knowne than in times paſt, eſpecially among our Apothecaries, is called by them *Siler montanum*, and *Seſeleos*: this plant they haue retained to verygood purpoſe and conſideration; but the errour of the name hathcauſed diuers of our late writers to erre, and to ſuppoſe that *Siler montanum*, called in ſhops, *Seſeleos*, was no other than *Seſeli Maſſilienſium* of *Dioſcorides*. But this plant containeth in his ſubſtance much more acrimony, ſharpeneſſe, and efficacy in working, than any of the plants called *Seſelios*. It hath ſtalkes like Ferula, two cubits high. The root ſmelleth like *Liguſticum*: the leaues are very much cut or diuided, like the leaues of Fennell or *Seſeli Maſſilienſe*, and broader than the leaues of *Peucedanum*. At the top of the ſtalkes grow ſpoky tufts like Angelica, which bring forth a long and leafie ſeed like Cumine, of a pale colour; in taſte ſeeming as though it were condited with ſugar, but withall ſomewhat ſharpe, and ſharper than *Seſeli pratenſe*.

2 There is a ſecond kinde of *Siler* which *Pena* and *Lobel* ſet forth vnder the title of *Seſeli pratenſe Monſpelienſium*, which *Dodonæus* in his laſt edition calleth *Siler pratenſe alterum*, that is in ſhew very like the former. the ſtalkes thereof grow to the height of two cubits, but his leaues are ſomewhat broader and blacker: there are not ſo many leaues growing vpon the ſtalke, and they are leſſe diuided than the former, and are of little ſauour. The ſeed is ſmaller than the former, and ſauouring very little or nothing. The root is blacke without, and white within, diuiding it ſelfe into ſundry diuiſions.

¶ *The Place.*

It groweth of it ſelfe in Liguria, not far from Genua in the craggy mountaines, and in the gardens of diligent Herbariſts.

¶ *The Time.*

Theſe plants do floure from Iune to the end of Auguſt.

¶ *The Names.*

It is called commonly *Siler Montanum*: in French and Dutch by a corrupt name *Ser-Montain*: in diuers ſhops, *Seſeleos*, but vntruly: for it is not *Seſeli*, nor a kinde thereof: in Engliſh, Siler mountaine, after the Latine name, and baſtard Louage. ‡ The firſt is thought to be the *Liguſticum* of the Antients, and it is ſo called by *Matthiolus* and others. ‡

¶ *The Nature.*

This plant with his ſeed is hot and dry in the third degree.

¶ *The Vertues.*

The ſeeds of *Siler* drunke with Wormewood wine, or wine wherein Wormewood hath been fodden, mooueth womens diſeaſes in great abundance: cureth the ſuffocation and ſtrangling of the matrix, and cauſeth it to returne vnto the naturall place againe. A

The root ſtamped with hony, and applied or put into old ſores, doth cure them, and couer bare and naked bones with fleſh. B

Being drunke it prouoketh vrine, eaſeth the paines of the guts or entrailes proceeding of crudities or rawneſſe, it helpeth concoction, conſumeth winde, and ſwelling of the ſtomacke. C

The root hath the ſame vertue or operation, but not ſo effectuall, as not being ſo hot and dry. D

† The figure which formerly was here was of the *Seſeli Maſſilienſe* deſcribed in the next chapter in the fourth place; and that which belonged to this place was put for our common Louage. Alſo that figure which belonged to the ſecond deſcription was formerly vnder the title of *Fœniculum dulce*.

CHAP. 224. *Of Seſelios, or Harte-worts of Candy.*

¶ *The Deſcription.*

1 THis plant being the *Seſeli* of Candy, and in times paſt not elſewhere found, tooke his ſurname of that place where it was firſt found, but now adaies it is to be ſeen in the corne fields about Narbon in France, from whence I had ſeeds, which proſper well in my garden. This is but an annuall plant, and increaſeth from yeere to yeere by his owne ſowing. The leaues grow at the firſt euen with the ground, ſomewhat hairy, of an ouerworne greene colour, in ſhape much like vnto Cheruill, but thicker: among which riſeth vp an hairy rough ſtalke, of the height of a cubit, bearing at the top ſpokie tufts with white floures: which being vaded, there followeth round and flat ſeed, compaſſed and cunningly wreathed about the edges like a ring.

The ſeed is flat like the other, ioyned two together in one, as you may ſee in the ſeed of Ferula or Angelica, in ſhape like a round target, in taſte like *Myrrhis*. *Matthiolus* did greatly miſtake this plant.

2 There is a kinde of *Seſeli Creticum*, called alſo *Tordylion*: and is very like vnto the former, ſauing that his leaues are more like vnto common Parſneps than Cheruil, and the whole plant is biggerthan the former.

1 *Seſeli Creticum minus:*
Small Seſeleos of Candie.

‡ 2 *Seſeli Creticum maius.*
Great Seſelios of Candie.

3 There is likewiſe a kinde of *Seſeli* that hath a root as big as a mans arme, eſpecially if the plant be old, but the new and young plants beare roots an inch thicke, with ſome knobs and tuberous ſprouts, about the lower part, the root is thicke, rough, and couered ouer with a thicke barke, the ſubſtance whereof is firſt gummie, afterward ſharpe, and as it were full of ſpattle; from the vpper part of the root proceed many knobs or thicke ſwelling roots, out of which there iſſueth great and large wings or branches of leaues, ſome whereof are notched and dented round about, growing vnto one ſide or rib of the leafe, ſtanding alſo one oppoſite vnto another, of a darke and delaid green colour, and ſomewhat ſhining aboue, but vnderneath of a grayiſh or aſhe colour: from amongſt theſe leaues there ariſeth a ſtraked or guttered ſtalke, a cubit and a halfe high, ſometimes an inch thicke, hauing many ioints or knees, and many branches growing about them, and vpon each ioint leſſer branches of leaues. At the top of the ſtalkes, and vpper ends of the branches grow little cups or vmbels of white floures; which being vaded, there commeth in place a ſeed, which is very like *Siler montanum*. ‡ I take this here deſcribed to be the *Seſeli montanum* 1. of *Cluſius*, or *Liguſticum alterum Belgarum* of *Lobel*: and therefore I haue giuen you *Cluſius* his figure in this place. ‡

There is alſo a kinde of *Seſeli*, which *Pena* ſetteth forth for the firſt kinde of *Daucus*, wherof I take it to be a kinde, growing euery where in the paſtures about London, that hath large leaues, growing for a time euen with the earth, and ſpred thereupon, and diuided into many parts, in manner almoſt like to the former for the moſt part in all things, in the round ſpokie tufts or vmbels, bearing ſtiffe and faire white floures in ſhape like them of Cinkefoile; in ſmell like *Sambucus* or Elder. When the floure is vaded, there commeth in place a yellow guttered ſeed, of a ſpicie and very hot taſte. The root is thicke, and blacke without, which rotteth and periſheth in the ground (as wee may

may ſee in many gummie or Ferulous plants) after it hath ſeeded, neither will it floure before the ſecond or third yeare after it is ſowne. ‡ I am ignorant what our Author means by this deſcription. ‡

‡ 3 *Seſeli Creticum maius.*
Mountaine Seſelios.

‡ 4 *Seſeli Maſſilienſe.*
Seſelios of *Marſeilles.*

4 There is likewiſe a kinde of *Seſeli* called *Seſeli Maſſilienſe*, which hath leaues very much cloued or cut, and finely iagged, very much like vnto the leaues of ſweet Fennell, greater and thicker than the common Fennell. The ſtalke groweth to the height of three cubits, hauing knotty ioints, as it were knees; bearing at the top thereof tufts like vnto Dill, and ſeed ſomewhat long and cornered, of a ſharpe and biting taſte. The root is long and thicke like vnto great Saxifrage, of a pleaſant ſmell, and ſharpe in taſte.

There is another *Seſeli* of Maſſilia, which hath large and great leaues like vnto Ferula, and not much vnlike *Siler Montanum*: among which riſe vp ſtalkes foure cubits high, bearing at the tops ſpokie tufts like vnto the laſt before rehearſed, of a good ſauour. The root is like vnto the former in ſhape, ſubſtance, and ſauour, but that it is greater.

¶ *The Place.*

Theſe plants are ſtrangers in England, notwithſtanding I haue them in my garden.

¶ *The Time.*

They floure and flouriſh in September.

¶ *The Names.*

Their names haue been touched in their ſeuerall deſcriptions.

¶ *The Temperature and Vertues.*

It prouoketh vrine, and helpeth the ſtrangurie, bringeth downe the ſickneſſe and dead birth: it A helpeth the cough and ſhortneſſe of breath, the ſuffocation of the mother, and helpeth the falling ſickneſſe.

The ſeed drunke with wine concocteth raw humours, taketh away the griping and torments of B the belly, and helpeth the ague, as *Dioſcorides* ſaith.

The iuice of the leaues is giuen to Goats and other cattell to drinke, that they may the ſooner C be deliuered of their young ones, as the ſame Author reporteth.

Chap. 425. *Of Spignell, Spicknell, or Mewe.*

¶ *The Deſcription.*

1 Spignell hath ſtalkes riſing vp to the height of a cubit and a halfe, beſet with leaues reſembling Fennell or Dill, but thicker, more buſhie, and more finely iagged; and at the top of the ſtalkes do grow ſpokie tufts like vnto Dil. The roots are thick, and full of an oleous ſubſtance, ſmelling well, and chafing or heating the tongue, of a reaſonable good ſauour.

1 *Meum.*
Spignell.

‡ 2 *Meum alterum Italicum.*
Italian Spignell.

2 There is a baſtard kinde of Spignell like vnto the former, ſauing that the leaues are not ſo finely cut or iagged: the floures are tufted more thicker than the former: the roots are many, thick, and full of ſap.

¶ *The Place.*

Mew, or Meon groweth in Weſtmerland, at a place called Round-twhat betwixt Aplebie and Kendall, in the pariſh of Orton.

Baſtard Mewe, or *Meum*, groweth in the waſte mountaines of Italie, and the Alps, and (as it hath been told me) vpon Saint Vincents rocke by Briſtow, where I ſpent two daies to ſeeke it, but it was not my hap to find it, therefore I make ſome doubt of the truth thereof.

¶ *The Time.*

Theſe herbes doe floure in Iune and Iuly, and yeeld their ſeed in Auguſt.

¶ *The Names.*

It is called of the Grecians μάων or μᾶον: likewiſe of the Latines, *Meum*: of the Italians, *Meo*: in Apulia, as *Matthiolus* declareth, it is called *Imperatrix*: in diuers places of Spaine, *Siſtra*: in others, *Pinello*: in High Dutch **Beerewurtz**: in French, *Siſtre*: *Ruellius* ſaith that it is named in France *Anethum tortuoſum*, and *ſylueſtre*, or writhed Dil, and wilde Dill: alſo it is called in Engliſh, Spignel, or Spicknell, of ſome Mew, and Bearewoort.

The ſecond may be called baſtard Spicknell.

¶ *The*

¶ *The Temperature.*

Theſe herbes, eſpecially the roots of right Meon, is hot in the third degree, and drie in the ſecond.

¶ *The Vertues.*

The roots of Meon, boiled in water and drunke, mightily open the ſtoppings of the kidnies and bladder, prouoke vrine and bodily luſt, eaſe and helpe the ſtrangurie, and conſume all windineſſe and belchings of the ſtomacke. A

The ſame taken with honie doth appeaſe the griefe of the belly, and is exceeding good againſt all Catarrhes, rheumes, and aches of the iointes, as alſo any phlegme which falls vpon the Lungs. B

If the ſame be laied plaiſterwiſe vpon the bellies of children, it maketh them to piſſe well. C

They clenſe the entrails, and deliuer them of obſtructions or ſtoppings: they prouoke vrine, driue forth the ſtone, and bring downe the floures: but if they be taken more than is requiſite, they cauſe the head-ache; for ſeeing they haue in them more heat than drineſſe, they carry to the head raw moiſture and windie heat, as *Galen* ſaith. D

Chap. 426. *Of Horeſtrange, or Sulphurwoort.*

¶ *The Deſcription.*

1 Svlphurwoort or Hogs-fennell hath a ſtiffe and hard ſtalke full of knees or knots, beſet with leaues like vnto Fennell, but greater, comming neerer vnto Ferula, or rather like the leaues of wilde Pine-tree, and at the top of the ſtalkes round ſpokie tufts full of little yellow floures, which do turne into broad browne ſeed. The root is thicke and long: I haue digged vp roots thereof as big as a mans thigh, blacke without, and white within, of a ſtrong and grieuous ſmell, and full of yellow ſap or liquour, which quickly waxeth hard or dry, ſmelling not much vnlike brimſtone, called *Sulphur*; which hath induced ſome to call it Sulphurwoort, hauing alſo at the top toward the vpper face of the earth, a certain buſh of haire, of a browne colour, among which the leaues and ſtalkes do ſpring forth.

2 The ſecond kinde of *Peucedanum* or Hogs-fennell is very like vnto the former, ſauing that the leaues be like Ferula: the roots are nothing ſo great as the former, but all the reſt of the plant doth far exceed the other in greatneſſe.

3 There is another kinde of *Peucedanum* or Hogs Fennell, which *Pena* found vpon Saint Vincents rock by Briſtow, whoſe picture he hath ſet forth in his *Aduerſaria*, which that famous Engliſh Phyſition of late memorie, D. *Turner* found there alſo, ſuppoſing it to be the right and true *Peucedanum*, whereof no doubt it is a kinde: it groweth not aboue a foot high, and is in ſhape and leaues like the right *Peucedanum*, but they be ſhorter and leſſer, growing ſomwhat like the writhed Fennell of Maſſilia, but the branches are more largely writhed, and the leaues are of the colour of the branches, which are of a pale greene colour. At the top of the branches grow ſmall white tufts, hauing ſeed like Dill, but ſhorter and ſlenderer, of a good taſte, ſomewhat ſharpe. The root is thicker than the ſmalneſſe of the herbe will well beare. Among the people about Briſtow, and the rocke aforeſaid, this hath been thought good to eat.

‡ The figure of this our Authour formerly gaue (yet vnfitly, it not agreeing with that deſcription) for *Oreoſelinum*: it may be he thought it the ſame with that of *Dodon.* his deſcription, becauſe he found it vnder the ſame title in *Tabernamontanus*. This is the *Selinum montanum pumilum* of *Cluſius*; and the *Peucedani facie puſilla planta* of *Pena* and *Lobel*; wherfore *Bauhine* was miſtaken in his *Pinax*, whereas he refers that of *Lobel* to his third *Peucedanum*: the root of this is black without, and white within, but ſhort, yet at the top about the thickneſſe of ones finger: the leaues are ſmall and green, commonly diuided into fiue parts; and theſe againe ſubdiuided by threes: the ſtalke is ſome ſixe inches or halfe a foot high, diuided into ſundry branches, creſted, broad, and at the toppes of the branches, euen when they firſt ſhoot vp, appeare little vmbels of white floures very ſmall, and conſiſting of fiue leaues apiece. The ſeed is blacke, ſhining and round, two being ioined together, as in moſt vmbelliferous plants. It floures in May, and ripens the ſeede in Iuly: I receiued in Iuly 1632, ſome plants of this from Briſtow, by the meanes of my oft mentioned friend Maſter *George Bowles*, who gathered it vpon Saint Vincents Rocke, whereas the Authours of the *Aduerſaria* report it to grow. ‡

1 *Peucedanum.*
Sulphurwoort.

2 *Peucedanum maius.*
Great Sulphurwoort.

‡ 3 *Peucedanum pumilum.*
Dwarfe Hogs-Fennell.

¶ *The Place.*

The first kinde of *Peucedanum* or Hogs Fennell groweth very plentifully on the South side of a wood belonging to Waltham, at the Nase in Essex by the high-way side; also at Whitstable in Kent, in a medow neere to the sea side, sometime belonging to Sir *Henry Crispe*, and adioyning to his house there. It groweth also in great plenty at Feuersham in Kent, neere vnto the hauen vpon the bankes thereof, and in the medowes adioyning.

The second kinde groweth vpon the sea coasts of Montpellier in France, and in the coasts of Italy.

¶ *The Time.*

These plants do floure in Iune, Iuly, and August.

¶ *The Names.*

The Grecians call it πευκέδανος: the Latines in like manner *Peucedanos*, or *Peucedanum*, and also *Pinastellum*: most of the shops, and likewise the common people name it *Fœniculum Porcinum*: of diuers, *Stataria*: of the Prophets, ἀγαθὸν δαίμονα: that is to say, a good Angell or Ghost: in high-Dutch, **Harstrang, Schweffel wurtzel, Sewfenckel**: in Italian and French, *Peucedano*: in Spanish, *Herbatum*: in English, Hore-strange, and Hore-strong, Sow-Fennell, or Hogs Fennell, Sulphur-wort, or Brimstone-wort. It is called *Peucedanum* and *Pinastellum*, of the Greeke and Latine words, πεύκη and *Pinus*.

¶ *The Temperature.*

These herbes, especially the yellow sap of the root, is hot in the second degree, and dry in the beginning of the third.

¶ *The Vertues.*

The yellow sap of the root of Hogs Fennell, or as they call it in some places of England, Hore-strange, taken by it selfe, or with bitter almonds and Rue, is good against the shortnesse of breath, it asswageth the griping paines of the belly, dissolueth and driueth away ventositie or windinesse of the stomacke; it wasteth the swelling of the milt or spleene, looseth the belly gently, and purgeth by siege both flegme and choler. A

The same taken in manner aforesaid prouoketh vrine, easeth the paine of the kidneyes and bladder, causeth easie deliuerance of childe, and expelleth the secondine, or after-birth, and the dead childe. B

The sap or iuyce of the root mixed with oyle of Roses, or Vineger, and applied, easeth the palsie, crampes, contraction or drawing together of sinewes, and all old cold diseases, especially the Sciatica. C

It is vsed with good successe against the rupture or burstings in yong children, and is very good to be applied vnto the nauels of children that stand out ouer much. D

The decoction of the root drunke is of like vertue vnto the iuyce, but not altogether so effectuall against the foresaid diseases. E

The root dried and made into pouder doth mundifie and clense old stinking and corrupt sores and vlcers, and healeth them: it also draweth forth the corrupt and rotten bones that hinder the same from healing, and likewise splinters and other things fixed in the flesh. F

The said pouder or iuyce of the root mixed with oyle of Roses, causeth one to sweat, if the body be anointed therewith, and therefore good to be put into the vnction or ointment for the French disease. G

The congealed liquor tempered with oyle of Roses, and applied to the head after the manner of an ointment, is good for them that haue the Lethargie, that are franticke, that haue dizzinesse in the head, that are troubled with the falling sickenesse, that haue the palsie, that are vexed with conuulsions and crampes, and generally it is a remedie for all infirmities of the sinewes, with Vineger and oyle, as *Dioscorides* teacheth. H

The same being smelt vnto reuiueth and calleth them again that be strangled with the mother, and that lie in a dead sleepe. I

Being taken in a reare egge it helpeth the cough and difficultie of breathing, gripings and windinesse, which, as *Galen* addeth, proceedeth from the grossenesse and clamminesse of humors. K

It purgeth gently, it diminisheth the spleene, by cutting, digesting, and making thin humours that are thicke: it causeth easie trauell, and openeth the matrix. L

A small piece of the root holden in the mouth is a present remedie against the suffocation of the mother. M

CHAP.

Chap. 427.
Of Herbe Ferula, or Fennell Gyant.

¶ *The Kindes.*

Dioſcorides maketh mention of a *Ferula*, out of which is gathered the Gum *Sagapene*; and alſo he declareth, that the Gums *Galbanum* and *Ammoniacum* are liquors of this herb *Ferula*: but what difference there is in the liquors, according to the clymat or countrey where it groweth, he doth not ſet downe; for it may be that out of one kinde of *Ferula* ſundry iuyces may be gathered, that is to ſay, according to the diuerſitie of the countries where they grow, as we haue ſaid: for as in Laſer, the iuyce of Laſerwort that groweth in Cyrene doth differ from that liquor which groweth in Media and Syria; ſo it is likely that the herbe *Ferula* doth bring forth in Media *Sagapenum*, in Cyrene *Ammoniacum*, and in Syria *Galbanum*. *Theophraſtus* ſaith that the herbe *Ferula* is diuided into mo kindes, and he calleth one great, by the name of *Ferula*; and another little, by the name *Ferulago*.

1 *Ferula.*
Fennell Gyant.

‡ 2 *Ferulago.*
Small Fennell-Gyant.

¶ *The Deſcription.*

1 *Ferula*, or Fennell Gyant, hath very great and large leaues of a deepe greene colour, cut and iagged like thoſe of Fennell, ſpreading themſelues abroad like wings: amongſt which riſeth vp a great hollow ſtalke, ſomewhat reddiſh on that ſide which is next vnto the Sun, diuided into certaine ſpaces, with ioynts or knees like thoſe of Hemlocks or Kexes, of the bigneſſe of a mans arme in the wreſt, of the height of foure or fiue cubits where it groweth naturally, as in Italy, Greece, and other hot countries; notwithſtanding it hath attained to the height of fourteene or fifteene foot in my garden, and likewiſe groweth fairer and greater than from whence it came, as it fareth with other plants that come hither from hot regions: as for example our great Artichoke, which firſt was brought out of Italy into England, is become (by reaſon of the great moiſture which our countrey is ſubiect vnto) greater and better than thoſe of Italy; inſomuch

inſomuch that diuers Italians haue ſent for ſome plants of our Artichokes, deeming them to be of another kinde; neuertheleſſe in Italy they are ſmall and dry as they were before. Euen ſo it happeneth to this *Ferula*, as we haue ſaid. This foreſaid ſtalke diuideth it ſelfe toward the top into diuers other ſmaller branches, whereon are ſet the like leaues that grow next the ground, but much leſſer. At the top of the branches at the firſt budding of the floures appeare certaine bundles incloſed in thin skins, like the yolke of an egge, which diuers call *Corculum Ferulæ*, or the little heart of *Ferula*; which being brought to maturitie, open themſelues into a tuft or vmbel like that of Dil, of a yellowiſh colour: after which come the ſeed, in colour and faſhion like thoſe of the Parſnep, but longer and greater, alwaies growing two together, ſo cloſely ioyned, that it cannot be diſcerned to be more than one ſeed vntill they be diuided: the root is very thicke and great, full of a certaine gummie iuyce, that floweth forth, the root being bruiſed, broken, or cut; which being dried or hardned, is that gum which is called *Sagapenum*, and in ſome ſhops *Serapinum*.

‡ 3 *Panax Aſclepium Ferulæ facie.*
Æſculapius his All-heale.

2 There is likewiſe another ſmaller *Ferula* like vnto the former in each reſpect, ſauing that it is altogether leſſe: the root likewiſe being wounded yeeldeth forth a ſap or iuyce, which when it is hardned is called *Galbanum*: of the Aſſyrians, *Metopium*.

I haue likewiſe another ſort ſent mee from Paris, with this title *Ferula nigra*; which proſpereth exceeding well in my garden, but difference I cannot finde any from the former, ſa- that the leaues are of a more blacke or ſwart colour.

‡ 3 I know not where more fitly than in this place to giue you the hiſtorie of that *Ferula* or Ferulaceous plant that *Dodonæus*, *Lobel*, and others haue ſet downe vnder the name of *Panax Aſclepium*. The ſtalke hereof is ſlender, a cubit high, creſted and ioynted, and from theſe ioynts proceed leaues bigger than thoſe of Fennell, and alſo rougher, and of a ſtrong ſmell: at the tops of the branches grow vmbels of yellow floures: the ſeed is flatriſh, like that of the other *Ferula*: the root long, white, and of a ſtrong ſmell. This growes naturally in Iſtria. ‡

¶ *The Place.*

Theſe plants are not growing wilde in England; I haue them all in my garden.

¶ *The Time.*

They floure in Iune and Iuly; they perfect their ſeed in September; not long after, the ſtalke with his leaues periſh: the root remaineth freſh and greene all Winter.

¶ *The Names.*

The firſt is called in Greeke Νάρθηξ: in Latine, *Ferula*: in Italian, *Ferola*: in Spaniſh, *Canaſheia*: in Engliſh, Herbe Ferula, and Fennell Gyant.

¶ *The Temperature.*

Theſe plants with their Gums are hot in the third degree, and dry in the ſecond.

¶ *The Vertues.*

The pith or marrow, called *Corculum Ferulæ*, as *Galen* teacheth, is of an aſtringent or binding qualitie, and therefore good for them that ſpit bloud, and that are troubled with the flix. A

Dioſcorides ſaith, that being put into the noſthrils it ſtayeth bleeding, and is giuen in Wine to thoſe that are bitten with Vipers. B

It is reported to be eaten in Apulia roſted in the embers, firſt wrapped in leaues or in old clouts, with pepper and ſalt; which, as they ſay, is a pleaſant ſweet food, that ſtirreth vp luſt, as they report. C

The ſeed doth heate, and attenuate or make thinne: it is a remedie againſt cold fits of an Ague, by procuring ſweat, being mixed with oyle, and the body anointed therewith. D

A dram of the iuyce of *Ferula* which beareth *Sagapenum*, purgeth by ſiege tough and ſlimie humors, E

mors, and all groſſe flegme and choler, and is alſo good againſt all old and cold diſeaſes which are hard to be cured; it purgeth the brain, and is very good againſt all diſeaſes of the head, againſt
F the Apoplexie and Epilepſie.

Being taken in the ſame manner, it is good againſt crampes, palſies, ſhrinkings and paines of
G the ſinewes.

It is good againſt the ſhortneſſe of breath, the cold and long cough, the paine in the ſide and
H breſt, for it mundifieth and clenſeth the breſt from all cold flegme and rheumaticke humors.

Sagapenum infuſed or ſteeped in vineger all night, and ſpread vpon leather or cloath, ſcattereth, diſſolueth, and driueth away all hard and cold ſwellings, tumors, botches, and hard lumpes growing about the ioynts or elſewhere, and is excellent good to be put into or mingled with all oynt-
I ments or emplaiſters which are made to mollifie or ſoften.

The iuyce of *Ferula Galbanifera*, called *Galbanum*, drunke in wine with a little myrrh, is good againſt all venome or poyſon that hath beene taken inwardly, or ſhot into the body with venomous
K darts, quarrels, or arrowes.

It helps womens paineful trauel, if they do take therof in a cup of wine the quantitie of a bean.
L The perfume of *Galbanum* helpeth women that are grieued with the riſing of the mother, and is good for thoſe that haue the falling ſickneſſe.

M *Galbanum* ſoftneth, mollifieth, and draweth forth thornes, ſplinters, or broken bones, and conſumeth cold and flegmaticke humors, ſeruing in ſundry ointments and emplaiſters for the vſe of Surgerie, and hath the ſame phyſicall vertues that are attributed vnto *Sagapenum*.

Chap. 428. *Of Drop-wort, or Filipendula.*

1 *Filipendula.*
Drop-wort.

2 *Filipendula montana.*
Mountaine Drop-wort.

¶ *The Kindes.*

THere be diuers ſorts of Drop-worts, ſome of the champion or fertill paſtures, ſome of more moiſt and dankiſh grounds, and ſome of the mountaine.

¶ *The*

¶ *The Deſcription.*

1 THe firſt kinde of Filipendula hath leaues growing and ſpred abroad like feathers, each leafe conſiſting of ſundry ſmall leaues dented or ſnipt round about the edges, growing to the ſtalke by a ſmall and ſlender ſtem: theſe leaues reſemble wilde Tanſie or Burnet, but that they be longer and thicker, ſet like feathers, as is aforeſaid: among theſe riſe vp ſtalkes a cubit and a halfe high, at the top whereof grow many faire white floures, each ſmall floure conſiſting of ſix ſlender leaues, like a little ſtar, buſhing together in a tuft like the floures of Medeſweet, of a ſoft ſweet ſmell: the ſeed is ſmall, and groweth together like a button: the roots are ſmall and blacke, whereupon depend many little knops or blacke pellets, much like the roots of the female Peonie, ſauing that they be a great deale ſmaller.

2 The ſecond kinde of Filipendula, called of *Pena* in his Obſeruations, *Oenanthe, ſiue Philipendula altera montana*, is neither at this day very well knowne, neither did the old writers heretofore once write or ſpeake of it: but *Pena* that painefull Herbariſt found it growing naturally in Narbone in France, neere vnto Veganium, on the top of the high hills called *Paradiſus Dei*, and neere vnto the mountaine Calcaris: this rare plant hath many knobby long roots, in ſhape like to *Aſphodelus luteus*, or rather like the roots of *Corruda*, or wilde Aſparagus; from which riſeth vp a ſtalke a foot high, and more, which is thicke, round, and chanelled, beſet full of leaues like thoſe of common Filipendula, but they be not ſo thicke ſet or winged, but more like vnto the leaues of a Thiſtle, conſiſting of ſundry ſmall leaues, in faſhion like to *Coronopus Ruellij*, that is, *Ruellius* his Bucks horne: round about the top of the ſtalke there groweth a very faire tuft of white floures, reſembling fine ſmall hoods, growing cloſe and thicke together like the floures of *Pedicularis*, that is, Red Rattle, called of *Carolus Cluſius*, *Alectorolophos*; whereof he maketh this plant a kinde, but in my iudgement and opinion it is rather like *Cynoſorchis*, a kinde of Satyrion.

3 *Filipendula anguſtifolia.*
Narrow leafed Drop-wort.

† 4 *Filipendula Cicutæ facie.*
Hemlocke Drop-wort.

3 There is another kinde of Filipendula ſet forth vnder the name of *Oenanthe*, that hath many tuberous and thicke roots like thoſe of Drop-wort, but white of colour, and euery one of thoſe knobs hath a certaine ſtring or fibre annexed thereto; from whence ariſeth a creſted ſtalk two foos high,

5 *Filipendula aquatica.*
Water Drop-wort.

high, diuiding it ſelf toward the top into ſundry armes or branches: from the hollow place or boſome of euery ioynt (out of which doe grow thoſe branches) the leaues doe alſo proceed, very much cut or iagged like Fennell: at the top of thoſe branches come forth ſpokie rundles of white floures faſhioned like ſtars.

† 4 The fourth kinde of Filipendula is as ſtrange a plant as the former, eſpecially with vs here in England, except in the waterie places and rilles in the North, where *Paludapium* or water Smallage groweth; whereunto in leaues it is not vnlike, but more like *Ruta pratenſis*: it hath many large branches, a naughty ſauor, and in colour and ſhape like *Cicuta*, that is, Hemlocke. The ſtalkes are more than two cubits high, comming from a root which exceedingly multiplies it ſelfe into bulbes, like *Aſphodelus albus*. The ſmell of this plant is ſtrong and grieuous; the taſte hot and biting, it being full of a iuyce, at firſt milky, but afterwards turning yellow. The ſpoky tuſts or rundles growing at the top are like *Cicuta*, yea, it much reſembleth Hemlocke in propertie and qualities, and ſo doe they affirme that haue proued and ſeene the experience of it: for being eaten in ſallads it did well nigh poyſon thoſe which ate of it, making them giddie in their heads, waxing very pale, ſtaggering and reeling like drunken men. Beware and take good heed of this and ſuch like Simples; for there is no Phyſitian that will giue it, becauſe there be many other excellent good Simples which God hath beſtowed vpon vs from the preuenting and curing of diſeaſes. ‡ Pernitious and not excuſable is the ignorance of ſome of our time, that haue bought and (as one may probably coniecture) vſed the roots of this plant in ſtead of thoſe of Peionie; and I know they are dayly by the ignorant women in Cheape-ſide ſold to people more ignorant than themſelues, by the name of water Louage; *Caueat Emptor*. The danger that may enſue by vſing them may be gathered by that which our Author hath here ſet downe, being taken out of the *Aduerſaria, pag.* 326. ‡

5 The fifth and laſt kinde of Filipendula, which is the fourth according to *Matthiolus* his account, hath leaues like water Smallage, which *Pliny* calleth *Sylaus*, the leaues very much reſembling thoſe of *Lauer Cretenæ*: among which riſeth vp a ſmall ſtalke deepely furrowed or creſted, bearing at the top thereof ſpokie or buſhy rundles of white floures thicke thruſt together. The roots are compact of very many filaments or threds,; among which come forth a few tuberous or knobbie roots like vnto the ſecond.

¶ *The Place and Time.*

The firſt groweth plentifully vpon ſtonie rockes or mountaines, and rough places, and in fertile paſtures. I found great plenty thereof growing in a field adioyning to Sion houſe, ſomtime a Nunnerie, neere London, on the ſide of a medow called Sion Medow.

The ſecond hath been ſufficiently ſpoken of in the deſcription. The third groweth neere vnto brookes and riuers ſides. The fourth groweth betweene the plowed lands in the moiſt and wet furrowes of a field belonging to Batterſey by London. ‡ It alſo groweth in great aboundance in many places by the Thames ſide; as amongſt the oyſters againſt Yorke houſe, a little aboue the Horſe-ferrey, againſt Lambeth, &c. ‡ The fifth groweth neere the ſides of riuers and waterſtreames, eſpecially neere the riuer of Thames or Tems, as in S. Georges fields, and about the Biſhop of Londons houſe at Fulham, and ſuch like places.

They floure from May to the end of Iune.

¶ *The Names.*

They are commonly called *Filipendulæ*. The firſt is called of *Nicolaus Myrepſus, Philipendula*: of ſome, *Saxifragra rubra*, and *Millefolium ſylueſtre*: of *Pliny*, *Molon*: in Italian and Spaniſh, *Filipendula*: in Engliſh, Filipendula and Drop-wort. Water Filipendula is called *Filipendula aquatica*, *Oenanthe aquatica*, and *Silaus Plinij*.

The

The fourth, whoſe leaues are like to Homlocks, is as ſome thinke called of *Cordus*, *Oiſenichium*: in Engliſh Homlocke Filipendula.

¶ *The Nature.*

These kindes of Filipendula are hot and dry in the third degree, opening and clenſing, and yet with a little aſtriction or binding. All the kindes of Oenanthes haue the ſame facultie, except the fourth, whoſe pernitious facultie we haue formerly touched.

¶ *The Vertues.*

The root of common Filipendula boiled in wine and drunken, is good againſt all paines of A the bladder, cauſeth one to make water, and breaketh the ſtone. The like *Dioſcorides* hath written of Oenanthe; the root, ſaith he, is good for them that piſſe by drops.

The powder of the roots of Filipendula often vſed in meate, will preſerue a man from the fal- B ling ſickeneſſe.

‡ ‡ The figures that were formerly in the fourth and fifth places, were both of the plant deſcribed in the fifth place. I haue giuen you in the fourth place the figure which *Lobel* and others haue giuen for the plant there deſcribed, but it is not well expreſt, for the leaues are large like thoſe of Smallage, the ſtalke, branches and vmbells very large, and like thoſe of Hemlocke, but rather bigger.

Chap. 429. *Of Homlocks, or herbe Bennet.*

¶ *The Deſcription.*

1 THe firſt kinde of Hemlocke hath a long ſtalke, fiue or ſix foot high, great and hollow, full of joints like the ſtalkes of Fennell, of an herby colour; poudered with ſmall red ſpots, almoſt like the ſtems of Dragons. The leaues are great, thicke, and ſmall cut or jagged like the leaues of Cheruill, but much greater, and of a very ſtrong and vnpleaſant ſauor. The floures are white, growing by tufts or ſpokie tops, which do change and turne into a white flat ſeed: the root is ſhort, and ſomewhat hollow within.

1 *Cicuta.*
Hemlocks.

2 The Apothecaries in times paſt not knowing the right *Seſeli Peloponnenſe*, haue erroniouſly taken this *Cicuta latifolia* for the ſame. The leaues whereof are broad, thicke, and like vnto *Cicutaria*, yet not the ſame; they called it *Seſeli Peloponnenſe cum folio Cicutæ*, the faculties whereof deny and refute that aſſertion and opinion, yea and the plant it ſelfe, which being touched, yeeldeth or breatheth out a moſt virulent or lothſome ſmell: theſe things ſufficiciently argue, that it is not a kinde of *Seſeli*, beſides the reaſons following: *Seſeli* hath a reaſonable good ſauour in the whole plant, the root is bare and ſingle, without fibres, like a Carrot; but *Cicuta* hath not onely a lothſome ſmell, but his roots are great, thicke, and knobby, like the roots of *Myrrhis*: the whole plant doth in a manner reſemble the leaues, ſtalkes and floures of *Myrrhis odorata*, whoſe ſmall white floures doe turne into long and crooked ſeeds, growing at the top of the branches three cubits high.

‡ 3 This in leaues, ſtalkes, and roots is larger than the laſt deſcribed, the ſtalkes equalling or exceeding the height of a man; the ſmell is ſtrange and greiuous, and in all the parts thereof it is like to the other plants of this kinde. *Lobel* figures it by the name of *Cicutaria maxima Brancionis*, and queſtions whither it be not *Thapſia tertia Salamanticenſium* of *Cluſius*; but *Cluſius* denies it ſo to be. ‡

2 *Cicuta latifolia fœtidiſſima.*
Broad leafed ſtinking Hemlocks.

‡ 3 *Cicuta latifolia altera.*
Gyant Hemlocke.

¶ *The Place.*

Common Hemlocke groweth plentifully about towne walls and villages in ſhadowie places, and fat ſoiles neere ditches.

The ſecond groweth vpon mountaines and deſart places, and is a ſtranger in England; yet I haue plants thereof in my garden.

¶ *The Time.*

They flouriſh and ſeed in September.

¶ *The Names.*

Homlocke is called in Greeke κώνειον: in Latine, *Cicuta*: in high Dutch, **Schirling:** in low Dutch, **Scheerlinck:** in Spaniſh, *Cegutay Canaheia.* in French, *Cigue* in Engliſh, Hemlocke, Homlocke, Kexe, and herbe Bennet.

The ſecond is called *Cicuta latifolia*, and *Cicutaria latifolia*, and *Seſeli Peloponnenſe quorundam*: in Engliſh, great Hemlockes, and garden Homlocke.

¶ *The Temperature.*

Galen ſaith, that Homlocke is extreme cold in operation, euen in the fourth degree of coldneſſe.

¶ *The*

¶ *The Vertues.*

It is therefore a very rash part to lay the leaues of Hemlocke to the ſtones of yong boyes or vir- A
gins breſts, and by that meanes to keepe thoſe parts from growing great; for it doth not only eas-
ily cauſe thoſe members to pine away, but alſo hurteth the heart and liuer, being outwardly ap-
ied: then muſt it of neceſſitie hurt more being inwardly taken; for it is one of the deadly poyſons
which killeth by his cold qualitie, as *Dioſcorides* writeth, ſaying, Hemlocke is a very euill, dange-
rous, hurtfull, and poyſonous herbe, inſomuch that whoſoeuer taketh of it into his body dieth re-
medileſſe, except the party drinke ſome wine that is naturally hot, before the venome haue taken
the heart, as *Pliny* ſaith: but being drunke with wine the poyſon is with greater ſpeed carried to the
heart, by reaſon whereof it killeth preſently; therefore not to be applied outwardly, much leſſe ta-
ken inwardly into the body.

The great Hemlocke doubtleſſe is not poſſeſſed with any one good facultie, as appeareth by his B
lothſome ſmell, and other apparant ſignes, and therefore not to be vſed in phyſicke.

Chap. 430. *Of wilde and water Hemlockes.*

¶ *The Deſcription.*

† 1 THis wilde kinde of Hemlocke hath a ſmall tough white root, from which ariſe vp diuers ſtiffe ſtalkes, hollow, ſomewhat reddiſh toward the Sun, ioynted or kneed at certaine diſtances: from which ioynts ſpring forth long leaues very greene, and finely minced or iagged like the common Cheruill or Parſley: the floures ſtand at the tops of the ſtalks in ſmall ſpokie vmbels, with little longiſh greene leaues about them: the ſeed followeth, like thoſe of Hemlocke, or as they grow together on the tops of the ſtalks they reſemble Coriander ſeeds, but leſſer: the whole plant is of a naughty ſmell.

† 1 *Cicutaria tenuifolia.*
Thin leafed wilde Hemlocke.

2 *Cicutaria paluſtris.*
Wilde water Hemlocke.

2 Water Hemlock, which *Lobel* calleth *Cicutaria paluſtris*: *Cluſius* and *Dodonæus*, *Phellandrium*, riſeth vp with a thicke fat and empty hollow ſtalke, full of knees or ioynts, creſted, chamfered, or

furrowed, of a yellowiſh greene colour: the leaues ſhoot forth of the ioynts and branches, like vnto wilde Hemlocke, but much thicker, fatter, and oileous, very finely cut or iagged, almoſt like thoſe of the ſmalleſt *Viſnaga*, or Spaniſh Tooth-pickes: the floures ſtand at the top of the ſtalkes in ſmall whitiſh tufts: the ſeed followeth, blackiſh, of the bigneſſe of Aniſe ſeed, and of a ſweet ſauour: the root is thicke and long, within the water, very ſoft and tender, with very many ſtrings faſtned thereto.

¶ *The Place.*

1 This growes among ſtones and rubbiſh, by the walls of cities and towns almoſt euery where.

The other groweth in the midſt of water ditches and ſtanding pooles and ponds, in moſt places of England: it groweth very plentifully in the ditches by a cauſey, as you goe from Redriffe to Detford neere London, and in many other places.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt.

¶ *The Names.*

‡ 1 This is *Petroſelini vitium* of *Tragus*; and *Dauci inutilis genus* of *Geſner*: *Thalius* calls it *Apium cicutarium*: *Lobel*, *Cicutaria fatua*: *Tabernamontanus*, *Petroſelinum caninum*; which name we may fitly make Engliſh, and call it Dogs-parſley.

2 This is *Liguſticum ſyl.* & *Fœniculum ſyl.* of *Tragus*: *Cicutaria paluſtris* of *Lobel* and others: *Dodonæus* thinkes it *Plinies Phellandrion*; and *Cæſalpinus* iudges it his *Silaus*. ‡

¶ *The Temperature and Vertues.*

Their temperature and faculties are anſwerable to the common Hemlocke, which haue no vſe in phyſicke, as we haue ſaid.

† The figure formerly in the firſt place was of *Myrrhis*; the deſcription I thinke was intended, yet not throughly agreeing with this I here giue you, wherefore I haue a little altered it.

Chap. 431.

Of Earth-nut, Earth Cheſt-nut, or Kipper-nut.

† 1 *Bulbocaſtanon minus.*
Small Earth-nut.

2 *Bulbocaſtanon maius.*
Great Earth-nut.

¶ *The Deſcription.*

1 EArth-nut or Kipper-nut, called after *Lobelius*, *Nucula terreſtris*, hath ſmall euen creſted ſtalkes a foot or ſomewhat more high: whereon do grow next the ground leaues like thoſe of Parſley, and thoſe that doe grow higher like vnto thoſe of Dill; the white floures doe ſtand on the top of the ſtalkes in ſpokie rundles, like the tops of Dill, which turne into ſmall ſeed, growing together by couples, of a very good ſmell, not vnlike to thoſe of Fennell, but much ſmaller: the root is round, knobbed, with certaine eminences or bunchings out; browne without, white within, of a firme and ſollid ſubſtance, and of a taſte like the Cheſſe-nut or Cheſt-nut, whereof it tooke his name.

2 There is alſo another Earth-nut that hath ſtalkes a foot high, whereon doe grow iagged leaues like thoſe of Engliſh Saxifrage, of a bright greene colour: the floures grow at the top of the branches, in ſmall ſpokie tufts conſiſting of little white floures: the root is like the other, bulbous faſhion, with ſome few ſtrings hanging at the bottome, of a good and pleaſant taſte. ‡ This differs from the former, in that the leaues are larger and greener: the root alſo is not ſo far within the ground, and it alſo ſends forth ſome leaues from the bulbe it ſelfe; whereas our common kind hath only the end of a ſmall root that carries the ſtem and leaues vpon it, faſtned vnto it as you ſee it expreſt in the former figure. ‡

¶ *The Place.*

Theſe herbes do grow in paſtures and corne fields almoſt euery where: there is a field adioining to High-gate, on the right ſide of the middle of the village, couered ouer with the ſame; and likewiſe in the next field vnto the conduit heads by Maribone, neere the way that leadeth to Paddington by London, and in diuers other places. ‡ I haue not yet obſerued the ſecond to grow wilde with vs. ‡

¶ *The Time.*

They floure in Iune and Iuly: the ſeed commeth to perfection afterward.

¶ *The Names.*

Alexander Trallianus hath made mention of Βάλανοκάστανον, *Lib.* 7. reckoning it vp among th oſe kinds of meate or ſuſtenances which be good for ſuch as haue rotten lungs: of ſome it is called *Agriocaſtanon*.

Guinterius thought the word was corrupted, and that *Balanocaſtanon* ſhould be read: but this is as ſtrange a word as *Bolbocaſtanon*, which was deriued of the forme of a bulbe, and the taſt of a Cheſt-nut: of ſome, *Nucula terreſtris*, or the little Earth-nut: it is thought to be *Bunium Dioſcoridis* of ſome; but we thinke not ſo: of Dr. *Turner*, *Apios*; yet there is another *Apios*, being a kinde of *Tithymale*: of *Matthiolus*, *Oenanthe*, making it a kinde of Filipendula: in high-Dutch, **Erdnuſz**: in low-Dutch, **Eertnoten**: the people of Sauoy call it *Fauerottes*: in Engliſh, Earth-nuts, Kipper-nuts, and Earth Cheſt-nuts.

¶ *The Temperature.*

The roots of Earth-nuts are moderately hot and dry, and alſo binding: but the ſeed is both hotter and drier.

¶ *The Vertues.*

The ſeed openeth and prouoketh vrine, and ſo doth the root likewiſe. A

The root is good for thoſe that ſpit and piſſe bloud, if the root be eaten raw, or roſted in the embers. B

The Dutch people doe vſe to eate them boyled and buttered, as we doe Parſeneps and Carrots, which ſo eaten comfort the ſtomacke, and yeeld nouriſhment that is good for the bladder and kidneyes. C

There is a plaiſter made of the ſeeds hereof, whereof to write in this place were impertinent to our hiſtorie. D

CHAP. 432. *Of Cumin.*

¶ *The Deſcription.*

THis garden Cumin is a low or baſe herbe of a foot high: the ſtalke diuideth it ſelfe into diuers ſmall branches, whereon doe grow little iagged leaues very finely cut into ſmall parcels, like thoſe of Fennell, but more finely cut, ſhorter and leſſer: the ſpoky tufts grow at the top of the branches and ſtalkes, of a red or purpliſh colour: after which come the ſeed, of a ſtrong or rancke ſmell, and a biting taſte: the root is ſlender, which periſheth when it hath ripened his ſeed.

Cuminum ſativum Dioſcoridis.
Garden Cumin.

¶ *The Place.*

Cumin is husbanded and ſown in Italy and Spain, and is very common in other hot countries, as in Æthiopia, Egypt, Cilicia, and all the leſſer Aſia.

It delights to grow eſpecially in putrified and hot ſoiles: I haue proued the ſeeds in my garden, where they haue brought forth ripe ſeed much fairer and greater than any that commeth from beyond the ſeas.

¶ *The Time.*

It is to be ſown in the middle of the ſpring; a ſhewre of raine preſently following doth much hinder the growth thereof, as *Ruellius* ſaith.

My ſelfe did ſow it in the midſt of May, which ſprung vp in ſix days after: and the ſeed was ripe in the end of Iuly.

¶ *The Names.*

It is called in Greeke κῶμινον ἥμερον, that is, tame or garden Cumin, that it may differ from the wilde ones: it is named in Latine *Cuminum*: in ſhops, *Cyminum*: in high-Dutch, **Roomiſche kymmel**: in Italian, *Comino*: in Spaniſh, *Cominchos*: in French, *Comin*: in Engliſh, Cumin.

¶ *The Temperature.*

The ſeed of garden Cumin, as *Galen* ſaith, is hot and dry in the third degree: *Dioſcorides* ſaith that it hath in it alſo a binding qualitie.

¶ *The Vertues.*

A The ſeed of Cumin ſcattereth and breaketh all the windineſſe of the ſtomacke, belly, guts, and matrix: it is good againſt the griping torments, gnawing or fretting of the belly, not onely receiued inwardly by the mouth, but alſo in cliſters, and outwardly applied to the belly with wine and barley meale boyled together to the forme of a pultis.

B Being handled according to art, either in a cataplaſme, pultis, or plaiſter, or boyled in wine and ſo applied, it taketh away blaſtings, ſwellings of the cods or genitors: it conſumeth windie ſwellings in the ioynts, and ſuch like.

C Being taken in a ſupping broth it is good for the cheſt and for cold lungs, and ſuch as are oppreſſed with aboundance of raw humors.

D It ſtancheth bleeding at the noſe, being tempered with vineger and ſmelt vnto.

E Being quilted in a little bag with ſome ſmall quantitie of Bay ſalt, and made hot vpon a bedpan with fire or ſuch like, and ſprinkled with good wine vineger, and applied to the ſide very hot, it taketh away the ſtitch and paines thereof, and eaſeth the pleuriſie very much.

Chap. 433. *Of wilde Cumin.*

¶ *The Kindes.*

There be diuers plants differing very notably one from another in ſhape, and yet all comprehended vnder the title of wilde Cumin.

¶ *The Deſcription.*

1 The wilde Cumin hath ſmall white roots with ſome fibres thereto appendant; from the which ariſe ſundry little iagged leaues, conſiſting of many leſſer leaues, finely dented about the edges, in faſhion like the ſmalleſt leaues of wilde Parſnep: among which ſpringeth vp a ſlender bending ſtalke a foot high, like vnto *Pecten Veneris*, bearing at the top thereof white round

1 *Cuminum ſylueſtre.*
Wilde Cumin.

2 *Cuminum ſiliquoſum.*
Codded wilde Cumin.

3 *Cuminum Corniculatum, ſive Hypecoum Cluſij.*
Horned wild Cumin.

round and hairie buttons or knops, like *Arction*, as *Dioſcorides* hath right well obſerued: within which knoppes is contained a tender downie ſubſtance, among which is the ſeed, like the ſeed of *Dens Leonis*, but much leſſer.

2 The ſecond kinde of Cumin is verie like vnto the foreſaid wilde Cumin, ſaue that it beareth a number of horned or crooked cods, after the manner of *Scorpioides*, but thicker, and leſſe crooked, and the ſeedes within the cods are ſeuerally diſtinct and ſeparated one from another by equall partitions, in ſmall croſſes, yellow of colour, & ſomewhat long: the ſtalkes are little and tender, beſet with leaues much like vnto the ſmall leaues of *Carui*, or *Pecten Veneris:* and at the top of the ſtalks there do grow pretty yellow floures, like thoſe of great Celandine or Rocket, ſauing that they be ſomwhat leſſer.

† 3 The third kinde of Cumin is very like vnto the laſt before mentioned, but the leaues are much greater, more ſlender, & more finely cut or iagged, like the leaues of *Seſeli* of *Maſſylia:* among which riſeth vp a ſtalke a cubit high or ſomewhat more, very ſmooth and whitiſh: at the top whereof ſpring forth fine yellow floures, not like the former, but conſiſting of ſix leaues apiece;

whereof

whereof two are large, and edged with greene on the outſide: the other foure are ſmall ones, and grow two on a ſide betweene the two larger leaues: theſe floures being vaded, there ſucceed crooked cods, greater, and more full of knots or diuiſions than the former, wherein is contained a ſmall and flat yellow ſeed like *Galega*: the root is long, thicke, and ſingle.

¶ *The Place.*

Theſe wilde Cumins do grow in Lycia, and Galatia, a prouince of Aſia, and in Carthage a citie of Spaine; ſeldome ſeene in theſe Northerne parts: notwithſtanding at the impreſſion hereof, the laſt did floure and flouriſh in my garden. ‡ Theſe grow in Prouince in France, and in diuers parts of Spaine. ‡

¶ *The Time.*

They floure in Auguſt, and perfect their ſeed in September.

¶ *The Names.*

Their names haue been touched in their titles in as ample manner as hath been ſet down by any Author.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the garden Cumin; notwithſtanding I cannot reade in any Author of their vſe in Phyſicke.

Chap. 434. *Of Flixweed.*

1 *Sophia Chirurgorum.*
Flixweed.

¶ *The Deſcription.*

1 Flixweed hath round and hard ſtalks, a cubit & a halfe high, wheron do grow leaues moſt finely cut and diuided into innumerable fine iags, like thoſe of the ſea Wormewood called *Seriphium*, or *Abſinthium tenuifolium*, but much finer and ſmaller, drawing neere vnto the ſmalleſt leaues of Corianders, of an ouerworne greene colour: the floures grow alongſt the tops of the ſpriggie branches, of a dark yellow colour: after which come long cods full of ſmall red ſeeds: the root is long, ſtraight, and of a wooddie ſubſtance.

2 The ſecond ſort differeth not from the precedent, ſauing that the leaues of this plant are broader, wherein eſpecially conſiſteth the difference; notwithſtanding in mine opinion *Tabernamontanus* found this ſecond ſort growing in ſome fertill place, whereby the leaues did grow broader and greater, which moued him to make of this a ſecond ſort, whereas in truth they are both but one and the ſelfe ſame plant.

¶ *The Place.*

This Flixeweede groweth in moſt places of England, almoſt euery where in the ruins of old buildings, by high waies, and in filthie obſcure baſe places.

¶ *The Time.*

It floureth and ſeedeth from Iune to the end of September.

¶ *The Names.*

Flixweed is called *Thalictrum*; and of ſome, *Thalictrum*, but vnproperly; for *Thalictrum* belongeth to Engliſh Rubarbe: the Paracelſians do vaunt and brag very much of an herbe called *Sophia*, adding thereto the ſurname *Paracelſi*, wherewith they imagine to do wonders, whether this be the ſame plant it is diſputable, the controuerſie not as yet decided; neuertheleſſe we muſt be content

to

to accept of this for the true *Sophia*, vntil ſome diſciple or other of his do ſhew or ſet forth the plant wherewith their maſter *Paracelſus*, did ſuch great matters: in Engliſh we call it Flixweed, of his facultie againſt the flix.

¶ *The Temperature.*

Sophia drieth without any manifeſt ſharpeneſſe or heate.

¶ *The Vertues.*

The ſeed of *Sophia* or Flixweed drunke with wine, or Smithes water, ſtoppeth the bloudy flix, the A laske, and all other iſſues of bloud.

The herbe bruiſed or put into vnguents, cloſeth and healeth vlcers, or old ſores and wounds, as B *Paracelſus* ſaith, and that becauſe it drieth without acrimonie or ſharpneſſe.

Chap. 435. *Of the great Celandine, or Swallow-woort.*

¶ *The Deſcription.*

1 THe great Celandine hath a tender brittle ſtalke, round, hairie, and full of branches, each whereof hath diuers knees or knottie ioints, ſet with leaues not vnlike to thoſe of Columbine, but tenderer and deeper cut or iagged, of a grayiſh greene vnder, and greene on the other ſide tending to blewneſſe: the floures do grow at the top of the ſtalkes, of a gold yellow colour, in ſhape like thoſe of the Wall-floure: after which come long cods, full of bleake or pale ſeeds: the whole plant is of a ſtrong ſmell, nothing pleaſant, and yeeldeth a thicke iuice of a milkie ſubſtance, of the colour of Saffron: the root is thicke and knobbie, with ſome threds annexed thereto, which being broken or bruiſed, yeeldeth a ſap or iuice of the colour of gold.

1 *Chelidonium maius.*
Great Celandine.

‡ 2 *Chelidonium maius folio magis diſſecto.*
Great Celandine with more cut leaues.

‡ 2 This other doth not in forme and magnitude differ from the former, but in the leaues, which are finelier cut and iagged, and ſomewhat in their ſhape reſemble an Oken leafe: the floures

alſo

alſo are a little iagged or cut about the edges: and in theſe two particulars conſiſts the whole difference. *Cluſius* calls it *Chelidonium maius laciniato flore*; and *Bauhine*, *Chelidonium maius foliis quernis*. ‡

¶ *The Place.*

It groweth in vntilled places, by common way ſides, among briers and brambles, about old wals, and in the ſhade, rather than in the Sun.

¶ *The Time.*

It is greene all the yeare, it floureth from Aprill to a good part of Sommer, the coddes are perfected in the meane time.

¶ *The Names.*

It is called in Greeke χελιδόνιον: in Latine, *Chelidonium maius*, and *Hirundinaria maior*: amongſt the Apothecaries, *Chelidonia*: diuers miſcall it by the name *Celidonium*: it is named in Italian, *Celidonia*: in Spaniſh *Celidubenha*, *Yerua de las golundrinhas*: in high Dutch, **Groſz Schoduttz**: in low Dutch **Stinkende Goutwe**: in French, *Eſclere*, or *Eſclayre*, and *Celidoine*: in Engliſh, Celandine, or great Celandine, Swallow-woort, and Tetterwoort.

It is called Celandine, not becauſe it then firſt ſpringeth at the comming in of the Swallows, or dieth when they goe away: for as we haue ſaid, it may be found all the yeare, but becauſe ſome hold opinion, that with this herbe the dammes reſtore ſight to their young ones when their eies be out: the which things are vaine and falſe; for *Cornelius Celſus* in his ſixth booke doth witneſſe, that when the ſight of the eies of diuers young birds be put forth by ſome outward meanes, it will after a time be reſtored of it ſelfe, and ſooneſt of all the ſight of the Swallow, whereupon (as the ſame Author ſaith) that the tale or fable grew, how thorow an herbe the dams reſtore that thing, which healeth of it ſelfe: the very ſame doth *Ariſtotle* alledge in the ſixt booke of the hiſtorie of Liuing creatures: [The eies of Swallowes (ſaith he) that are not fledge, if a man do pricke them out, do grow againe, and afterwards do perfectly recouer their ſight.]

¶ *The Temperature.*

The great Celandine is manifeſtly hot and drie, and that in the third degree, and withall ſcoures and clenſeth effectually.

¶ *The Vertues.*

A The iuice of the herbe is good to ſharpen the ſight, for it clenſeth and conſumeth away ſlimie things that cleaue about the ball of the eie, and hinder the ſight, and eſpecially being boiled with honie in a braſen veſſell, as *Dioſcorides* teacheth.

B The root cureth the yellow iaundiſe, which commeth of the ſtopping of the gall, eſpecially when there is no ague adioined with it, for it openeth and deliuereth the gall and liuer from ſtoppings.

C The root being chewed, is reported to be good againſt the tooth-ache.

D The iuice muſt be drawn forth in the beginning of Sommer, and dried in the Sunne, ſaith *Dioſcorides*.

E The root of Celandine boiled with Anniſe-ſeed in white wine, openeth the ſtoppings of the liuer, and cureth the iaundies very ſafely, as hath been often proued.

F The root cut in ſmall pieces is good to be giuen vnto Haukes againſt ſundry diſeaſes, whereunto they are ſubiect, as wormes, craie, and ſuch like.

G ‡ I haue by experience found (ſaith *Cluſius*) that the iuice of the great Celandine dropped into ſmall greene wounds of what ſort ſoeuer, wonderfully cures them. ‡

Chap. 436. *Of Coxcombe, or Yellow Rattle.*

¶ *The Deſcription.*

Criſta Galli, or *Criſta Gallinacea*, hath a ſtraight vpright ſtalke, ſet about with narrow leaues, ſnipt round about the edges: the floures grow at the top of the ſtems, of a yellow colour; after which come vp little flat pouches or purſes, couered ouer or contained within a little bladder, or flat skin, open before like the mouth of a fiſh, wherein is contained flat yellowiſh ſeed, which being ripe and drie, will make a noiſe or ratling when it is ſhaken or moued, of which propertie it tooke the name yellow Rattle.

¶ *The*

Criſta Galli.
Yellow Rattle, or Coxcombe.

Pedicularis.
Louſewoort, or red Rattle.

¶ *The Place.*

It groweth in drie medowes and paſtures, and is to them a great annoiance.

¶ *The Time.*

It floureth moſt part of the Sommer.

¶ *The Names.*

It is called in low Dutch **Ratelen**, and **Geele Ratelen**: commonly in Latine, *Criſta Galli*, and *Gallinacea Criſta*: in Engliſh, Coxcombe, Penie graſſe, yellow or white Rattle: in High Dutch it is called **geel Rodel**: in French *Creſte de Coc*: diuers take it to be the old writers *Alectorolophos*. ‡ Some thinke it to be the *Mimmulus*: or as others (& that more fitly) reade it, *Nummulus*, mentioned by *Pliny*, *lib.* 18. *cap.* 28. ‡

¶ *The Temperature and Vertues.*

But what temperature or vertue this herbe is of, men haue not as yet beene carefull to know, ſeeing it is accounted vnprofitable. A

CHAP. 437. *Of red Rattle, or Louſewoort.*

¶ *The Deſcription.*

RED Rattle (of *Dodonæus* called *Fiſtularia*, and according to the opinion & cenſure of *Carolus Cluſius*, *Pena* & others, the true *Alectorolophos*) hath very ſmall, rent, or iagged leaues, of a browne red colour, and weake, ſmall and tender ſtalkes, whereof ſome lie along trailing vpon the ground; within very mooriſh medowes they grow a cubit high and more, but in moiſt and wet heathes, and ſuch like barren grounds not aboue an handful high: the floures grow round about the ſtalke, from the middeſt thereof euen to the top, and are of a brown red colour, in ſhape like the floures of dead Nettle: which being paſt, there ſucceed little flat pouches, wherin is contained flat and blackiſh ſeed, in ſhew very like vnto the former: the root is ſmall, white, and tender.

¶ *The Place.*

It groweth in moiſt and mooriſh medowes, the herbe is not onely vnprofitable, but alſo hurtfull, and an infirmitie of the medowes.

¶ *The Time.*

It is found with his floures and ſtalkes in May and Iune.

¶ *The Names.*

It is called in Greeke [illegible] in High Dutch, **Braun Rodel**: in Latine, *Pedicularis*, of the effect, becauſe it filleth ſheep and other cattel that feed in medowes where this groweth full of lice: diuers of the later Herbariſts call it *Fiſtularia*: of ſome, *Criſta Galli*: and diuers take it to be *Mimmulus herba*: in Engliſh, Rattle-graſſe, Red Rattle-graſſe, and Louſe-woort.

¶ *The*

¶ *The Temperature.*

It is cold and drie and aſtringent.

¶ *The Vertues.*

A It is held to be good for Fiſtulaes and hollow vlcers, and to ſtay the ouermuch flowing of the menſes, or any other flux of bloud, if it be boiled in red wine and drunke.

Chap. 438. *Of Yarrow, or Noſe-bleed.*

¶ *The Deſcription.*

1 Common Yarrow hath very many ſtalkes comming vp a cubit high, round, and ſomewhat hard: about which ſtand long leaues, cut in the ſides ſundry wiſe, and as it were made vp of many ſmall iagged leaues, euery one of which ſeeme to come neere to the ſlender leaues of Coriander: there ſtand at the top tufts or ſpoked rundles: the floures whereof are either white or purple, which being rubbed do yeeld a ſtrong ſmell, but vnpleaſant; the root ſendeth downe many ſtrings.

1 *Milleſolium terreſtre vulgare.*
Common Yarrow.

2 *Milleſolium flore rubro.*
Red floured Yarrow.

2 The ſecond kinde of Milfoile or Yarrow hath ſtalkes, leaues and roots like vnto the former, ſauing that his ſpokie tufts are of an excellent faire red or crimſon colour, and being a little rubbed in the hand, of a reaſonable good ſauour.

¶ *The Place.*

The firſt groweth euery where in drie paſtures and medowes: red Milfoile groweth in a field by Sutton in Kent called Holly-Deane, from whence I brought thoſe plants that do grow in my Garden; but it is not common euery where as the other is.

¶ *The Time.*

They floure from May to the end of October.

¶ *The*

¶ *The Names.*

Yarrow is called of the Latine Herbariſts *Millefolium*: it is *Dioſcorides* his ἀχιλλεία: in Latine, *Achillea*, and *Achillea ſideritis*; which thing he may very plainely ſee that will compare with that deſcription which *Dioſcorides* hath ſet downe: this was found out, ſaith *Pliny* in his 25. booke, chap. 5. by *Achilles*, *Chirons* diſciple, which for that cauſe is named *Achilleios*: of others, *Sideritis*: among vs, *Millefolium*: yet be there other *Sideritides*, and alſo another *Panaces Heracleion*, whereof we will intreat in another place: *Apuleius* ſetteth downe diuers names hereof, ſome of which are alſo found among the baſtard names in *Dioſcorides*: in Latine it is called *Militaris*, *Supercilium Veneris*, *Acram*, or *Acorum ſyluaticum*: of the French-men, *Millefueille*: in high Dutch, **Garben, ſcharffgras**: in low Dutch, **Geruwe**: in Italian, *Millefoglio*: in Spaniſh, *Milhoyas yerua*: in Engliſh, Yarrow, Noſebleed, common Yarrow, red Yarrow, and Milfoile.

¶ *The Temperature.*

Yarrow, as *Galen* ſaith, is not vnlike in temperature to the *Sideritides*, or Iron worts, that is to ſay, clenſing, and meanely cold, but it moſt of all bindeth.

¶ *The Vertues.*

The leaues of Yarrow doe cloſe vp wounds, and keepe them from inflammation, or fiery ſwelling: it ſtancheth bloud in any part of the body, and it is likewiſe put into bathes for women to ſit in: it ſtoppeth the laske, and being drunke it helpeth the bloudy flixe. A

Moſt men ſay that the leaues chewed, and eſpecially greene, are a remedy for the tooth-ache. B

The leaues being put into the noſe, do cauſe it to bleed, and eaſe the paine of the megrim. C

It cureth the inward excorations of the yard of a man, comming by reaſon of pollutions or extreme flowing of the ſeed, although the iſſue do cauſe inflammation and ſwelling of thoſe ſecret parts, and though the ſpermaticke matter do come downe in great quantity, if the juice be injected with a ſyringe, or the decoction. This hath been prooued by a certain friend of mine, ſometimes a Fellow of Kings Colledge in Cambridge, who lightly bruſed the leaues of common Yarrow, with Hogs-greaſe, and applied it warme vnto the priuie parts, and thereby did diuers times helpe himſelfe, and others of his fellowes, when he was a ſtudent and a ſingle man liuing in Cambridge. D

One dram in powder of the herbe giuen in wine, preſently taketh away the paines of the colicke. E

Chap. 439. *Of yellow Yarrow, or Milfoile.*

1 *Millefolium luteum.*
Yellow Yarrow.

† 2 *Achillea, ſiue Millefolium nobile.*
Achilles Yarrow.

¶ *The Deſcription.*

1 YEllow Yarrow is a ſmall plant ſeldome aboue a ſpan high: the ſtalkes whereof are couered with long leaues, very finely cut in the edges like feathers in the wings of little birds: the tufts or ſpokie rundles bring forth yellow floures, of the ſame ſhape and forme of the common Yarrow: the root conſiſteth of threddy ſtrings.

2 Achilles Yarrow, or noble Milfoile, hath a thicke and tough root, with ſtrings faſtened thereto: from which immediately riſe vp diuers ſtalkes, very greene and creſted, whereupon doe grow long leaues compoſed of many ſmall jagges, cut euen to the middle rib: the floures ſtand on the top of the ſtalkes with ſpokie vmbels or tufts, of a whitiſh colour, and pleaſant ſmell.

¶ *The Place.*

Theſe kinds of Yarrow are ſeldome found: they grow in a fat and fruitfull ſoile, and ſometimes in medowes, and are ſtrangers in England.

¶ *The Time.*

They floure from May vntill Auguſt.

¶ *The Names.*

Dioſcorides deſcription doth ſufficiently declare, that this herbe is *Stratiotes Millefolium*: in Greeke, στρατιώτης χιλιόφυλλος: the height of the herbe ſheweth it, the forme of the leaues agree; there is ſome ambiguity or doubt in the colour of the floures, which *Dioſcorides* deſcribeth to be white, as the vulgar copies haue; but *Andreas Lacuna* addeth out of the old booke, of a yellow colour: it is named of the later age, *Millefolium minus*, or little Yarrow, and *Millefolium luteum*, yellow Yarrow, or Noſe-bleede: the Apothecaries and common people know it not.

¶ *The Temperature.*

Yarrow is meanely cold and ſomewhat binding.

¶ *The Vertues.*

A It is a principall herbe for all kinde of bleedings, and to heale vp new and old vlcers and greene wounds: there be ſome, ſaith *Galen*, that vſe it for fiſtulaes.

B This plant *Achillea* is thought to be the very ſame wherewith *Achilles* cured the wounds of his ſouldiers, as before in the former chapter.

† The plant here figured and deſcribed in the ſecond place, was alſo figured and deſcribed formerly in the fifth place of the 209. chapter of this booke, by the title of *Tanacetum minus album*, but the figure of *Lobels* which is put there being ſomewhat imperfect, I thought it not amiſſe here to giue that of *Dodonæus* which is ſomewhat more exquiſite, otherwiſe both the figure and hiſtory might in this place haue been omitted.

Chap. 440. *Of Valerian, or Setwall.*

¶ *The Deſcription.*

1 THe tame or garden Valerian hath his firſt leaues long, broad, ſmooth, green, and vndiuided; and the leaues vpon the ſtalkes greater, longer, and deepely gaſhed on either ſide, like the leaues of the greater Parſnep, but yet leſſer: the ſtalke is aboue a cubit high, ſmooth, and hollow, with certaine joints farre diſtant one from another: out of which joints grow forth a couple of leaues, and in the tops of the ſtalkes vpon ſpokie rundles ſtand floures heaped together, which are ſmall, opening themſelues out of a long little narrow necke, of colour whitiſh, and ſometimes withall of a light red: the root is an inch thicke, growing aſlope, faſtned on the vpper part of the earth by a multitude of ſtrings, the moſt part of it ſtanding out of the ground, of a pleaſant ſweet ſmell when it is broken.

2 The greater wilde Valerian hath leaues diuided and jagged, as thoſe of the former; thoſe about the ſtalke hereof are alſo ſmooth, hollow, and jointed, and aboue a cubit high: the floures ſtand on ſpokie rundles like to thoſe of the former, but of a light purple colour: the roots are ſlender, and full of ſtrings and ſmall threds, not altogether without ſmell.

3 The other wilde one is much like in forme to the garden Valerian, but farre leſſer: the firſt leaues thereof be vndiuided, the other are parted and cut in ſunder: the ſtalkes a ſpan long: the floures which ſtand on ſpokie rundles are like to thoſe of the others, of a light whitiſh purple colour: the roots be ſlender, growing aſlope, creeping, and full of fine ſmall threds, of little ſmell.

4 There is a ſmall Valerian growing vpon rockes and ſtony places, that is like vnto the laſt deſcribed, ſauing it is altogether leſſe. ‡ The ſtalk is ſome halfe foot high, and ſtrait, diuiding it ſelfe into branches toward the top, and that alwaies by couples: the bottome leaues are whole, the top

leaues

1 *Valeriana hortenſis.*
Garden Valerian, or Setwall.

2 *Valeriana maior ſylueſtris.*
Great wilde Valerian.

3 *Valeriana minor.*
Small Valerian.

4 *Valeriana Petræa.*
Stone Valerian.

leaues much diuided, the floures are ſmall, of a whitiſh purple colour, parted into fiue, and ſtanding vpon round rough heads, which when the floures are falne, become ſtar-faſhioned, diuided into ſix parts: it floures in Iune, and is an annuall plant. ‡

5 *Valeriana Græca.*
Greekiſh Valerian.

‡ 6 *Valeriana Mexicana.*
Indian Valerian.

5 The fifth ſort of Valerian hath diuers ſmall hollow ſtalkes, a foot high and ſomewhat more, garniſhed with leaues like vnto thoſe that do grow on the vpper part of the ſtalks of common Valerian, but ſmaller, cut or iagged almoſt to the middle rib: at the top of the ſtalkes doe grow the floures cluſtering together, of a blew colour, conſiſting of fiue leaues apiece, hauing in the middle thereof ſmall white threds tipped with yellow: the ſeed is ſmall, growing in little huskes or ſeed veſſels: the root is nothing elſe but as it were all of threds.

6 I haue another ſort of Valerian (the ſeed whereof was ſent me from that reuerend Phyſition *Bernard Paludane*, vnder the title of *Valeriana Mexicana:*) hauing ſmall tender ſtalkes trailing vpon the ground, very weake and brittle: whereupon doe grow ſmooth greeniſh leaues like thoſe of Corne Sallade (which wee haue ſet forth amongſt the Lettuce, vnder the title *Lactuca Agnina*, or Lambs Lettuce:) among the leaues come forth the floures cluſtering together, like vnto the great Valerian in forme, but of a deepe purple colour: the root is very ſmall and threddie, which periſheth with the reſt of the plant, when it hath brought his ſeed to maturitie or ripeneſſe, and muſt bee ſowne anew the next yeare in May, and not before.

7 There is alſo another ſort or kinde of Valerian called by the name *Phyteuma*, of the learned Phyſitions of Montpelier and others (ſet forth vnder the ſtocke or kindred of the Valerians, reſembling the aforeſaid Corn-ſallad, which is called of ſome *Prolifera*, from the Greeke title *Phyteuma*; as if you ſhould ſay, good to make conception, and to procure loue:) the loweſt leaues are like thoſe of the ſmall Valerian, of a yellowiſh colour: the vpper leaues become more iagged: the ſtalks are an handfull high: on the tops whereof do ſtand ſmall round ſpokie tufts of white floures; which being paſt, the ſeeds appeare like ſmall round pearles, which being ripe, grow to be ſomewhat flat, hauing in the middle of each ſeed the print of an hole, as it were grauen or bored therein. The root is ſmall and ſingle, with ſome fibres annexed thereto.

‡ 8 This ſends forth from a white and wooddie root many leaues ſpred vpon the ground; green,

and

‡ 8 *Valeriana annua, Cluſ.*
Annuall Valerian.

‡ 9 *Valeriana Alpina latifolia.*
Broad leaued Setwall of the Alps

‡ 10 *Valeriana Alpina anguſtifolia.*
Small Alpine Setwall.

and not vnlike thoſe of the Star-Thiſtle: among theſe riſe vp ſome round hollow branched ſtalks two cubites high: at each ioint grow forth two leaues leſſer, yet like the lower: at the tops of the branches grow the floures as it were in little vmbels, conſiſting of fiue leaues apiece; and theſe of a light red, or fleſh colour: and then theſe as it were vmbels grow into longiſh branches bearing ſeed almoſt like, yet leſſe than the red Valerian: it floures in Iuly, and periſheth when it hath ripened the ſeed. *Cluſius* hath ſet this forth by the name of *Valeriana annua altera.*‡

9 The ſame Author hath alſo giuen vs the hiſtorie of ſome other Plants of this kind; and this he cals *Valeriana ſyl. Alpina t latifol.* the ſtalk hereof is ſome foot high, round, greene, and creſted: vpon which ſtand leaues longiſh, ſharpe pointed, and cut in with two or three deepe gaſhes: but the bottome leaues are more round and larger, comming neere to theſe of *Trachelium*, yet leſſer, ſlenderer, and bitter of taſte: the floures which are white of colour, and the ſeed, are like thoſe of the other Valerians: the root is ſmall, creeping, fibrous, white and aromatick: it growes vpon the Alpes, and floures in Iune and Iuly.

10 This ſendes forth leaues like thoſe of the mountain Daiſie: out of the midſt of which

riſeth vp a ſtalk ſome foot high, iointed, and at the top diuided into little branches, carrying white floures like the other Valerians: the root is as aromaticke as that of the laſt mentioned; and grows in the chinkes of the Alpine rockes, where it floures in Iune and Iuly. *Cluſius* hath it by the name of *Valeriana ſylueſtris Alpin. 2. Saxatilis.* ‡

¶ *The Place.*

The firſt and likewiſe the Greeke Valerian are planted in gardens; the wilde ones are found in moiſt places hard to riuers ſides, ditches, and waterie pits; yet the greater of theſe is brought into gardens where it flouriſheth, but the leſſer hardly proſpereth.

¶ *The Time.*

Theſe floure in May, Iune, and Iuly, and moſt of the Sommer moneths.

¶ *The Names.*

Generally the Valerians are called by one name, in Latine, *Valeriana*: in Greeke, : in ſhoppes alſo *Phu*, which for the moſt part is meant by the garden Valerian, that is called of *Dioſc.* : in Latine, *Sylueſtris*, or *Ruſtica Nardus*: of *Pliny*, *Nardus Cretica*: which names are rather referred to thoſe of the next chapter, although theſe be reckoned as wilde kindes thereof: of certaine in our age, *Marinella*, *Amantilla*, *Valentiana*, *Genicularis*, *Herba Benedicta*, and *Theriacaria*: in moſt ſhops, *Valeriana Domeſtica*: of *Theophraſtus Paracelſus*, *Terdina*: in high Dutch, **Groß baldrian**: in low Dutch, **Speercruyt**, **S. Joris cruyt**, and **Valeriane**: in Engliſh, Valerian, Capons taile, and Setwall, but vnproperly, for that name belongeth to *Zedoaria*, which is not Valerian: what hath been ſet downe in the titles ſhall ſerue for the diſtinctions of the other kindes.

¶ *The Temperature.*

The garden Valerian is hot, as *Dioſcorides* ſaith, but not much, neither the green root, but the dried ones; for the green is eaſily perceiued to haue very little heate, and the dried to be hotter, which is found by the taſte and ſmell.

¶ *The Vertues.*

A The drie root, as *Dioſcorides* teacheth, prouoketh vrine, bringeth downe the deſired ſickneſſe, helpeth the paine in the ſides, and is put into counterpoiſons and medicines preſeruatiue againſt the peſtilence, as are treacles, mithridates, and ſuch like: whereupon it hath been had (and is to this day among the poore people of our Northerne parts) in ſuch veneration amongſt them, that no broths, pottage, or phyſicall meats are worth any thing, if Setwall were not at an end: whereupon ſome woman Poet or other hath made theſe verſes:

They that will haue their heale,
Muſt put Setwall in their keale.

B It is vſed generally in ſleight cuts, wounds, and ſmall hurts.

C The extraction of the roots giuen, is a moſt ſingular medicine againſt the difficultie of making water, and the yellow iaundies.

D Wilde Valerian is thought of the later Herbariſts to be good for them that are burſten, for ſuch as be troubled with the crampe and other conuulſions, and alſo for all thoſe that are bruiſed with falls.

E The leaues of theſe and alſo thoſe of the garden, are good againſt vlcers and ſorenes of the mouth and gums, if the decoction thereof be gargarized or held in the mouth.

F Some hold opinion that the roots of wilde Valerian dried and poudered, and a dramme weight thereof taken with wine, do purge vpward and downeward.

Chap. 441. *Of Mountaine Setwall, or Nardus.*

¶ *The Deſcription.*

1 THe *Nardus* named *Celtica*, but now by ſome, *Liguſtica Nardus*, flouriſheth in high mountaines. The Valleſians in their mother tongue call it *Selliga*; whence *Geſner* thought it to be *Saliunca*; neither do I doubt, but that it is the ſame which *Virgil* ſpeaketh of in theſe verſes:

Puniceis humilis quantum Saliunca roſetis,
Iudicio noſtro tantum tibi cedit Amintas.

For it is a very little herbe creeping on the ground, and afterward lifting vp it ſelfe with a ſtalke of a handfull high; whereupon from the lower part grow ſmall thin leaues, firſt green, but afterwards ſomewhat yellowiſh: vpon the roughneſſe of the root there are many ſcales, platted one vpon another; but vnder the root there are many browne ſtrings and hairy threds, in ſmell like the roots of *Aſtrabacca*, or rather the wilde mountaine Valerian, whereof it ſeemes to be a kinde, in taſte ſharpe and bitter. The floures grow along the vpper branches, white or yellowiſh, and very ſmall.

2 The

1 *Nardus Celtica.*
Celticke Spikenard.

3 *Hirculus.*
Vrine-wort.

4 ‡. *Nardus montana germinans:*
Mountaine Nard at the firſt ſpringing vp.

4 *Nardus montana.*
Mountaine Spikenard.

2 The ſecond ſort of Spikenard hath many threddy roots, from the which riſe vp many ſcaly rough and thicke ſtalkes, hauing at the top certaine flat hoary leaues growing vpon ſmal and tender foot-ſtalkes. The whole plant is of a pleaſant ſweet ſmell.

3 *Hirculus* is a plant very rare, which as yet I neuer ſaw, notwithſtanding we are greatly beholding to *Carolus Cluſius* the father of forreine Simples, who finding this plant among many bunches or handfulls of mountaine Spikenard, hath made it knowne vnto poſteritie, as he hath done many other rare plants, in

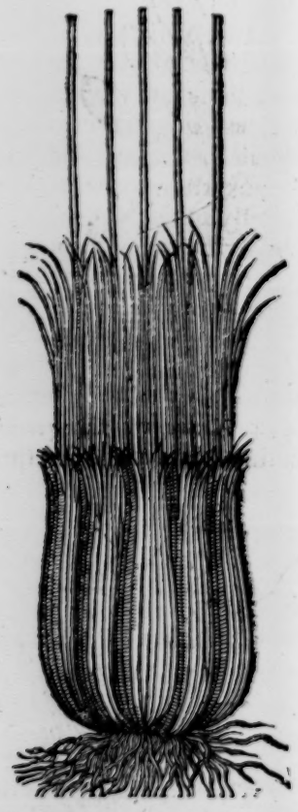
tranſlating

tranſlating of *Garcias* the Luſitanian Phyſitian, he ſetteth it forth with a light deſcription, ſaying, It is a baſe and low herbe two handfulls high, bringing forth leaues without any ſtalkes at all, ‡ very hairy about the root, and blackiſh, hauing no pleaſant ſent at all. The leaues chewed yeeld no aromaticke taſte, but are clammie, or viſcide; whereas the leaues of Celticke Narde are hot, with a little aſtriction, and of a pleaſant ſmell and taſte. ‡

4 Mountaine Spikenard hath a great thicke knobbed root, ſet here and there with ſome tender fibres, of a pleaſant ſweet ſmel; from the which come forth three or foure ſmooth broad leaues, and likewiſe iagged leaues deepely cut euen to the middle rib: among which riſe vp naked ſtalks, garniſhed in the middle with a tuft of iagged leaues. The floures grow at the top of the ſtalks, in an vmbel or tuft like thoſe of the wilde Valerian in ſhape and colour, and ſuch alſo is the ſeed. ‡ I haue giuen you the figure of the root and whole leaues as they ſhew themſelues when they firſt appeare, as it was taken by *Cluſius*. ‡

5 *Nardus Indica.*
Indian Spikenard.

6 Nardus Narbonenſis.
French Spikenard.



5 The Spikenard of India is a low plant, growing cloſe vnto the ground, compoſed of many rough browne hairy cloues, of a ſtrong, yet not vnpleaſant ſmell. The root is ſmall and threddie. ‡ It hath certainly ſtalkes, floures, and ſeeds; but none of our Indian Writers or Trauellers haue as yet deſcribed them. I haue ſeene little pieces of ſlender hollow ſtalkes ſome two inches long faſtned to the roots that are brought to vs. ‡

† *6* This French Spikenard, being a baſtard kinde, groweth cloſe vpon the ground like the precedent, compact of ſcaly rough leaues: in the middle whereof commeth forth a great buſh of round greene ſtiffe and ruſhy leaues: among the which ſhoot vp diuers round ſtalkes a cubit high, ſet from the middle to the top with greeniſh little cods, ſtanding in chaffie huskes like thoſe of Schœnanth. The root is ſmall and threddy: the whole plant is altogether without ſmell, which ſheweth it to be a baſtard kinde of Spikenard.

¶ *The Place.*

Theſe plants [the firſt foure] are ſtrangers in England, growing in great plentie vpon the mountaines of Iudenberg and Heluetia, on the rockes among the moſſe, and in the mountains of Tiroll and Saltzburg.

The firſt and ſecond, if my memorie faile me not, do grow in a field in the North part of England

land, called Crag cloſe, and in the foot of the mountaine called Ingleborow Fels. ‡ The fourth may be found in ſome gardens with vs. The fifth growes in the East Indies, in the prouinces of Mandou and Chito in the kingdome of Bengala and Decan. The laſt growes in Prouince in France, neere a little city called Gange. ‡

¶ *The Time.*

The leaues grow to withering in September, at which time they ſmell more pleaſantly than when they flouriſhed and were greene.

¶ *The Names.*

Nardus is called in Pannonia or Hungarie, of the countrey people, *Speick*: of ſome, *Bechi fiu*; that is, the herbe of Vienna, becauſe it doth grow there in great aboundance, from whence it is brought into other countries: of *Geſner*, *Saliunca*: in Engliſh, Celticke Spikenard: of the Valletians, *Selliga*, and *Nardus Celtica*.

¶ *The Temperature and Vertues.*

Celticke Narde mightily prouokes vrine, as recordeth *Rondeletius*; who trauelling through the A
deſart countrey, chanced to lodge in a monaſterie where was a Chanon that could not make his water, but was preſently helped by the decoction of this herbe, through the aduice of the ſaid *Rondeletius*.

‡ The true Spikenard or Indian Nard hath a heating and drying facultie, being (according to B
Galen) hot in the firſt degree [yet the Greeke copy hath the third] and dry in the ſecond. It is compoſed of a ſufficiently aſtringent ſubſtance, and not much acride heate, and a certaine light bitterneſſe. Conſiſting of theſe faculties, according to reaſon, both inwardly and outwardly vſed it is conuenient for the liuer and ſtomacke.

It prouoketh vrine, helps the gnawing paines of the ſtomacke, dries vp the defluxions that trou- C
ble the belly and intrals, as alſo thoſe that moleſt the head and breſt.

It ſtayes the fluxes of the belly, and thoſe of the wombe, being vſed in a peſſarie, and in a bath D
it helpes the inflammation thereof.

Drunke in cold water, it helpes the nauſeouſneſſe, gnawings, and windineſſe of the ſtomacke, E
the liuer, and the diſeaſes of the kidneyes, and it is much vſed to be put into Antidotes.

It is good to cauſe haire to grow on the eye lids of ſuch as want it, and is good to be ſtrewed vp- F
on any part of the body that abounds with ſuperfluous moiſture, to dry it vp.

The Celticke-Nard is good for all the forementioned vſes, but of leſſe efficacie, vnleſſe in the G
prouoking of vrine. It is alſo much vſed in Antidotes.

The mountaine Nard hath alſo the ſame faculties, but is much weaker than the former, and not in vſe at this day that I know of. ‡

Chap. 442. *Of Larkes heele or Larkes claw.*

¶ *The Deſcription.*

1 THe garden Larks ſpur hath a round ſtem ful of branches, ſet with tender iagged leaues very like vnto the ſmall Sothernwood: the floures grow alongſt the ſtalks toward the tops of the branches, of a blew colour, conſiſting of fiue little leaues which grow together and make one hollow floure, hauing a taile or ſpur at the end turning in like the ſpurre of Tode-flax. After come the ſeed, very blacke, like thoſe of Leekes: the root periſheth at the firſt approch of Winter.

2 The ſecond Larks ſpur is like the precedent, but ſomewhat ſmaller in ſtalkes and leaues: the floures are alſo like in forme, but of a white colour, wherein eſpecially is the difference. Theſe floures are ſometimes of a purple colour, ſometimes white, murrey, carnation, and of ſundry other colours, varying infinitely, according to the ſoile or countrey wherein they liue.

‡ 3 Larks ſpur with double floures hath leaues, ſtalkes, roots, and ſeeds like the other ſingle kinde, but the floures of this are double; and hereof there are as many ſeuerall varieties as there be of the ſingle kinde, to wit, white, red, blew, purple, bluſh, &c.

4 There is alſo another varietie of this plant, which hath taller ſtalkes and larger leaues than the common kinde: the floures alſo are more double and larger, with a leſſer heele: this kind alſo yeeldeth vſually leſſe ſeed than the former. The colour of the floure is as various as that of the former, being either blew, purple, white, red, or bluſh, and ſometimes mixed of ſome of theſe. ‡

5 The wilde Larks ſpur hath moſt fine iagged leaues, cut and hackt into diuers parts, confuſedly ſet vpon a ſmall middle tendrell: among which grow the floures, in ſhape like the others, but

a great

1 *Conſolida regalis ſatiua.*
Garden Larks heele.

2 *Conſolida ſatiua flore albo vel rubro.*
White or red Larks ſpur.

‡ 3 *Conſolida regalis flore duplici.*
Double Larks ſpur.

‡ 4 *Conſolida reg. elatior flo. pleno.*
Great double Larks ſpur.

a great deale leſſer, ſometimes purple, otherwhiles white, and often of a mixt colour. The root is ſmall and threddy.

5 *Conſolida regalis ſylueſtris.*
Wilde Larkes heele.

¶ *The Place.*

Theſe plants are ſet and ſowne in gardens: the laſt groweth wilde in corne fields, and where corn hath grown, ‡ but not with vs, that I haue yet obſerued; though it be frequently found in ſuch places in many parts of Germanie. ‡

¶ *The Time.*

They floure for the moſt part all Sommer long, from Iune to the end of Auguſt, and oftimes after.

¶ *The Names.*

Larks heele is called *Flos Regius*: of diuers, *Conſolida regalis*; who make it one of the Conſounds or Comfreyes. It is alſo thought to be the *Delphinium* which *Dioſcorides* deſcribes in his third booke; wherewith it may agree. It is reported by *Gerardus* of Veltwijcke, who remained Lieger with the great Turke from the Emperor *Charles* the fifth, That the ſaid *Gerard* ſaw at Conſtantinople a copy which had in the chap. of *Delphinium*, not leaues but floures like Dolphines: for the floures, and eſpecially before they be perfected, haue a certaine ſhew and likeneſſe of thoſe Dolphines, which old pictures and armes of certain antient families haue expreſſed with a crooked and bending figure or ſhape; by which ſigne alſo the heauenly Dolphine is ſet forth. And it skilleth not, though the chapter of *Delphinium* be thought to be falſified and counterfeited; for although it be ſome other mans, and not of *Dioſcorides*, it is notwithſtanding ſome one of the old Writers, out of whom it is taken, and foiſted into *Dioſcorides* his bookes: of ſome it is called *Bucinus*, or *Bucinum*: in Engliſh, Larks ſpur, Larks heele, Larks toes, and Larks claw: in high-Dutch, **Ridder ſpoozen**; that is, *Equitis calcar*, Knights ſpur: in Italian, *Sperone*: in French, *Pied d' alouette.*

¶ *The Temperature.*

Theſe herbes are temperate and warme of nature.

¶ *The Vertues.*

We finde little extant of the vertues of Larks heele, either in the antient or later writers, worth the noting, or to be credited; for it is ſet downe, that the ſeed of Larks ſpur drunken is good againſt the ſtingings of Scorpions; whoſe vertues are ſo forcible, that the herbe onely thrown before the Scorpion or any other venomous beaſt, cauſeth them to be without force or ſtrength to hurt, inſomuch that they cannot moue or ſtirre vntill the herbe be taken away: with many other ſuch trifling toyes not worth the reading. A

CHAP. 443. *Of Gith, or Nigella.*

¶ *The Kindes.*

THere be diuers ſorts of Gith or Nigella, differing ſome in the colour of the floures, others in the doubleneſſe thereof, and in ſmell of the ſeed.

¶ *The Deſcription.*

1 THe firſt kind of Nigella hath weake and brittle ſtalks of the height of a foot, full of branches, beſet with leaues very much cut or iagged, reſembling the leaues of Fumiterie, but much greener: the floures grow at the top of the branches, of a whitiſh blew colour, each floure being

1 *Melanthium.*
Garden Nigella.

2 *Melanthium ſylueſtre.*
Wilde Nigella.

3 *Melanthium Damaſcenum.*
Damaske Nigella.

‡ 4 *Melanthium Damaſcenum flo. pleno.*
Double floured Damaske Nigella.

being parted into fiue ſmall leaues, ſtarre faſhion: the floures being vaded, there come vp ſmall knobs or heads, hauing at the end thereof fiue or ſix little ſharpe hornes or pointalls, and euery knob or head is diuided into ſundry ſmall cels or partitions, wherein the ſeed is conteined, which is of a blackiſh colour, very like vnto Onion ſeed, in taſte ſharpe, and of an excellent ſweet ſauour.

2 The wilde Nigella hath a ſtreaked ſtalke a foot or more high, beſet full of grayiſh leaues, very finely jagged, almoſt like the leaues of Dil: the floures are like the former, ſaue that they are blewer: the cods or knops are like the heads or huskes of Columbines, wherein is conteined the ſweet and pleaſant ſeed, like the former.

5 *Nigella flore albo multiplici:*
Damaske Nigella.

‡ 6 *Nigella Hiſpanica flore amplo.*
Great Spaniſh Nigella.

3 The third kinde of Nigella, which is both faire and pleaſant, called Damaske Nigella, is very like vnto the wilde Nigella in his ſmall cut and jagged leaues, but his ſtalke is longer: the floures are like the former, but greater, and euery floure hath fiue ſmall greene leaues vnder him, as it were to ſupport and beare him vp: which floures being gone, there ſucceed and follow knops and ſeed like the former, but without ſmell or ſauour.

‡ 4 This in the ſmalneſſe, and ſhape of the leaues and the manner of growing is like to the laſt deſcribed hauing ſmal leaues growing vnder the floure, which is not ſingle, as in the laſt deſcribed, but double, conſiſting of fiue or more rankes of little blewiſh leaues, which are ſucceeded by ſuch cornered heads as thoſe of the former, hauing in them a blacke ſeed without any manifeſt ſmell. ‡

5 The fifth kinde of Nigella hath many ſmall and ſlender ſtalkes, ſet full of ſlender and thin leaues deepely cut or jagged, of a faint yellowiſh greene colour: the floures grow at the top of the ſtalkes, of a whitiſh colour, and exceeding double: which being vaded, there ſucceed bowles or knobs, full of ſweet blacke ſeed like the former: ths root is ſmall and tender.

‡ 6 The root of this is ſlender, and yellowiſh; the ſtalke ſome cubit high, round, green, creſted, and toward the top diuided into ſundry branches, the leaues toward the bottome are ſomewhat ſmall cut, but ſomewhat larger vpon the ſtalkes. The floure is much larger than any of the former, compoſed of fiue leaues, of a light blew aboue, and ſomewhat whitiſh vnderneath, with

large veines running about them: in the middle ſtands vp the head, encompaſſed with blackiſh threds, and ſome 7. or 8. little gaping bleuiſh floures at the bottomes of them; the leaues of the floures decaying the head becomes bigger, hauing at the tops thereof 6. 7. or 8. longiſh twined hornes growing, in a ſtar faſhion; the inſide is parted into cels conteyning a yelloviſh green, or elſe blackiſh ſeed. It is ſet forth in the *Hortus Eyſtettenſis* by the name of *Melanthium Hiſpanicum maius*; by Mr. *Parkinſon* it is called *Nigella Hiſpanica flore ſimplici*; and *Bauhine* in his *Prodromus* hath it by the name of *Nigella latifolia flore maiore ſimplici cæruleo*. It is an annuall plant, and floures in Iuly; it is ſometimes to be found in the gardens of our Floriſts. ‡

¶ *The Place.*

The tame are ſowne in gardens: the wilde ones do grow of themſelues among corne and other graine, in diuers countries beyond the ſeas.

¶ *The Time.*

The ſeed muſt be ſowne in Aprill: it floureth in Iuly and Auguſt.

¶ *The Names.*

Gith is called in Greeke μελάνθιον: in Latine alſo *Melanthium*: in ſhops, *Nigella*, and *Nigella Romana*: of diuers, *Gith*, and *Saluſandria*, and ſome among the former baſtard names, *Papauer nigrum*: in high Dutch, **Swartzkymmich**: in low Dutch, **Nardus ſaet**: in Italian, *Nigella*: in Spaniſh, *Axenuz*, *Alipiure*: in French, *Nielle odorante*: in Engliſh, Gith, and Nigella Romana, in Cambridgeſhire, Biſhops woort: and alſo *Diuæ Catharinæ flos*, Saint Katharines floure.

¶ *The Temperature.*

The ſeed of the garden Nigella is hot and dry in the third degree, and of thin parts.

¶ *The Vertues.*

A The ſeed of *Nigella Romana* drunke with wine, is a remedy againſt the ſhortnes of breath, diſſolueth and putteth forth windineſſe, prouoketh vrine, the menſes, increaſeth milke in the breſts of nurſes if it be drunke moderately; otherwiſe it is not onely hurtfull to them, but to any that take thereof too often, or in too great a quantity.

B The ſeed killeth and driueth forth wormes, whether it be taken with wine or water, or laid to the nauell in manner of a plaiſter.

C The oile that is drawne forth thereof hath the ſame property.

D The ſeed parched or dried at the fire, brought into pouder, and wrapped in a piece of fine lawne or ſarcenet, cureth all murs, catarrhes, rheumes, and the poſe, drieth the braine, and reſtoreth the ſence of ſmelling vnto thoſe which haue loſt it, being often ſmelled vnto from day to day, and made warme at the fire when it is vſed.

E It takes away freckles, ſcurfs, and hard ſwellings, being laid on mixed with vineger. To be briefe, as *Galen* ſaith, it is a moſt excellent remedy where there is need of clenſing, drying, and heating.

F It ſerueth well among other ſweets to put into ſweet waters, bagges, and odoriferous powders.

† The figures of the third and fourth of the former edition were tranſpoſed.

Chap. 444. *Of Cockle.*

¶ *The Deſcription.*

Cockle is a common and hurtfull weed in our Corne, and very well knowne by the name of Cockle, which *Pena* calleth *Pſeudomelanthium*, and *Nigellaſtrum*, by which names *Dodonæus* and *Fuchſius* do alſo terme it; *Mutonus* calleth it *Lolium*; and *Tragus* calleth it *Lychnoiaes ſegetum*. This plant hath ſtraight, ſlender, and hairy ſtems, garniſhed with long hairy and grayiſh leaues, which grow together by couples, incloſing the ſtalke round about: the floures are of a purple colour, declining to redneſſe, conſiſting of fiue ſmall leaues, in proportion very like to wilde Campions; when the floures be vaded there follow round knobs or heads full of blackiſh ſeed, like vnto the ſeed of *Nigella*, but without any ſmell or ſauour at all.

¶ *The Place and Time.*

The place of his growing, and time of his flouring, are better knowne then deſired.

¶ *The Names.*

Cockle is called *Pſeudomelanthium*, and *Nigellaſtrum*, wilde or baſtard Nigella; of *Fuchſius*, *Lolium*: of *Mouton*, *Lychnoides ſegetum*: of *Tragus*, *Githago*: in high Dutch, **Kornegele**: in low Dutch, **Cozne rooſen**: in French, *Nielle des Bledz*: in Engliſh, Cockle, field Nigella, or wilde Nigella: in Italian, *Githone*; whereupon moſt Herbariſts being mooued with the likeneſſe of the word, haue thought it to be the true Gith or *Melanthium*; but how farre they are deceiued it is better knowne, than needfull to be confuted: for it doth not onely differ in leaues from the true Gith, but alſo in other properties, and yet it is called Gith or *Melanthium*, and that is of the blackenes of the ſeed, yet not properly, but with a certain addition, that it may differ from the true *Melanthium*: for

Hippocrates

Pſeudomelanthium.
Baſtard Nigella, or Cockle.

Hippocrates calleth it *Melanthium ex Tritico*, of wheate: *Octauius Horatianus* calleth that Gith which groweth among Corne: and for the ſame cauſe it is named of the learned of this our time *Nigellaſtrum*, *Gigatho*, and *Pſeudomelanthium*: *Ruellius* ſaith it is called in French *Niele*, and *Flos Micancalus*.

¶ *The Temperature.*

The ſeed of Cockle is hot and dry in the later end of the ſecond degree.

¶ *The Vertues.*

The ſeed made in a peſſarie or mother ſuppoſitorie, with honey put vp, bringeth downe the deſired ſickneſſe, as *Hippocrates* in his booke of womens diſeaſes doth witneſſe. A

Octauius Horatianus giueth the ſeed parched and beaten to pouder to be drunke againſt the yellow jaundice. B

Some ignorant people haue vſed the ſeed hereof for the ſeed of Darnell, to the great danger of thoſe who haue receiued the ſame: what hurt it doth among corne, the ſpoyle vnto bread, as well in colour, taſte, and vnwholeſomnes, is better known than deſired. C

Chap. 445. *Of Fumitorie.*

¶ *The Kindes.*

THere be diuers herbes comprehended vnder the title of Fumitorie; ſome wilde, and others of the garden; ſome with bulbous or tuberous roots, and others with fibrous or threddy roots: and firſt of thoſe whoſe roots are nothing but ſtrings.

¶ *The Deſcription.*

1 FVmitorie is a very tender little herbe: the ſtalkes thereof are ſlender, hauing as it were little knots or ioynts full of branches, that ſcarſe grow vp from the ground without proppings, but for the moſt part they grow ſidelong: the leaues round about are ſmall, cut on the edges as thoſe of Coriander, which as well as the ſtalkes are of a whitiſh greene: the floures be made vp in cluſters at the tops of the ſmall branches, of a red purple colour: then riſe vp huskes, round and little, in which lieth the ſmall ſeed: the root is ſlender, and groweth ſtraight downe. ‡ This is alſo found with floures of a purple violet colour, and alſo ſomtimes with them white. ‡

2 The ſecond kinde of Fumitorie hath many ſmall long and tender branches, wherupon grow little leaues, commonly ſet together by threes or fiues, in colour and taſte like vnto the former; hauing at the top of the branches many ſmall claſping tendrels, with which it taketh hold vpon hedges, buſhes, and whatſoeuer groweth next vnto it: the floures are ſmall, and cluſtering together, of a white colour, with a little ſpot in their middles; after which ſucceed cods containing the ſeed: the root is ſingle, and of a fingers length.

3 The third kinde of Fumitorie hath a very ſmall root, conſiſting of diuers little ſtrings; from which ariſe ſmall and tender branches trailing here and there vpon the ground, beſet with many ſmall and tender leaues moſt finely cut and iagged, like the little leaues of Dill, of a deepe greene colour tending to blewneſſe: the floures ſtand on the tops of the branches, in bunches or cluſters thicke thruſt together, like thoſe of the medow Clauer, or three leafed graſſe, of a moſt bright red colour, and very beautifull to behold: the root is very ſmall and threddy.

1 *Fumaria purpurea.*
Common or purple Fumitory.

† 2 *Fumaria alba latifolia clauiculata.*
White broad leafed Fumitorie.

3 *Fumaria tenuifolia.*
Fine leafed Fumitorie.

4 *Fumaria lutea.*
Yellow Fumitorie.

4 The yellow Fumitorie hath many crambling threddy roots, ſomewhat thicke, groſſe, and fat, like thoſe of *Aſparagus*: from which riſe diuers vpright ſtalkes a cubit high, diuiding themſelues toward the top into other ſmaller branches; wheron are confuſedly placed leaues like thoſe of *Thalictrum*, or Engliſh Rubarb, but leſſer and thinner: alongſt the tops of the branches grow yellow floures, reſembling thoſe of Sage: which being paſt, there followeth ſmall ſeed like vnto duſt.

¶ *The Place.*

The Fumitories grow in corne fields among Barley and other graine; in vineyards, gardens, and ſuch like manured places. I found the ſecond and third growing in a corne field betweene a ſmall village called Charleton and Greenwich.

¶ *The Time.*

Fumitorie is found with his floure in the beginning of May, and ſo continues to the end of ſommer. When it is in floure is the beſt time to gather it to keepe dry, or to diſtill.

¶ *The Names.*

Fumitorie is called in Greeke Καπνὸς, and Καπνὸν, and often Καπνὸν: in Latine, *Fumaria*: of *Pliny*, *Capnos*: in ſhops, *Fumus terræ*: in high-Dutch, **Erdtrauch**: in low-Dutch, **Griſecom, Duyuen kernel**: in Spaniſh, *Palomilha*: in French and Engliſh, Fumiterre.

¶ *The Temperature.*

Fumitorie is not hot, as ſome haue thought it to be, but cold and ſomething dry; it openeth and clenſeth by vrine.

¶ *The Vertues.*

It is good for all them that haue either ſcabs or any other filth growing on the skinne, and for them alſo that haue the French diſeaſe. A

It remoueth ſtoppings from the liuer and ſpleene: it purifieth the bloud, and is oft times good for them that haue a quartane ague. B

The decoction of the herbe is vſed to be giuen, or elſe the ſyrrup that is made of the iuyce: the diſtilled water thereof is alſo profitable againſt the purpoſes aforeſaid. C

It is oftentimes boyled in whay, and in this manner it helpeth in the end of the Spring and in Sommer time thoſe that are troubled with ſcabs. D

Paulus Ægineta ſaith that it plentifully prouoketh vrine, and taketh away the ſtoppings of the liuer, and feebleneſſe thereof; that it ſtrengthneth the ſtomacke, and maketh the belly ſoluble. E

Dioſcorides affirmeth, that the iuyce of Fumitorie, of that which groweth among Barley, as *Ægineta* addeth, with gum Arabicke, doth take away vnprofitable haires that pricke the eyes, growing vpon the eye lids, the haires that pricke being firſt plucked away, for it will not ſuffer others to grow in their places. F

The decoction of Fumitorie drunken driueth forth by vrine and ſiege all hot cholericke burnt and hurtfull humors, and is a moſt ſingular digeſter of ſalt and pituitous humors. G

† There were formerly ſix figures and deſcriptions in this chapter; whereof the two firſt figures were of the common Fumitorie, the one with purple, the other with white floures, and the two later were of the *Fumaria latifolia claiculata*, differing onely in the largeneſſe and ſmallneſſe of the leafe. The deſcription in the ſecond place belonged to the *Fumaria claiculata*, which alſo was againe deſcribed in the fifth and ſixth places, yet not to much purpoſe; wherefore I haue put the figure to the ſecond, and omitted the other as ſuperfluous.

Chap. 446. *Of bulbous Fumitorie, or Hollow-root.*

¶ *The Deſcription.*

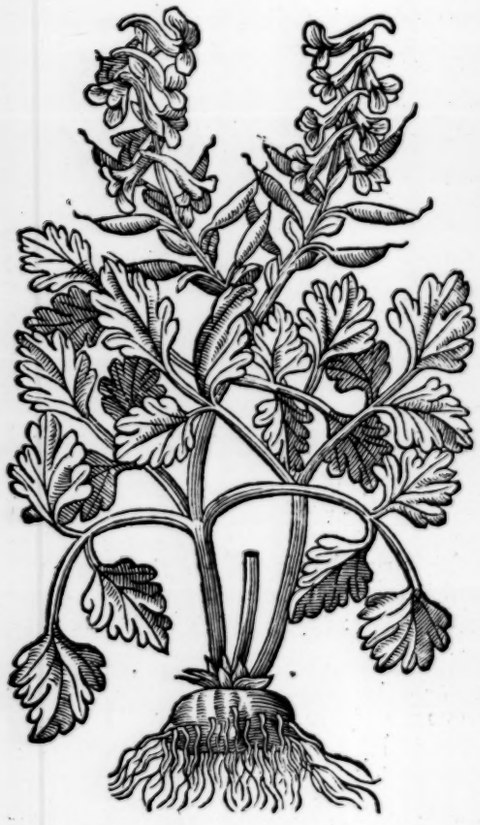
1 The leaues of great Hollow-root are iagged and cut in ſunder, as be thoſe of Coriander, of a light greeniſh colour, that is to ſay, like the gray colour of the leaues of Columbine, whereunto they be alſo in forme like, but leſſer: the ſtalks be ſmooth, round, and ſlender, an handfull long; about which, on the vpper part ſtand little floures orderly placed, long, with a little horne at the end like the floures of Tode-flax, of a light red tending to a purple colour: the ſeed lieth in flat cods, very ſoft and greeniſh when it is ready to yeeld vp his black ſhining ripe ſeed: the root is bumped or bulbous, hollow within, and on the vpper part preſſed down ſomewhat flat, couered ouer with a darke yellow skin or barke, with certaine ſtrings faſtned thereto, and of a bitter and auſtere taſte.

2 The ſecond is like vnto the firſt in each reſpect, ſauing that it bringeth floures of a white colour, and the other not ſo.

3 The ſmall purple Hollow-root hath roots, leaues, ſtalkes, floures, and ſeeds like the precedent, the eſpeciall difference is, that this plant is ſomewhat leſſe.

4 The ſmall white Hollow-root likewiſe agreeth with the former in each reſpect, ſauing that this plant bringeth white floures, and the other not ſo.

1 *Radix caua maior purpurea.*
Great purple Hollow-root.



2 *Radix caua maior alba.*
Great white Hollow-root.

5 This kinde of Hollow-root is alſo like the laſt deſcribed, ſauing that the floures hereof are mixed with purple and white, which maketh it to differ from the others.

6 There is no difference in this, that can poſſibly be diſtinguiſhed, from the laſt deſcribed, ſauing that the floures hereof are of a mixt colour, white and purple, with ſome yellow in the hollowneſſe of the ſame, wherein conſiſteth the difference from the precedent.

7 This thin leafed Hollow-root hath likewiſe an hollow root, couered ouer with a yellow pilling, of the bigneſſe of a tenniſe ball: from which ſhoot vp leaues ſpred vpon the ground, very like vnto the leaues of Columbines, as well in forme as colour, but much thinner, more iagged, and altogether leſſer: among which riſe vp ſmall tender ſtalkes, weake and feeble, of an handfull high, bearing from the middle thereof to the top very fine floures, faſhioned vnto one piece of the Columbine floure, which reſembleth a little bird of a purple colour.

8 This other thin leafed Hollow-root is like the precedent, ſauing that this plant brings forth white floures tending to yellowneſſe, or as it were of the colour of the field Primroſe.

9 **Bunnykens holwortele**, as the Dutch men doe call it, hath many ſmall iagged leaues growing immediately from the ground, among which riſe vp very ſlender ſtalkes, whereon doe grow ſuch leaues as thoſe next the ground: on the top of the branches ſtand faire purple floures like vnto the others of his kinde, ſauing that the floures hereof are as it were ſmall birds, the bellies or lower parts whereof are of a white colour, wherein it differeth from all the reſt of the Hollow-roots.

10 The laſt and ſmall hollow-root is like the laſt deſcribed, ſauing that it is altogether leſſe, and the floures hereof are of a greene colour, not vnlike in ſhape to the floures of Cinkefoile.

‡ This plant, whoſe figure our Author here gaue with this ſmall deſcription, is that which from the ſmel of muske is called *Moſchatella*, by *Cordus* and others: it is the *Denticulata* of *Daleſchampius*: the *Fumaria bulboſa tuberoſa minima* of *Tabernamontanus*: and the *Ranunculus minimus ſeptentrionalium herbido muſcoſo flore* of *Lobel*. The root hereof is ſmall and toothed, or made of little bulbes reſembling teeth, and ending in white hairy fibres: it ſendeth vp diuers little branches ſome two

or

or three inches high: the leaues are ſomewhat like thoſe of the yellow Fumitorie, or *Radix cava*, but much leſſe: the floures grow cluſtering on the top of the ſtalke, commonly fiue or ſeuen together, each of them made of foure yellowiſh green leaues with ſome threds in them; it floures in Aprill, and is to be found in diuers places amongſt buſhes at that time, as in Kent about Chiſlehurſt, eſpecially in *Pits* his wood, and at the further end of Cray heath, on the left hand vnder a hedge among bryers and brambles, which is his proper ſeat. ‡

9 *Radix caua minor.*
Bunnikens Holwoort.

10 *Radix cauæ minima viridi flore.*
Small Bunnikens Holwoort.

¶ *The Place.*

Theſe plants do grow about hedges, brambles, and in the borders of fields and vineyards, in low and fertile grounds, in Germanie and the Low-countries, neuertheleſſe the two firſt, and alſo the two laſt deſcribed do grow in my garden.

¶ *The Time.*

Theſe do floure in March, and their ſeed is ripe in Aprill: the leaues and ſtalkes are gon in May, and nothing remaining ſaue onely the roots, ſo little a while do they continue.

¶ *The Names.*

Hollow root is called in high Dutch **Holwurtz**: in low Dutch, **Hoolewoztele**, that is, *Radix cava*: in Engliſh, Hollow root, and Holewoort: it is vſed in ſhops in ſteed of *Ariſtolochia*, or round Birthwoort; which errour is better knowne than needfull to be confuted: and likewiſe their errour is apparant, who raſhly iudge it to be *Piſtolochia*, or little Birthwoort. It ſhould ſeem the old Writers knew it not; wherefore ſome of our later Authors haue made it *Leontopetali ſpecies*, or a kinde of Lions Turnep: others, *Eriphium*: and otherſome, *Theſium*: moſt men, *Capnos Chelidonia*: it ſeemeth to agree with *Leontopetalon* in bulbed roots, and ſomewhat in leaues, but in no other reſpects, as may be perceiued by *Dioſcorides* and *Plinies* deſcription of *Leontopetalon*. And if *Eriphium* haue his name ἀπὸ τοῦ ἦρος, that is to ſay of the Spring, then this root may be not vnproperly *Eriphium*, and *Veris Planta*: or the Plant of the Spring: for it is euident that it appeareth and is greene in the Spring onely: ſome thinke it hath beene called *Eriphium*, *ab Hædo*, or of the Goat: but this *Eriphion* is quite another plant, as both *Apuleius* writeth, and that booke alſo mentioneth which is attributed to *Galen*, and dedicated to *Paternianus*. In the booke which is dedicated to *Paternianus*, there be read theſe words; [*Eriphion* is an herbe which is found vpon high mountaines, it hath leaues like Snallage, a fine floure like the Violet, and a root as great as an Onion: it hath likewiſe other roots

which

which ſend forth roots after roots. Whereby it is euident that this root whereof we intreat is not this kinde of *Eriphium*. Concerning *Theſium* the old Writers haue written but little: *Theophraſtus* ſaith, that the root thereof is bitter, and being ſtamped purgeth the belly. *Pliny* in his 21. booke, chap. 17. ſheweth, that the root which is called *Theſium* is like the bulbed plants, and is rough in taſte: *Athenæus* citing *Timachida* for an Authour, ſaith, that *Theſium* is called a floure, of which *Ariadnes* garland was made. Theſe things ſeeme well to agree with Hollow root; for it is bumped or bulbous, of taſte bitter and auſtere, or ſomething rough, which is alſo thought to purge: but what certaintie can be affirmed, ſeeing the old writers are ſo briefe? what manner of herbe *Capnos Chelidonia* is, which groweth by hedges, and hereupon is ſurnamed χελιδώνιος, *Aetius* doth not expound, onely the name thereof is found in his ſecond Tetrab. the third booke, chap. 110. in *Martianus* his *Collyrium*, and in his Tetrab. 3. booke, 2. chap. among ſuch things as ſtrengthen the liuer. But if *Capnos Chelidonia* be that which *Pliny* in his 25. booke, chap. 13. doth call *Prima Capnos*, or the firſt *Capnos*, and commendeth it for the dimneſſe of the ſight, it is plain enough that *Radix cauа*, or the Hollow root, is not *Capnos Chelidonia*: for *Plinies* firſt *Capnos* is branched, and foldeth it ſelfe vpon hedges: but Hollow root hath no ſuch branches growing on it, and is a low herbe, and is not held vp with props, nor needeth them. But if *Aetius* his *Capnos Chelidonia* be another herb differing from that of *Pliny* (which thing perchance was the cauſe why it ſhould bee ſurnamed *Chelidonia*) there is ſome reaſon why it ſhould be called *Capnos Chelidonia*; for it is ſomewhat like Fumitorie in leaues, though greater, and commeth vp at the firſt ſpring, which is about the time when the Swallowes do come in; neuertheleſſe it doth not follow, that it is true and right *Capnos Chelidonia*, for there be alſo other herbs comming vp at the ſame ſeaſon, and periſh in ſhort time after, which notwithſtanding are not called *Chelidonia*.

¶ *The Temperature.*

Hollow root is hot and drie, yet more drie than hot, that is to ſay, dry in the third degree, and hot in the ſecond; it bindeth, clenſeth, and ſomewhat waſteth.

¶ *The Vertues.*

A Hollow root is good againſt old and long laſting ſwellings of the Almonds in the throat, and of the iawes: it likewiſe preuaileth againſt the paines of the hemorrhoides, which are ſwolne and
B painefull, being mixed with the ointment of Poplar buds, called *Vng. Populeon.*

It is reported that a dram weight hereof being taken inwardly, doth purge by ſiege, and draweth forth flegme.

† I haue reduced the eight figures which were formerly here put to the firſt 8. deſcriptions, being all of one and the ſame plant, to two, yet haue I left the deſcriptions, which in my opinion might haue been as well ſpared as the figures, for excepting the various colour of the floures there are but two diſtinct differences of the *Fumaria bulboſa maior*, the one hauing a hollowneſſe in the bottome of the root, and the other wanting it; and this which hath the ſollid root hath alſo the greene leaues betweene the floures cut in or diuided, the floures alſo are leſſe, more in number, and of an elegant red purple colour; and ſeldome found of any other colour, whereas the other varies much in the colour of the floures.

Chap. 447. *Of Columbine.*

¶ *The Deſcription.*

1 THe blew Columbine hath leaues like the great Celandine, but ſomewhat rounder, indented on the edges, parted into diuers ſections, of a blewiſh greene colour, which being broken yeeld forth little iuice or none at all: the ſtalke is a cubit and a halfe high, ſlender, reddiſh, and ſleightly haired: the ſlender ſprigs whereof bring forth euerie one one floure with fiue little hollow hornes, as it were hanging forth, with ſmall leaues ſtanding vpright, of the ſhape of little birds: theſe floures are of colour ſomtimes blew, at other times of a red or purple, often white, or of mixt colors, which to diſtinguiſh ſeuerally would be to ſmal purpoſe, being things ſo familiarly knowne to all: after the floures grow vp cods, in which is contained little blacke and glittering ſeed: the roots are thicke, with ſome ſtrings thereto belonging, which continue manie yeares.

2 The ſecond doth not differ ſauing in the colour of the floures; for like as the others are deſcribed to be blew, ſo theſe are of a purple red, or horſe-fleſh colour, which maketh the difference.

3 The double Columbine hath ſtalks, leaues, and roots, like the former: the floures hereof are very double, that is to ſay, many of thoſe little floures (hauing the forme of birds) are thruſt one into the belly of another, ſometimes blew, often white, and other whiles of mixt colours, as nature liſt to play with her little ones, differing ſo infinitely, that to diſtinguiſh them apart would require

mor

1 *Aquilegia cærulea.*
Blew Columbines.

2 *Aquileia rubra.*
Red Columbines.

3 *Aquilina multiplex.*
Double Columbines.

‡ 4 *Aquilegia variegata.*
Variegated Columbine.

‡ 5 *Aquilegia flo. inverſo rubro.*
Columbine with the inuerted red floure.

‡ 6 *Aquilegia flo. inverſo albo.*
Inuerted Columbine with the white floure.

‡ 7 *Aquilegia flore roſeo.*
Roſe Columbine.

‡ 8 *Aquilegia degener.*
Degenerate Columbine.

more time than were requiſite to leeſe: and therefore it ſhall ſuffice what hath beene ſaid for their deſcriptions.

‡ 4 There are alſo other varieties of this double kinde, which haue the floures of diuers or partie colours, as blew and white, and white and red variouſly marked or ſpotted.

5 This kinde hath the floures with their heeles or ſpurres turned outward or in the middle of the floure, whence it is called *Aquilina inverſa*: the floures of this are commonly reddiſh, or of a light or darke purple colour, and double.

6 This differs from the laſt in the colour of the floures which are white, yet double, and inuerted as the former.

7 The roots, leaues, and ſtalks of this are not vnlike thoſe of the precedent, but the floure is much different in ſhape; for it hath no heels or ſpurs, but is made of ſundrie long leaues lying flat open, being ſometimes more ſingle, and otherwhiles more double. The colour of the floure is either red, white, blew, or variouſly mixt of theſe as the former.

8 This though it be termed degenerate, is a kinde of it ſelfe, and it differs from the laſt deſcribed in that the vtmoſt leaues are the largeſt, and the colour thereof is commonly greene, or greene ſomewhat inclining to a purple. ‡

¶ *The Place.*

They are ſet and ſowne in gardens for the beautie and variable colours of the floures.

¶ *The Time.*

They floure in May, Iune, and Iuly.

¶ *The Names.*

Columbine is called of the later Herbariſts *Aquileia*, *Aquilina*, and *Aquilegia*: of *Coſteus*, *Pothos*: of *Geſner*, *Leontoſtomum*: of *Daleſchampius*, *Iouis flos*: of ſome, *Herba Leonis*, or the herbe wherein the Lion doth delight: in High Dutch, **Agley**: in Low Dutch, **Akeleyen**: in French, *Ancoiles*: in Engliſh, Columbine. ‡ *Fabius Columna* iudges it to be the *Iſopyrum* deſcribed by *Dioſcorides*. ‡

¶ *The Temperature.*

Columbines are thought to be temperate betweene heate and moiſture.

¶ *The Vertues.*

Notwithſtanding what temperature or vertues Columbines haue is not yet ſufficiently known; A
for they are vſed eſpecially to decke the gardens of the curious, garlands, and houſes: neuertheleſſe *Tragus* writeth, that a dram weight of the ſeed, with halfe a ſcruple or ten graines of Saffron giuen in wine, is a good and effectuall medicine for the ſtopping of the liuer, and the yellow iaundiſe, but ſaith he, that who ſo hath taken it muſt be well couered with cloathes, and then ſweat.

Moſt in theſe daies following others by tradition, do vſe to boile the leaues in milke againſt the B
foreneſſe of the throat, falling and excoriation of the uvula: but the antient writers haue ſaid nothing hereof: *Ruellius* reporteth, that the floures of Columbines are not vſed in medicine: yet ſome there be that do affirme they are good againſt the ſtopping of the liuer, which effect the leaues doe alſo performe.

‡ *Cluſius* ſaith, that Dr. *Francis Rapard* a Phyſition of Bruges in Flanders, told him that the C
ſeed of this common Columbine very finely beaten to pouder, and giuen in wine, was a ſingular medicine to be giuen to women to haſten and facilitate their labour, and if the firſt taking it were not ſufficiently effectuall, that then they ſhould repeat it againe. ‡

Chap. 448. *Of Wormewood.*

¶ *The Deſcription.*

1 The firſt kind being our common and beſt knowne Wormwood, hath leaues of a grayiſh colour, very much cut or iagged, and very bitter: the ſtalkes are of a wooddie ſubſtance, two cubits high, and full of branches, alongſt which doe grow little yellowiſh buttons, wherein is found ſmall ſeed like the ſeed of Tanſey, but ſmaller: the root is likewiſe of a wooddie ſubſtance, and full of fibres.

2 The ſecond kinde of Wormwood bringeth forth ſlender ſtalkes about a foot high or ſomewhat more, garniſhed with leaues like the former, but whiter, much leſſer, and cut or iagged into moſt fine and ſmall cuts or diuiſions: the floures are like the former, hanging vpon ſmall ſtemmes with their heads downeward: the roots are whitiſh, ſmall and many, crawling and crambling one ouer another, and thereby infinitely do increaſe, of ſauour leſſe pleaſant than the common Wormwood.

wood. Some haue termed this plant *Absinthium santonicum*, but they had slender reason so to do: for if it was so called becausе it was imagined to grow in the Prouince of Saintoinge, it may very wel appeare to the contrarie; for in the Alpes of Galatia, a countrey in Asia *minor*, it groweth in great plenty, and therefore may rather be called *Galatium Sardonicum*, and not *Santonicum*: but leauing controuersies impertinent to the History, it is the Ponticke Wormwood of *Galens* description, and so holden of the learned *Paludane* (who for his singular knowledge in plants is worthy triple honor) and likewise many others.

1 *Absinthium latifolium sive Ponticum.*
Broad leafed Wormwood.

† 2 *Absinthium tenuifolium Ponticum Galeni.*
Small Ponticke VVormwood.

¶ *The Place.*

This broad leafed Wormewood delighteth to grow on rocks and mountaines, and in vntilled places; it groweth much vpon dry bankes, it is common euery where in all countries: the best, saith *Dioscorides*, is found in Pontus, Cappadocia, and on mount Taurus: *Pliny* writeth, that Ponticke Wormwood is better than that of Italie: *Ouid* in these words doth declare that Ponticke Wormwood is extreme bitter.

Turpia deformes gignunt Absinthia campi,
Terraque de fructu, quam sit amara docet.

Vntilled barren ground the lothsome Wormwood yeelds,
And knowne it's by the fruit how bitter are the fields.

And *Bellonius* in his first booke of Singularities, chap. 76. doth shew, that there is also a broad leafed Wormwood like vnto ours, growing in the Prouinces of Pontus, and is vsed in Constantinople by the Physitions there, it is likewise found in certain cold places of Switzerland, which by reason of the chilnesse of the aire riseth not vp, but creepeth vpon the ground, whereupon diuers cal it creeping Wormwood.

¶ *The Time.*

The little flours and seeds are perfected in Iuly and August, then may Wormwood be gathered and laied vp for profitable vses.

¶ *The Names.*

It is called in Greeke ἀψίνθιον: it is named of *Apuleius*, *Absinthium rusticum*, countrey Wormwood,

Or

or peſants Wormewood: we haue named it *Abſinthium latifolium*, broad leafed Wormewood, that it may differ from the reſt: the Interpretors of the Arabians call the better ſort, which *Dioſcorides* nameth Ponticke Wormwood, *Romanum Abſinthium*, Roman Wormwood: and after theſe, the barbarous Phyſitions of the later age: the Italians name Wormwood *Aſſenſo*: the Spaniards, *Axenxios*, *Aſſenſios*, moſt of them *Donzell*: the Portingales, *Aloſna*: in high Dutch, **Weronmut**, **Wermut**: in French, *Aluyne*: in Engliſh, common Wormwood.

Victor Trincauilla, a ſingular Phyſition, in his practiſe tooke it for *Abſinthium Ponticum*.

2 This is commonly called *Abſinthium Romanum*: and in low Dutch, **Roomſche Alſene**: by which name it is knowne to very many Phyſitions and Apothecaries, who vſe this in ſtead of Ponticke wormwood: furthermore it hath a leafe and floure far leſſe than the other wormwoods: likewiſe the ſmell of this is not onely pleaſant, but it yeeldeth alſo a ſpicie ſent, wheras all the reſt haue a ſtrong and lothſome ſmell: and this Ponticke Wormwood doth differ from that which *Dioſcorides* commendeth: for *Dioſcorides* his Pontick wormwood is accounted among them of the firſt kinde, or of broad leaſed wormwood, which thing alſo *Galen* affirmeth in his ſixt booke of the Faculties of medicines, in the chapter of Sothernwood. There be three kinds of Wormwood (ſaith he) wherof they vſe to call one by the generall name, and that is eſpecially Pontick: whereby it is manifeſt that *Galen* in this place hath referred Ponticke to no other than to the firſt wormwood; and therefore many not without cauſe maruell, that *Galen* hath written in his booke of the Method of curing, how Pontick wormwood is leſſe in floure and leafe: many excuſe him, and lay the fault vpon the corruption of the booke, and in his 9. booke of Method, the leſſer they would haue the longer: therefore this wormwood with the leſſer leafe is not the right Pontick wormewood, neither againe the Arabians Romane wormewood, who haue no other Romane than Ponticke of the Grecians. Alſo many beleeue that this is called *Santonicum*, but this is not to be ſought for in Myſia, Thracia, or other countries Eaſtward, but in France beyond the Alps, if we may beleeue *Dioſcorides* his copies there be that would haue it grow not beyond the Alps of Italy, but in Galatia a countrie in Aſia, & in the region of the Sardines, which is in the leſſer Aſia, whereupon it was called in Greeke Σαρδόνιον, which was changed into the name *Santonicum* through the errour of the tranſlators: *Dioſcorides* his copies keep the word *Sardonium*, & *Galens* copies *Santonicum*, which came to poſterity as it ſeemeth. is called in Engliſh, Romane Wormewood, garden or Cypres Wormewood, and French Wormwood.

¶ *The Temperature.*

Wormewood is of temperature hot and drie, hot in the ſecond degree, and drie in the third: it is bitter and clenſing, and likewiſe hath power to binde or ſtrengthen.

¶ *The Vertues.*

It is very profitable to a weake ſtomacke that is troubled with choler, for it clenſeth it through his bitterneſſe, purgeth by ſiege and vrine: by reaſon of the binding qualitie, it ſtrengthneth and conforteth the ſtomacke, but helpeth nothing at all to remoue flegme contained in the ſtomacke, as *Galen* addeth. A

If it be taken before a ſurfeit it keepeth it off, and remoueth lothſomeneſſe, ſaith *Dioſcorides*, and it helpeth not only before a ſurfeit, but alſo it quickly refreſheth the ſtomack and belly after large eating and drinking. B

It is oftentimes a good remedie againſt long and lingring agues, eſpecially tertians: for it doth not onely ſtrengthen the ſtomacke and make an appetite to meat, but it yeeldeth ſtrength to the liuer alſo, and riddeth it of obſtructions or ſtoppings, clenſing by vrine naughtie humours. C

Furthermore, Wormewood is excellent good for them that vomite bloud from the ſpleene, the which hapneth when the ſpleene being ouercharged and filled vp with groſſe bloud doth vnburden it ſelfe, and then great plenty of bloud is oftentimes caſt vp by vomite. It happeneth likewiſe that ſtore of blacke and corrupt bloud mixed with excrements paſſeth downewards by the ſtoole, and it oftentimes hapneth that with violent and large vomiting the ſicke man fainteth or ſwouneth, or when he is reuiued doth fall into a difficult and almoſt incureable tympanie, eſpecially when the diſeaſe doth often happen; but from theſe dangers Wormewood can deliuer him, if when he is refreſhed after vomite, and his ſtrength any way recouered, he ſhall a good while vſe it, in what manner ſoeuer he himſelfe ſhall thinke good. D

Againe, Wormewood voideth away the wormes of the guts, not onely taken inwardly, but applied outwardly: it withſtandeth all putrifactions; it is good againſt a ſtinking breath; it keepeth garments alſo from the Mothes; it driueth away gnats, the bodie being annointed with the oile thereof. E

Likewiſe it is ſingular good in pulteſſes and fomentations to binde and to drie. F

Beſides all this *Dioſcorides* declareth, that it is good alſo againſt windineſſe and griping pains of the ſtomacke and belly, with Seſeli and French Spikenard: the decoction cureth the yellow iaundies or the infuſion, if it be drunke thriſe a day ſome ten or twelue ſpoonfuls at a time. G

H It helpeth them that are ſtrangled with eating of Muſhroms, or toad ſtools, if it be drunk with vineger.

I And being taken with wine, it is good againſt the poiſon of *Ixia* (being a viſcous matter proceeding from the thiſtle *Chamælion*) and of Hemlock, and againſt the biting of the ſhrew mouſe, and of the Sea Dragon: it is applied to the ſquincie or inflammations of the throat with honie and niter, and with water to night wheales, and with hony to ſwartiſh markes that come vpon bruſes.

K It is applied after the ſame manner to dim eies, and to mattering eares.

L *Ioachimus Camerarius* of Noremberg commendeth it greatly againſt the iaundice, giuing of the floures of Wormwood, Roſemarie, Sloes, of each a ſmall quantitie, and a little ſaffron, boiled in wine, the body firſt being purged and prepared by the learned Phyſition.

† The figure which formerly was in the ſecond place, was of a ſmall wormwood, not different from the common kinde, but only in the ſmalneſſe, and more aromatike taſte; it growes on mountanous places, and *Geſner* calls it *Abſinthium commune minus, vel Alpinum*: now our Authors deſcription was intended for this, whoſe figure we haue giuen you, for it is the *Abſinthium ſantonicum*, of ſome, as *Ruellius* and *Ceſalpinus*; and the *Galatium Sardonium* of *Pena* and *Lobel*.

Chap. 449. *Of Small leafed Wormewood.*

Abſinthium tenuifolium Auſtriacum.
Auſtrian Wormewood.

¶ *The Deſcription.*

SMall leafed Wormwood bringeth forth very many little branches, ſlender, a ſpan or a foot high, full of leaues, leſſe by a great deale, and tenderer than the former, moſt finely and nicely minced: the floures like thoſe of the former, hang vpon the little branches and ſprigs: the roots are ſmall, creeping ouertwhart, from whence do riſe a great number of yong ſprouts: this VVormwood alſo is ſomewhat white, and no leſſe bitter than the broad leafed one, and hath not ſo ranke, or ſo vnpleaſant a ſmell, but rather delightfull.

¶ *The Place.*

It grows plentifully in Myſia, Thracia, Hungarie, and Auſtria, and in other regions neere adioining: it is alſo found in Bohemia, and in many vntilled places of Germanie; it is a garden plant in the low Countries, and in England.

¶ *The Time.*

It bringeth forth floures and ſeed in Autumne: a little while after when winter commeth, the herbe withereth away, but the roote remaineth aliue, from which leaues and ſtalks do come againe in the ſpring.

¶ *The Names.*

‡ This *Lobel* calls *Abſinthium Ponticum Tridentinum Herbariorum: Cluſius*, *Abſinthium tenuifolium Auſtriacum: Tabernamontanus, Abſinthium Nabathæum Auicennæ:* wee may call it in Engliſh, ſmall leaued Wormwood. ‡

¶ *The Temperature.*

Small leafed VVormwood is of facultie hot and drie, it is as bitter alſo as the broad leafed one, and of like facultie.

¶ *The Vertues.*

The faculties are referred vnto the common VVormwood.

Chap.

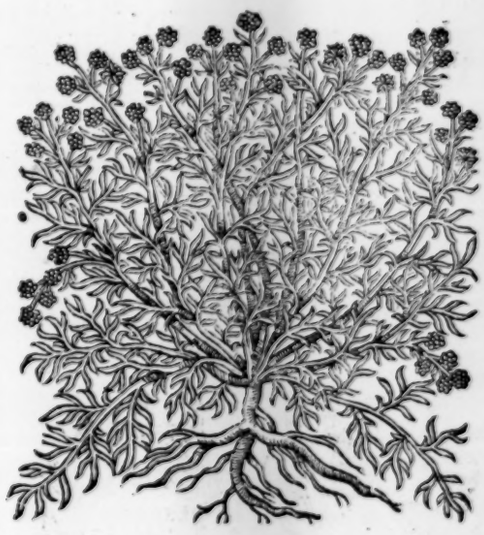
CHAP. 450. *Of Sea Wormewood.*

¶ *The Description.*

1 THe white or common Sea VVormwood hath many leaues cut and diuided into infinite fine iags, like those of Sothernwood, of a white hoarie colour and strong smell, but not vnpleasant: among which rise vp tough hoarie stalks set with the like leaues, on the top wherof do grow smal yellowish floures: the root is tough, and creepeth far abroad, by means whereof it greatly increaseth.

1 *Absinthium marinum album.*
VVhite Sea VVormwood.

2 *Absinthium marinum repens.*
Creeping Sea VVormwood.



2 The broad leafed Sea VVormwood hath very many soft leaues, growing close by the ground, of a darke swart colour, nothing so finely cut or iagged as the other of his kinde: the floures grow vpon the tops of the stalks, of a yellowish colour: the root is tough and creeping. ‡ This hath many weake slender branches commonly two foot long at their ful growth, red of colour, and creeping vpon the ground: the leaues are small, narrow, long and iagged, or parted towards their ends into sundry parcels: they are greene aboue, and grayish vnderneath: the toppes of the branches are set with many little stalkes, some inch long: which vpon short foot-stalkes comming out of the bosomes of little longish narrow leaues carry small round knops, like as in other plants of this kind: the taste is a little bitterish, and the smell not vnpleasant: this growes with M^r. *Parkinson* and others, and (as I remember) it was first sent ouer from the Isle of Rees by M^r. *Iohn Tradescant*. *Lobel* in his Obseruations mentions it by the name of *Absinth. Ponticum supinum Herbariorum*; and *Tabern.* sets it forth by the title of *Absinthium repens*. ‡

¶ *The Place.*

These VVormwoods do grow vpon the raised grounds in the salt marshes neere vnto the sea, in most places of England; which being brought into gardens doth there flourish as in his naturall place, and retaineth his smell, taste, and naturall qualitie, as hath beene often proued. ‡ I haue not

heard that the later growes wilde in any place with vs in England. ‡

¶ *The Time.*

Theſe bring forth floures and ſeeds when the other Wormwoods doe. ‡ The later ſcarce ſeedes with vs, it floures ſo late in the yeare. ‡

¶ *The Names.*

Sea VVormwood is called in Greeke ἀψίνθιον θαλάσσιον: in Latine, *Abſinthium marinum*, and likewiſe *Seriphium*: in Dutch, **See Alſene**: of diuers, *Santonicum*, as witneſſeth *Dioſcorides*: neuertheleſſe there is another *Santonicum* differing from ſea VVormwood: in Engliſh of ſome women of the countrey, Garden Cypreſſe.

¶ *The Temperature.*

Sea VVormwood is of nature hot and drie, but not ſo much as the common.

¶ *The Vertues.*

A *Dioſcorides* affirmeth, that being taken of it ſelfe, or boiled with Rice, and eaten with hony, it killeth the ſmall wormes of the guts, and gently looſeth the belly, the which *Pliny* doth alſo affirme.

B The iuice of ſea VVormwood drunke with wine reſiſteth poiſon, eſpecially the poiſon of Hemlockes.

C The leaues ſtamped with figs, ſalt-peter, and the meale of Darnel, and applied to the belly, ſides, or flankes, help the dropſie, and ſuch as are ſpleenticke.

D The ſame is ſingular againſt all inflammations, and heat of the ſtomacke and liuer, exceeding all the kindes of VVormwood for the ſame purpoſes that common VVormwood ſerueth.

E It is reported by ſuch as dwell neere the ſea ſide, that the cattell which do feed where it groweth become fat and luſty very quickly.

F The herbe with his ſtalks laid in cheſts, preſſes, and ward-robes, keepeth clothes from moths and other vermine.

Chap. 451. *Of Holy Wormewood.*

Sementina.
Holie VVormewood.

¶ *The Deſcription.*

THis Wormwood called *Sementina*, and *Semen ſanctum*, whichwe haue Engliſhed, Holy, is that kinde of Wormwood which beareth that ſeed which we haue in vſe, called VVormeſeed: in ſhops, *Semen Santolinum*: about which there hath been great controuerſie amongſt writers: ſome holding that the ſeed of *Santonicum Galatium* to be the true VVormſeed: others deeming it to be that of *Romanum Abſinthium*: it doth much reſemble the firſt of the ſea VVormwoods in ſhape and proportion: it riſeth vp with a wooddie ſtalke, of the height of a cubite, diuided into diuers branches and wings; whereupon are ſet very ſmall leaues: among which are placed cluſters of ſeeds in ſuch abundance, that to the firſt view it ſeemeth to be a plant conſiſting all of ſeed.

¶ *The Place.*

It is a forreine plant: the ſeeds being ſowne in the gardens of hot regions doe proſper well; in theſe cold countries it will not grow at all. Neuertheles there is one or two companions about London, who haue reported vnto mee that they had great ſtore of it growing in their gardens yearely, which they ſold at a great price vnto our London Apothecaries, and gained much money thereby; one of the men dwelleth by the Bagge and Bottle neere London, whoſe name is *Cornewall*; into whoſe garden I was brought to ſee the thing that I would not beleeue; for being often told

told that there it did grow, I ſtill perſiſted it was not true: but when I did behold this great quantitie of VVormwood, it was nothing elſe but common *Ameos*. How many Apothecaries haue been deceiued, how many they haue robbed of their money, and how many children haue been nothing the better for taking it, I refer it to the iudgement of the ſimpleſt, conſidering their owne report, to haue ſold many hundreth pounds weight of it; the more to their ſhame be it ſpoken, and the leſſe wit or skill in the Apothecaries: therefore haue I ſet downe this as a caueat vnto thoſe that buy of theſe ſeeds, firſt to taſte and trie the ſame before they giue it to their children, or commit it to any other vſe. ‡ Certainely our Author was either miſinformed, or the people of theſe times were very ſimple, for I dare boldly ſay there is not any Apothecary, or ſcarce any other ſo ſimple as to be thus deceiued now. ‡

¶ *The Time.*

It floureth and bringeth forth his ſeed in Iuly and Auguſt.

¶ *The Names.*

The French men call it *Barbotine*; the Italians, *Semen Zena*: whereupon alſo the Latine name *Sementina* came: the ſeed is called euery where *Semen ſanctum*: Holy-ſeed; and *Semen contra Lumbricos*: in Engliſh, VVormſeed; the herb it ſelfe is alſo called VVormſeed, or wormſeed-wort: ſome name it *Semen Zedoariæ*, Zedoarie ſeede, becauſe it hath a ſmell ſomewhat reſembling that of Zedoarie.

¶ *The Temperature.*

The ſeed is very bitter, and for that cauſe of nature hot and drie.

¶ *The Vertues.*

It is good againſt wormes of the belly and entrailes, taken any way, and better alſo if a little Rubarbe bee mixed withall, for ſo the wormes are not onely killed, but likewiſe they are driuen downe by the ſiege, which thing muſt alwaies be regarded. A

The ſeed mixed with a little *Aloe ſuccotrina*, and brought to the forme of a plaiſter, and applied to the nauell of a childe doth the like. B

Chap. 452. *Of forreine and Baſtard Wormewoods.*

1 *Abſinthium album.*
VVhite wormwood.

2 *Abſinthium Ægyptium.*
VVormwood of Ægypt.

¶ *The Deſcription.*

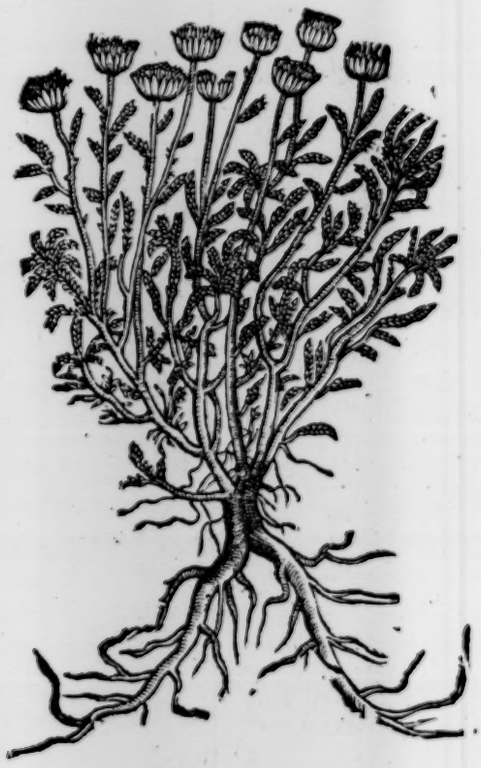
† 1 *Abſinthium album* hath ſtraight and vpright ſtalkes, a foot high, beſet with broad leaues, but very deeply cut or clouen, in ſhew like vnto thoſe of the great Daiſy, but white of colour: at the top of the ſtalkes, out of ſcaly heads, as in an vmbell grow floures, compact of ſix ſmall white leaues: the root is long, with ſome fibres annexed vnto it.

2 This kinde of Wormwood *Geſner* and that learned Apothecarie *Valerandus Donraz*, called *Abſinthium Egyptium*: the leaues of this plant are very like to the leaues of *Trichomanes*, which is our common Maiden haire, of a white colour, euery ſmall leafe ſtanding one oppoſite againſt another, and of a ſtrong ſauour.

3 This VVormwood, which *Dodonæus* calleth *Abſinthium inodorum*, and *Inſipidum*, is very like vnto the ſea VVormwood, in his ſmall and tender leaues: the ſtalke beareth flowers alſo like vnto the foreſaid Sea-Wormwood, but it is of a ſad or deep colour, hauing neither bitter taſte, nor any ſauour at all; whereupon it was called, and that very fitly, *Abſinthium inodorum*, or *Abſinthium inſipidum*: in Engliſh, fooliſh, or vnſauory wormwood. ‡ *Dodonæus* ſaith not that his *Abſinthium inſipidum* is like the ſea wormwood, but that it is very like our common broad leaued VVormwood, and ſo indeed it is, and that ſo like, that it is hard to be diſcerned therefrom, but onely by the want of bitterneſſe and ſmell. ‡

3 *Abſinthium inodorum.*
Vnſauorie VVormwood.

4 *Abſinthium marinum, Abrotani fœminæ facie.*
Small Lauander Cotton.



4 This kinde of Sea-wormwood is a ſhrubby and wooddie plant, in face and ſhew like to Lauander Cotton, of a ſtrong ſmel; hauing floures like thoſe of the common wormwood, at the firſt ſhew like thoſe of Lauander Cotton: the root is tough and wooddie.

¶ *The Place.*

Theſe plants are ſtrangers in England, yet we haue a few of them in Herbariſts gardens.

¶ *The Time.*

The time of their flouring and ſeeding is referred to the other wormwoods.

¶ *The Names.*

The white wormwood *Conradus Geſnerus* nameth *Seriphium fœmina*, and ſaith, that it is commonly called *Herba alba*, or white herbe: another had rather name it *Santonicum*; for as *Dioſcorides* ſaith, *Santonicum* is found in France beyond the Alpes, and beareth his name of the ſame country

countrey where it groweth: but that part of Swiſſerland which belongeth to France is accounted of the Romans to be beyond the Alps; and the prouince of Santon is far from it: for this is a part of Guines, ſcituate vpon the coaſt of the Ocean, beneath the floud Gerond Northward: therefore Santon Wormwood, if it haue his name from the Santons, groweth farre from the Alps: but if it grow neere adioyning to the Alps, then hath it not his name from the Santons.

¶ *The Temperature and Vertues.*

White Wormwood is hot and ſomewhat dry.

Vnſauorie Wormwood, as it is without ſmell and taſte, ſo is it ſcarſe of any hot qualitie, much leſſe hath it any ſcouring facultie. Theſe are not vſed in phyſicke, where the others may be had, being as it were wilde or degenerate kindes of Wormwood; ſome of them participating both of the forme and ſmell of other plants. A

† *This figure which was here formerly in the firſt place, by the name of Abſinthium arborescens, is the firſt of the next chapter ſaue one, where you may ſee more thereof. The white Wormwood mentioned here to the Names, but no where elſe in the Chapter, is either the ſame with, or one very like our Sea Wormewood. Let ſuch as are curious look into Cæſalpinus his Hort. Med. in the title of Abſinthium Santonicum: and in Dodonæus, Pempt. 1. lib. 2. cap. 5. where the firſt deſcription is of this Wormewood.*

Chap. 453. *Of Mugwort.*

1 *Artemiſia, mater Herbarum.*
Common Mugwort.

¶ *The Deſcription.*

1 The firſt kinde of Mug wort hath broad leaues, very much cut or clouen like the leaues of common Wormewood, but larger, of a darke greene colour aboue, and hoarie vnderneath: the ſtalkes are long and ſtraight, and full of branches, whereon do grow ſmall round buttons, which are the floures, ſmelling like Marierome when they wax ripe: the root is great, and of a wooddie ſubſtance.

2 The ſecond kinde of Mugwort hath a great thicke and wooddy root, from whence ariſe ſundry branches of a reddiſh colour, beſet full of ſmall and fine iagged leaues, verie like vnto ſea Sothernwood: the ſeed groweth alongſt the ſmall twiggy branches, like vnto little berries, which fall not from their branches in a long time after they be ripe. ‡ I know not how this differeth from the former, but only in the colour of the ſtalk and floures, which are red or purpliſh; whereas the former is more whitiſh. ‡

3 There is alſo another Mugwort, which hath many branches riſing from a wooddie root, ſtanding vpright in diſtances one from another, of an aſhie colour, beſet with leaues not much vnlike ſea Purſlane; about the lower part of the ſtalkes, and toward the top of the branches they are narrower and leſſer, and cut with great and deepe iagges, thicke in ſubſtance, and of a whitiſh colour, as all the reſt of the plant is: it yeeldeth a pleaſant ſmell like *Abrotanum marinum*, and in taſte is ſomewhat ſaltiſh: the floures are many, and yellow: which being vaded, there followeth moſſie ſeed like vnto that of the common Wormwood. ‡ The leaues of this plant are of two ſorts; for ſome of them are long and narrow, like thoſe of Lauander (whence *Cluſius* hath called it *Artemiſia folio Lauendulæ*) other ſome are cut in or diuided almoſt to the middle rib; as you may ſee it expreſt apart in a figure by it ſelfe, which ſhewes both the whole, as alſo the diuided leaues.

¶ *The*

3 *Artemiſia marina.*
Sea Mugwort.

‡ *Artemiſiæ marinæ ramulus, folia integra & diſſecta exprimens.*
A branch ſhewing the cut and vncut leaues.

¶ *The Place.*

The common Mugwort groweth wilde in ſundry places about the borders of fields, about high waies, brooke ſides, and ſuch like places.

Sea Mugwort groweth about Rie and Winchelſea caſtle, and at Portſmouth by the Iſle of Wight.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Mugwort is called in Greeke Ἀρτεμισία: and alſo in Latine *Artemiſia*, which name it had of *Artemiſia* Queene of Halicarnaſſus, and wife of noble *Mauſolus* King of Caria, who adopted it for her owne herbe: before that it was called Παρθένις, *Parthenis*, as *Pliny* writeth. *Apuleius* affirmeth that it was likewiſe called *Parthenion*; who hath very many names for it, and many of them are placed in *Dioſcorides* among the baſtard names: moſt of theſe agree with the right *Artemiſia*, and diuers of them with other herbes, which now and then are numbred among the Mugworts: it is alſo called *Mater Herbarum*: in high-Dutch, **Beifuſz**, and **Sant Johanus Gurtell**: in Spaniſh and Italian, *Artemiſia*: in French, *Armoiſe*: in low-Dutch, **Bijuoet, Sint Jans kruyt**: in Engliſh, Mugwort, and common Mugwort.

¶ *The Temperature.*

Mugwort is hot and dry in the ſecond degree, and ſomewhat aſtringent.

¶ *The Vertues.*

Pliny ſaith that Mugwort doth properly cure womens diſeaſes.

A *Dioſcorides* writeth, that it bringeth downe the termes, the birth, and the after-birth.

B And that in like manner it helpeth the mother, and the paine of the matrix, to be boyled as

C bathes for women to ſit in; and that being put vp with myrrh, it is of like force that the bath is of. And that the tender tops are boiled and drunk for the ſame infirmities; and that they are applied in manner of a pulteſſe to the ſhare, to bring downe the monethly courſe.

D *Pliny* ſaith, that the traueller or wayfaring man that hath the herbe tied about him feeleth no wearieſomneſſe at all; and that he who hath it about him can be hurt by no poyſonſome medicines, nor by any wilde beaſt, neither yet by the Sun it ſelfe; and alſo that it is drunke againſt *Opium*, or

the

the iuyce of blacke Poppy. Many other fantaſticall deuices inuented by Poets are to be ſeene in the Works of the antient Writers, tending to witchcraft and ſorcerie, and the great diſhonour of God; wherefore I do of purpoſe omit them, as things vnworthie of my recording, or your reviewing.

Mugwort pound with oyle of ſweet almonds, and laid to the ſtomacke as a plaiſter, cureth all the paines and griefes of the ſame. E

It cureth the ſhakings of the ioynts, inclining to the palſie, and helpeth the contraction or drawing together of the nerues and ſinewes. F

† There were formerly two deſcriptions of the *Artemiſia marina*; wherefore I omitted the former, being the more vnperfect.

CHAP. 454. *Of Sothernwood.*

¶ *The Kindes.*

Dioſcorides affirmeth that Sothernwood is of two kindes, the female and the male, which are euery where knowne by the names of the greater and of the leſſer: beſides theſe there is a third kinde, which is of a ſweeter ſmell, and leſſer than the others, and alſo others of a baſtard kinde.

† 1 *Abrotanum fœmina arboreſcens.*
Female Sothernwood.

2 *Abrotanum mas.*
Male Sothernwood.

¶ *The Deſcription.*

1 THe greater Sothernwood by carefull manuring doth oftentimes grow vp in manner of a ſhrub, and commeth to be as high as a man, bringing forth ſtalkes an inch thicke, or more; out of which ſpring very many ſprigs or branches, ſet about with leaues diuerſly iagged and finely indented, ſomewhat white, and of a certaine ſtrong ſmell: in ſtead of floures, little ſmal cluſters of buttons do hang on the ſprigs, from the middle to the very top, of colour yellow, and at the length turne into ſeed. The root hath diuers ſtrings.

2 The

3 *Abrotanum humile.*
Dwarfe Sothernwood.

4 *Abrotanum inodorum.*
Vnſauorie Sothernwood.

5 *Abrotanum campeſtre.*
Wilde Sothernwood.

2 The leſſer Sothernwood groweth low, ful of little ſprigs of a woody ſubſtance: the leaues are long, and ſmaller than thoſe of the former, not ſo white: it beareth cluſtering buttons vpon the tops of the ſtalks: the root is made of many ſtrings.

3 The third kinde is alſo ſhorter: the leaues hereof are iagged and deeply cut after the maner of the greater Sothernwood, but they are not ſo white, yet more ſweet, wherein they are like vnto Lauander cotton. This kinde is very full of ſeed: the buttons ſtand alongſt on the ſprigs, euen to the very top, and be of a glittering yellow. The root is like to the reſt.

4 The vnſauorie Sothernwood groweth flat vpon the ground, with broad leaues deepely cut or iagged in the edges like thoſe of the common Mugwort: among which riſe vp weake and feeble ſtalkes trailing likewiſe vpon the ground, ſet confuſedly here and there with the like leaues that grow next the ground, of a grayiſh or hoary colour, altogether without ſmell. The floures grow alongſt the ſtalkes, of a yellowiſh colour, ſmall and chaffie: the root is tough and wooddy, with ſome ſtrings anexed thereto.

5 This wilde Sothernwood hath a great long thicke root, tough and wooddy, couered

Outer

ouer with a scaly barke like the scaly backe of an adder, and of the same colour: from which rise very many leaues like those of Fennell, of an ouerworne greene colour: among which grow small twiggy branches on the tops, and alongst the stalkes do grow small clustering floures of a yellow colour: the whole plant is of a darke colour, as well leaues as stalkes, and of a strong vnsauourie smell.

¶ *The Place.*

Theophrastus saith that Sothernwood delighteth to grow in places open to the Sun: *Dioscorides* affirmeth that it groweth in Cappadocia, and Galatia a countrey in Asia, and in Hierapolis a city in Syria: it is planted in gardens almost euery where: that of Sicilia and Galatia is most commended of *Pliny*.

¶ *The Time.*

The buttons of Sothernwood do flourish and be in their prime in August, and now and then in September.

¶ *The Names.*

It is called in Greeke Ἀβρότονον: the Latines and Apothecaries keepe the same name *Abrotanum*: the Italians and diuers Spaniards call it *Abrotano*: and other Spaniards, *Yerua lombriguera*: in high Dutch, **Stabwurtz**: in low-Dutch, **Aueroone**, and **Auercruist**: the French, *Aurone*, and *Auroesme*: the English men, Sothernwood: it hath diuers bastard names in *Dioscorides*; the greater kinde is *Dioscorides* his *Fœmina*, or female Sothernwood; and *Pliny* his *Montanum*, or mountaine Sothernewood: the mountaine Sothernwood we take for the female, and the champion for the male. There be notwithstanding some that take Lauander Cotton to be the female Sothernwood; grounding thereupon, because it bringeth forth yellow floures in the top of the sprigs like cluster buttons: but if they had more diligently pondered *Dioscorides* his words, they would not haue been of this opinion: the lesser Sothernwood is *Mas*, the male, and is also *Plinies* champion Sothernwood; in Latine, *Campestre*. The third, as we haue said, is likewise the female, and is commonly called sweet Sothernwood, because it is of a sweeter sent than the rest. *Dioscorides* seemeth to call this kind *Siculum*, Sicilian Sothernwood.

¶ *The Temperature.*

Sothernwood is hot and dry in the end of the third degree: it hath also force to distribute and to rarifie.

¶ *The Vertues.*

The tops, floures, or seed boyled, and stamped raw with water and drunke, helpeth them that cannot take their breaths without holding their neckes straight vp and is a remedie for the cramp, and for sinewes shrunke and drawne together; for the sciatica also, and for them that can hardly make water; and it is good to bring downe the termes. A

It killeth wormes, and driueth them out: if it be drunke with wine it is a remedie against deadly poysons. B

Also it helpeth against the stinging of scorpions and field spiders, but it hurts the stomacke. C

Stamped and mixed with oyle it taketh away the shiuering cold that commeth by the ague fits, and it heateth the body if it be anointed therewith before the fits do come. D

If it be pounded with barley meale and laid to pushes it taketh them away. E

It is good for inflammations of the eyes, with the pulpe of a rosted Quince, or with crummes of bread, and applied pultis wise. F

The ashes of burnt Sothernwood, with some kinde of oyle that is of thin parts, as of *Palma Christi*, Radish oyle, oyle of sweet Marierome, or Organie, cureth the pilling of the haire off the head, and maketh the beard to grow quickly: being strewed about the bed, or a fume made of it vpon hot embers, it driueth away serpents: if but a branch be layd vnder the beds head they say it prouoketh venerie. G

The seed of Sothernwood made into pouder, or boyled in wine and drunke, is good against the difficultie and stopping of vrine; it expelleth, wasteth, consumeth, and digesteth all cold humors, tough slime and flegme, which do vsually stop the spleene, kidneyes, and bladder. H

Sothernwood drunke in wine is good against all venome and poyson. I

The leaues of Sothernwood boyled in water vntill they be soft, and stamped with barley meale and barrowes grease vnto the forme of a plaister, dissolue and waste all cold tumors and swellings, being applied or laid thereto. K

† The description here in the first place is that of the *Abrotanum fœmina arborescens* of *Dodonæus*, being the very first in his *Pemptades*. The figure which our Author put hereto was of the Lauander Cotton, which should haue beene in the next chapter saue one: Now the figure that hee should haue put here was put two chapters before, by the name of *Absinthium arborescens*, by which name *Lobel* also calls it: but I haue thought it fitter to put it here, because here was the better description, and the plant is the better referred to this kinde.

CHAP.

Chap. 455.

Of Oke of Ieruſalem, and Oke of Cappadocia.

1 *Botrys.*
Oke of Ieruſalem.

2 *Ambroſia.*
Oke of Cappadocia.

¶ *The Deſcription.*

1 OKe of Ieruſalem, or *Botrys*, hath ſundry ſmall ſtems a foot and a halfe high, diuiding themſelues into many ſmall branches, beſet with ſmall leaues deeply cut or iagged, very much reſembling the leafe of an Oke, which hath cauſed our Engliſh women to call it Oke of Ieruſalem; the vpper ſide of the leafe is of a deepe greene, and ſomewhat rough and hairy, but vnderneath it is of a darke reddiſh or purple colour: the ſeedie floures grow cluſtering about the branches, like the yong cluſters or blowings of the Vine: the root is ſmall and threddy: the whole herbe is of a pleaſant ſmell and ſauour, and of a feint yellowiſh colour, and the whole plant dieth when the ſeed is ripe.

2 The fragrant ſmell that this kind of *Ambroſia* or Oke of Cappadocia yeeldeth, hath moued the Poets to ſuppoſe that this herbe was meate and food for the gods: *Dioſcorides* ſaith it groweth three handfuls high: in my garden it groweth to the height of two cubits, yeelding many weake crooked and ſtreaked branches, diuiding themſelues into ſundrie other ſmall branches, hauing from the middeſt to the top thereof many moſſie yellowiſh floures not much vnlike common Wormwood, ſtandiug one before another in good order; and the whole plant is as it were couered ouer with bran or a mealy duſt: the floures do change into ſmall prickly cornered buttons, much like vnto *Tribulus terreſtris*; wherein is contained blacke round ſeed, not vnpleaſant in taſte and ſmell: the leaues are in ſhape like the leaues of Mugwort, but thinner and more tender: all the whole plant is hoary, and yeeldeth a pleaſant ſauor: the whole plant periſhed with me at the firſt approch of Winter.

¶ *The Place.*

Theſe plants are brought vnto vs from beyond the ſeas, eſpecially from Spaine and Italy.

¶ *The Time.*

They floure in Auguſt, and the ſeed is ripe in September.

¶ *The*

¶ *The Names.*

Oke of Ieruſalem is called in Greeke Βότρυς: in Latine *Botrys*: In Italian, *Botri*: in Spaniſh, *Bien granada*: in high-Dutch, **Traubenkraut**, and **Krottenkraut**: in French and low-Dutch, *Pyment*: in Engliſh, Oke of Ieruſalem; and of ſome, Oke of Paradiſe.

Oke of Cappadocia is called in Greeke Ἀμβροσία: in Latine, *Ambroſia*; neither hath it any other knowne name. *Pliny* ſaith that *Ambroſia* is a wandering name, and is giuen vnto other herbes: for *Botrys* (Oke of Ieruſalem, as we haue written) is of diuers alſo called *Ambroſia*: In Engliſh it is called Oke of Cappadocia.

¶ *The Temperature.*

Theſe plants are hot and dry in the ſecond degree, and conſiſt of ſubtill parts.

¶ *The Vertues.*

Theſe plants be good to be boyled in wine, and miniſtred vnto ſuch as haue their breſts ſtopt, A
and are ſhort winded, and cannot eaſily draw their breath, for they cut and waſte groſſe humours and tough flegme. The leaues are of the ſame force; being made vp with ſugar they commonly call it a conſerue.

It giueth a pleaſant taſte to fleſh that is ſodden with it, and eaten with the broth. B

It is dried and layd among garments, not onely to make them ſmell ſweet, but alſo to preſerue C
them from moths and other vermine; which thing it doth alſo performe.

There were formerly two more deſcriptions in this chapter, both which were made by looking vpon the figures in *Lobels Icons*; the former being of his *Ambroſia Pontanea ſtrigoſior*, which is nothing elſe but the *Coronopus Ruellii*, or Swines Creſſes. The later was of his *Ambroſia trifolia*, which our Author in the laſt chapter ſet forth by the name of *Abrotanum campeſtre*.

CHAP. 456. *Of Lauander Cotton.*

† *Chamæcypariſſus.*
Lauander Cotton.

¶ *The Deſcription.*

LAuander Cotton bringeth forth cluſtred buttons of a golden colour, and of a ſweet ſmell, and is often vſed in garlands, and decking vp of gardens and houſes. It hath a wooddy ſtocke, out of which grow forth branches like little boughes, ſlender, very many, a cubit long, ſet about with little leaues, long, narrow, purled, or crumpled; on the tops of the branches ſtand vp floures, one alone on euery branch, made vp with ſhort threds thruſt cloſe together, like to the floures of Tanſie, and to the middle buttons of the floures of Cammomill, but yet ſomething broader, of colour yellow, which be changed into ſeed of an obſcure colour. The root is of a wooddy ſubſtance. The ſhrub it ſelfe is white both in branches and leaues, and hath a ſtrong ſweet ſmell.

‡ There are ſome varieties of this plant, which *Matthiolus*, *Lobel*, and others refer to *Abrotanum fœmina*, and ſo call it; and by the ſame name our Authour gaue the figure thereof in the laſt chapter ſaue one, though the deſcription did not belong thereto, as I haue formerly noted. Another ſort thereof our Authour, following *Tabernamontanus* and *Lobel*, ſet forth a little before by the name of *Abſinthium marinum Abrotani fœminæ facie*, that *Dodonæus* calls *Santolina prima*; and this here figured, *Santolina altera*. He alſo mentioneth three other differences thereof, which chiefely conſiſt in the leaues; for his third hath very ſhort and ſmall leaues like thoſe of Heath; whence *Bauhine* calls it *Abrotanum fœmina foliis Ericæ*. The fourth hath the leaues leſſe toothed, and more like to Cypreſſe,

hence it is called in the *Aduerſ. Abrotanum peregrinum cupreſſi folijs.* The fifth hath not the ſtalkes growing vpright, but creeping: the leaues are toothed, more thicke and hoary than the reſt; in other reſpects alike. *Bauhine* calls it *Abrotanum fœmina repens caneſcens.* ‡

¶ *The Place.*

Lauander Cotton groweth in gardens almoſt euery where.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

They are called by one name *Santolina*, or Lauander Cotton: of moſt, *Chamæcypariſſus*. But *Pliny* concerning *Chamæcypariſſus* is ſo ſhort and briefe, that by him their opinions can neither be reiected nor receiued.

They are doubtleſſe much deceiued that would haue Lauander Cotton to be *Abrotanum fœmina*, or the female Sothernwood: and likewiſe they are in the wrong who take it to be *Seriphium*, ſea Wormewood; and they who firſt ſet it abroch to be a kinde of Sothernwood we leaue to their errors; becauſe it is not abſolutely to be referred to one, but a plant participating of Wormewood and Sothernwood.

¶ *The Temperature.*

The ſeed of Lauander Cotton hath a bitter taſte, being hot and dry in the third degree.

¶ *The Vertues.*

A *Pliny* ſaith, That the herbe *Chamæcypariſſus* being drunke in wine is a good medicine againſt the poyſons of all ſerpents and venomous beaſts.

B It killeth wormes either giuen greene or dry, and the ſeed hath the ſame vertue againſt wormes, but auoideth them with greater force. It is thought to be equall with the vſuall worme-ſeed.

‡ The figure which formerly was in this place was of a kinde of Moſſe, which *Tragus* ſet forth by the name of *Sauina ſilueſtris*: *Turner* and *Tabernamontanus* called it *Chamæcypariſſus*. See more thereof in the Moſſes.

Chap. 457. *Of Sperage, or Aſparagus.*

1 *Aſparagus ſatiuus.*
Garden Sperage.

2 *Aſparagus petræus.*
Stone or mountaine Sperage.

¶ *The Deſcription.*

1 THe firſt being the manured or garden Sperage, hath at his firſt riſing out of the ground thicke tender ſhoots very ſoft and brittle, of the thickeneſſe of the greateſt ſwans quil, in taſte like vnto the greene beane, hauing at the top a certaine ſcaly ſoft bud, which in time groweth to a branch of the height of two cubits, diuided into diuers other ſmaller branches, whereon are ſet many little leaues like haires, more fine than the leaues of Dill: among which come forth ſmall moſſie yellowiſh floures, which yeeld forth the fruit, greene at the firſt, afterward red as Corall, of the bigneſſe of a ſmall peaſe; wherein is contained groſſe blackiſh ſeed exceeding hard, which is the cauſe that it lieth ſo long in the ground after the ſowing, before it do ſpring vp. The roots are many thicke ſoft and ſpongie ſtrings hanging downe from one head, and ſpred themſelues all about, whereby it greatly increaſeth.

2 We haue in our mariſh and low grounds neere vnto the ſea, a Sperage of this kinde, which differeth a little from that of the garden, and yet in kinde there is no difference at all, but only in manuring, by which all things or moſt things are made more beautifull, and larger. This may be called *Aſparagus paluſtris*, mariſh Sperage.

4 *Aſparagus ſylueſtris aculeatus.*
Wilde prickly Sperage.

5 *Aſparagus ſylueſtris Spinoſus Cluſij.*
Wilde thornie Sperage.

3 Stone or mountaine Sperage is one of the wilde ones, ſet forth vnder the title of *Corruda*; which *Lobel* calleth *Aſparagus petræus*; and *Galen*, *Myacanthinus*, that doth very well reſemble thoſe of the garden, in ſtalkes, roots, and branches, ſauing that thoſe fine hairy leaues which are in the garden Sperage be ſoft, blunt, and tender; and in this wilde Sperage, ſharpe hard and pricking thornes, though they be ſmall and ſlender: the root hereof is round, of the bigneſſe of a peaſe, and of a blacke colour: the roots are long, thicke, fat, and very many.

4 This fourth kinde differeth from the laſt deſcribed, being a wilde Sperage of Spaine and Hungarie: the plant is altogether ſet with ſharpe thornes (three or foure comming forth together) as are the branches of Whinnes, Goſe, or Furſen: the fruit is blacke when it is ripe, and full of a greeniſh pulpe, wherein lie hard and blacke ſeeds, ſometimes one, otherwhiles two in a berry: the roots are like the others, but greater and tougher.

‡ 6 *Drypis.*
Sperage Thiſtle.

5 *Carolus Cluſius* deſcribeth alſo a certain wilde Speragè with ſharp prickles all alongſt the ſtalkes, orderly placed at euery ioynt one, hard, ſtiffe, and whitiſh, the points of the thornes pointing downward: from the which ioynts alſo doe grow out a few long greene leaues faſtned together, as alſo a little yellow floure, and one berry three cornered, and of a blacke colour, wherein is contained one black ſeed, ſeldome more: the roots are like the other.

6 *Drypis* being likewiſe a kinde hereof, hath long and ſmall roots, creeping in the ground like Couch graſſe; from which ſpring vp branches a cubit high, ful of knotty ioints: the leaues are ſmall like vnto Iuniper, not much differing from *Corruda* or *Nepa*: the floures grow at the top of the ſtalke in ſpokie tufts or rundles, of a white colour, cloſely thruſt together: the ſeed before it bee taken out of the huske is like vnto Rice; being taken out, like that of Melilot, of a ſaffron colour.

¶ *The Place.*

The firſt being our garden Aſparagus groweth wild in Eſſex, in a medow adioining to a mill, beyond a village called Thorp; and alſo at Singleton not far from Carbie, and in the medows neere Moulton in Lincolnſhire. Likewiſe it groweth in great plentie neere vnto Harwich, at a place called Bandamar lading, and at North Moulton in Holland, a part of Lincolnſhire.

The wilde Sperages grow in Portugal and Biſcay among ſtones, one of the which *Petrus Bellonius* doth make mention to grow in Candie, in his firſt booke of Singularities, *cap.* 18.

¶ *The Time.*

The bare naked tender ſhoots of Sperage ſpring vp in Aprill, at what time they are eaten in ſallads; they floure in Iune and Iuly; the fruit is ripe in September.

¶ *The Names.*

The garden Sperage is called in Greeke Ἀσπάραγος: in Latine likewiſe *Aſparagus*: in ſhops, *Sparagus*, and *Speragus*: in high-Dutch, **Spargen**: in low-Dutch, **Aſparges**, and **Cozalcruiſt**; that is to ſay, *Herba Coralli*, or Corall-wort, of the red berries, which beare the colour of Corall: in Spaniſh, *Aſparragos*: in Italian, *Aſparago*: in Engliſh, Sperage, and likewiſe Aſparagus, after the Latine name: in French, *Aſperges*. It is named *Aſparagus* of the excellencie, becauſe *aſparagi*, or the ſprings hereof are preferred before thoſe of other plants whatſoeuer; for this Latine word *Aſparagus* doth properly ſignifie the firſt ſpring or ſprout of euerie plant, eſpecially when it is tender, and before it do grow into a hard ſtalke, as are the buds, tendrels, or yong ſprings of wild Vine or hops, nnd ſuch like.

Wilde Sperage is properly called in Greeke Μυάγρος, which is as much to ſay as Mouſe prickle, and Ἀσπάραγος πετραῖος, that is to ſay, *Petræus Aſparagus*, or Stone Sperage: it is alſo named in Latine, *Aſparagus ſylueſtris*, and *Corruda*.

¶ *The Temperature.*

The roots of the garden Sperage, and alſo of the wilde, doe cleanſe without manifeſt heate and drineſſe.

¶ *The Vertues.*

A The firſt ſprouts or naked tender ſhoots hereof be oftentimes ſodden in fleſh broth and eaten, or boyled in faire water, and ſeaſoned with oyle, vineger, ſalt, and pepper, then are ſerued at mens tables for a ſallad; they are pleaſant to the taſte, eaſily concocted, and gently looſe the belly.

B They ſomewhat prouoke vrine, are good for the kidnies and bladder, but they yeeld vnto the body little nouriſhment, and the ſame moiſt, yet not faultie: they are thought to increaſe ſeed, and ſtir vp luſt.

‡ The Nepa formerly mentioned in this chapter, but now omitted, was againe ſet forth by our Author amongſt the Furſes, where you may finde it.

CHAP. 458.

Of Horſe-taile, or Shaue-graſſe.

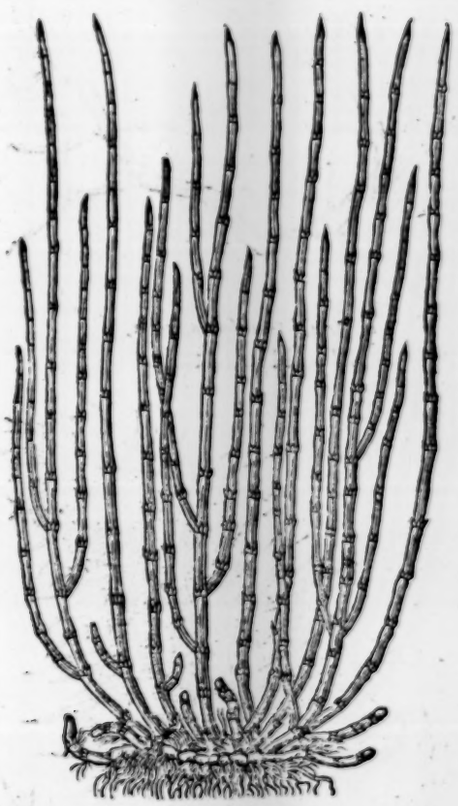
¶ *The Deſcription.*

1 GReat Horſe-taile riſeth vp with a round ſtalke, hollow within like a Reed, a cubit high, compact as it were of many ſmall pieces, one put into the end of another, ſometimes of a reddiſh colour, very rough, and ſet at euery ioint with many ſtiffe ruſh-like leaues or rough briſtles, which maketh the whole plant to reſemble the taile of a horſe, whereof it tooke his name: on the top of the ſtalke do ſtand in ſtead of floures cluſtered and thicke Catkins, not vnlike to the firſt ſhoots of Sperage, which is called *Myacantha*: the root is ioynted, and creepeth in the ground.

2 This ſmall or naked Shaue-graſſe, wherewith Fletchers and Combe-makers do rub and poliſh their worke, riſeth out of the ground like the firſt ſhoots of Aſparagus, iointed or kneed by certaine diſtances like the precedent, but altogether without ſuch briſtly leaues, yet exceeding rough and cutting: the root groweth aſlope in the earth, like thoſe of the Couch-graſſe.

1 *Equiſetum maius.*
Great Horſe-taile.

2 *Equiſetum nudum:*
Naked Horſe-taile.



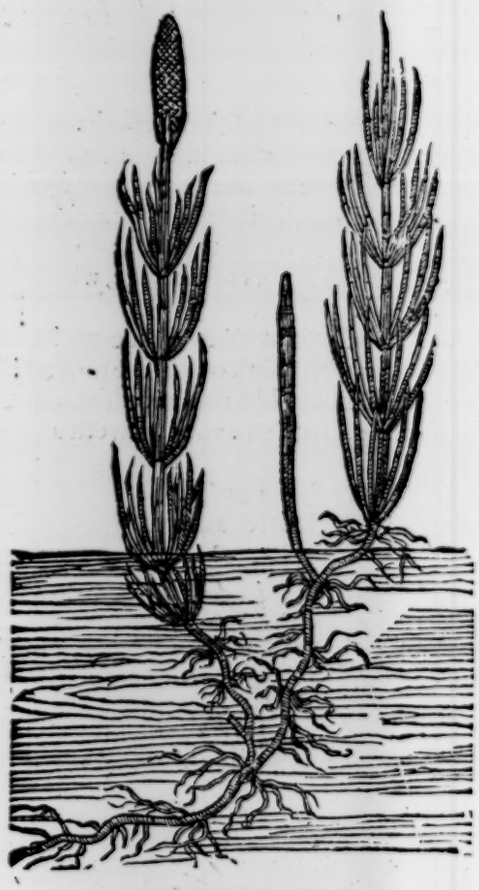
3 Horſe-taile which for the moſt part groweth among corne, and where corne hath been, hath a very ſlender root, and ſingle; from which riſe vp diuers iointed ſtalkes, whereon doe grow verie long rough narrow iointed leaues, like vnto the firſt deſcribed, but thicker and rougher, as is the reſt of the plant.

4 Water Horſe-taile, that growes by the brinks of riuers and running ſtreams, and often in the midſt of the water, hath a very long root, according to the depth of the water, groſſe, thicke, and iointed, with ſome threds anexed thereto: from which riſeth vp a great thick iointed ſtalke, whereon do grow long rough ruſhy leaues, pyramide or ſteeple faſhion. The whole plant is alſo tough, hard, and fit to ſhaue and rub wooden things as the other.

5 This kinde of Horſe-taile that growes in woods and ſhadowie places, hath a ſmall root, and ſingle, from which riſeth vp a rough chamfered ſtalke ioynted by certaine ſpaces, hauing at each ioynt two buſhes of rough briſtly leaues ſet one againſt another like the other of his kinde.

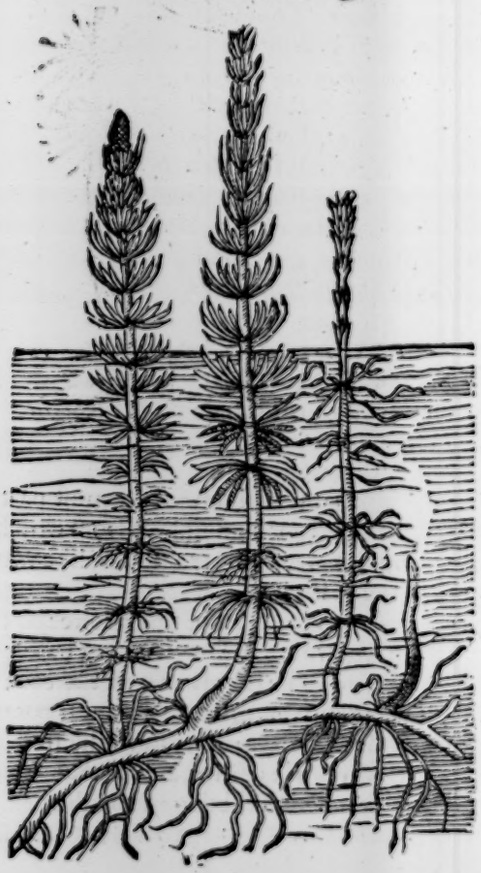
3 *Equiſetum ſegetale.*
Corne Horſe-taile.

4 *Equiſetum paluſtre.*
Water Horſe-taile.



5 *Equiſetum ſyluaticum.*
Wood Horſe-taile.

6 *Cauda equina fœmina.*
Female Horſe-taile.



9 *Iuncaria Salmanticenſis.*
Italian ruſhie Horſ-taile.

6 The female Horſe taile groweth for the moſt part in wateriſh places, and by the brinks of ſmall rills and pirling brookes; it hath a long root like that of Couch graſſe, from which riſe vp diuers hollow ſtalkes, ſet about at certaine diſtances with ſmal leaues in rundles like thoſe of Woodroofe, altogether barren of ſeed and floure, whereof it was called by *Lobel*, *Polygonon fœmina ſemine Vidua.* ‡ This is ſometimes found with tenne or more ſeedes at each ioynt; whence *Bauhine* hath called it *Equiſetum paluſtre breuioribus folijs poly ſpermon.*‡

‡ 7 In ſome boggie places of this kingdome is found a rare and pretty *Hippuris* or Horſe taile, which growes vp with many little branches, ſome two or three inches high, putting forth at each ioynt many little leaues, cluſtering cloſe about the ſtalke, and ſet after the manner of other Horſe-tailes: towards the tops of the branches the ioynts are very thicke: the colour of the whole plant is gray, a little inclining to green, very brittle, and as it were ſtony or grauelly like Coralline, and will craſh vnder your feet, as if it were frozen; and if you chew it, you ſhall finde it all ſtonie or grauelly. My friend Mr. *Leonard Buckner* was the firſt that found this plant, and brought it to me; he had it three miles beyond Oxford, a little on this ſide Euanſham-ferry, in a bog vpon a common by the Beacon hill neere Cumner-wood, in the end of Auguſt, 1632. Mr. *Bowles* hath ſince found it growing vpon a bog not far from Chiſſelhurſt in Kent. I queſtion whether this bee not the *Hippuris lacuſtris quædam folijs manſù arenoſis* of *Geſner*: but if *Geſners* be that which *Bauhine* in his *Prodromus, pag.* 24. ſets forth by the name of *Equiſetum nudum minus variegatum*, then I iudge it not to be this of my deſcription: for *Bauhines* differs from this in that it is without leaues, and ofttimes bigger: the ſtalks of his are hollow, theſe not ſo: this may be called *Hippuris Coralloides*, Horſe-taile Coralline.

8 Towards the later end of the yeare, in diuers ditches, as in Saint Iames his Parke, in the ditches on the backe of Southwarke towards Saint Georges fields, &c. you may finde couered ouer with watera kinde of ſtinking Horſe-taile: it growes ſometimes a yard long, with many ioints and branches, and each ioint ſet with leaues, as in the other Horſe-tailes, but they are ſomewhat iagged or diuided towards the tops. I take this to be the *Equiſetum fatidum ſub aqua repens*, deſcribed in the fift place of *Bauhinus* his *Prodromus*: we may call it in Engliſh, Stinking water Horſe-taile.‡

9 *Cluſius* hath ſet forth a plant, that he referreth vnto the ſtocke of Horſe-tailes, which he thus deſcribeth: it hath many twiggie or ruſhie ſtalks, whereupon it was called *Iuncaria*: and may bee Engliſhed, Ruſh-weed: the leaues grow vpon the branches like thoſe of Flax: on the toppes of the ſtalks grow ſmall chaffie floures of a whitiſh colour. The ſeed is ſmall, and blacke of colour. The root is little and white: the whole plant is ſweetiſh in taſte.

10 *Dodonæus* ſetteth forth another Horſe-taile, which he called climing Horſe-taile, or horſtaile of Olympus. There is (ſaith he) another plant like Horſe-taile, but greater and higher. It riſeth vp oftentimes with a ſtalke as big as a mans arme, diuided into many branches: out of which there grow long ſlender ſprigs very full of ioints, like to the firſt Horſe-taile. The floures ſtand about the ioints, of a moſſie ſubſtance, ſmall as are thoſe of the Cornell tree; in places whereof grow vp red fruit full of ſowre iuice, not vnlike to little Mulberries, in which is the ſeed. The root is hard and woodd ie. This growes now and then to a great height, and ſometimes lower. *Bellonius* writeth in his Singularities, that it hath been ſeene to be equall in height with the Plane tree: it climeth vp lower, neere to ſhorter and leſſer trees or ſhrubs, yet doth it not faſten it ſelfe to the trees with any tendrels or claſping aglets; much leſſe doth it winde it ſelfe about them, yet doth it delight to ſtand neere and cloſe vnto them.

¶ The

¶ *The Place.*

The titles and deſcriptions ſhew the place of their growing: the laſt *Bellonius* reporteth to grow in diuers vallies of the mountaine Olympus, and not far from Raguſa a citie in Sclauonia.

¶ *The Time.*

They floure from Aprill to the end of Sommer.

¶ *The Names.*

Horſe-taile is called in Greeke ἵππουρις, *Hippuris*: in Latine, *Equiſetum* and *Equinalis*: of *Plinie* in his 15. booke, 28 chap. *Equiſetis*, of the likeneſſe of a horſe haire: of ſome, *Salix equina*: in ſhoppes, *Cauda equina*: in high Dutch, **Schaffthew**: in low Dutch, **Peerdſteert**: in Italian, *Coda di Cauallo*: in Spaniſh, *Coda de mula*: in French, *Queue de cheual*: and *Caqueue*: in Engliſh, Horſe-taile, and Shaue-graſſe.

Shaue-graſſe is not without cauſe named *Aſperella*, of his ruggedneſſe, which is not vnknowne to women, who ſcoure their pewter and woodden things of the kitchin therewith: which the German women call **Kannenkraut**: and therefore ſome of our huſwiues do call it Pewterwoort. Of ſome the tenth is called *Ephedra*, *Anobaſis*, and *Caucon*.

¶ *The Temperature.*

Horſe-taile, as *Galen* ſaith, hath a binding facultie, with ſome bitterneſſe, and therefore it doth mightily dry, and that without biting.

¶ *The Vertues.*

A *Dioſcorides* ſaith, that Horſe-taile being ſtamped and laied to, doth perfectly cure wounds, yea though the ſinewes be cut in ſunder, as *Galen* addeth. It is of ſo great and ſo ſingular a vertue in healing of wounds, as that it is thought and reported for truth, to cure the wounds of the bladder, and other bowels, and helpeth ruptures or burſtings.

B The herbe drunke either with water or wine, is an excellent remedy againſt bleeding at the noſe, and other fluxes of bloud. It ſtaieth the ouermuch flowing of womens floures, the bloudy flix, and the other fluxes of the belly.

C The iuice of the herbe taken in the ſame manner can do the like, and more effectually.

D Horſe-taile with his roots boiled in wine, is very profitable for the vlcers of the kidnies & bladder, the cough and difficultie of breathing.

Chap. 459. *Of Sea-Cluſter, or Sea Raiſon.*

† 1 *Vua marina minor.*
Small Sea Grape.

¶ *The Deſcription.*

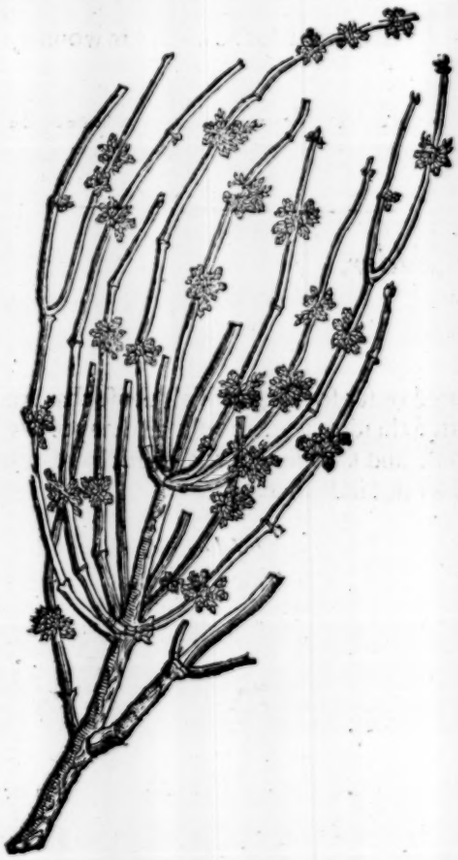
1 Small Sea Grape is not vnlike to horſtaile: it bringeth forth ſlender ſtalks, almoſt like ruſhes, ſet with many little ioints, ſuch as thoſe are of the Horſe-taile, and diuided into many wings and branches; the tops whereof are ſharpe pointed, ſomewhat hard and pricking: it is without leaues: the floures grow in cluſters out of the ioints, with little ſtems, they are ſmall and of a whitiſh green colour: the fruit conſiſteth of many little pearles, like to the vnripe berries of Raſpis, or Hind-berry: when it is ripe it is red with a ſaffron colour, in taſte ſweet and pleaſant: the ſeede or kernell is hard, three ſquare, ſharpe on euery ſide, in taſte binding: the root is iointed, long, and creeps aſlope: the plant it ſelfe alſo doth rather lie on the ground than ſtand vp: it groweth all full of ſmall ſtalkes and branches, caſting themſelues all abroad.

2 *Carolus Cluſius* hath ſet forth another ſort of ſea Grape, far different from the precedent; it riſeth vp to the height of a man, hauing manie branches of a wooddie ſubſtance, in form like to Spaniſh Broome, without any leaues at all: whereupon doe grow cluſters of floures vpon ſlender foot-ſtalks, of a yellowiſh moſſie or herby colour, like thoſe of the Cornell tree: after which come the fruit like vnto the mulberrie, of a reddiſh colour and ſower taſte, wherein lieth hid one or two

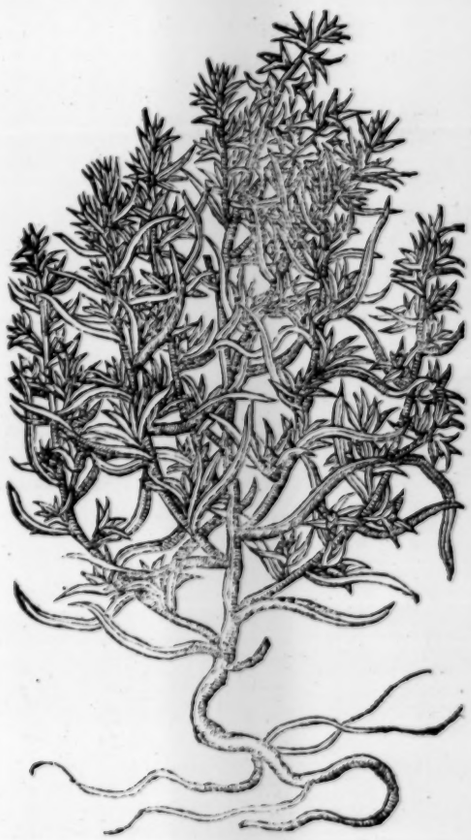
ſeeds

ſeeds like thoſe of Millet, blacke without, and white within: the root is hard, tough, and wooddie.

2 *Vua marina maior.*
Great ſhrubbie ſea Grape.



3 *Tragos Matthioli.*
Baſtard Sea Grape.



3 *Tragon Matthioli*, or rather *Tragos improbus, Matthioli*, which he vnaduiſedly called *Tragon*, is without controuerſie nothing elſe but a kinde of *Kali*: this plant riſeth vp out of the ground with ſtalks ſeldome a cubite high, diuided into ſundry other groſſe, thicke, and writhen branches, ſet, or armed with many pricking leaues, of the colour and ſhape of *Aizoon*, and ſomewhat thicke and fleſhie: among which come forth ſuch prickley burres, as are to be ſeen in *Tribulus terreſtris*, as that it is hard for a man to touch any part thereof without pricking of the hands: the floures are of an herbie colour, bringing forth flat ſeed like vnto *Kali*: the root is ſlender, and ſpreadeth vnder the turfe of the earth: the whole plant is full of clammie iuice, not any thing aſtringent, but ſomewhat ſaltiſh, and of no ſingular vertue that is yet knowne: wherefore I may conclude, that this cannot be *Tragos Dioſcoridis*, and the rather, for that this *Tragon* of *Matthiolus* is an herbe, and not a ſhrub, as I haue before ſpoken in *Vua marina*, neither beareth it any berries or graines like wheat, neither is it pleaſant in taſte and ſmell, or any thing aſtringent, all which are to be found in the right *Tragos* before expreſſed; which (as *Dioſcorides* ſaith) is without leaues, neither is it thorney as *Tragus improbus Matthioli* is: this plant I haue found growing in the Iſle of Shepey, in the tract leading to the houſe of Sir *Edward Hobby*, called Sherland.

¶ *The Place.*

It loueth to grow vpon dry banks and ſandy places neere to the ſea: it is found in Languedocke, not far from Montpelier, and in other places by the ſea ſide, and is a ſtranger in England.

¶ *The Time.*

When it groweth of it ſelfe the fruit is ripe in Autumne, the plant it ſelfe remaineth long green, for all the cold in Winter.

¶ *The Names.*

It is called of the later Herbariſts, *Vua marina*: in French, *Raiſin de Mer*, of the pearled fruit, and the likeneſſe that it hath with the Raſpis berrie, which is as it were a Raiſon or Grape, conſiſting of many little ones: it is named in Greeke τραγος, but it is not called *Tragus*, or *Traganos*, of a Goat (for ſo ſignifieth the Greeke word) or of his ranke and rammiſh ſmell, but becauſe it bringeth forth

fruit

fruit fit to be eaten, of the Verbe πασω, which ſignifieth to eat: it may be called Scorpion, becauſe the ſprigs thereof are ſharpe pointed like to the Scorpions taile.

¶ *The Temperature.*

The berries or Raiſons, and eſpecially the ſeed that is in them haue a binding quality, as we haue ſaid, and they are drie in the later end of the ſecond degree.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the Raiſons of ſea Grape do ſtay the flix, and alſo the whites in women, when they much abound.

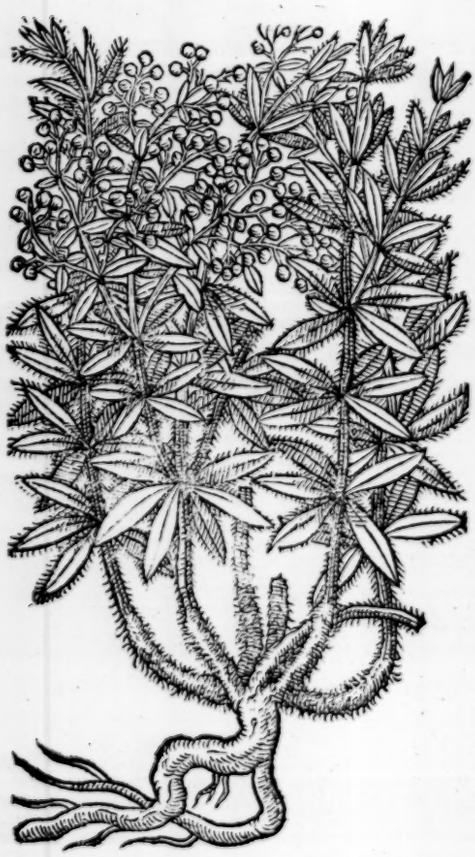
† Our Author as you ſee gaue the hiſtory of the leſſer in the firſt place, but formerly the figure was in the third place, and another figure of the ſame in the ecnd place, and the figure of the greater was in the firſt place.

Chap. 460. *Of Madder.*

¶ *The Kindes.*

There is but one kinde of Madder onely which is manured or ſet for vſe, but if all thoſe that are like vnto it in leaues and manner of growing were referred thereto, there ſhould be many ſorts: as Gooſe-graſſe, ſoft Cliuer, our Ladies Bedſtraw, Woodroofe, and Croſſe-woort, all which are like to Madder in leaues, and therefore they be thought to be wilde kinds thereof.

1 *Rubia tinctorum.*
Red Madder.



2 *Rubia ſylueſtris.*
Wilde Madder.

¶ *The Deſcription.*

1 The garden or manured Madder hath long ſtalks or trailing branches diſperſed farre abroad vpon the ground, ſquare, rough, and full of ioints; at euery ioint ſet round with greene rough leaues, in manner of a ſtarre, or as thoſe of Woodroofe: the floures grow at the toppe of

of the branches, of a faint yellow colour: after which come the ſeed, round, greene at the firſt, afterward red, and laſtly of a blacke colour: the root long, fat, full of ſubſtance, creepeth far abroad within the vpper cruſt of the earth, and is of a reddiſh colour when it is greene and freſh.

2 Wilde Madder is like in forme vnto that of the garden, but altogether ſmaller, and the leaues are not ſo rough, but ſmooth and ſhining: the floures are white: the root is very ſmall and tender, and oftentimes of a reddiſh colour.

3 *Rubia marina.*
Sea Madder.

‡ 4 *Rubia ſpicata Cretica.*
Small Candie Madder.

3 Sea Madder hath a root two foot long, with many dry threds hanging thereat, of a reddiſh colour like Alkanet, on the outſide of the ſame forme and bigneſſe, but within it of the colour of the ſcrapings of Iuniper, or Cedar wood, ſending forth diuers ſlender ſtalks round and ful of ioints: from which come forth ſmall thin leaues, ſtiffe and ſharpe pointed, ſomewhat hairie, in number commonly foure, ſtanding like a Burgonion croſſe; from the boſome of which come forth certain tufts of ſmaller leaues thruſt together vpon a heape: the floures grow at the top of the ſtalks, of a pale yellowiſh colour.

‡ *Rubia ſpicata Cretica Cluſij.*

‡ 4 This hath proceeding from the root many knottie foure ſquare rough little ſtalks, a foot high, diuided immediately from the root into many branches, hauing but one ſide branch growing forth of one ioint: about which ioints grow ſpred abroad foure or fiue, ſometimes ſixe narrow, ſhort, ſharpe pointed leaues, ſomewhat rough: the toppes of the ſtalkes and branches are nothing but long ſmall foure ſquare ſpikes or eares, made of three leafed greene huskes: out of the top of each huske groweth a very ſmall greeniſh yellow floure, hauing foure exceeding ſmal leaues ſcarce to be ſeene: after which followeth in each huske one ſmall blackiſh ſeed, ſomewhat long, round on the one ſide, with a dent or hollowneſſe on the other. The root is ſmall, hard, wooddie, crooked or ſcragged, with many little branches or threds, red without, and white within, and periſheth when the ſeeds are ripe. Iuly, 19. 1621.

Synanchica

Synanchica Lug. p. 1185.

5 The root is crooked, blackiſh without, yellow vnderneath the skinne, white within that and wooddie; about fiue or ſix inches long, with many hairy ſtrings: from the root ariſe many foure-ſquare branches trailing vpon the ground, ſometimes reddiſh towards the root: the leaues are ſmall and ſharpe pointed, like thoſe of *Gallium*, and grow along the ſtalke, on certaine knees or ioints, foure or fiue together, ſometimes fewer: from thoſe ioints the ſtalk diuideth it ſelfe towards the top into many parts, whereon grow many floures, each floure hauing foure leaues, ſometimes white, ſometimes of a fleſh colour, and euery leafe of theſe fleſh coloured leaues is artificially ſtraked in the middle, and neere the ſides with three lines of a deeper red, of no pleaſant ſmell: after which commeth the ſeed ſomething round, growing two together like ſtones. It floureth all the Sommer long, and groweth in drie Chalkie grounds aboundantly. Auguſt 13. 1619. *Iohn Goodyer.* ‡

‡ 6 *Rubia minima.*
Dwarfe Madder.

‡ 6 *Lobel* thus deſcribes this Dwarfe Madder: there is another (ſaith hee) which I gathered, growing vpon Saint Vincents rocks not farre from Briſtow: the leaues are of the bigneſſe of thoſe of Rupture-woort, ſharpe pointed, and growing after the manner of thoſe of Madder, vpon little creeping ſtalkes, ſome inch and halfe high, whereon grow yellowiſh ſmall floures. The root is ſmall, and of the colour of Corall. ‡

¶ *The Place.*

Madder is planted in gardens, and is verie common in moſt places of England. Maſter *George Bowles* found it growing wilde on Saint Vincents rocke; and out of the Cliffes of the rockes at Aberdovie in Merioneth ſhire.

The ſecond groweth in moiſt medowes, in mooriſh grounds, and vnder buſhes almoſt euery where.

3 This grows by the ſea ſide in moſt places.

‡ The fourth growes onely in ſome few gardens with vs, but the fifth may bee found wilde in many places: I found it in great plenty on the hill beyond Chattam in the way to Canturburie. ‡

¶ *The Time.*

They flouriſh from May vnto the end of Auguſt: the roots are gathered and dried in Autumne, and ſold to the vſe of Diers and Medicine.

¶ *The Names.*

Madder is called in Greeke ἐρυθρόδανον; *Erythrodanum*: in Latine, *Rubia*, and *Rubeia*: in ſhops, *Rubia tinctorum*: *Paulus Ægineta* ſheweth that it is named *Thapſon* which the Diers vſe, and the Romanes call it *Herba Rubia*: in Italian *Rubbia*, and *Robbia*: in Spaniſh, *Ruvia*, *Roya*, and *Granza*: in French, *Garance*: in high Dutch, **Rotte**: in low Dutch, **Mee**, and **Mee Crappen**: in Engliſh, Madder, and red Madder.

¶ *The Temperature.*

Of the temperature of Madder, it hath beene diſputed among the learned, and as yet not cenſured, whether it doe binde or open; ſome ſay both; diuers diuerſly deeme: a great Phyſition (I do not ſay the great learned) called me to account as touching the faculties heereof, although he had no commiſſion ſo to doe, notwithſtanding I was content to be examined vpon the point, what the nature of Madder was, becauſe I haue written that it performeth contrary effects, as ſhall be ſhewed: the roots of Madder, which both the Phyſitions and diers doe vſe, as they haue an obſcure binding power

power and force; ſo be they likewiſe of nature and temperature cold and dry: they are withall of diuers thin parts, by reaſon whereof there colour doth eaſily pierce: yet haue they at the firſt a certain little ſweetnes, with an harſh binding quality preſently following it; which not onely we our ſelues haue obſerued, but alſo *Auicen* the prince of Phyſitions, who in his 58. Chapter hath written, that the root of Madder hath a rough and harſh taſte: now M^r. Doctor, whether it binde or open I haue anſwered, attending your cenſure: but if I haue erred, it is not with the multitude, but with thoſe of the beſt and beſt learned.

¶ *The Vertues.*

The decoction of the roots of Madder is euery where commended for thoſe that are burſten, A
bruſed, wounded, and that are fallen from high places.

It ſtencheth bleeding, mitigateth inflammations, and helpeth thoſe parts that be hurt and B
bruſed.

For theſe cauſes they be mixed with potions, which the later Phyſitians call wound drinkes: in C
which there is ſuch force and vertue, as *Matthiolus* alſo reporteth, that there is likewiſe great hope of curing of deadly wounds in the cheſt and intrails.

Our opinion and judgement is confirmed by that moſt expert man, ſometimes Phyſition of D
Louaine, *Iohannes Spiringus*, who in his *Rapſodes* hath noted, that the decoction of Madder giuen with *Triphera*, that great compoſition is ſingular good to ſtay the reds, the hemorrhoides and bloudy flixe, and the ſame approoued by diuers experiments: which confirmeth Madder to be of an aſtringent and binding qualitie.

Of the ſame opinion as it ſeemeth is alſo *Eros Iulia* her freed man (commonly called *Trotula*) E
who in a compoſition againſt vntimely birth doth vſe the ſame: for if he had thought that Madder were of ſuch a qualitie as *Dioſcorides* writeth it to be of, he would not in any wiſe haue added it to thoſe medicines which are good againſt an vntimely birth.

For *Dioſcorides* reporteth, that the root of Madder doth plentifully prouoke vrine, and that F
groſſe and thicke, and oftentimes bloud alſo, and it is ſo great an opener, that being but onely applied, it bringeth downe the menſes, the birth, and after-birth: but the extreme rednes of the vrine deceiued him, that immediately followeth the taking of Madder, which redneſſe came as he thought, from bloud mixed therewith, which notwithſtanding commeth no otherwiſe then from the colour of the Madder.

For the root hereof taken any maner of way doth by & by make the vrine extreme red: no other- G
wiſe than Rubarb doth make the ſame yellow, not changing in the meane time the ſubſtance thereof, nor making it thicker than it was before, which is to be vnderſtood in thoſe which are in perfect health, which thing doth rather ſhew that it doth not open, but binde, no otherwiſe than Rubarbe doth: for by reaſon of his binding quality the wateriſh humors do for a while keepe their colour. For colours mixed with binding things do longer remaine in the things coloured, and do not ſo ſoone vade: this thing they will know that gather colours out of the iuices of floures and herbes, for with them they mixe allume, to the end that the colour may be retained and kept the longer, which otherwiſe would be quickely loſt. By theſe things it manifeſtly appeareth that Madder doth nothing vehemently either clenſe or open, and that *Dioſcorides* hath raſhly attributed vnto it this kinde of qualitie, and after him *Galen* and the reſt that followed, ſtanding ſtiffely to his opinion.

Pliny ſaith, that the ſtalkes with the leaues of Madder, are vſed againſt ſerpents. H

The root of Madder boiled in Meade or honied water, and drunken, openeth the ſtopping of the I
liuer, the milt and kidnies, and is good againſt the jaundiſe.

The ſame taken in like maner prouoketh vrine vehemently, inſomuch that the often vſe thereof K
cauſeth one to piſſe bloud, as ſome haue dreamed.

Langius and other excellent Phyſitions haue experimented the ſame to amend the lothſome L
colour of the Kings-euill, and it helpeth the vlcers of the mouth, if vnto the decoction be added a little allume and hony of Roſes.

‡ 5 The fifth being the *Synanchica* of *Daleſchampius*, dries without biting, and it is excellent M
againſt ſqinancies, either taken inwardly, or applied outwardly, for which cauſe they haue called it *Synanchica*, *Hiſt. Lugd.* ‡

Chap. 461. *Of Gooſe-graſſe, or Cliuers.*

¶ *The Deſcription.*

1 A *Parine*, Cliuers or Gooſe-graſſe, hath many ſmall ſquare branches, rough and ſharpe, full of joints, beſet at euery joint with ſmall leaues ſtar faſhion, and like vnto ſmall Madder:

the floures are very little and white, pearking on the tops of the ſprigs: the ſeeds are ſmall, round, a little hollow in the middeſt in maner of a nauell, ſet for the moſt part by couples: the roots ſlender and full of ſtrings: the whole plant is rough, and his ruggednesſe taketh hold of mens veſtures and woollen garments as they paſſe by: being drawne along the tongue it fetcheth bloud: *Dioſcorides* reports, that the ſheepheards in ſtead of a Cullender do vſe it to take haires out of milke, if any remaine therein.

2 The great Gooſe-graſſe of *Pliny* is one of the Moone-worts of *Lobel*, it hath a very rough tender ſtalke, whereupon are ſet broad leaues ſomewhat long, like thoſe of Scorpion graſſe, or *Alyſſon Galeni*, *Galens* Moone-woort, very rough and hairy, which grow not about the joints, but three or foure together on one ſide of the ſtalke: the floures grow at the top of the branches, of a blew colour: after which commeth rough cleauing ſeeds, that do ſticke to mens garments which touch it: the root is ſmall and ſingle.

1 *Aparine.*
Gooſe-graſſe or Cleuers.

2 *Aparine maior Plinij:*
Great Gooſe-graſſe.

¶ *The Place.*

Gooſe-graſſe groweth neere the borders of fields, and oftentimes in the fields themſelues mixed with the corne alſo by common waies, ditches, hedges, and among thornes: *Theophraſtus* and *Galen* write, that it groweth among Lentles, and with hard embracing it doth choke it, and by that meanes is burdenſome and troubleſome vnto it.

¶ *The Time.*

It is found plentifully euery where in ſummer time.

¶ *The Names.*

It is named in Greeke ἀπαρίνη: *Apparine:* in Latine, *Lappa minor*, but not properly: *Pliny* affirmeth it to be *Lappaginis ſpeciem:* of ſome, *Philanthropos*, as though he ſhould ſay, a mans friend, becauſe it taketh hold of mens garments; of diuers alſo for the ſame cauſe, *Philadelphos:* in Italian, *Speronella:* in Spaniſh, *Preſera*, or *amor di Hortalano:* in high Dutch, **Kleeb kraut:** in French, *Reble*, *ou Grateron:* in low Dutch, **Kleefcruyt:** in Engliſh, Gooſe-ſhare, Gooſe-graſſe, Cleuer, or Clauer.

¶ *The Temperature.*

It is, as *Galen* ſaith, moderately hot and dry, and ſomewhat of thin parts.

¶ *The*

¶ *The Vertues.*

The iuice which is preſſed out of the ſeeds, ſtalks, and leaues, as *Dioſcorides* writeth, is a remedie for them that are bitten of the poiſonſome ſpiders called in Latine *Phalangia*, and of vipers if it be drunke with wine. A

And the herbe ſtamped with ſwines greaſe waſteth away the kernels by the throte. B

Pliny teacheth that the leaues being applied do alſo ſtay the aboundance of bloud iſſuing out of wounds. C

Women do vſually make pottage of Cleuers with a little mutton and Otemeale, to cauſe lankneſſe, and keep them from fatneſſe. D

CHAP. 462. *Of Croſſe-woort.*

¶ *The Deſcription.*

1 CRoſſe-woort is a low and baſe herbe, of a pale greene colour, hauing many ſquare feeble rough ſtalks full of ioints or knees, couered ouer with a ſoft downe: the leaues are little, ſhort, & ſmal, alwaies foure growing together, and ſtanding croſſewiſe one right againſt another, making a right Burgunion croſſe: toward the top of the ſtalke, and from the boſome of thoſe leaues come forth very many ſmall yellow floures, of a reaſonable good ſauour, each of which is alſo ſhaped like a Burgunion croſſe: the roots are nothing elſe but a few ſmall threds or fibres.

1 *Cruciata.*
Croſſe-woort.

‡ 2 *Rubia Cruciata lævis.*
Croſſe-woort Madder.

‡ 2 This in mine opinion may be placed here as fitly as any where els; for it hath the leaues ſtanding croſſe-waies foure at a ioint, ſomewhat like thoſe of the largeſt Chickweed: the ſtalkes are betweene a foote and a halfe and two cubites high. The white Starre-faſhioned floures ſtand in roundles about the tops of the ſtalks. It growes plentifully in Piemont, on the hills not farre from Turine. *Lobel* ſets it forth by the name of *Rubia Lævis Taurinenſium.* ‡

¶ *The Place.*

Cruciata, or Croſſe-woort, groweth in moiſt and fertile medowes; I found the ſame growing in the Churchyard of Hampſtead neere London, and in a paſture adioining thereto, by the mill: alſo it groweth in the Lane or high way beyond Charlton, a ſmall village by Greenwich, and in ſundry other places.

¶ *The Time.*

It floureth for the moſt part all Sommer long.

¶ *The Names.*

It is called *Cruciata*, and *Cruciatis*, of the placing of the leaues in manner of a Croſſe: in Engliſh, Croſſe-woort, or Golden Mugweet.

¶ *The Temperature.*

Croſſewoort ſeemeth to be of a binding and dry qualitie.

¶ *The Vertues.*

A Croſſewoort hath an excellent propertie to heale, ioine, and cloſe wounds together, yea it is very fit for them, whether they be inward or outward, if the ſaid herbe be boiled in wine and drunke.

B The decoction thereof is alſo miniſtred with good ſucceſſe to thoſe that are burſten: and ſo is the herbe, being boiled vntill it bee ſoft, and laied vpon the burſten place in manner of a pultis.

Chap. 463. *Of Woodrooffe.*

1 *Aſperula.* Woodrooffe.

‡ 2 *Aſperula flore caruleo.* Blew Woodrooffe.

¶ *The Deſcription.*

1 WOodrooffe hath many ſquare ſtalkes full of ioints, and at euery knot or ioint ſeuen or eight long narrow leaues, ſet round about like a ſtar, or the rowell of a ſpurre: the floures grow at the top of the ſtems, of a white colour, and of a very ſweet ſmell, as is the reſt of the herbe, which being made vp into garlands or bundles, and hanged vp in houſes in the heat of Sommer, doth very wel attemper the aire, coole and make freſh the place, to the delight and comfort of ſuch as are therein.

2 There

‡ 3 *Saginæ Spergula.*
Spurrye.

2 There is another sort of Woodrooffe called *Asperula Cærulea*, or blew Woodrooffe; it is an herbe of a foot high, soft, hairy, and something branched, with leaues & stalks like those of white Woodrooffe: the floures thereof are blew, standing vpon short stems on the tops of the stalks: the seed is small, round, and placed together by couples: the root is long, and of a red colour.

3 There is another herb called *Saginæ spergula*, or Spurry, which is sown in Brabant, Holland, and Flanders, of purpose to fatten cattel, and to cause them to giue much milke, and there called Spurrey, and Franke Spurrey: it is a base and low herbe, very tender, hauing many iointed stalks, whereupon do grow leaues set in round circles like those of Woodrooffe, but lesser and smoother, in forme like the rowell of a spur: at the top of the stalks do grow small white floures, after which come round seed like those of Turneps: the root is small and threddie.

‡ 4 There are one or two plants more, which may fitly be here mentioned: the first of them is the *Spergula marina* of *Daleschampius*, which from a pretty large wooddy and roughish root sends vp iointed stalks some foot long: at each ioint come forth two long thick round leaues, and out of their bosomes other lesser leaues: the top of the stalks is diuided into sundry branches, bearing floures of a faint reddish colour, composed of fiue little leaues, with yellowish threds in the middle: after which follow cups or seed vessels, which open into foure parts, and containe a little flat reddish seed: it grows in the salt marshes about Dartford, and other such places; floures in Iuly and August, and in the meane space ripens the seed. We may call this in English, Sea Spurrie.

5 This other hath a large root, considering the smalnesse of the plant: from which arise many weak slender branches some three or foure inches long, sometimes more, lying commonly flat on the ground, hauing many knots or ioints: at each whereof vsually grow a couple of white scaly leaues, and out of their bosomes other small sharpe pointed little greene leaues: at the tops of the branches grow little red floures, succeeded by such, yet lesser heads than those of the former: it floures in Iuly and August, and growes in sandy grounds, as in Tuthill-fields nigh Westminster: the figure set forth in *Hist. Lugd. p.* 2179, by the title of *Chamæpeuce Plinij, Camphorata minor Daleschampij*, seems to be of this plant, but without the floure: *Bauhine* in his *Prodromus* describes it by the name of *Alsine Spergulæ facie*. This may be called Chickweed Spurrey, or small red Spurrey. ‡

¶ *The Place.*

White Woodrooffe groweth vnder hedges, and in woods almost euery where: the second groweth in many places of Essex, and diuers other parts in sandy grounds. The third in Corne fields.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Most haue taken Woodrooffe to be *Pliny* his *Alysson*, which as he saith, doth differ from *Erythrodanum*, or Garden Madder, in leaues onely, and lesser stalks: but such a one is not onely this, but also that with blew floures: for *Galen* doth attribute to *Alysson*, a blew floure: notwithstanding *Galens* and *Plinies Alysson* are thought to differ by *Galens* owne words, writing of *Alysson* in his second booke of Counterpoisons, in *Antonius Cous* his composition, in this maner: *Alysson* is an herb very like vnto Horehound, but rougher and fuller of prickles about the circles: it beareth a floure tending to blew.

Woodrooffe is named of diuers in Latine *Asperula odorata*, and of most men *Aspergula odorata*: of others, *Cordialis*, and *Stellaria*: in high Dutch, **Hertzfreydt**: in low Dutch, **Leuerkraut**: that is to

ſay *Iecoraria*, or *Hepatica*, Liuerwoort: in French, *Muguet*: in Engliſh, Woodrooffe, Woodrowe, and Woodrowell.

¶ *The Temperature.*

Woodrooffe is of temperature ſomething like vnto our Ladies Bedſtraw, but not ſo ſtrong, being in a meane betweene heate and drineſſe.

¶ *The Vertues.*

A It is reported to be put into wine, to make a man merry, and to be good for the heart and liuer: it preuaileth in wounds, as *Cruciata*, and other vulnerarie herbes do.

Chap. 464. *Of Ladies Bedſtraw.*

¶ *The Kindes.*

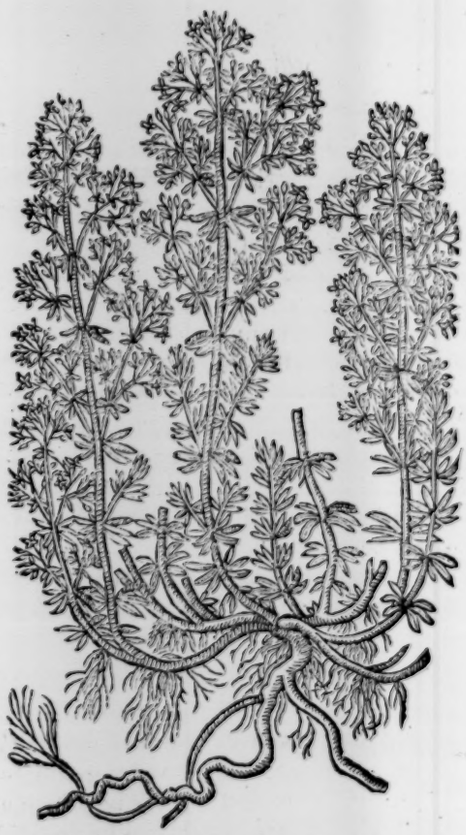
THere be diuers of the herbes called Ladies Bedſtraw, or Cheeſe-renning; ſome greater, others leſſe; ſome with white floures, and ſome with yellow.

¶ *The Deſcription.*

1 LAdies Bedſtraw hath ſmall round euen ſtalkes, weake and tender, creeping hither and thither vpon the ground: whereon doe grow very fine leaues, cut into ſmall iags, finer than thoſe of Dill, ſet at certaine ſpaces, as thoſe of Woodrooffe: among which come forth floures of a yellow colour, in cluſters or bunches thicke thruſt together, of a ſtrong ſweet ſmel but not vnpleaſant: the root is ſmall and threddie.

1 *Gallium luteum.*
Yellow Ladies Bedſtraw.

2 *Gallium album.*
Ladies Bedſtraw with white floures.



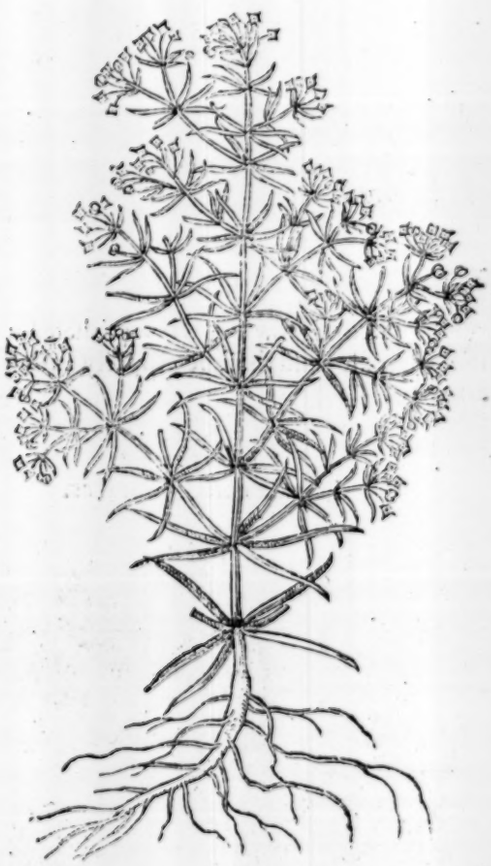
2 Ladies Bedſtraw with white floures is like vnto Cleauers or Gooſe-graſſe, in leaues, ſtalkes, and manner of growing, yet nothing at all rough, but ſmooth and ſoft: the floures be white, the ſeed round: the roots ſlender, creeping within the ground: the whole plant rampeth vpon buſhes, ſhrubs and all other ſuch things as ſtand neere vnto it: otherwiſe it cannot ſtand, but muſt reele and fall to the groud.

3 This

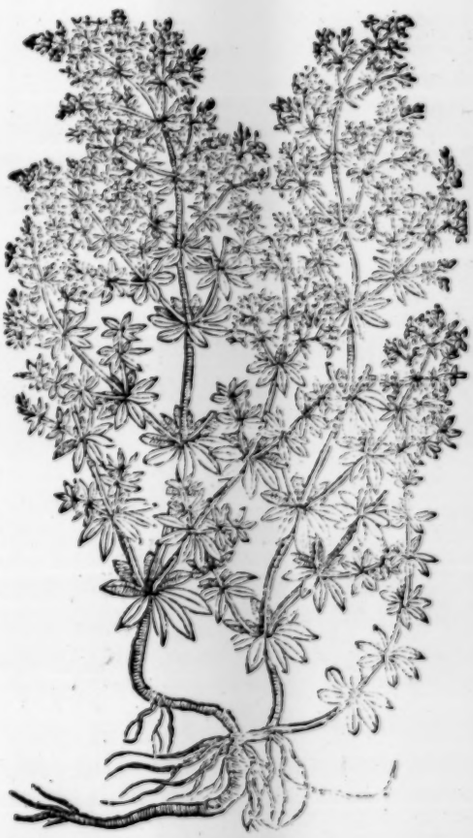
3 This ſmall *Gallium*, or Ladies little red bed-ſtrow, hath been taken for a kind of wild Madder; neuertheleſſe it is a kinde of Ladies bed-ſtrow, or cheeſe-renning, as appeareth both by his vertues in turning milke to cheeſe, as alſo by his forme, being in each reſpect like vnto yellow *Gallium*, and differs in the colour of the floures, which are of a dark red colour, with a yellow pointal in the middle, conſiſting of foure ſmall leaues: the ſeed hereof was ſent me from a Citiſen of Strauſburg in Germanie, and it hath not been ſeen in theſe parts before this time.

4 There is likewiſe another ſort of *Gallium* for diſtinctions ſake called *Mollugo*, which hath ſtalks that need not to be propped vp, but of it ſelfe ſtandeth vpright, and is like vnto the common white *Gallium*, but that it hath a ſmoother leafe. The floures thereof be alſo white, and very ſmall. The root is blackiſh.

† 3 *Gallium rubrum.*
Ladies Bed-ſtrow with red floures.



4 *Gallium, ſiue Mollugo montana.*
Great baſtard Madder.



¶ *The Place.*

The firſt groweth vpon ſunnie bankes neere the borders of fields, in fruitfull ſoiles almoſt euery where.

The ſecond groweth in mariſh grounds and other moiſt places.

The third groweth vpon mountaines and hilly places, and is not yet found in England.

The fourth and laſt groweth in hedges among buſhes in moſt places.

¶ *The Time.*

They floure moſt of the Sommer moneths.

¶ *The Names.*

The firſt is called in Greeke γάλιον: it hath that name of milke, called in Greeke γάλα, into which it is put as cheeſe-renning: in Latine likewiſe *Gallium*: in high-Dutch, **Wagerkraut, Walſtroo:** in low-Dutch, **Walſtroo:** in French, *Petit Muguet*: in Italian, *Galio*: in Spaniſh, *Coaia leche yerua*: in Engliſh, our Ladies Bed-ſtrow, Cheeſe-renning, Maids haire, and pety Mugwet.

The others are *Species Lappaginis*, or kindes of ſmall Burres, ſo taken of the Antients: The laſt, of the ſoftneſſe and ſmoothneſſe of the leaues, is commonly called *Mollugo*: diuers take it for a kinde of wilde Madder, naming it *Rubia ſylueſtris*, or wilde Madder.

¶ *The Temperature.*

Theſe herbes, eſpecially that with yellow floures, is dry and ſomething binding, as *Galen* ſaith.

¶ *The*

¶ *The Vertues.*

A The floures of yellow Maids haire, as *Dioſcorides* writeth, is vſed in ointments againſt burnings, and it ſtancheth bloud: it is put into the Cerote or Cere-cloath of Roſes: it is ſet a ſunning in a glaſſe, with Oyle Oliue, vntill it be white: it is good to anoint the wearied Traueller: the root thereof drunke in wine ſtirreth vp bodily luſt; and the floures ſmelled vnto worke the ſame effect.

B The herbe thereof is vſed for Rennet to make cheeſe, as *Matthiolus* reporteth, ſaying, That the people of Tuſcanie or Hetruria do vſe to turne their milke, that the Cheeſe which they make of Sheeps and Goats milke might be the ſweeter and more pleaſant in taſte, and alſo more wholſome, eſpecially to breake the ſtone, as it is reported.

C The people in Cheſhire, eſpecially about Namptwich, where the beſt cheeſe is made, do vſe it in their Rennet, eſteeming greatly of that cheeſe aboue other made without it.

D We finde nothing extant in the antient writers, of the vertues and faculties of the white kinde, but are as herbes neuer had in vſe either for phyſicke or Surgerie.

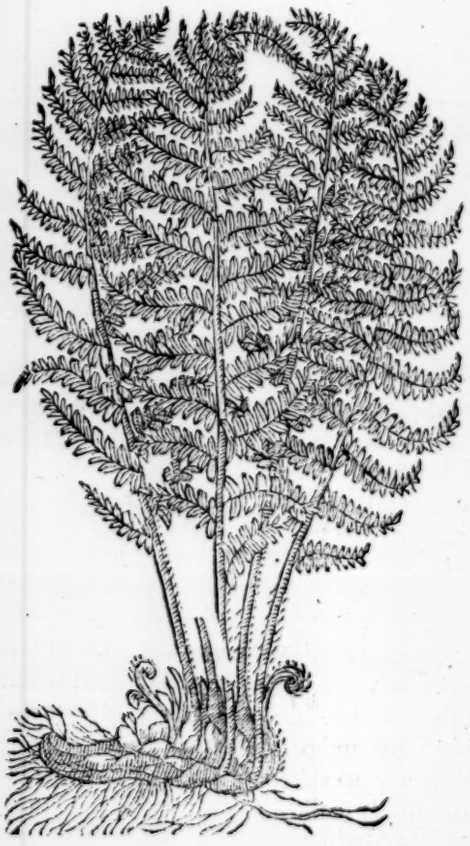
† The figure that was formerly in the third place was of the *Gallium album minus* of *Tabern.* which commonly hath but two leaues at a ioynt, yet ſometimes it is found with three.

Chap. 465. *Of Ferne.*

¶ *The Kindes.*

THere be diuers ſorts of Ferne, differing as well in forme as place of growing; whereof there be two ſorts according to the old writers, the male and the female; and theſe be properly called Ferne: the others haue their proper names, as ſhall be declared.

1 *Filix mas.*
Male Ferne.



2 *Filix fœmina.*
Female Ferne, or Brakes.

¶ *The*

¶ *The Deſcription.*

1 THe male Ferne bringeth forth preſently from the root broad leaues and rough, ſomewhat hard, eaſie to be broken, of a light greene colour, and ſtrong ſmell, more than a cubit long, ſpred abroad like wings, compounded as it were of a great number ſtanding vpon a middle rib, euerie one whereof is like a feather, nicked in the edges, and on the backeſide are ſprinkled as it were with a very fine earthy-coloured duſt or ſports, which many raſhly haue taken for ſeed: the root conſiſteth of a number of tufts or threds, and is thicke and blacke, and is without ſtalke and ſeed, and altogether barren.

‡ *Filicis (vulgo) maris varietates & differentiæ.*
Differences of the male Ferne.

I haue obſerued foure ſorts of Ferne, by moſt writers eſteemed to be the male Ferne of *Dioſcorides*: by *Anguillara*, *Geſner*, *Cæſalpinus*, and *Cluſius*, accounted to be the female, and ſo indeed doe I thinke them to be, though I call them the male, with the multitude. If you looke on theſe Fernes according to their ſeuerall growths and ages, you may make many more ſorts of them than I haue done; which I am afraid hath beene the occaſion of deſcribing more ſorts than indeed there are in nature. Theſe deſcriptions I made by them when they were in their perfect growths.

1 *Filix mas ramoſa pinnulis dentatis.*

The roots are nothing but an aboundance of ſmall blacke hairy ſtrings, growing from the lower parts of the maine ſtalkes (for ſtalkes I will call them) where thoſe ſtalkes are ioyned together. At the beginning of the Spring you may perceiue the leaues to grow forth of their folding cluſters, couered with browniſh ſcales at the ſuperficies of the earth, very cloſely ioyned together: a young plant hath but a few leaues; an old one, ten, twelue, or more: each ſtalke at his lower end neere the ioyning to his fellowes, at his firſt appearing, before he is an inch long hauing ſome of thoſe blacke fibrous roots for his ſuſtenance. The leaues being at their full growth hath each of them a three-fold diuiſion, as hath that Ferne which is commonly called the female: the maine ſtalke, the ſide branches growing from him, and the nerues growing on thoſe ſide branches bearing the leaues: the maine ſtalke of that plant I deſcribe was fully foure foot long (but there are vſually from one foot to foure in length) full of thoſe browniſh ſcales, eſpecially toward the root, firme, one ſide flat, the reſt round, naked fully one and twenty inches, to the firſt paire of ſide branches. The ſide branches, the longeſt being the third paire from the root, were nine inches long, and ſhorter and ſhorter towards the top, in number about twenty paire; for the moſt part towards the root they grow by couples, almoſt oppoſite, the neerer the top the further from oppoſition: the nerues bearing the leaues, the longeſt were two inches and a quarter long, and ſo ſhorter and ſhorter toward the tops of the ſide branches; about twentie in number on each ſide of the longeſt ſide branch. The leaues grow for the moſt part by couples on the nerue, eight or nine paire on a nerue; each leafe being gaſhed by the ſides, the gaſhes ending with ſharpe points, of a deep green on the vpper ſide, on the vnder ſide paler, and each leafe hauing two rowes of duſty red ſcales, of a browne or blackiſh colour: toward the top of the maine ſtalke thoſe ſide branches change into nerues, bearing only the leaues. When the leaues are at their full growth, you may ſee in the middeſt of them at their roots the ſaid ſcaly folding cluſter; and as the old leaues with their blacke threddy roots wholly periſh, they ſpring vp; moſt yeares you may finde many of the old leaues greene all the Winter, eſpecially in warme places. This groweth plentifully in the boggy ſhadowie moores neere Durford Abbey in Suſſex, and alſo on the moiſt ſhadowie rockes by Mapledurham in Hampſhire, neere Peters-field; and I haue found it often on the dead putrified bodies and ſtems of old rotten okes, in the ſaid moores; neere the old plants I haue obſerued verie many ſmall yong plants growing, which came by the falling of the ſeed from thoſe duſty ſcales: for I beleeue all herbes haue ſeeds in themſelues to produce their kindes, *Gen.* 1. 11. & 12.

The three other haue but a twofold diuiſion, the many ſtalks and the nerues bearing the leaues. The roots of them all are blacke fibrous threds like the firſt, their maine ſtalks grow many thicke and cloſe together at the root, as the firſt doth: the difference is in the faſhion of their leaues, and manner of growing, and for diſtinctions ſake I haue thus called them:

2 *Filix mas non ramoſa pinnulis latis denſis minutim dentatis.*

The leaues are of a yellowiſh greene colour on both ſides, ſet very thicke and cloſe together on the

the nerue, that you cannot ſee betweene them, with maruellous ſmall nickes by their ſides, and on their round tops: each leafe hath alſo two rowes of duſty ſeed ſcales; the figures ſet forth by *Lobel*, *Tabern.* and *Gerard*, vnder the title of *Filix mas*, do well reſemble this Ferne. This growes plentifully in moſt places in ſhadowie woods and copſes.

3 *Filix mas non ramoſa pinnulis anguſtis, raris, profunde dentatis.*

The leaues are of a deepe greene, not cloſely ſet together on the the nerue, but you may far off ſee betwixt them, deeply indented by the ſides, ending with a point not altogether ſharpe: each leafe hath alſo two rowes of duſty ſeed ſcales. I haue not ſeene any figure well reſembling this plant. This groweth alſo in many places in the ſhade.

4 *Filix mas non ramoſa pinnulis latis auriculatis ſpinoſis.*

The leaues are of a deeper greene than either of the two laſt deſcribed, placed on the nerue not very cloſe together, but that you may plainly ſee between them; each leafe (eſpecially thoſe next the ſtalke) hauing on that ſide fartheſt off the ſtalk a large eare or outgrowing ending, with a ſharp pricke like a haire, as doth alſo the top of the leafe: ſome of the ſides of the leaues are alſo nicked, ending with the like pricke or haire. Each leafe hath two rowes of duſty ſeed ſcales. This I take to be *Filix mas aculeata maior Bauhini.* Neither haue I ſeene any figure reſembling this plant. It groweth abundantly on the ſhadowie moiſt rockes by Maple-durham neere Peters-field in Hampſhire. *Iohn Goodyer.* Iuly 4. 1633. ‡

2 The female Ferne hath neither floures nor ſeed, but one only ſtalke, chamfered, ſomething edged, hauing a pith within of diuers colours, the which being cut aſlope, there appeareth a certain forme of a ſpred-Eagle: about this ſtand very many leaues which are winged, and like to the leaues of the male Ferne, but leſſer: the root is long and blacke, and creepeth in the ground, being now and then an inch thicke, or ſomewhat thinner. This is alſo of a ſtrong ſmell, as is the male.

¶ *The Place.*

Both the Fernes are delighted to grow in barren dry and deſart places: and as *Horace* teſtifieth,

Neglectis vrenda Filix innaſcitur agris.

It comes not vp in manured and dunged places, for if it be dunged (as *Theophraſtus*, *lib.*8. *cap.*8. reporteth) it withereth away.

The male ioyeth in open and champion places, on mountaines and ſtony grounds, as *Dioſcorides* ſaith. ‡ It growes commonly in ſhadowie places vnder hedges. ‡

The female is often found about the borders of fields vnder thornes and in ſhadowie woods.

¶ *The Time.*

Both theſe Fernes wither away in winter: in the ſpring there grow forth new leaues, which continue greene all Sommer long.

¶ *The Names.*

The former is called in Greeke πτερις: *Nicander* in his diſcourſe of Treacle nameth it βασις: in Latine *Filix mas*: in Italian, *Felce*: in Spaniſh, *Helecho*, *Falguero*, and *Feyto*: in high-Dutch, **Waldt Farne**: in French, *Fougere*, or *Feuchiere maſle*: in low-Dutch, **Varen Manneken**: in Engliſh, male Ferne.

The ſecond kinde is called in Greeke θηλυπτερις, that is, *Filix fœmina*, or female Ferne: in Latine, as *Dioſcorides* noteth among the baſtard names, *Lingua ceruina*: in high-Dutch, **Waldt Farn weiblin**, and **Groſz Farnkraut**: in low-Dutch, **Varen Wiifken**: in French, *Fougere femelle*: in Engliſh, Brake, common Ferne, and female Ferne.

¶ *The Temperature.*

Both the Fernes are hot, bitter, and dry, and ſomething binding.

¶ *The Vertues.*

A The roots of the male Ferne being taken to the weight of halfe an ounce, driueth forth long flat wormes out of the belly, as *Dioſcorides* writeth, being drunke in Mede or honied water; and more effectually, if it be giuen with two ſcruples or two third parts of a dram of Scamonie, or of blacke Hellebor: they that will vſe it, ſaith he, muſt firſt eate Garlicke. After the ſame manner, as *Galen* addeth, it killeth the childe in the mothers wombe. The root hereof is reported to be good for them that haue ill ſpleenes: and being ſtamped with ſwines greaſe and applied, it is a remedie againſt the pricking of the reed: for proofe hereof, *Dioſcorides* ſaith the Ferne dieth if the Reed be planted about it; and contrariwiſe, that the Reed dieth if it be compaſſed with Ferne: which is vaine to thinke, that it hapneth by any antipathie or naturall hatred, and not by reaſon this Ferne proſpereth not in moiſt places, nor the Reed in dry.

B The female Ferne is of like operation with the former, as *Galen* ſaith. *Dioſcorides* reports, That this bringeth barrenneſſe, eſpecially to women; and that it cauſeth women to be deliuered before their time: he addeth, that the pouder hereof finely beaten is laid vpon old vlcers, and healeth the

the galled neckes of oxen and other cattell: it is alſo reported, that the root of Ferne caſt into an hogſhead of wine keepeth it from ſouring.

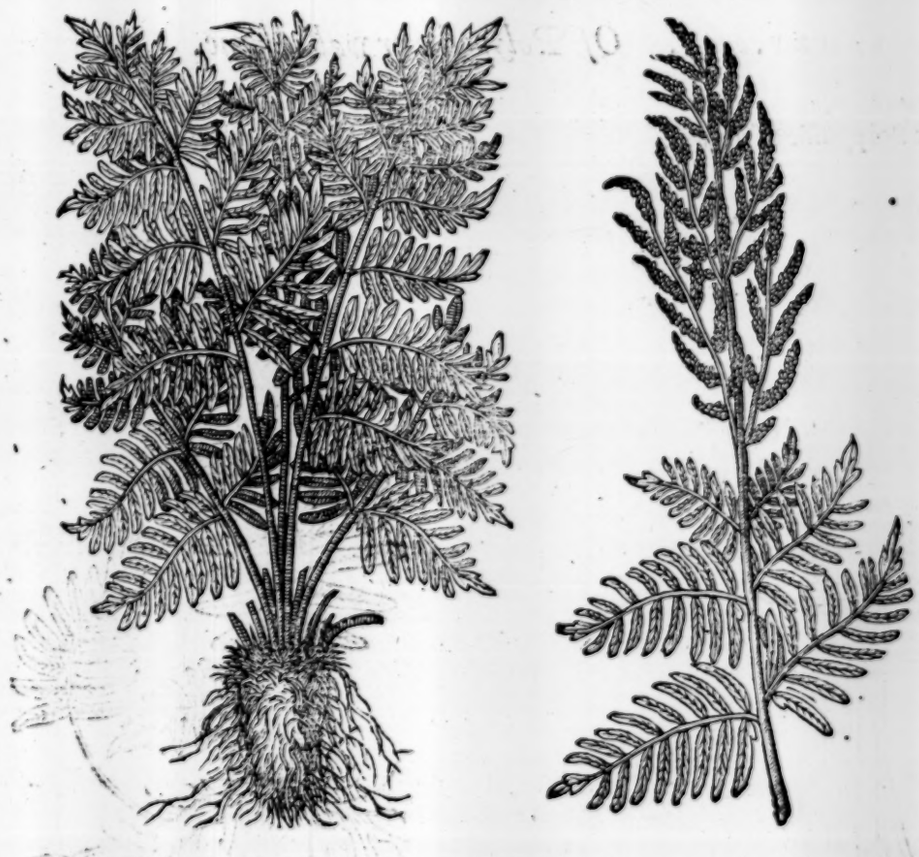
The root of the male Ferne ſodden in Wine is good againſt the hardneſſe and ſtopping of the milt: and being boyled in water, ſtayeth the laske in yong children, if they be ſet ouer the decoction thereof to eaſe their bodies by a cloſe ſtoole. C

Chap. 466. *Of Water-Ferne, or* Oſmund *the water-man.*

¶ *The Deſcription.*

WAter Ferne hath a great triangled ſtalke two cubits high, beſet vpon each ſide with large leaues ſpred abroad like wings, and dented or cut like Polypodie: theſe leaues are like the large leaues of the Aſh tree; for doubtleſſe when I firſt ſaw them afar off it cauſed me to wonder thereat, thinking that I had ſeene yong Aſhes growing vpon a bog; but beholding it a little neerer, I might eaſily diſtinguiſh it from the Aſh, by the browne rough and round graines that grew on the top of the branches, which yet are not the ſeed thereof, but are very like vnto the ſeed. The root is great and thicke, folded and couered ouer with many ſcales and interlacing roots, hauing in the middle of the great and hard wooddy part thereof ſome ſmall whiteneſſe, which hath beene called the heart of *Oſmund* the water-man.

Filix florida, ſiue Oſmunda Regalis.
Water Ferne, or Oſmund Royall.



¶ *The Place.*

It groweth in the midſt of a bog at the further end of Hampſted heath from London, at the bottome of a hill adioyning to a ſmall cottage, and in diuers other places, as alſo vpon diuers bogges on a heath or common neere vnto Bruntwood in Eſſex, eſpecially neere vnto a place there that ſome haue digged, to the end to finde a neſt or mine of gold; but the birds were ouer fledge, and flowne away before their wings could be clipped. ‡ It did grow plentifully in both theſe places, but of late it is all deſtroyed in the former. ‡

¶ *The*

¶ *The Time.*

It flouriſheth in Sommer, as the former Fernes: the leaues decay in Winter: the root continueth freſh and long laſting; which being brought into the garden proſpereth as in his native ſoile, as my ſelfe haue proued.

¶ *The Names.*

It is called in Latine *Oſmunda:* it is more truly named *Filix paluſtris,* or *aquatilis:* ſome terme it by the name of *Filicaſtrum:* moſt of the Alchimiſts call it *Lunaria maior: Valerius Cordus* nameth it *Filix latifolia:* it is named in high-Dutch, **Groſz Farn:** in low-Dutch, **Groot Varen, wilt Varen:** in Engliſh, Water-Ferne, Oſmund the Water-man: of ſome, Saint Chriſtophers herbe, and Oſmund.

¶ *The Temperature.*

The root of this alſo is hot and dry, but leſſe than they of the former ones.

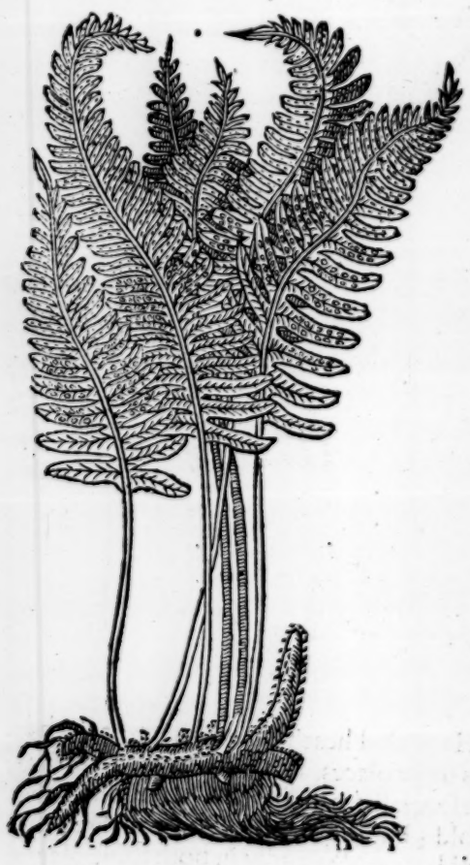
¶ *The Vertues.*

A The root, and eſpecially the heart or middle part thereof, boiled or elſe ſtamped, and taken with ſome kinde of liquor, is thought to be good for thoſe that are wounded, dry-beaten, and bruiſed; that haue fallen from ſome high place: and for the ſame cauſe the Empericks do put it in decoctions, which the later Phyſitians do call wound-drinks: ſome take it to be ſo effectuall, and of ſo great a vertue, as that it can diſſolue cluttered bloud remaining in any inward part of the body, and that it alſo can expell or driue it out by the wound.

B The tender ſprigs thereof at their firſt comming forth are excellent good vnto the purpoſes aforeſaid, and are good to be put into balmes, oyles, and conſolidatiues, or healing plaiſters, and into vnguents appropriate vnto wounds, punctures, and ſuch like.

Chap. 467: *Of Polypodie or wall-Ferne.*

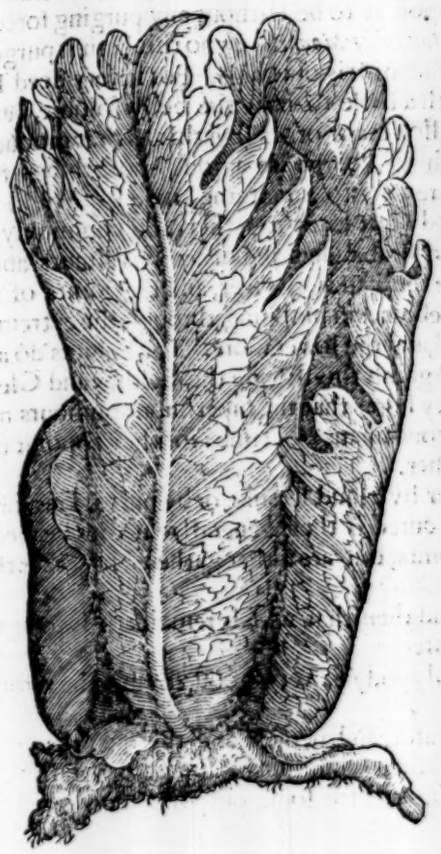
1 *Polypodium.*
Wall Ferne, or Polypodie of the wall.



2 *Polypodium quercinum.*
Polypodie of the Oke.

¶ *The*

‡ 3 *Polypodium Indicum.*
Indian Polypody.



¶ *The Deſcription.*

1 THe leaues of Polypodie might be thought to be like thoſe of male Ferne, but that they are far leſſer, and not nicked at all in the edges: theſe do preſently ſpring vp from the roots, being cut on both the edges with many deepe gaſhes, euen hard to the middle rib; on the vpper ſide they are ſmooth, on the nether ſide they are lightly powdred as it were with duſty markes: the root is long, not a finger thick, creeping aſlope, on which are ſeen certaine little buttons like to thoſe pits and dents that appeare in the tailes of cuttle fiſhes: this hath in it a certaine ſweetneſſe, with a taſte ſomething harſh: this kinde of Ferne likewiſe wanteth not onely floures and ſeed, but ſtalkes alſo.

2 Polypodie of the Oke is much like vnto that of the wall, yet the leaues of it are more finely cut, ſmooth on the vpper ſide, of a pale green color, together with the ſtalkes and middle ribs; on the nether ſide rough like thoſe of Ferne: this Ferne alſo liueth without a ſtalke: it groweth without ſeed: the root hath many ſtrings faſtned to it, one folded within another, of a meane bigneſſe, and ſweet in taſte: it ſendeth forth heere and there new dodkins or ſprings, whereby it increaſeth.

‡ 3 *Cluſius* in his *Exoticks, lib. 4. cap.* 17. giues vs the Hiſtory of an Indian Ferne or Polypody found amongſt the papers of one Dr. *Nicholas Colie* a Dutch Phyſitian, who died in his returne from the Eaſt-Indies. The root of it was ſix inches long, and almoſt one thicke, of the ſame ſhape and colour as the ordinarie one is: from this came vp three leaues, of which the third was leſſer than the other two; the two larger were eleuen inches long, and their breadth from the middle rib (which was very large) was on each ſide almoſt fiue inches; the edges were diuided almoſt like an Oken caſe: from the middle rib came other veines that ran to the ends of the diuiſions, and betweene theſe be ſmaller veines variouſly diuaricated and netted, which made the leafe ſhew prettily. The colour of it was like that of a dry oken leafe. Where Dr. *Colie* gathered this it was vncertaine, for he had left nothing in writing. ‡

¶ *The Place.*

It groweth on the bodies of old rotten trees, and alſo vpon old walls, and the tops of houſes: it is likewiſe found among rubbiſh neere the borders of fields, eſpecially vnder trees and thornes, and now and then in woods: and in ſome places it groweth ranke and with a broader leafe, in others not ſo ranke, and with a narrower leafe.

That which groweth on the bodies of old Okes is preferred before the reſt; in ſtead of this moſt do vſe that which is found vnder the Okes, which for all that is not to be termed *Quercinum*, or Polypodie of the Oke.

¶ *The Time.*

Polypody is greene all the yeere long, and may be gathered at any time; it bringeth forth new leaues in the firſt ſpring.

¶ *The Names.*

The Grecians call it πολυπόδιον, of the holes of the fiſhes *Polypi*, appearing in the roots: it is called in Latine, *Polypodium*, after the Greeke name, and many times *Filicula*, as though they ſhould ſay *Parua Filix*, or little Ferne: the Italians name it *Polipodio*: the Spaniards, *Filipodio*, and *Polypodio*: in high Dutch, **Engelſuſz, Baumfarn, Dropfoourtz**: in low Dutch, **Boom varen**: in French, *Polypode*: and we of England, Polypodie: that which groweth vpon the wall we call Polypodie of the wall, and that on the Oke, Polypodie of the Oke.

¶ *The Temperature.*

Polypodie doth dry, but yet without biting as *Galen* writeth.

¶ *The Vertues.*

A *Dioſcorides* writeth, that it is of power to purge and to draw forth choler and flegme. *Actuarius* addeth, that it likewiſe purgeth melancholy: other ſuppoſe it to be without any purging force at all, or elſe to haue very little: of the ſame minde is alſo *Iohannes Monardus*, who thinketh it purgeth very gently; which thing is confirmed by Experience, the miſtris of things. For in very deed Polypody of it ſelfe doth not purge at all, but onely ſerueth a little to make the belly ſoluble, being boiled in the broth of an old cocke, with Beetes or Mallowes, or other like things that mooue to the ſtoole by their ſlipperines. *Ioannes Meſue* reckoneth vp Polypodie among thoſe things that do eſpecially dry and make thin: peraduenture he had reſpect to a certaine kinde of *arthritis*, or ache in the joints: in which not one only part of the body, but many together moſt commonly are touched: for which it is very much commended by the Brabanders and other inhabitants about the riuer Rhene, and the Maze. In this kinde of diſeaſe the hands, the feet, and the joints of the knees and elbowes do ſwell. There is joined withall a feeblenesin mooving, through the extremity of the paine: ſometimes the vpper parts are leſſe grieued, and the lower more. The humors do alſo eaſily run from one place to another, and then ſettle. Againſt this diſeaſe the Geldres and Cleuelanders do vſe the decoction of Polypodie, whereby they hope that the ſuperfluous humours may be waſted and dried vp, and that not by and by, but in continuance of time: for they appoint that this decoction ſhould be taken for certaine daies together.

B But this kinde of gout is ſooner taken away either by bloud letting, or by purgations, or by both, and afterwards by ſweate; neither is it hard to be cured if theſe generall remedies be vſed in time: for the humors do not remaine fixed in thoſe joints, but are rather gathered together than ſettled about them.

C Therefore the body muſt out of hand be purged, and then that which remaineth is to be waſted and conſumed away by ſuch things as procure ſweate.

D Furthermore, *Dioſcorides* ſaith, that the root of Polypody is very good for members out of joint, and for chaps betweene the fingers.

E The root of Polypodie boiled with a little honie, water, and pepper, and the quantitie of an ounce giuen, emptieth the belly of cholericke and pituitous humours; ſome boile it in water and wine, and giue thereof to the quantitie of three ounces for ſome purpoſes with good ſucceſſe.

Chap. 468. *Of Oke-Ferne.*

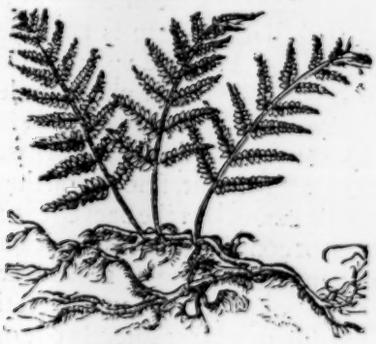
‡ OVr Author here (as in many other places) knit knots, ſomewhat intricate to looſe, for firſt he confounds in the names and nature the Polypody of the Oke, or leſſer Polypodie with the Dryopteris, or Oke-Ferne; but that I haue new put backe to the former chapter, his fit place; then in the ſecond place did he giue the Deſcription of the Dryopteris of the *Aduerſ.* taken from thence, *pag.* 263. Then were the place, times, names, &c. taken out of the chapter of *Dryopteris Candiaa* of *Dodonæus*, being, *Pempt* 3. *lib.* 5. *cap.* 4. But the figure was of the *Filicula fœmina petræa* 4. of *Tabernamontanus*. Now I will in this chapter giue you the *Dryopteris* of the *Aduerſaria*, then that of *Dodonæus*, and thirdly that of *Tragus*; for I take them to be different; and this laſt to be that figured by our Author, out of *Tabernamontanus*. ‡

¶ *The Deſcription.*

1 THis kinde of Ferne called *Dryopteris*, or *Filix querna*, hath leaues like vnto the female Ferne before ſpoken of, but much leſſer, ſmaller, and more finely cut or jagged, and is not aboue a foot high, being a very ſlender and delicate tender herbe. The leaues are ſo finely jagged that in ſhew they reſemble feathers, ſet round about a ſmall rib or ſinew; the backe ſide being ſprinckled, not with ruſſet or browne markes or ſpecks, as the other Fernes are, but as it were painted with white ſpots or markes, not ſtanding out of the leaues in ſcales, as the ſpots in the male Ferne, but they are double in each leafe cloſe vnto the middle rib or ſinew. The root is long, browne, and ſomewhat hairy, very like vnto Polypody, but much ſlenderer, of a ſharpe and cauſticke taſte. ‡ *Rondeletius* affirmed that he found the vſe of this deadly, being put into medicines in ſtead of Polypody by the ignorance of ſome Apothecaries in Dauphenye in France. Mr. *Goodyer* hath ſent me an acurate deſcription together with a plant of this Ferne which I haue thought good here alſo to ſet forth. ‡

Dryopteris

‡ *Dryopteris Aduerſ.*
True Oke Ferne.



‡ 2 *Dryopteris alba Dod.*
White Oke-Ferne.

‡ 3 *Dryopteris Tragi.*
Tree Ferne.

Dryopteris Pena & Lobelij.

The roots creepe in the ground or mire, neere the turfe or vpper part thereof, and fold amongſt themſelues, as the roots of *Polypodium* do, almoſt as big as a wheat ſtraw, and about fiue, ſix, or ſeuen inches long, cole blacke without, and white within, of a binding taſte inclining to ſweetneſſe, with an innumerable companie of ſmall blacke fibres like haires growing thereunto. The ſtalkes ſpring from the roots in ſeuerall places, in number variable, according to the length and encreaſe of the root; I haue ſeene ſmall plants haue but one or two, and ſome bigger plants haue fourteene or fifteene: they haue but a two-fold diuiſion, the ſtalke growing from the root, and the nerue bearing the leaues: the ſtalke is about fiue, ſix, or ſeuen inches long, no bigger that a bennet or ſmall graſſe ſtalke, one ſide flat, as are the male Fernes, the reſt round, ſmooth, and green. The firſt paire of nerues grow about three inches from the root, and ſo do all the reſt grow by couples, almoſt exactly one againſt another, in number about eight, nine, or ten couples, the longeſt ſeldome exceeding an inch in length. The leaues grow on thoſe nerues alſo by couples, eight or nine couples on a nerue, without any nickes or indentures, of a yellowiſh greene colour. This Ferne may be ſaid

to be like *Polypodium* in his creeping root, like the male Ferne in his ſtalke, and like the female Ferne in his nerues and leaues. I could finde no ſeed-ſcales on the backeſides of any of the leaues of this Ferne. Many yeares paſt I found this ſame in a very wet moore or bog, being the land of *Richard Auſten*, called Whitrow Moore, where Peate is now digged, a mile from Peters-field in Hampſhire; and this ſixth of Iuly, 1633, I digged vp there many plants, and by them made this deſcription. I neuer found it growing in any other place: the leaues periſh at Winter, and grow vp againe very late in the Spring. *Iohn Goodyer.* Iuly 6. 1633.

2 *Dodonæus* thus deſcribes his: *Dryopteris* (ſaith he) doth well reſemble the male Ferne, but the leaues are much ſmaller, and more finely cut, ſmooth on the foreſaid, and of a yellowiſh green together with the ſtalkes and middle nerues; on the backe it is rough as other Fernes, and alſo liueth without ſtalke or ſeed. The root conſiſts of fibres intricately folded together, of an indifferent thickneſſe, here and there putting vp new buds. This is the *Adianthum* of the *Aduerſ.* who affirme the vſe thereof to be ſafe, and not pernitious and deleterie, as that of *Dryopteris*. It thus differs from the former; the leaues of this are not ſet directly one oppoſite to another, the diuiſions of the leaues are larger and more diuided. The root is more threddy, and creepes not ſo much as that of the former.

3 This (which is *Cluſius* his *Filix pumila ſaxatilis prima*, and which I take to be the *Dryopteris* or *Filix arborea* of *Tragus*) hath blacke ſlender long creeping roots, with few ſmall hard hairy fibres faſtned to them, of a very aſtringent taſte: from theſe riſe vp ſundry ſtalkes a foot high, diuided into certaine branches of winged leaues, like to thoſe of the female Ferne, but much leſſe, tenderer and finer cut, and hauing many blackiſh ſpots on their lower ſides. This differs from the two former, in that the leaues are branched, which is a chiefe difference; and *Bauhinus* did very well obſerue it, if he had as well followed it, when he diuided *Filix* into *ramoſa & non ramoſa*. ‡

¶ *The Place.*

It is oftentimes found in ſunny places, in the vallies of mountains and little hils, and in the tops of the trunks of trees in thicke woods.

¶ *The Time.*

The leaues hereof periſh in Winter; in the Spring new come forth.

¶ *The Names.*

This is called in Greeke Δρυόπτερις: in Latine, *Querna Filix*: *Oribaſius* in his eleuenth book of phyſicall Collections calleth it *Bryopteris*, of the moſſe with which it is found; for, as *Dioſcorides* writeth, it groweth in the moſſe of Okes. The Apothecaries in times paſt miſcalled it by the name of *Adiantum*: but they did worſe in putting it in compound medicines in ſtead of *Adiantum*. *Valerius Cordus* calleth it *Pteridion*: in low-Dutch, **Eiſcken varen**: the Spaniards, *Helecho de Reble*: it is named in Engliſh, Oke-Ferne, Petty-Ferne; and it may moſt fitly be called Moſſe-Ferne.

¶ *The Temperature and Vertues.*

A Oke-Ferne hath many taſtes, it is ſweet, biting, and bitter, it hath in the root a harſh or choking taſte, and a mortifying qualitie, and therefore it taketh away haires. *Dioſcorides* ſaith further, that Oke-Ferne ſtamped roots and all is a remedie to root vp haires, if it be applied to the body after ſweating, the ſweat being wiped away.

Chap. 469. *Of blacke Oke-Ferne.*

¶ *The Deſcription.*

1 THere is alſo a certaine other kinde of Ferne like to the former Oke-Ferne of *Dodonæus* his deſcription, but the ſtalkes and ribs of the leaues are blackiſh, and the leaues of a deeper greene colour: this groweth out alſo immediately from the root, and is likewiſe diuerſly, but not ſo finely indented: the root is made vp of many ſtrings, not vnlike to the male Ferne, but much leſſer.

2 The female blacke Ferne is like vnto the male, ſauing his leaues are not ſo ſharpe at the points, more white and broad than the male, wherein conſiſteth the difference.

¶ *The Place.*

They grow likewiſe vpon trees in ſhadowie woods, and now and then in ſhadowie ſandy banks, and vnder hedges.

¶ *The*

1 *Onopteris mas.*
The male blacke Ferne.

¶ *The Time.*

They remaine greene all the yeare long, otherwiſe than Polypodie & Maidens haire do; yet do they not ceaſe to bring forth new leaues in Summer: they are deſtitute of floures and ſeed, as is the former.

¶ *The Names.*

This is called of diuers of the later Herbariſts, *Dryopteris nigra*, or blacke Oke-Ferne, of the likeneſſe that it hath with *Dryopteris*; which we haue called in Engliſh, Oke-Ferne, or moſſe Ferne: of others, *Adiantum nigrum*, or blacke Maidens haire, that it may differ from the former, which is falſly called *Adiantum*. There are of the later Herbariſts who would haue it to be *Lonchitis aſpera*, or rough Spleen-wort; but what likeneſſe hath it with the leaues of *Scolopendrium*? none at all: therfore it is not *Lonchitis aſpera*, much leſſe *Adiantum Plinij*, which differeth not from *Adiantum Theophraſti*; for what he hath of *Adiantum*, the ſame he taketh out of *Theophraſtus*: the right *Adiantum* we will deſcribe hereafter. Notwithſtanding blacke Oke-Ferne was vſed of diuers vnlearned Apothecaries of France and Germany for *Adiantum*, or Maiden-haire of Lumbardy: but theſe men did erre in doing ſo; yet not ſo much as they who take Polypodie of the Oke for the true Maiden-haire.

¶ *The Temperature and Vertues.*

The blacke Oke-Ferne hath no ſtipticke qualitie at all, but is like in facultie to *Trichomanes*, or Engliſh Maiden-haire.

CHAP. 470. *Of Harts-tongue.*

¶ *The Deſcription.*

1 THe common kinde of Harts-tongue, called *Phyllitis*, that is to ſay, a plant conſiſting only of leaues, bearing neither ſtalke, floure, nor ſeed, reſembling in ſhew a long tongue, whereof it hath been and is called in ſhops *Lingua ceruina*, that is, Harts tongue: theſe leaues are a foot long, ſmooth and plaine vpon one ſide, but vpon that ſide next the ground ſtraked ouerthwart with certaine long rough markes like ſmall wormes, hanging on the backſide thereof. The root is blacke, hairy, and twiſted, or ſo growing as though it were wound together.

2 The other kind of Ferne, called *Phyllitis multifida*, or *Laciniata*, that is, iagged Harts tongue, is very like vnto the former, ſauing that the leaues thereof are cut or iagged like a mans hand, or the palme and browantles of a Deare, bearing neither ſtalke, floure, nor ſeed.

3 There is another kinde of Harts-tongue called *Hemionitis*, which hath bred ſome controuerſie among writers: for ſome haue tooke it for a kinde of Harts-tongue, as it is indeed; others deſcribe it as a proper plant by it ſelfe, called *Hemionitis*, of ἡμίονος, that is, *Mulus*, a Mule, becauſe Mules do delight to feed thereon: it is barren in ſeeds, ſtalkes, and floures, and in ſhape it agreeth very well with our Harts-tongue: the roots are compact of many blackiſh haires: the leaues are ſpotted on the backſide like the common Harts-tongue, and differ in that, that this *Hemionitis* in the baſe or loweſt parts of the leaues is arched after the manner of a new Moone, or a forked arrow, the yongeſt and ſmalleſt leaues being like vnto the great Binde-weed, called *Volubilis*.

4 There is a kinde of Ferne called likewiſe *Hemionitis ſterilis*, which is a very ſmall and baſe herbe not aboue a finger high, hauing foure or fiue ſmall leaues of the ſame ſubſtance and colour, ſpotted on the backe part, and in taſte like Harts-tongue; but the leaues beare the ſhape of them of *Totabona*, or good *Henry*, which many of our Apothecaries do abuſiuely take for Mercurie: The roots are very many, ſmooth, blacke, and threddie, bearing neither ſtalke, floure, nor ſeed: this plant

1 *Phyllitis.*
Harts-tongue.

2 *Phylliis multifida.*
Finger Harts-tongue.

‡ 3 *Hemionitis maior.*
Mules Ferne, or Moone-Ferne.

‡ 4 *Hemionitis minor.*
Small Moone-Ferne.

‡ 5 *Hemionitis perigrina.*
Handed Moone-Ferne.

my very good friend M^r. *Nicholas Belſon* found in a grauelly lane in the way leading to Oxey parke neere vnto Watford, fifteene miles from London: it growes likewiſe on the ſtone walls of Hampton Court, in the garden of M^r. *Huggens*, keeper of the ſaid houſe or pallace.

5 There is a kinde of Ferne called alſo *Hemionitis*, but with this addition *Peregrina*, that is very ſeldome found, and hath leaues very like to Harts-tongue, but that it is palmed or branched in the part next the ground, almoſt in manner of the ſecond *Phyllitis*, at the top of the leaues; otherwiſe they reſemble one another in nature and forme.

¶ *The Place.*

The common Harts-tongue groweth by the waies ſides as you trauell from London to Exceter in great plenty, in ſhadowie places, and moiſt ſtonie vallies and wels, and is much planted in gardens.

The ſecond I found in the garden of Maſter *Cranwich* a Chirurgion dwelling at Much-dunmow in Eſſex, who gaue me a plant for my garden.

‡ M^r. *Goodyer* found it wilde in the banks of a lane neere Swaneling, not many miles from Southampton. ‡

It groweth vpon Ingleborough hils, and diuers other mountains of the North of England.

¶ *The Time.*

It is greene all the yeare long, yet leſſe greene in winter: in Sommer it now and then bringeth forth new leaues.

¶ *The Names.*

It is called in Greeke ὑμιονῖτις: in Latine alſo *Phyllitis*: in ſhops, *Lingua ceruina*: and falſely *Scolopendria*, for it differeth much from the right *Scolopendria*, or Stone Ferne: it is called in high Dutch, **Hirſzong**: in low Dutch, **Herſtonge**: in Spaniſh, *Lengua ceruina*: in French, *Langue de Cerf*: in Engliſh, Harts-tongue: of ſome, Stone Harts-tongue: *Apuleius* in his 83. Chapter nameth it *Radiolus*.

¶ *The Temperature.*

It is of a binding and drying facultie.

¶ *The Vertues.*

This common Harts-tongue is commended againſt the laske and bloudy flix: *Dioſcorides* teacheth, that being drunke in wine it is a remedie againſt the bitings of ſerpents. A

It doth open the hardneſſe and ſtopping of the ſpleen and liuer, and all other griefes proceeding of oppilations or ſtoppings whatſoeuer. B

CHAP. 471. *Of Spleene-woort, or Milt-waſte.*

¶ *The Deſcription.*

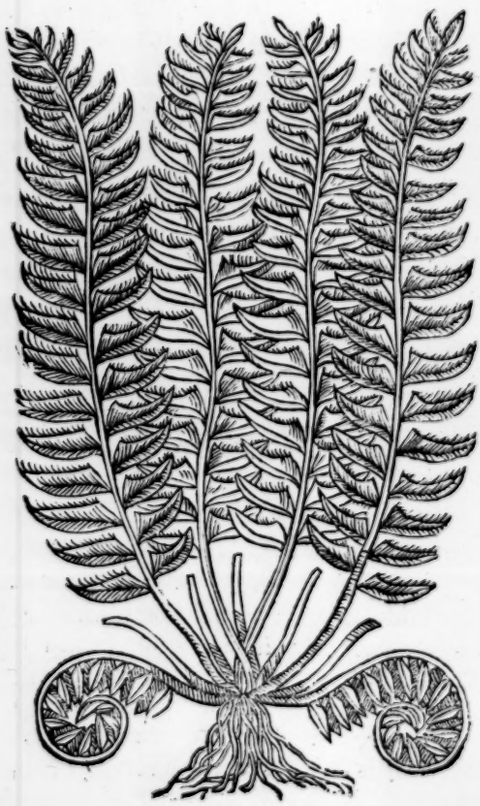
1 SPleene-woort being that kinde of Ferne called *Aſplenium*, or *Ceterach*, and the true *Scolopendria*, hath leaues a ſpan long, iagged or cut vpon both ſides, euen hard to the middle ribbe; euery cut or inciſure being as it were cut halfe round (whereby it is knowne from the rough Spleene-woort) not one cut right againſt another, but one beſides the other, ſet in ſeuerall order, being ſlipperie and greene on the vpper ſide, ſoft and downie vnderneath; which when they be withered are folded vp together like a ſcrole, and hairie without, much like to the rough Beare-worme wherewith men bait their hookes to catch fiſh: the root is ſmall, blacke, and rough, much platted or interlaced, hauing neither ſtalke, floure, nor ſeeds.

2 Rough

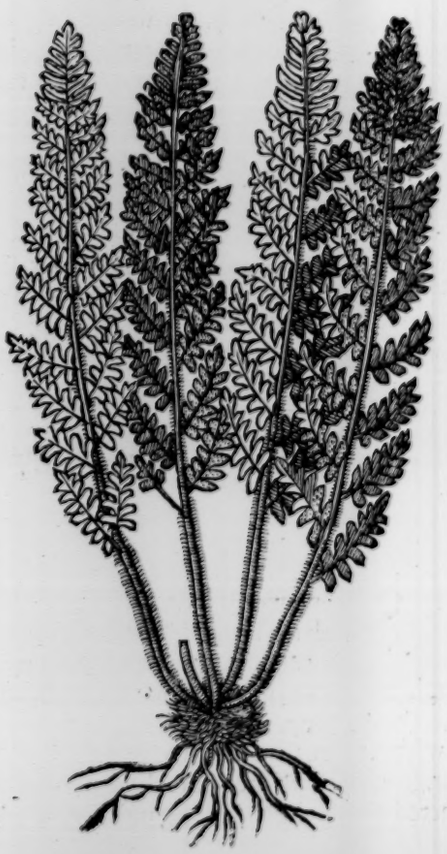
1 *Aſplenium ſive Ceterach.*
Spleenewoort or Miltwaſte.

2 *Lonchitis aſpera:*
Rough Spleenewoort.

† 3 *Lonchitis aſpera maior.*
Great rough Spleene-woort.



† 4 *Lonchitis Maranthæ.*
Baſtard Spleene-woort.



2 Rough Spleenewoort is partly like the other Fernes in ſhew, and beareth neither ſtalke nor ſeed, hauing narrow leaues a foot long, and ſomewhat longer, ſlaſhed on the edges euen to the middle rib, ſmooth on the vpper ſide, and of a ſwart greene colour; vnderneath rough, as is the leaues of Polypodie: the root is blacke, and ſet with a number of ſlender ſtrings.

‡ 3 This greater Spleenwoort hath leaues like *Ceterach*, of a ſpanne long, ſomewhat reſembling thoſe of Polypodie, but that they are more diuided, ſnipt about the edges, and ſharpe pointed: the root is fibrous and ſtringie. This growes on the rockes and mountainous places of Italy, and is the *Lonchitis aſpera maior* of *Matthiolus* and others. ‡

4 This kinde of Spleenewoort is not onely barren of ſtalks and ſeeds, but alſo of thoſe ſpots and marks wherewith the others are ſpotted: the leaues are few in number, growing pyramidis or ſteeplewiſe, great and broad below, and ſharper toward the top by degrees: the root is thick, black, and buſhie, as it were a Crowes neſt.

¶ *The Place.*

Ceterach groweth vpon old ſtone walls and rockes, in darke and ſhadowie places throughout the Weſt part of England; eſpecially vpon the ſtone walls by Briſtow, as you go to Saint Vincents Rocke, and likewiſe about Bathe, VVells, and Salisburie, where I haue ſeene great plentie thereof.

The rough Spleenwoort groweth vpon barren heaths, drie ſandie bankes, and ſhadowie places in moſt parts of England, but eſpecially on a heath by London called Hampſtead heath, where it groweth in great abundance.

¶ *The Names.*

Spleene-woort or Milt-waſte is called in Greeke, ἀσπλήνιον in Latine likewiſe, *Aſplenium*, and alſo *Scolopendria*: of *Gaza*, *Mula herba*: in ſhops, *Ceterach*: in high Dutch, **Steynfarn**: in low Dutch, **Steynuaren**, and **Miltcruyt**: in Engliſh, Spleenwoort, Miltwaſte, Scaleferne, and Stoneferne: it is called *Aſplenion*, becauſe it is ſpeciall good againſt the infirmities of the Spleene or Milt, and *Scolopendria*, of the likeneſſe that it hath with the Beare-worme, before remembred.

Rough Miltwaſte is called of diuers of the later writers *Aſplenium ſylueſtre*, or wilde Spleenwoort: of ſome, *Aſplenium magnum*, or great Spleene-woort: *Valerius Cordus* calleth it *Struthiopteris*: and *Dioſcorides*, *Lonchitis aſpera*, or rough Spleene-woort: in Latine according to the ſame Authour, *Longina*, and *Calabrina*: in Engliſh, rough Spleen-wort, or Miltwaſte.

¶ *The Temperature.*

Theſe plants are of thin parts, as *Galen* witneſſeth, yet are they not hot, but in a meane.

¶ *The Vertues.*

Dioſcorides teacheth, that the leaues boiled in wine and drunk by the ſpace of forty daies, do take away infirmities of the ſpleen; help the ſtrangurie, and yellow iaundice, cauſe the ſtone in the bladder to moulder and paſſe away, all which are performed by ſuch things as be of thinne and ſubtill parts: he addeth likewiſe that they ſtay the hicket, or yeoxing, and alſo hinder conception, either inwardly taken, or hanged about the partie, and therefore, ſaith *Pliny*, Spleenewoort is not to be giuen to women, becauſe it bringeth barrenneſſe. A

There be Empericks or blinde practitioners of this age, who teach, that with this herbe not onely the hardneſſe and ſwelling of the Spleene, but all infirmities of the liuer alſo may be effectually, and in very ſhort time remooued, inſomuch that the ſodden liuer of a beaſt is reſtored to his former conſtitution againe, that is, made like vnto a raw liuer, if it bee boyled againe with this herbe. B

But this is to be reckoned among the old wiues fables, and that alſo which *Dioſcorides* telleth of, touching the gathering of Spleenewoort in the night, and other moſt vaine things, which are found here and there ſcattered in old books: from which moſt of the later Writers do not abſtaine, who many times fill vp their pages with lies and friuolous toies, and by ſo doing do not a little deceiue yong ſtudents. C

† Formerly vnder the title of *Lonchitis Matthæi* was put the figure now in the third place, and the figure which ſhould haue beene there, was in the third place of the next chapter, vnder the title of *Filicula petræa mas.*

Chap. 472. *Of diuers ſmall Fernes.*

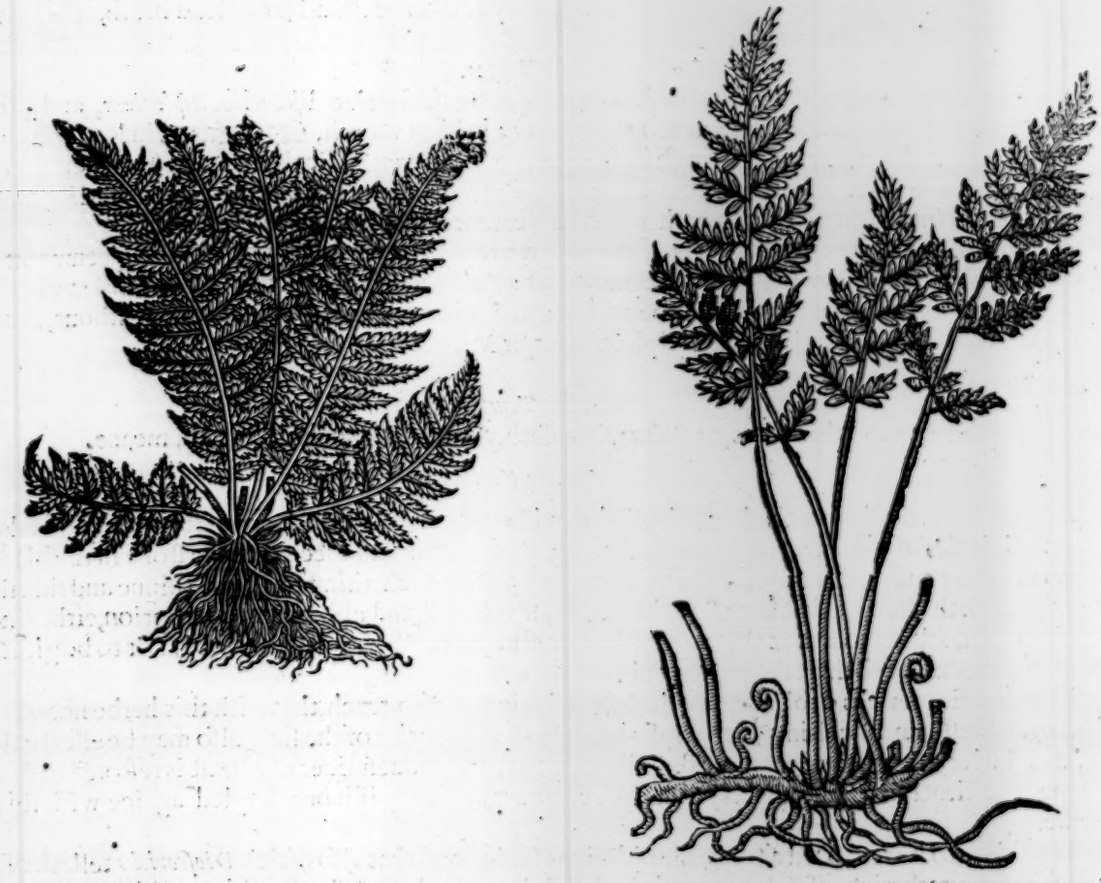
¶ *The Deſcription.*

1 THis ſmall or dwarfe Ferne, which is ſeldome found except in the banks of ſtony fountaines, wells, and rockes bordering vpon riuers, is very like vnto the common Brakes in leaues, but altogether leſſer: the root is compoſed of a bundle of blacke threddie ſtrings.

2 The female, which is found likewiſe by running ſtreames, wells, and fountaines, vpon rockes, and ſtonie places, is like the precedent, but is a great deale ſmaller, blacker of colour, fewer roots, and ſhorter.

1 *Filicula fontana mas.*
The male Fountaine Ferne.

† 3 *Filicula petræa mas.*
The male dwarfe ſtone Ferne.

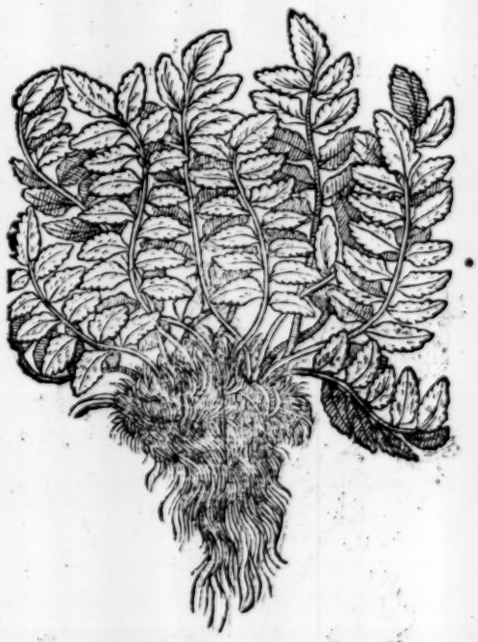


3 The male dwarfe Ferne that groweth vpon the ſtonie mountaines of the North and Weſt parts of England, eſpecially toward the ſea, and alſo in the ioints of ſtone walls among the morter, hath ſmall leaues deepely cut on both ſides, like vnto *Ceterach* or Spleene-woort, barren both of ſeeds and ſtalks, as alſo of thoſe ſpots or markes that are to be ſeene vpon the backe part of the other Fernes: the root creepeth along, ſet with ſome few hairie ſtrings, reſembling thoſe of the Oke Ferne, called *Dryopteris*.

4 The female ſtone Ferne hath diuers long leaues riſing from a threddy root, contrarie to that of the male, compoſed of many ſmall leaues finely minced or cut like the teeth of a ſaw, of a whitiſh green colour, without any ſpots or marks at all, ſeeds or ſtalks, which groweth vnder ſhadowie rocks, and craggie mountaines in moſt places. ‡ From a ſmall root compoſed of many blacke, hairie, and intricately folding ſtrings, come vp many leaues two or three inches high, ſtiffe, thicke, darke greene, and ſhining: in the diuiſion, growth, poſition, ſhape and taſte, it reſembles the male Ferne, and hath alſo ruſtie ſpots on the backe: the middle ribbe and ſtalke is of a ſhining brow-

niſh

4 *Filicula petræa fœmina, ſive Chamæfilix marina*
The female dwarfe ſtone Ferne. (*Anglica.*



niſh ſilken colour: it growes in the chinkes of the rockes by the Sea ſide in Cornewall.

¶ *The Place.*

The place is ſufficiently touched in the deſcription.

¶ *The Time.*

They flouriſh both Winter and Sommer, for when the leaues wither by reaſon of age, there ariſe young to ſupplie the place, ſo that they are not to be ſeene without greene and withered leaues both at once.

¶ *The Names.*

It ſufficeth what hath bin ſaid of the names in their ſeuerall titles: notwithſtanding the laſt deſcribed we haue called *Chamæfilix marina Anglica*: which groweth vpon the rockie cliffe neere Harwich, as alſo at Douer, among the Sampire that there groweth.

¶ *The Temperature and Vertues.*

Their temperature and faculties inworking A
are referred vnto the kindes of blacke Oke Fernes, called *Dryopteris*, and *Onopteris*.

4 It is hard to ſay what our Author in this chapter meant, by his figures and deſcriptions, wherefore I haue left his deſcriptions as I found them: the ſecond figure which was very like the firſt I haue omited: for the third, which was of the *Lonchitis Marantha*, mentioned in the foregoing chapter, I haue put *Cluſius* his figure of his *Filix ſaxatilis* 2. which growes in ſuch places, and reaſonable well fits our Authors deſcription: in the fourth place I haue put *Lobbels Chamæfilix marina Anglica*, and his deſcription, which our Author, as I iudge, intended in that place to haue giuen vs.

CHAP. 473. *Of true Maiden-haire.*

¶ *The Kindes.*

THeophraſtus and *Pliny* haue ſet downe two Maiden-haires, the blacke and the white, whereunto, may be added another called *Ruta muraria*, or wall Rue, equall to the others in facultie, whereof we will intreat.

1 *Capillus Veneris verus.*
True Maiden-haire.

¶ *The Deſcription.*

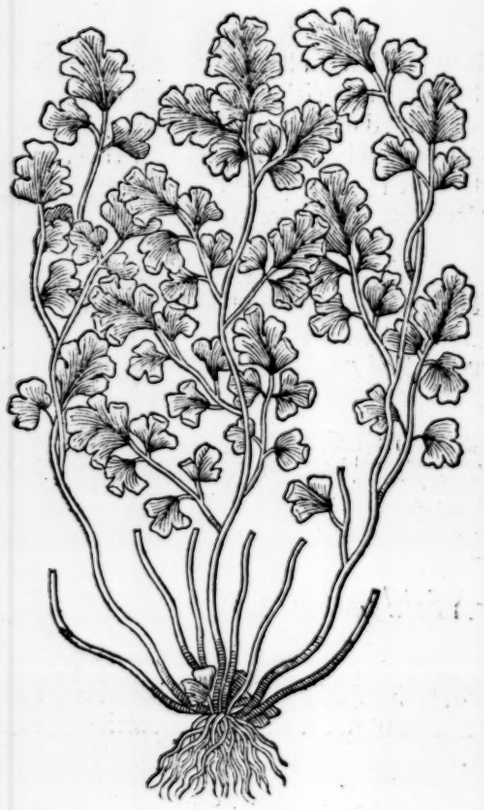
1 WHoſo will follow the variable opinions of writers concerning the Ferne called *Adianthum verum*, or *Capillus Veneris verus*, muſt of neceſſitie be brought into a labyrinth of doubts, conſidering the diuers opinions thereof: but this I know that Venus-haire, or Maiden-haire, is a low herb growing an hand high, ſmooth, of a darke crimſon colour, and glittering withall: the leaues be ſmal, cut in ſunder, and nicked in the edges ſomething like thoſe of Coriander, confuſedly or without order placed, the middle rib whereof is of a blacke ſhining colour: the root conſiſteth of manie ſmall threddie ſtrings.

2 This Aſſyrian Maiden-haire is likewiſe a baſe or low herbe, hauing leaues, flat, ſmooth, and plaine, ſet vpon a blackiſh middle rib, like vnto that of the other Maiden-haire, cut or notched in the edges, nature keeping no certaine forme, but making one leafe of this faſhion, and another far different from it: the root is tough and threddie.

3 This plant which we haue inſerted among the Adianthes as a kinde thereof, may without errour ſo paſſe, which is in great requeſt in Flanders and Germanie, where the practitioners in Phyſicke do vſe the ſame in ſtead of *Capillus Veneris*, and with better ſucceſſe than any of the Capillare herbs,

herbs,although *Matthiolus* and *Dioſcorides* himſelfe hath made this wall Rue to be a kinde of *Paronychia*,or Nailewoort:notwithſtanding the Germanes wil not leaue the vſe thereof,but receiue it as the true Adianth,eſteeming it equal,if not far better,than either *Ceterach*, *Capillus Veneris verus*, or *Tricomanes*,called alſo *Polytrichon* : it bringeth forth very many leaues, round and ſlender, cut into two or three parts,very hard in handling,ſmooth and greene on the outſide,of an ill fauoured dead colour vnderneath,ſet with little fine ſpots,which euidently ſheweth it to be a kinde of Ferne: the root is blacke and full of ſtrings.

2 *Capillus Veneris Syriaca.*
Aſſyrian Maiden-haire.



3 *Ruta muraria, ſive Saluia vitæ.*
Wall Rue,or Rue Maiden-haire.

¶ *The Place.*

The right Maiden-haire groweth vpon walls, in ſtonie, ſhadowie,and moiſt places, neere vnto fountaines,and where water droppeth : it is a ſtranger in England: notwithſtanding I haue heard it reported by ſome of good credit, that it groweth in diuers places of the Weſt countrey of England.

The Aſſyrian Maiden-haire taketh his ſurname of his natiue countrey Aſſyria,it is a ſtranger in Europe.

Stone Rue groweth vpon old walls neere vnto waters,wells,and fountaines : I found it vpon the wall of the churchyard of Dartford in Kent, hard by the riuer ſide where people ride through, and alſo vpon the walls of the Churchyard of Sittingburne in the ſame Countie, in the middle of the towne hard by a great lake of water,and alſo vpon the Church walls of Railey in Eſſex, and diuers other places.

¶ *The Time.*

Theſe plants are greene both winter and ſommer,and yet haue neither floures nor ſeed.

¶ *The Names.*

Maiden-haire is called in Greek Ἀδίαντον: *Theophraſtus* and *Pliny* name it *Adiantum nigrum*,or black Maiden-haire : for they ſet downe two Maiden-haires, the blacke and the white, making this the blacke,and the Rue of the wall the white:it is called in Latine *Polytrichum*,*Callitrichum*, *Cincinalis*, *Terræ Capillus*,*Supercilium terræ*:of *Apulcius*,*Capillus Veneris*,*Capillaris*,*Crinita*: & of diuers,*Coriandrum putei* : the Italians keepe the name *Capillus Veneris* : in Engliſh, blacke Maiden haire,and Venus haire, and it may be called our Ladies haire.

It

It is called *Adianton* becauſe the leafe, as *Theophraſtus* ſaith, is neuer wet, for it caſteth off water that falleth thereon, or being drowned or couered in water, it remaineth ſtill as if it were dry, as *Pliny* likewiſe writeth; and is termed *Callitricon* and *Polytricon*, of the effect it hath in dying haire, and maketh it to grow thicke.

VVall Rue is commonly called in Latine, *Ruta muraria*, or *Ruta muralis*: of ſome, *Saluia vitæ*, but wherefore I know not, neither themſelues, if they were liuing: of the Apothecaries of the Low-Countries *Capillus Veneris*, or Maiden haire, and they haue vſed it a long time for the right Maiden haire; it is that kinde of *Adiantum* which *Theophraſtus* termed *Adiantum Candidum*, or white Maiden haire, for he maketh two, one blacke, and the other white, as we haue ſaid. *Pliny* doth likewiſe ſet downe two kindes, one he calleth *Polytricon*; the other, *Tricomanes*, or Engliſh Maiden-haire, whereof we will intreate in the chapter following, which he hath falſely ſet downe for a kinde of *Adiantum*, for *Tricomanes* doth differ from *Adiantum*.

Some there be that thinke, Wall-Rue is *Paronychia Dioſcoridis*, or *Dioſcorides* his Whitlow-wort, wherein they haue been greatly deceiued: it is called in high Dutch, **Maurranten:** in low Dutch, **Steencruyt:** in French, *Rue de maræille:* in Engliſh, Wall-Rue, and white Maiden-haire.

¶ *The Temperature and Vertues.*

The true Maiden-haire, as *Galen* teſtifieth, doth dry, make thin, waſte away, and is in a meane betweene heate and coldneſſe: *Meſues* ſheweth that it conſiſteth of vnlike or diſagreeing parts, and that ſome are watery and earthy, and the ſame binding, and another ſuperficially hot and thinne: And that by this it taketh away obſtructions or ſtoppings, maketh things thinne that are thicke, looſeneth the belly, eſpecially when it is freſh and greene: for as this part is thin, ſo is it quickly reſolued, and that by reaſon of his binding and earthy parts: it ſtoppeth the belly, and ſtayeth the laske and other fluxes. A

Being drunke it breaketh the ſtone, and expelleth not onely the ſtones in the kidnies, but alſo thoſe which ſticke in the paſſages of the vrine. B

It raiſeth vp groſſe and ſlimie humors out of the cheſt and lungs, and alſo thoſe which ſticke in the conduits of the winde pipe, it breaketh and raiſeth them out by ſpetting, if a loch or licking medicine be made thereof. C

Moreouer, it conſumeth and waſteth away the Kings-euill, and other hard ſwellings, as the ſame Author affirmeth, and it maketh the haire of the head or beard to grow that is fallen and pilled off. D

Dioſcorides reckoneth vp many vertues and operations of this Maiden-haire, which do not onely differ, but are alſo contrary one to another. Among others he ſaith, that the ſame ſtancheth bloud: and a little before, that it draweth away the ſecondines, and bringeth downe the deſired ſickenes: which words do confound one another with contrarieties; for whatſoeuer things do ſtanch bloud, the ſame do alſo ſtay the termes. E

He addeth alſo in the end, that it is ſowne about ſheepe-folds for the benefit of the ſheepe, but what that benefit ſhould be, he ſheweth not. F

Beſides, that it cannot be ſowne, by reaſon it is without ſeed, it is euident, neither can it fitly be remooued. Therefore in this place it ſeemeth that many things are tranſpoſed from other places, and falſly added to this chapter: and peraduenture ſome things are brought hither out of diſcourſe of *Cytiſus*, or Milke Trefoile, whereof here to write were to ſmall purpoſe. G

Wall-Rue is not much vnlike to blacke Maiden-haire in temperature and facultie. H

Wall-Rue is good for them that haue a cough, that are ſhort winded, and that be troubled with ſtitches and paine in their ſides. I

Being boiled, it cauſeth concoction of raw humors which ſticke in the lungs; it taketh away the paine of the kidnies and bladder, it gently prouoketh vrine, and driueth forth ſtones. K

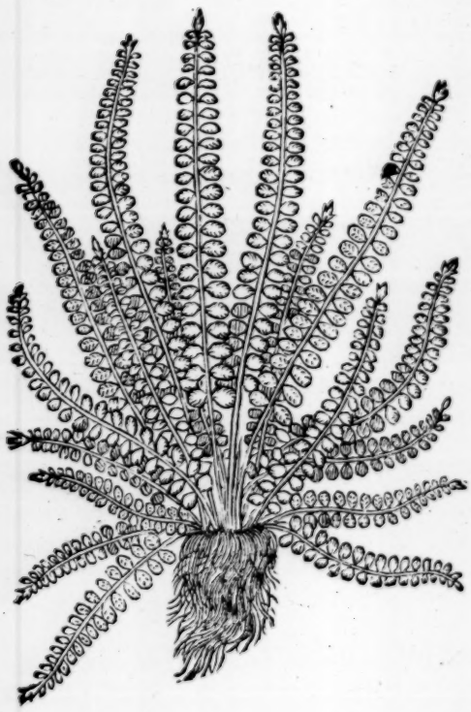
It is commended againſt ruptures in young children, and ſome affirme it to be excellent good, if the powder thereof be taken continually for forty daies together. L

Chap. 474. *Of Engliſh, or common Maiden-haire.*

¶ *The Deſcription:*

1 Engliſh Maiden-haire hath long leaues of a darke green colour, conſiſting of very many ſmall round leaues ſet vpon a middle rib, of a ſhining blacke colour, daſhed on the nether ſide with ſmall rough markes or ſpeckes, of an ouerworne colour: the roots are ſmall and threddy.

1 *Trichomanes mas.*
The Male Engliſh Maiden-haire.



2 The female Engliſh Maiden-haire is like vnto the precedent, ſauing that it is leſſer, and wanteth thoſe ſpots or markes that are in the other, wherein conſiſteth the difference. ‡ Our Authors figure was of the *Trychomanes fœmina* of *Tabernamontanus*, which expreſſes a variety with branched leaues, and therein only was the difference. ‡

¶ *The Place.*

It growes for the moſt part nere vnto ſprings and brookes, and other moiſt places, vpon old ſtone walls and rockes: I found it growing in a ſhadowie ſandie lane in Betſome, in the pariſh of Southfleet in Kent, vpon the ground whereas there was no ſtones or ſtony ground neere vnto it, which before that time I did neuer ſee; it groweth likewiſe vpon ſtone walls at her Majeſties palace of Richmond, & in moſt ſtone wals of the Weſt and North parts of England. ‡ Mr. *Goodyer* ſaith, that in Ianuary, 1624. he ſaw enough to lade an horſe growing on the bancks in a lane, as he rode betweene Rake and Headly in Hampſhire neere Wollmer Forreſt. ‡

¶ *The Time.*

It continueth a long time, the coldneſſe of winter doth it no harme, it is barren as the other Fernes are, whereof it is a kinde.

¶ *The Names.*

It is called in Greeke, πτερὶς μικρὰ: in Latine, *Filicula*, as though we ſhould ſay, *Parua Filex*, or little Ferne; alſo *Capillaris*: in ſhops, *Capillus Veneris*. *Apuleius* in his 51 chapter maketh it all one with *Callitrichon*: of ſome it is called *Polytrichon*: in Engliſh, common Maiden-haire.

¶ *The Temperature and Vertues.*

A Theſe, as *Dioſcorides* and *Galen* do write, haue all the faculties belonging to *Adiantum*, or blacke Maiden-haire.

B The decoction made in wine and drunke, helpeth them that are ſhort winded, it helpeth the cough, ripeneth tough flegme, and auoideth it by ſpitting.

C The lie wherein it hath been ſodden, or laid to infuſe, is good to waſh the head, cauſing the ſcurfe and ſcales to fall off, and haire to grow in places that are pild and bare.

Chap. 475. *Of Thiſtles.*

¶ *The Kindes:*

THe matter of the Thiſtles is diuers, ſome Thiſtles ſerue for nouriſhment, as the Artichoke without prickles, and the Artichoke with prickles; other for medicine, as the root of Carline which is good for many things; the bleſſed thiſtle alſo, otherwiſe called *Carduus benedictus*; Sea Huluer, and diuers others: ſome are poiſonſome, as *Chamæleon niger*; one ſmooth, plaine, and without prickles, as the Thiſtle called Beares Breech, or *Acanthus ſatiuus*, whereof there is another with prickles, which we make the wilde, of the which two we intend to write in this chapter.

¶ *The Deſcription.*

1 BEares breech of the garden hath broad leaues, ſmooth, ſomewhat blacke, gaſhed on both the edges, and ſet with many cuts and fine nickes: betweene which riſeth vp in the midſt a big ſtalke brauely deckt with floures, ſet in order from the middle vpward, of colour white, of forme long, which are armed as it were with two catkins, one higher, another lower: after them grow forth the huskes, in which is found broad ſeed: the roots be blacke without, and white within,

in, andfull of clammie iuice, and are diuided into many off-springs, which as they creepe far, so do they now and then bud forth and grow afresh: these roots are so full of life, that how little soeuer of them remaine, it oftentimes also bringeth forth the whole plant.

1 *Acanthus sativus.*
Garden Beares-breech.

‡ 2 *Acanthus syl. aculeatus.*
Prickley Beares-breech.

2 Wilde Beares-breech,called *Acanthus syluestris*,*Pena* setteth forth for *Chameleonta Monspelicnsium*,and reporteth that he found it growing amongst the grauelly and moist places neere to the walls of Montpellier,and at the gate of Aegidia, betweene the fountaine and the brooke neere to the wall: this thistle is in stalke, floures, colour of leaues and seed like the first kinde, but shorter and lower,hauing large leaues,dented or iagged with many cuts and incisions, not onely in some few parts of the leaues,as some other Thistles,but very thickly dented or clouen,and hauing many sharpe,large, white and hard prickles about the sides of the diuisions and cuts,not very easie to be handled or touched without danger to the hand and fingers.

¶ *The Place.*

Dioscorides writeth,that garden Branke Vrsine groweth in moist and stonie places, and also in gardens: it were vnaduisedly done to seeke it in either of the Germaines any where, but in gardens onely; in my garden it doth grow very plentifully.

The wilde was found in certain places of Italy neere to the sea,by that notable learned man *Alfonsus Pancius*,Physition to the Duke of Ferrara,and professor of simples and Physick,and is a stranger in England.‡ I haue seene it growing in the garden of M^r. *Iohn Parkinson.* ‡

¶ *The Time.*

Both the Branke Vrsines do floure in the sommer season, the seed is ripe in Autumne: the root remaineth fresh; yet now and then it perisheth in winter in both the Germaines, if the weather be too cold: but in England the former seldome or neuer dieth.

¶ *The Names.*

It is called in Greeke ἄκανθος: the Latines keepe the same name *Acanthus*: yet doth *Acanthus* signifie generally all kinde of Thistles,and that is called *Acanthus* by the figure *Antonomasia*:the English name is Branke Vrsine, and Beares breech.

The tame or garden Branke Vrsine is named in Latine *Sativus*,or *Hortensis Acanthus*: in Greeke, ἥμερος: and of *Galen*, *Oribasius*,and *Pliny*,ἀκάμπτιος: *Pliny* also calleth this *Acanthus lævis*, or smooth

Branke Vrſine,and reporteth it to be a citie herbe,and to ſerue for arbors : ſome name it *Branca Vrſina*(others vſe to cal Cow-parſnep by the name of *Branca Vrſina*,but with the addition *Germanica:*) the Italians call it *Acantho*,and *Branca Orſina* : the Spaniards,*Yerua Giguante* : the Ingrauers of old time were wont to carue the leaues of this Branke Vrſine in pillers, and other works,and alſo vpon the eares of pots;as among others *Virgill* teſtifieth in the third Eclog of his Bucolicks:

Et nobis idem Alcimedon duo pocula fecit,
Et molli circum eſt anſas amplexus Acantha.

‡ I take *Virgils Acanthus* to be that which we now commonly call *Pyracantha*, as I ſhall hereafter ſhew when I come to treat thereof. ‡

The other Branke Vrſine is named in Greeke ἄκανθος ἀγρία: and in Latine,*Syluęſtris Acanthus*,or wilde Branke Vrſine, and they may be called properly *Acantha*, or *Spina*,a prickle ; by which name it is found called of moſt Herbariſts,*Acanthus* : yet there is alſo another *Acanthus* a thornie ſhrub:the liquour which iſſueth forth of it,as *Herodotus* and *Theophraſtus* affirme, is a gumme : for difference wherof peraduenture this kinde of *Acanthus* is named *Herbacantha:* There is likewiſe found among the baſtard names of *Acanthus* the word *Mamolaria*,and alſo *Crepula*,but it is not expreſſed to which of them,whether to the wilde or tame it ought to be referred.

¶ *The Temperature.*

Theleaues of the garden Branke Vrſine conſiſt in a meane as it were betweene hot and cold,being ſomwhat moiſt,with a mollifying and gentle digeſting facultie,as are thoſe of the Mallow,and therefore they are profitably boyled in clyſters,as well as Mallow leaues. The root, as *Galen* teacheth,is of a more drying qualitie.

¶ *The Vertues.*

A *Dioſcorides* ſaith,that the roots are a remedie for lims that are burnt with fire,and that haue been out of ioint,if they be laied thereunto: that being drunke they prouoke vrine, and ſtop the belly: that they helpe thoſe that be broken,and be troubled with the crampe, and be in a conſumption of the lungs.

B They are good for ſuch as haue the ptiſicke and ſpet bloud withal; for thoſe that haue faln from ſome high place,that are bruiſed and drie beaten,and that haue ouerſtrained themſelues, and they are as good as the roots of the greater Comfrey, whereunto they are verie like in ſubſtance,tough iuice,and qualitie.

C Of the ſame root is made an excellent plaiſter againſt the ache and numneſſe of the hands and feet.

D It is put into clyſters with good ſucceſſe againſt ſundry maladies.

Chap. 476. *Of the Cotton Thiſtle.*

¶ *The Deſcription.*

1 THe common Thiſtle,whereof the greateſt quantitie of down is gathered for diuers purpoſes,as well by the poore to ſtop pillowes, cuſhions, and beds for want of feathers,as alſo bought of the rich Vpholſters to mixe with the feathers and downe they do ſell,which deceit would be looked vnto : this Thiſtle hath great leaues,long and broad, gaſhed about the edges, and ſet with ſharp and ſtiffe prickles all alongſt the edges,couered all ouer with a ſoft cotton or downe: out from the middeſt whereof riſeth vp a long ſtalke aboue two cubits high ,cornered,and ſet with filmes, and alſo full of prickles : the heads are likewiſe cornered with prickles,and bring foorth floures conſiſting of many whitiſh threds:the ſeed which ſucceedeth them is wrapped vp in down; it is long,of a light crimſon colour, and leſſer than the ſeede of baſtard ſaffron : the root groweth deep in the ground,being white,hard,wooddie,and not without ſtrings.

2 The Illyrian cotton thiſtle hath a long naked root,beſet about the top with a fringe of many ſmall threds or iags:from which ariſeth a very large and tall ſtalke,higher than any man,rather like a tree than an annuall herbe or plant: this ſtalke is garniſhed with ſcroles of thinne leaues, from the bottome to the top,ſet full of moſt horrible ſharpe prickes, and ſo is the ſtalke and euerie part of the plant, ſo that it is impoſſible for man or beaſt to touch the ſame without great hurt or danger: his leaues are very great,far broader and longer than any other thiſtle whatſoeuer, couered with an hoarie cotten or downe like the former : the floures doe grow at the top of the ſtalkes,

which

which is diuided into ſundry branches, and are of a purple colour, ſet or armed round about with the like, or rather ſharper thornes than the aforeſaid.

1 *Acanthium album.*
The white Cotton Thiſtle.

2 *Acanthium Illyricum purpureum.*
The purple Cotton Thiſtle.

¶ *The Place.*

Theſe Thiſtles grow by high waies ſides, and in ditches almoſt euery where.

¶ *The Time*

They floure from Iune vntill Auguſt, the ſecond yeare after they be ſowne: and in the mean time the ſeed waxeth ripe, which being thorow ripe the herbe periſheth, as doe likewiſe moſt of the other Thiſtles, which liue no longer than till the ſeed be fully come to matutitie.

¶ *The Names.*

This Thiſtle is taken for that which is called in Greeke [illegible], which *Dioſcorides* deſcribeth to haue leaues ſet with prickles round about the edges, and to be couered with a thin downe like a copweb, that may be gathered and ſpun to make garments of, like thoſe of ſilke: in high Dutch it is called **ꝛeiſzwꝛge diſtill**: in Low Dutch, **witte weech diſtel**: in French, *Chardon argentin*: in Engliſh, Cotton-Thiſtle, white Cotton-Thiſtle, wilde white Thiſtle, Argentine or the Siluer Thiſtle.

¶ *The Temperature and Vertues.*

Dioſcorides ſaith, that the leaues and roots hereof are a remedy for thoſe that haue their bodies drawne backwards; thereby *Galen* ſuppoſeth that theſe are of temperature hot. A

CHAP. 477. *Of our Ladies-Thiſtle.*

¶ *The Deſcription.*

THe leaues of our Ladies Thiſtle are as bigge as thoſe of white Cotton-Thiſtle: for the leaues thereof be great, broad, large, gaſhed in the edges, armed with a multitude of ſtiffe and ſharpe prickles, as are thoſe of Ote-Thiſtle, but they are without down, altogether ſlippery, of a light

Carduus Mariæ.
Ladies Thiſtle.

green and ſpeckled, with white and milky ſpots and lines drawne diuers waies: the ſtalk is high, and as big as a mans finger: the floures grow forth of heads full of prickles, being threds of a purple colour: the ſeed is wrapped in downe like that of Cotton Thiſtle: the root is long, thicke, and white.

¶ *The Place.*

It groweth vpon waſte and common places by high waies, and by dung-hils almoſt euerie where.

¶ *The Time.*

It floureth and ſeedeth when Cotton Thiſtle doth.

¶ *The Names.*

It is called in Latine, *Carduus Lacteus*, and *Carduus-Mariæ*, in high Dutch, **Onſer Vrouwen Diſtell**: in French, *Chardon ae neſtre dame*: in Engliſh, our Ladies Thiſtle: it may properly be called *Leucographus*, of the white ſpots and lines that are on the leaues: *Pliny* in his 27. booke, chap. 11. maketh mention of an herb called *Leucographis*, but what maner of one it is he hath not expreſſed; therefore it would be hard to affirme this to be the ſame that his *Leucographis* is; and this is thought to bee *Spina alba*, called in Greeke λευκάκανθα, or white Thiſtle, Milk Thiſtle, and *Carduus Ramptarius*: of the Arabians, *Bedard*, or *Bedeguar*, as *Matthæus Syluaticus* teſtifieth.

¶ *The Temperature and Vertues.*

The tender leaues of *Carduus Leucographus*, the prickles taken off, are ſometimes vſed to bee eaten with other herbes.

A *Galen* writeth, that the roots of *Spina alba* do drie and moderately binde, that therefore it is good for thoſe that be troubled with the laſk and the bloudy flix, that it ſtaieth bleedings, waſteth away cold ſwellings; eaſeth the paine of the teeth if they bee waſhed with the decoction thereof.

B The ſeed thereof is of a thin eſſence and hot facultie, therefore he ſaith that it is good for thoſe that be troubled with cramps.

C *Dioſcorides* affirmeth that the ſeeds being drunke are a remedie for infants that haue their ſinews drawne together, and for thoſe that be bitten of ſerpents: and that it is thought to driue away ſerpents, if it be but hanged about the necke.

Chap. 478. *Of the Globe Thiſtle.*

¶ *The Deſcription.*

GLobe Thiſtle hath a very long ſtalke, and leaues iagged, great, long, and broad, deeply gaſhed, ſtrong of ſmell, ſomewhat greene on the vpper ſide, and on the nether ſide whiter and downy: the floures grow forth of a round head like a globe, which ſtandeth on the tops of the ſtalkes; they are white and ſmall, with blew threds in the midſt: the ſeed is long, with haires of a meane length: the root is thicke and branched.

2 There is another Globe Thiſtle that hath leſſer leaues, but more full of prickles, with round heads alſo: but there groweth out of them beſides the floures, certaine long and ſtiffe prickles.

3 There is likewiſe another kinde reſembling the firſt in forme and figure, but much leſſer, and the floures thereof tend more to a blew.

4 There is alſo another Globe Thiſtle, which is the leaſt, and hath the ſharpeſt prickles of all the reſt: the head is ſmall; the floures whereof are white, like to thoſe of the firſt.

5 There

1 *Cardnus globoſus.*
The Globe-Thiſtle.

‡ 2 *Carduus globoſus acutus.*
Prickly headed Globe-Thiſtle.

‡ 3 *Carduus globoſus minor.*
Small Globe-Thiſtle.

‡ 5 *Carduus globoſus capitulo latiore.*
Flat headed Globe-Thiſtle.

5 There is a certaine other kinde hereof, yet the head is not ſo round, that is to ſay, flatter and broader aboue; out of which ſpring blew floures: the ſtalke hereof is ſlender, and couered with a white thin downe: the leaues are long, gaſhed likewiſe on both ſides, and armed in euery corner with ſharpe prickles.

6 There

6 There is another called the Down-Thiſtle, which riſeth vp with thicke and long ſtalks. The leaues thereof are iagged, ſet with prickles, white on the nether ſide: the heads be round and many in number, and are couered with a ſoft downe, and ſharpe prickles ſtanding forth on euerie ſide, being on the vpper part fraughted with purple floures all of ſtrings: the ſeed is long, and ſhineth, as doth the ſeed of many of the Thiſtles.

‡ 6 *Carduus eriocephalus.*
Woolly headed Thiſtle.

¶ *The Place.*

They are ſown in gardens, and do not grow in theſe countries that we can finde.

‡ I haue found the ſixth by Pocklington and in other places of the Woldes in Yorkeſhire. M^r. *Goodyer* alſo found it in Hampſhire. ‡

¶ *The Names.*

They floure and flouriſh when the other Thiſtles do.

¶ *The Names.*

Fuchſius did at the firſt take it to be *Chamæleon niger*; but afterwards being better aduiſed, he named it *Spina peregrina*, and *Carduus globoſus*. *Valerius Cordus* doth fitly call it *Sphærocephalus*: the ſame name doth alſo agree with the reſt, for they haue a round head like a ball or globe. Moſt would haue the firſt to be that which *Matthiolus* ſetteth downe for *Spina alba*: this Thiſtle is called in Engliſh, Globe Thiſtle, and Ball-Thiſtle.

The downe or woolly headed Thiſtle is called in Latine, being deſtitute of another name, *Eriocephalus*, of the woolly head: in Engliſh, Downe Thiſtle, or woolly headed Thiſtle. It is thought of diuers to be that which *Bartholomæus Vrbevcteranus* and *Angelus Palea*, Franciſcan Friers, report to be called *Corona Fratrum*, or Friers Crowne: but this Thiſtle doth far differ from that, as is euident by thoſe things which they haue written concerning *Corona Fratrum*; which is thus: In the borders of the kingdome of Aragon towards the kingdome of Caſtile we finde another kind of Thiſtle, which groweth plentifully there, by common waies, and in wheate fields, &c. *Vide Dod. Pempt. 5. lib. 5. cap. 5.*

¶ *The Temperature and Vertues.*

Concerning the temperature and vertues of theſe Thiſtles we can alledge nothing at all.

Chap. 479. *Of the Artichoke.*

¶ *The Kindes.*

THere be three ſorts of Artichokes, two tame or of the garden; and one wilde, which the Italian eſteemeth greatly of, as the beſt to be eaten raw, which he calleth *Cardune*.

¶ *The Deſcription.*

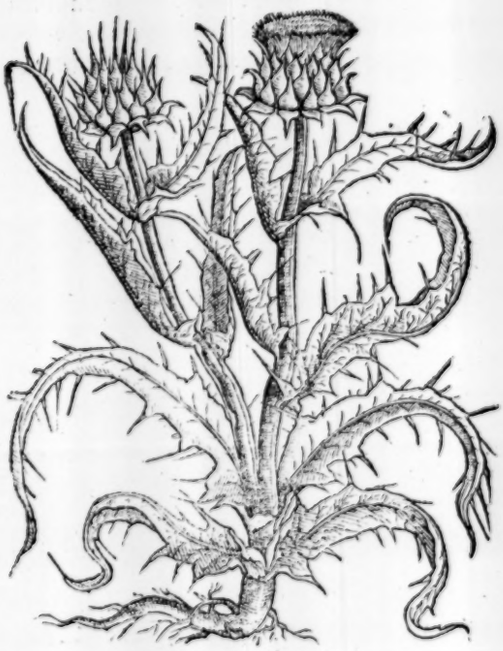
1 THe leaues of the great Artichoke, called in Latine *Cinara*, are broad, great, long, ſet with deepe gaſhes in the edges, with a deepe channell or gutter alongſt the middle, hauing no prickles at all, or very few, and they be of a greene aſh colour: the ſtaike is aboue a cubit high, and bringeth forth on the top a fruit like a globe, reſembling at the firſt a cone or Pine apple, that is to ſay, made vp of many ſcales; which is when the fruit is great or looſed of a greeniſh red colour within, and in the lower part full of ſubſtance and white; but when it opens it ſelfe there growes

alſo

1 *Cinara maxima Anglica.*
The great red Artichoke.

2 *Cinara maxima alba.*
The great white Artichoke.

3 *Cinara ſylueſtris.*
Wilde Artichoke.



alſo vpon the cone a floure all of threds, of a gallant purple tending to a blew colour. The ſeed is long, greater and thicker than that of our Ladies thiſtle, lying vnder ſoft and downy haires which are contained within the fruit. The root is thicke, and of a meane length.

2 The ſecond great Artichoke differeth from the former in the colour of the fruit, otherwiſe there is little difference, except the fruit hereof dilateth it ſelfe further abroad, and is not ſo cloſely compact together, which maketh the difference.

3 The prickly Artichoke, called in Latine *Carduus*, or *Spinoſa Cinara*, differeth not from the former, ſaue that all the corners of the leaues hereof, and the ſtalkes of the cone or fruit, are armed with ſtiffe and ſharp prickles, whereupon it beareth well the name of *Carduus*, or Thiſtle.

¶ *The Place.*

The Artichoke is to be planted in a fat and fruitfull ſoile: they do loue water and moiſt ground. They commit great error who cut away the ſide or ſuperfluous leaues that grow by the ſides, thinking thereby to increaſe the greatneſſe of the fruit, when as in truth they depriue the root from much water by that meanes, which ſhould nouriſh it to the feeding of the fruit; for if you marke the trough or hollow channell that is in euery leafe, it ſhall appeare very euidently, that the

Creator

Creator in his ſecret wiſedome did ordaine thoſe furrowes, euen from the extreme point of the leafe to the ground where it is faſtned to the root, for no other purpoſe but to guide and leade that water which falls far off, vnto the root; knowing that without ſuch ſtore of water the whole plant would wither, and the fruit pine away and come to nothing.

¶ *The Time.*

They are planted for the moſt part about the Kalends of Nouember, or ſomewhat ſooner. The plant muſt be ſet and dunged with good ſtore of aſhes, for that kinde of dung is thought beſt for planting thereof. Euery yeare the ſlips muſt be torne or ſlipped off from the body of the root, and theſe are to be ſet in Aprill, which will beare fruit about Auguſt following, as *Columella*, *Palladius*, and common experience teacheth.

¶ *The Names.*

The Artichoke is called in Latine *Cinara*, of *Cinis*, Aſhes, wherewith it loueth to be dunged. *Galen* calleth it in Greeke κύναρα, but with *k* and *v* in the firſt ſyllable: of ſome it is called *Cactos*: it is named in Italian, *Carcioffi*, *Archiocchi*: in Spaniſh, *Alcarrhofa*: in Engliſh, Artichoke: in French, *Artichaux*: in low-Dutch, **Artichoken**: whereupon diuers call it in Latine *Articocalus*, and *Articoca*: in high-Dutch, **Strobildozn.**

The other is named in Latine commonly not onely *Spinoſa cinara*, or prickly Artichoke, but alſo of *Palladius*, *Carduus*: of the Italians, *Cardo*, and *Cardino*: of the Spaniards, *Cardos*: of the French men, *Chardons*: *Leonhartus Fuchſius* and moſt writers take it to be *Scolymus Dioſcoridis*; but *Scolymus Dioſcoridis* hath the leafe of Chameleon or *Spina alba*, with a ſtalke full of leaues, and a prickly head: but neither is *Cinara* the Artichoke which is without prickles, nor the Artichok with prickles any ſuch kinde of herbe; for though the head hath prickles, yet the ſtalke is not full of leaues, but is many times without leaues, or elſe hath not paſt a leafe or two. *Cinara* doth better agree with that which *Theophraſtus* and *Pliny* call κάκτος, *Cactus*, and yet it doth not bring forth ſtalkes from the root creeping alongſt the ground: it hath broad leaues ſet with prickles; the middle ribs of the leaues, the skin pilled off, are good to be eaten, and likewiſe the fruit, the ſeed and down taken away; and that which is vnder is as tender as the braine of the Date tree: which things *Theophraſtus* and *Pliny* report of *Cactus*. That which they write of the ſtalkes, ſent forth immediately from the root vpon the ground, which are good to be eaten, is peraduenture the ribs of the leaues: euerie ſide taken away (as they be ſerued vp at the table) may be like a ſtalke, except euen in Sicilia, where they grew only in *Theophraſtus* time. It bringeth forth both certaine ſtalks that lie on the ground, and another alſo ſtanding ſtraight vp; but afterwards being remoued and brought into Italy or England, it bringeth forth no more but one vpright: for the ſoile and clyme do much preuaile in altering of plants, as not onely *Theophraſtus* teacheth, but alſo euen experience it ſelfe declareth: and of *Cactus*, *Theophraſtus* writeth thus; κάκτος (*Cactus*) groweth onely in Sicilia: it bringeth forth preſently from the root ſtalkes lying along vpon the ground, with a broad and prickly leafe: the ſtalkes being pilled are fit to be eaten, being ſomewhat bitter, which may be preſerued in brine: it bringeth forth alſo another ſtalke, which is likewiſe good to be eaten.

¶ *The Temperature and Vertues.*

A The nailes, that is, the white and thicke parts which are in the bottome of the outward ſcales or flakes of the fruit of the Artichoke, and alſo the middle pulpe whereon the downy ſeed ſtands, are eaten both raw with pepper and ſalt, and commonly boyled with the broth of fat fleſh, with pepper added, and are accounted a dainty diſh, being pleaſant to the taſte, and good to procure bodily luſt: ſo likewiſe the middle ribs of the leaues being made white and tender by good cheriſhing and looking to, are brought to the table as a great ſeruice together with other junkets: they are eaten with pepper and ſalt as be the raw Artichokes: yet both of them are of ill iuyce; for the Artichoke containeth plenty of cholericke iuyce, and hath an hard ſubſtance, inſomuch as of this is ingendred melancholy iuyce, and of that a thin and cholerick bloud, as *Galen* teacheth in his book of the Faculties of nouriſhments. But it is beſt to eate the Artichoke boyled: the ribbes of the leaues are altogether of an hard ſubſtance: they yeeld to the body a raw and melancholy iuice, and containe in them great ſtore of winde.

B It ſtayeth the inuoluntarie courſe of the naturall ſeed either in man or woman.

C Some write, that if the buds of yong Artichokes be firſt ſteeped in wine, and eaten, they prouoke vrine, and ſtir vp the luſt of the body.

D I finde moreouer, that the root is good againſt the ranke ſmell of the arme-holes, if when the pith is taken away the ſame root be boyled in wine and drunke: for it ſendeth forth plenty of ſtinking vrine, whereby the ranke and rammiſh ſauor of the whole body is much amended.

Chap.

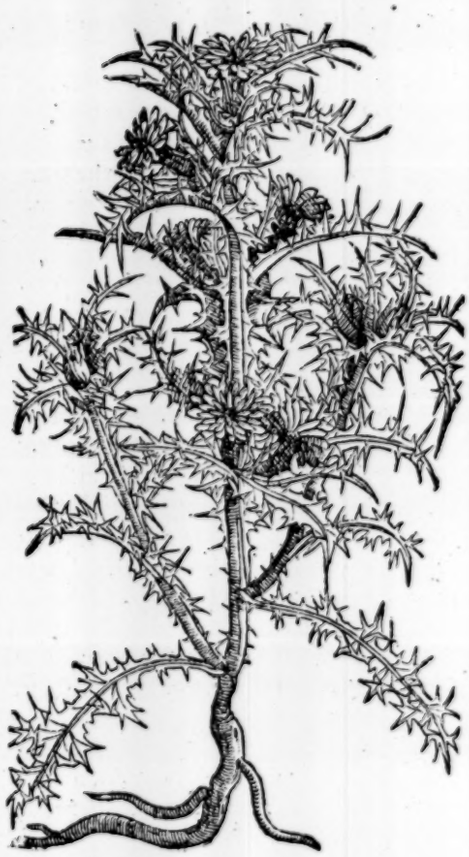
Chap. 480. *Of Golden Thiſtles.*

¶ *The Deſcription.*

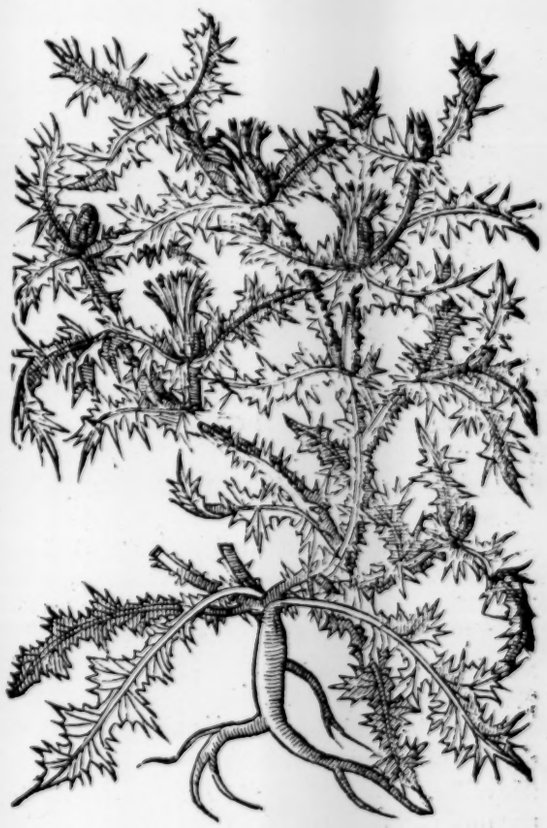
1 THe ſtalkes of Golden Thiſtle riſe vp forthwith from the root, being many, round, and branched. The leaues are long, of a beautifull green, with deepe gaſhes on the edges, and ſet with moſt ſharpe prickles: the floures come from the boſome of the leaues, ſet in a ſcalie chaffie knap, very like to Succorie floures, but of colour as yellow as gold: in their places come vp broad flat and thin ſeeds, not great, nor wrapped in downe: the root is long, a finger thicke, ſweet, ſoft, and good to be eaten, wherewith ſwine are much delighted: there iſſueth forth of this thiſtle in what part ſoeuer it is cut or broken, a iuyce as white as milke.

‡ There is ſome varietie of this Thiſtle; for it is found much larger about Montpelier than it is in Spaine, with longer branches, but fewer floures: the leaues alſo are ſpotted or ſtreaked with white like as the milke Thiſtle: whence *Cluſius*, whom I here follow, hath giuen two figures thereof; the former by the name of *Scolymus Theophraſti Hiſpanicus*; and the other by the title of *Scolymus Theophraſti Narbonenſis*. This with white ſpots I ſaw growing this yere with M^r. *Tradeſcant* at South Lambeth. ‡

1 *Carduus Chryſanthemus Hiſpanicus.*
The Spaniſh golden Thiſtle.



‡ *Carduus Chryſanthemus Narbonenſis.*
The French golden Thiſtle.



2 The golden Thiſtle of Peru, called in the Weſt Indies, *Fique del Inferno*, a friend of mine brought it vnto me from an Iſland there called Saint Iohns Iſland, among other ſeeds. What reaſon the inhabitants there haue to call it ſo, it is vnto me vnknowne, vnleſſe it be becauſe of his fruit, which doth much reſemble a fig in ſhape and bigneſſe, but ſo full of ſharpe and venomous prickles, that whoſoeuer had one of them in his throat, doubtleſſe it would ſend him packing either to heauen or to hell. This plant hath a ſingle wooddy root as big as a mans thumbe, but ſomwhat long: from which ariſeth a brittle ſtalke full of ioynts or knees, diuiding it ſelfe into ſundry other ſmall branches, ſet full of leaues like vnto the milke Thiſtle, but much ſmaller, and ſtraked with many white lines or ſtreakes: and at the top of the ſtalks come forth faire and goodly yellow floures, very like vnto the ſea Poppy, but more elegant, and of greater beauty, hauing in the midſt

thereof

thereof a ſmall knop or boll, ſuch as is in the middle of our wild Poppy, but full of ſharpe thorns, and at the end thereof a ſtaine or ſpot of a deepe purple: after the yellow floures be fallen, this foreſaid knop groweth by degrees greater and greater, vntill it come to full maturitie, which openeth it ſelfe at the vpper end, ſhewing his ſeed, which is very blacke and round like the ſeeds of muſtard. The whole plant and each part thereof doth yeeld verie great aboundance of milkie iuyce, which is of a golden colour, falling and iſſuing from any part thereof, if it be cut or bruiſed: the whole plant periſheth at the approch of Winter. The vertues hereof are yet vnknowne vnto me, wherefore I purpoſe not to ſet downe any thing thereof by way of coniecture, but ſhall, God willing, be ready to declare that which certaine knowledge and experience either of myne owne or others, ſhall make manifeſt vnto me.

¶ *The Place.*

The golden Thiſtle is ſowne in gardens of the Low-Countries. *Petrus Bellonius* writes, That it groweth plentifully in Candy, and alſo in moſt places of Italy: *Cluſius* reporteth that he found it in the fields of Spaine, and of the kingdome of Caſtile, and about Montpelier, with fewer branches, and of a higher growth.

The Indian Thiſtle groweth in Saint Iohns Iſland in the Weſt Indies, and proſpereth very well in my garden.

¶ *The Time.*

They floure from Iune to the end of Auguſt: the ſeed of the Indian golden Thiſtle muſt be ſowne when it is ripe, but it doth not grow vp vntill May next after.

¶ *The Names.*

This Thiſtle is called in Latine *Carduus Chryſanthemus*: in Greeke of *Theophraſtus*, Σκόλυμος; for thoſe things which he writeth of *Scolymus* in his ſixth and ſeuenth bookes doe wholly agree with this Thiſtle *Chryſanthemus*: which are theſe; *Scolymus*, doth floure in the Sommer ſolſtice, brauely and a long time together; it hath a root that may be eaten both ſod and raw, and when it is broken it yeeldeth a milky iuyce: *Gaza* nameth it *Carduus*. Of this *Pliny* alſo makes mention, *lib. 21. ca. 16.* *Scolymus*, ſaith he, differs from thoſe kindes of Thiſtles, *viz.* *Acarna*, and *Atractilis*, becauſe the root thereof may be eaten boyled. Againe, *Lib. 22. Cap. 22.* The Eaſt Countries vſe it as a meate: and he calleth it by another name Ἀκμώνιον. Which thing alſo *Theophraſtus* ſeemeth to affirme, in his ſixt booke; for when he reckoneth vp herbes whoſe leaues are ſet with prickles, he addeth *Scolymus*, or *Limonia*.

Notwithſtanding, *Pliny* maketh mention likewiſe of another *Scolymus*, which hee affirmeth to bring forth a purple floure, and betweene the middle of the prickes to wax white quickely, and to fall off with the winde; in his twentieth booke, *cap. 23.* Which Thiſtle doubtleſſe doth not agree with *Carduus Chryſanthemus*, that is, with *Theophraſtus* his *Scolymus*, and with that which we mentioned before: ſo that there be in *Pliny* two *Scolymi*; one with a root that may be eaten, and another with a purple floure, turning into downe, and that ſpeedily waxeth white. *Scolymus* is likewiſe deſcribed by *Dioſcorides*; but this differs from *Scolymus Theophraſti*, and it is one of thoſe which *Pliny* reckoneth vp, as we wil more at large declare hereafter. But let vs come againe to *Chryſanthemus*: This the inhabitants of Candy, keeping the marks of the old name, do call *Aſcolymbros*: the Italians name it *Anconitani Rinci*: the Romans, *Spina borda*: the Spaniards, *Cardon lechar*: and of diuers it is alſo named *Glycyrrhizon*, that is to ſay, *dulcis Radix*, or ſweet Root: it is called in Engliſh, golden Thiſtle: ſome would haue it to be that which *Vegetius* in *Arte Veterinaria* calls *Eryngium*: but they are deceiued; for that *Eryngium* whereof *Vegetius* writeth is *Eryngium marinum*, or ſea Huluer, of which we will intreat.

The golden Thiſtle of India may be called *Carduus Chryſanthemus*, of his golden colour, adding thereto his natiue countrey *Indianus*, or *Peruanus*, or the golden Indian Thiſtle, or the golden Thiſtle of Peru: the ſeed came to my hands by the name *Fique del Inferno*: in Latine, *Ficus infernalis*, the infernall fig, or fig of hell.

¶ *The Temperature and Vertues.*

A The root and tender leaues of this *Scolymus*, which are ſometimes eaten, are good for the ſtomacke, but they containe very little nouriſhment, and the ſame thinne and waterie, as *Galen* teacheth.

B *Pliny* ſaith, that the root hereof was commended by *Eratoſthenes*, in the poore mans ſupper, and that it is reported alſo to prouoke vrine eſpecially; to heale tetters and dry ſcurfe, being taken with vineger; and with Wine to ſtir vp fleſhly luſt, as *Heſiod* and *Alcæus* teſtifie; and to take away the ſtench of the arme-holes, if an ounce of the root, the pith picked out, be boyled in three parts of wine, till one part be waſted, and a good draught taken faſting after a bath, and likewiſe after meat: which

which later words *Dioſcorides* likewiſe hath concerning his *Scolymus* : out of whom *Pliny* is thought to haue borrowed theſe things.

† The plant our Author here deſcribes in the ſecond place, is that which I deſcribed and figured formerly, pag. 401. by the name of *Papauer ſpinoſum*. I muſt confeſſe, I there ſhould haue omitted it, becauſe it is here ſet forth ſufficiently by our Author, whereof indeed I had a little remembrance, and therefore at that time ſought his Index by all the names I could remember, but not making it a *Carduus*, I at that time miſſed thereof; but here finding it, I haue let the hiſtory ſtand as it was, and onely omitted the figure which you may finde before, and ſomething alſo in the hiſtory not here deliuered.

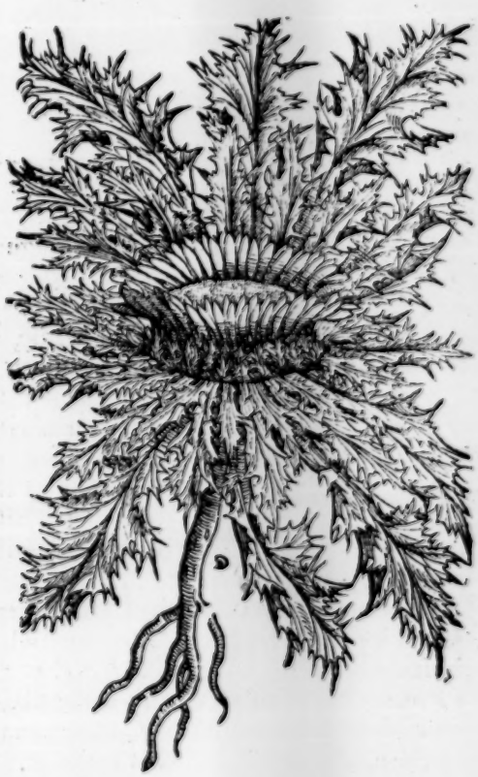
CHAP. 481. *Of white Carline Thiſtle of* Dioſcorides.

¶ *The Deſcription.*

1 THe leaues of Carline are very full of prickles, cut on both edges with a multitude of deepe gaſhes, and ſet along the corners with ſtiffe and very ſharpe prickles; the middle ribs whereof are ſometimes red: the ſtalke is a ſpan high or higher, bringing forth for the moſt part onely one head or knap being full of prickles, on the outward circumference or compaſſe like the Vrchin huske of a cheſnut: and when this openeth at the top, there groweth forth a broad floure, made vp in the middle like a flat ball, of a great number of threds, which is compaſſed about with little long leaues, oftentimes ſomewhat white, very ſeldome red: the ſeed vnderneath is ſlender and narrow, the root is long, a finger thicke, ſomething blacke, ſo chinked as though it were ſplit in ſunder, ſweete of ſmell, and in taſte ſomewhat bitter.

‡ 1 *Carlina cauleſcens magno flore.*
Tall Carline Thiſtle.

2 *Carlina, ſeu Chameleon albus* Dioſcoridis.
The white Carline Thiſtle of *Dioſcorides* with the red floure.



2 There is alſo another hereof without a ſtalke, with leaues alſo very full of prickles, like almoſt to thoſe of the other, lying flat on the ground on euery ſide: among which there groweth forth in the middle a round head or knap, ſet with prickles without after the ſame maner, but greater: the floure whereof in the middle is of ſtrings, and paled round about with red leaues, and ſometimes with white, in faire and calme weather the floures both of this and alſo of the other laie

‡ 3 *Carlina acaulos minor flore purp.*
Dwarfe Carline Thiſtle.

themſelues wide open, and when the weather is foule and miſty, are drawne cloſe together: the root hereof is long, and ſweet of ſmell, white, ſound, not nicked or ſplitted as the other.

‡ 3 This ſmall purple Carline Thiſtle hath a prety large root diuided oft times at the top into diuers branches, from which riſe many green leaues lying ſpred vpon the ground, deeply cut and ſet with ſharpe prickles; in the midſt of theſe leaues come vp ſometimes one, but otherwhiles more ſcaly heads, which carry a pretty large floure compoſed of many purple threds, like that of the Knapweed, but larger, and of a brighter colour; theſe heads grow vſually cloſe to the leaues, yet ſometimes they ſtand vpon ſtalkes three or foure inches high: when the floure is paſt they turne into downe, and are carried away with the winde: the ſeed is ſmall and grayiſh. This growes vpon Blacke-Heath, vpon the chalky hills about Dartford, and in many ſuch places. It floures in Iuly and Auguſt. *Tragus* calls it *Chamæleon albus, vel exiguus*; *Lobel*, *Carduus acaulis, Septentrionalium*, and *Chamæleon albus, Cordi*; *Cluſius, Carlina minor purpureo flore*, and he ſaith in the opinion of ſome, it ſeemes not vnlike to the *Chamæleon* whereof *Theophraſtus* makes mention, *lib. 6. cap. 3. Hiſt. plant.* ‡

¶ *The Place.*

They both grow vpon high mountaines in deſart places, and oftentimes by high way ſides: but that which bringeth forth a ſtalke groweth euery where in Germany, and is a ſtranger in England.

¶ *The Time.*

They floure and ſeed in Iuly and Auguſt, and many times later.

¶ *The Names.*

The former is called in Latine, *Carlina*, and *Cardopatium*; and of diuers, *Carolina*, of *Charlemaine* the firſt Romane Emperor of that name, whoſe armie (as it is reported) was in times paſt through the benefit of this root deliuered and preſerued from the plague: it is called in high Dutch, **Eberwurtz**: in low Dutch, French, and other languages, as likewiſe in Engliſh, *Carline*, and Carline Thiſtle: it is *Dioſcorides* his *Leucacantha* the ſtrong and bitter roots ſhew the ſame; the faculties alſo are anſwerable, as forthwith we will declare: *Leucacantha* hath alſo the other names, but they are counterfeit, as among the Romanes *Gniacardus*; and among the Thuſcans, *Spina alba*, or white Thiſtle, yet doth it differ from that Thiſtle which *Dioſcorides* calleth *Spina alba*, of which he alſo writting apart, doth likewiſe attribute to both of them their owne proper faculties and operations, and the ſame differing.

The later writers do alſo call the other *Carlina altera*, and *Carlina humilis*, or *minor*, low or little Carline: but they are much deceiued who go about to referre them both to the Chamæleons; for in Italy, Germany, or France, *Chamæleones*, the Chamæleons do neuer grow, as there is one witneſſe for many, *Petrus Bellonius*, in his fift booke of Singularities, who ſufficiently declareth what difference there is betweene the Carlines and the Chamæleons; which thing ſhall be made manifeſt by the deſcription of the Chamæleons.

¶ *The Temperature and Vertues.*

A The root of Carline, which is chiefely vſed, is hot in the later end of the ſecond degree, and dry in the third, with a thinnes of parts and ſubſtance; it procureth ſweate, it driueth forth all kinde of wormes of the belly, it is an enemy to all maner of poiſons, it doth not onely driue away infections of the plague, but alſo cureth the ſame, if it be drunke in time.

B Being chewed it helpeth the tooth-ache; it openeth the ſtoppings of the liuer and ſpleene.

C It prouoketh vrine, bringeth downe the menſes, and cureth the dropſie.

D And it is giuen to thoſe that haue been dry beaten, and fallen from ſome high place.

The

The like operations *Dioſcorides* hath concerning *Leucacantha* : *Leucacantha* (ſaith he) hath a root E
like Cyperus, bitter and ſtrong, which being chewed eaſeth the paine of the teeth : the decoction
thereof with a draught of wine is a remedie againſt paines of the ſides, and is good for thoſe that
haue the Sciatica or ache in the huckle bones, and for them that be troubled with the crampe.
The iuyce alſo being drunke is of like vertues. F

CHAP. 482. *Of wilde Carline Thiſtle.*

¶ *The Deſcription.*

1 THe great wilde Carline Thiſtle riſeth vp with a ſtalke of a cubit high or higher, diuided into certaine branches : the leaues are long, and very full of prickles in the edges, like thoſe of Carline : the floures grow alſo vpon a prickely head, being ſet with threds in the middeſt, and paled round about with a little yellowiſh leaues : the root is ſlender, and hath a twinging taſte.

2 *Carolus Cluſius* deſcribeth a certaine other alſo of this kinde, with one onely ſtalke, ſlender, ſhort, and not aboue a handfull high, with prickly leaues like thoſe of the other, but leſſer, both of them couered with a certaine hoary downe : the heads or knaps are for the moſt part two, they haue a pale downe in the midſt, and leaues ſtanding round about, being ſomewhat ſtiffe and yellow : the root is ſlender, and of a reddiſh yellow.

1 *Carlina ſylueſtris maior.*
The great wilde Carline Thiſtle.

2 *Carlina ſylueſtris minor.*
The little wilde Carline Thiſtle.

¶ *The Place.*

The great Carline is found in vntoiled and deſart places, and oftentimes vpon hills. ‡ It groweth vpon Blacke Heath, and in many other places of Kent. ‡

The leſſer Carline *Carolus Cluſius* writeth that he found growing in dry ſtony and deſart places, about Salmantica a city of Spaine.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

It is commonly called in Latine, and that not vnfitly, *Carlina ſylueſtris*; for it is like to Carline in floures, and is not very vnlike in leaues. And that this is Ἄκαρνα, it is ſo much the harder to affirme, by how much the briefer *Theophraſtus* hath written hereof; for he ſaith that this is like baſtard ſaffron, of a yellow colour and fat iuyce: and *Acorna* differs from *Acarna*; for *Acarna*, as *Heſychius* ſaith, is the Bay tree; but *Acorna* is a prickly plant.

¶ *The Temperature and Vertues.*

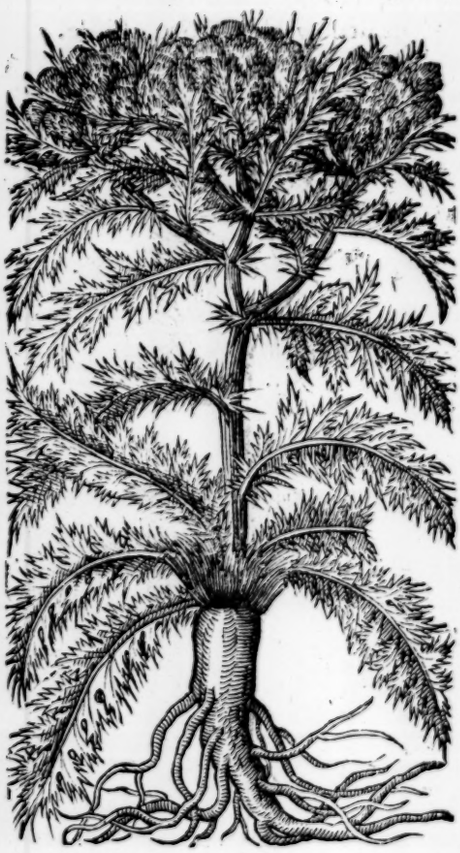
It is hot, eſpecially in the root, the twinging taſte thereof doth declare; but ſeeing it is of no vſe, the other faculties be vnſearched out.

Chap. 483. *Of Chamæleon Thiſtle.*

¶ *The Kindes.*

There be two Chamæleons, and both blacke: the vertues of their roots do differ, and the roots themſelues do differ in kinde, as *Theophraſtus* declareth.

† 1 *Chamæleon niger.*
The blacke Chamæleon Thiſtle.



2 *Chamæleon niger Salmanticenſis.*
The Spaniſh blacke Chamæleon.

¶ *The Deſcription.*

1 The leaues of blacke Chamæleon are leſſer and ſlenderer than thoſe of the prickely Artichoke, and ſprinckled with red ſpots: the ſtalke is a cubit high, a finger thicke, and ſomewhat red: it beareth a tufted rundle, in which are ſlender prickely floures of a blew colour like the Hyacinth. The root is thicke, blacke without, of a cloſe ſubſtance, ſometimes eaten away, which being cut is of a yellowiſh colour within, and being chewed it bites the tongue.

2 This

2 This blacke Chamæleon hath many leaues, long and narrow, very full of prickles, of a light greene, in a manner white: the ſtalke is chamfered, a foot high, and diuided into branches, on the tops whereof ſtand purple floures growing forth of prickly heads: the root is blacke, and ſweet in taſte. This is deſcribed by *Cluſius* in his Spaniſh Obſeruations, by the name of *Chamæleon Salmanticenſis*, of the place wherein he found it: for he ſaith that this groweth plentifully in the territory of Salmantica a city in Spaine: but it is very manifeſt that this is not blacke Chamæleon, neither doth *Cluſius* affirme it.

¶ *The Place.*

It is very common, ſaith *Bellonius*, in Lemnos, where it beareth a floure of ſo gallant a blew, as that it ſeemeth to contend with the skie in beautie; and that the floure of Blew-Bottle being of this colour, ſeemes in compariſon of it to be but pale. It groweth alſo in the fields neere Abydum, and hard by the riuers of Helleſpont, and in Heraclea in Thracia.

Chamæleon Salmanticenſis groweth plentifully in the territorie of Salmantica a city in Spaine.

¶ *The Time.*

They floure and flouriſh when the other Thiſtles do.

¶ *The Names.*

The blacke Chamæleon is called in Greeke χαμαιλέων μέλας: in Latine, *Chamæleon niger*: of the Romans, *Carduus niger*, and *Vernilago*: of ſome, *Crocodilion*: in Engliſh, the Chamæleon Thiſtle, or the Thiſtle that changeth it ſelfe into many ſhapes and colours.

¶ *The Temperature and Vertues.*

The root hereof, as *Galen* ſaith, containeth in it a deadly qualitie: it is alſo by *Nicander* numbred among the poyſonous herbes, in his booke of Treacles; by *Dioſcorides*, *lib. 6.* and by *Paulus Ægineta*: and therefore it is vſed only outwardly, as for ſcabs, morphewes, tetters, and to be briefe, for all ſuch things as ſtand in need of clenſing: moreouer, it is mixed with ſuch things as doe diſſolue and mollifie, as *Galen* ſaith. A

† The figure which was formerly in the firſt place did not agree with the hiſtorie (which was taken out of *Dalechamp*) though *Tabern.* gaue it for *Chamæleon niger*; for it is the *Tricoma Creta*, &c. of *Lobel*. You ſhall finde it hereafter with the *Acarna Valerandi*.

Chap. 484. *Of Sea Holly.*

¶ *The Kindes.*

Dioſcorides maketh mention onely of one ſea Holly: *Pliny*, *lib. 22. cap. 7.* ſeemes to acknowledge two, one growing in rough places, another by the ſea ſide. The Phyſitians after them haue obſerued more.

¶ *The Deſcription.*

1 Sea Holly hath broad leaues almoſt like to Mallow leaues, but cornered in the edges, and ſet round about with hard prickles, fat, of a blewiſh white, and of an aromaticall or ſpicie taſte: the ſtalke is thicke, aboue a cubit high, now and then ſomewhat red below: it breaketh forth on the tops into prickly or round heads or knops, of the bigneſſe of a Wall-nut, held in for the moſt part with ſix prickely leaues, compaſſing the top of the ſtalke round about: which leaues as wel as the heads are of a gliſtring blew: the floures forth of the heads are likewiſe blew, with white threds in the midſt: the root is of the bigneſſe of a mans finger, very long, and ſo long, as that it cannot be all plucked vp, vnleſſe very ſeldome; ſet here and there with knots, and of taſte ſweet and pleaſant.

2 The leaues of the ſecond ſea Holly are diuerſly cut into ſundry parcels, being all ful of prickles alongſt the edges: the ſtalke is diuided into many branches, and bringeth forth prickly heads, but leſſer than thoſe of the other: from which there alſo grow forth blew floures, ſeldome yellow: there ſtand likewiſe vnder euery one of theſe, ſix rough and prickly leaues like thoſe of the other, but thinner and ſmaller: the root hereof is alſo long, blacke without, white within, a finger thicke, of taſte and ſmell like that of the other, as be alſo the leaues, which are likewiſe of an aromaticall or ſpicie taſte, which being new ſprung vp, and as yet tender, be alſo good to be eaten.

1 *Eryngium marinum.*
Sea Holly.

2 *Eryngium mediterraneum.*
Leuant ſea Holly.

¶ *The Place.*

Eryngium marinum growes by the ſea ſide vpon the baich and ſtony ground: I found it growing plentifully at Whitſtable in Kent, at Rie and Winchelſea in Suſſex, and in Eſſex at Landamer lading, at Harwich, and vpon Langtree point, on the other ſide of the water, from whence I haue brought plants for my garden.

Eryngium Campeſtre groweth vpon the ſhores of the Mediterranean ſea, and in my garden likewiſe.

¶ *The Time.*

Both of them do floure after the Sommer ſolſtice, and in Iuly.

¶ *The Names.*

This Thiſtle is called in Greeke Ἐρύγγιον: and likewiſe in Latine *Eryngium:* and of *Pliny* alſo *Eryngе:* in ſhops, *Eringus*; in Engliſh, Sea Holly, ſea Holme, or ſea Huluer.

The firſt is called in Latine *Eryngium marinum:* in low-Dutch euery where, **Cryus diſtil, Eindeloos, Meerwortele:** in Engliſh, ſea Holly.

The ſecond is named of *Pliny, lib. 22. cap. 8. Centum capita,* or hundred headed Thiſtle: in high-Dutch, **Wanſztrew, Bzanchendiſtell, Radendiſtel:** in Spaniſh, *Cardo corredor:* in Italian, *Eringio,* and *Eringo:* this is ſyrnamed *Campeſtre,* or Champion ſea Holly, that it may differ from the other.

¶ *The Temperature.*

The roots of them both are hot, and that in a mean; and a little dry alſo, with a thinneſſe of ſubſtance, as *Galen* teſtifieth.

¶ *The Vertues.*

A The roots of ſea Holly boyled in wine and drunken are good for them that are troubled with the Collicke, it breaketh the ſtone, expelleth grauell, and helpeth alſo the infirmities of the kidnies, prouoketh vrine, greatly opening the paſſages, being drunke fifteene dayes together.

B The roots themſelues haue the ſame propertie if they be eaten, and are good for thoſe that be liuer-ſicke, and for ſuch as are bitten with any venomous beaſt: they eaſe cramps, convulſions, and the falling ſickneſſe, and bring downe the termes.

The

The roots condited or preserued with sugar, as hereafter followeth, are exceeding good to be giuen vnto old and aged people that are consumed and withered with age, and which want naturall moisture: they are also good for other sorts of people that haue no delight or appetite to venerie, nourishing and restoring the aged, and amending the defects of nature in the younger. C

¶ *The manner to condite Eryngos.*

Refine sugar fit for the purpose, and take a pound of it, the white of an egge, and a pint of cleere water, boile them together and scum it, then let it boile vntill it be come to good strong syrrup, and when it is boiled, as it cooleth, adde thereto a saucer full of Rose-water, a spoone full of Cinnamon water, and a graine of Muske, which haue been infused together the night before, and now strained; into which syrrup being more than halfe cold, put in your roots to soke and infuse vntill the next day; your roots being ordered in manner hereafter following: D

These your roots being washed and picked, must be boiled in faire water by the space of foure houres, vntill they be soft, then must they be pilled cleane, as ye pill parsneps, and the pith must bee drawne out at the end of the root; and if there be any whose pith cannot be drawne out at the end, then you must slit them, and so take out the pith: these you must also keepe from much handling, that they may be cleane, let them remaine in the syrrup till the next day, and then set them on the fire in a faire broad pan vntill they be verie hot, but let them not boile at all: let them there remaine ouer the fire an houre or more, remooving them easily in the pan from one place to another with a woodden slice. This done, haue in a readinesse great cap or royall papers, whereupon you must straw some Sugar, vpon which lay your roots after that you haue taken them out of the pan. These papers you must put into a Stoue, or hot house to harden; but if you haue not such a place, lay them before a good fire. In this manner if you condite your roots, there is not any that can prescribe you a better way. And thus may you condite any other root whatsoeuer, which will not onely bee exceeding delicate, but very wholesome, and effectuall against the diseases aboue named. E

A certaine man affirmeth, saith *Aetius*, that by the continual vse of Sea Holly, he neuer afterward voided any stone, when as before he was very often tormented with that disease. F

It is drunke, saith *Dioscorides*, with Carrot seed against very many infirmities, in the weight of a dramme. G

The iuice of the leaues pressed forth with wine is a remedie for those that are troubled with the running of the reines. H

They report that the herbe Sea Holly, if one Goat take it into her mouth, it causeth her first to stand still, and afterwards the whole flocke, vntill such time as the Shepheard take it forth of her mouth, as *Plutarch* writeth. I

Chap. 485. *Of bastard Sea Hollies.*

¶ *The Description.*

THis *Eryngium* which *Dodonæus* in his last edition calleth *Eryngium planum*; and *Pena* more fitly and truely, *Eryngium Alpinum cæruleum*, hath stalkes a cubite and a halfe high, hauing spaces betweene euery ioint: the lower leaues are greater and broader, and notched about the edges; but those aboue are lesser, compassing or enuironing each ioint star-fashion, beset with prickles which are soft and tender, not much hurtful to the hands of such as touch them; the knobs or heads are also prickley, and in colour blew. The root is bunchie or knottie, like that of *Helenium*, that is, Elecampane, blacke without, and white within, and like the Eringes in sweetnesse and taste.

2 The second bastard Sea Holly, whose picture is set forth in *Dodonæus* his last Edition verie gallantly, being also a kind of Thistle, hath leaues like vnto the former Erynges, but broader next the rootes than those which grow next the stalkes, somewhat long, greenish, soft, and not prickley, but lightly creuised or notched about the edges, greater than Quince leaues. The stalks grow more than a cubit high, on the tops whereof there hang downwards fiue or six knobs or heads, in colour and floures like the other; hauing three or foure whitish roots of a foot long.

3 The third kinde of bastard *Eryngium* hath his first leaues (which grow next the ground) great, broad, and soft, growing as it were in a rundle about the root. The stalke is small and slender, diuided into some branches, which beare many little leaues, turning or standing many waies, which

be

1 *Eryngium cæruleum.*
Blew Sea Holly.

2 *Eryngium ſpurium primum Dodonæi.*
Baſtard Sea Holly.

3 *Eryngium pumilum Cluſij.*
Dwarfe Sea Holly.

4 *Eryngium Montanum.*
Mountaine Sea Holly.

‡ 5 *Eryngium pusillum planum.*
Small smooth Sea Holly.

be also slender, prickly, and set about the stalks star-fashion. The knops or heads growing at the tops of the branches are round and prickly, bearing little blew floures and leaues, which compasse them about: the root is slender, and lasteth but one yeare.

4 The fourth kinde of bastard Sea Holly, which *Pena* calleth *Eryngium montanum recentiorum*, and is the fourth according to *Dodonæus* his account, is like to the Erynges, not in shape but in taste: this beareth a very small and slender stalke, of a meane height, whereupon doe grow three or foure leaues, & seldom fiue, made of diuers leaues set vpon a midd'e rib, narrow, long, hard, and of a darke greene colour, dented on both edges of the leafe like a saw: the stalke is a cubit high, iointed or kneed, and diuiding it selfe into many branches, on the tops whereof are round tufts or vmbels, wherin are contained the floures, and after they be vaded, the seedes, which are small, somewhat long, well smelling, and sharpe in taste: the roor is white and long, not a finger thicke, in taste sweet, but afterwards somewhat sharpe, and in sent and sauour not vnpleasant: when the root is dried, it may be crumbled in pieces, and therefore quickly braied.

‡ 5 This is a low plant presently from the root diuided into sundry branches, slender, round & lying on the ground: at each ioint grow leaues without any certain order, broad toward their ends, and narrower at their setting on, snipt about their edges: those next the root were some inch broad, and two or more long, of a yellowish greene colour: the stalkes are parted into sundry branches, and at each ioint haue little leaues, and rough and greene heads, with blewish floures in them: the roots creepe, and are somewhat like those of *Asparagus*. This neither *Clusius* nor *Lobel* found wilde; but it grew in the garden of *Iohn Mouton* of Tourney, a learned Apothecarie, verie skilfull in the knowledge of plants: whereupon they both called it *Eryngium pusillum planum Moutoni*. ‡

¶ *The Place.*

These kindes of sea Holly are strangers in England: we haue the first and second in our London gardens.

¶ *The Time.*

They floure and flourish when the Thistles do.

¶ *The Names.*

These plants be *Eryngia spuria*, or bastard Sea Hollies, and are lately obserued: and therefore they haue no old names.

The first may bee called in Latine *Eryngium Borussicum*, or *Non spinosum*: Sea Hollie without prickles.

The second is called by *Matthiolus*, *Eryngium planum*, or flat Sea Holly: others had rather name it *Alpinum Eryngium*, or Sea Holly of the Alpes.

The third is rightly called *Eryngium pumilum*, little Sea Huluer.

Matthiolus maketh the fourth to be *Crithmum quartum*, or the fourth kinde of Sampier: and others, as *Dodonæus* and *Lobel*, haue made it a kinde of Sea Huluer.

¶ *The Temperature and Vertues.*

Touching the faculties hereof we haue nothing to set downe, seeing they haue as yet no vse in medicine, nor vsed to be eaten. But yet that they be hot, the very taste doth declare.

CHAP.

Chap. 486. *Of Star-Thiſtle.*

¶ *The Deſcription.*

1 THe Star-Thiſtle, called *Carduus ſtellatus*, hath many ſoft frizled leaues, deepely cut or gaſht, altogether without prickles: among which riſeth vp a ſtalke, diuiding it ſelfe into many other branches, growing two foot high; on the tops whereof are ſmall knops or heads like the other Thiſtles, armed round about with many ſharpe prickles, faſhioned like a blaſing ſtar, which at the beginning are of a purple colour, but afterwards of a pale bleak or whitiſh colour: the ſeed is ſmall, flat, and round; the root is long, and browne without.

1 *Carduus ſtellatus.*
The Star-Thiſtle.

† 2 *Carduus Solſtitialis.*
Saint Barnabies Thiſtle.

2 Saint Barnabies Thiſtle is another kinde of Star-Thiſtle; notwithſtanding it hath prickles no where ſaue in the head onely, and the prickles of it ſtand forth in manner of a ſtar: the ſtalks are two cubits high, parted into diuers branches ſofter than are thoſe of ſtar-Thiſtle, which ſtalks haue velmes or thin skins cleauing vnto them all in length, by which they ſeeme to be foure-ſquare: the leaues are ſomewhat long, ſet with deep gaſhes on the edges: the floures are yellow, and conſiſt of threds: the ſeed is little; the root long and ſlender.

¶ *The Place.*

The two firſt do grow vpon barren places neere vnto cities and townes, almoſt euery where.

¶ *The Time.*

They floure and flouriſh eſpecially in Iuly and Auguſt.

¶ *The Names.*

The firſt is called in Latine, *Stellaria*; as alſo *Carduus Stellatus*, and likewiſe *Carduus Calcitrapa*; but they are deceiued, who take it to be *Eryngium*, or Sea-Holly, or any kinde thereof. *Matthiolus* ſaith that it is called in Italian *Calcatrippa*: in high Dutch, **Wallen diſtel**: in low Dutch, **Sterre diſtell**: in French, *Chauſſe trappe*: in Engliſh, Star-Thiſtle.

S. Barnabies Thiſtle is called in Latine *Solſtitialis ſpina*, becauſe it floureth in the Sommer Solſtice

ſtice,as *Geſner* ſaith, or rather becauſe after the Solſtice the prickles thereof be ſharpeſt:of *Guillandinus*,*Eryngium*,but not properly,and *Stellaria Horatij Augerij*,who with good ſucceſſe gaue it againſt the ſtone,dropſies,greene ſickneſſe,and quotidian feuers.It is called in Engliſh as aboue ſaid,Saint Barnabies Thiſtle.

¶ *The Temperature.*

The Star-Thiſtle is of a hot nature.

¶ *The Vertues.*

The ſeed is commended againſt the ſtrangurie: it is reported to driue forth the ſtone,if it bee A
drunke with wine.

Baptiſta Sardus affirmeth,that the diſtilled water of this Thiſtle is a remedie for thoſe that are in- B
fected with the French Pox, and that the vſe of this is good for the liuer, that it taketh away the ſtoppings thereof.

That it clenſeth the bloud from corrupt and putrified humours. C

That it is giuen with good ſucceſſe againſt intermitting feuers; whether they be quotidian or D
tertian.

As touching the faculties of Saint Barnabies Thiſtle, which are as yet not found out, we haue E
nothing to write.

† There were formerly three figures and deſcriptions in this chapter,and all of them out of the 14. and 15. chapter of the fifth booke, and fifth Pemptas of *Dodonæus*;but the firſt and ſecond figures were both of the firſt deſcribed,the third figure was of the *Acanthium peregrinum* of *Tabernæmontanus* which I know not what to make of,but I thinke it was drawne for,and(if the tuberous clogs of the roots were ſomewhat larger) might very well ſerue for the *Caſtor maximus Aſphodeli radice*,whoſe figure as I drew it from the plant I will hereafter giue you: the third deſcription was of the *Lacta matris lutea*, deſcribed in the third place of the 249. Chap. *pag.727.*

CHAP. 487 *Of Teaſels.*

¶ *The Kindes.*

OVr age hath ſet downe two kindes of Teaſels:the tame,and the wilde. Theſe differ not ſaue only in the husbanding; for all things that are planted and manured doe more flouriſh, and become for the moſt part fitter for mans vſe.

1 *Dipſacus ſatiuus*.
Garden Teaſell.

2 *Dipſacus ſyluestris*.
Wilde Teaſell.

¶ *The*

‡ 3 *Dipſacus minor, ſive Virga paſtoris.*
Sheepheards-rod.

¶ *The Deſcription.*

1 GArden Teaſel is alſo of the number of the Thiſtles, it bringeth forth a ſtalke that is ſtraight, very long, iointed, and ful of prickles: the leaues grow forth of the ioints by couples, not onely oppoſite or ſet one right againſt another, but alſo compaſſing the ſtalke about, and faſtened together; and ſo faſtened, that they hold dew and raine water in manner of a little baſon: theſe be long, of a light greene colour, and like to thoſe of Lettice, but full of prickles in the edges, and haue on the outſide all alongſt the ridge ſtiffer prickles: on the tops of the ſtalkes ſtand heads with ſharpe prickles like thoſe of the Hedge-hog, and crooking backward at the point like hookes: out of which heads grow little floures: The ſeed is like Fennell ſeed, and in taſte bitter: the heads wax white when they grow old, and there are found in the midſt of them when they are cut, certaine little magots: the root is white, and of a meane length.

2 The ſecond kinde of Teaſell which is alſo a kinde of Thiſtle, is very like vnto the former, but his leaues are ſmaller & narrower: his floures of a purple colour, and the hooks of the Teaſell nothing ſo hard or ſharpe as the other, nor good for any vſe in dreſſing of cloath.

3 There is another kinde of Teaſell, being a wilde kinde therof, and accounted among theſe Thiſtles, growing higher than the reſt of his kindes; but his knobbed heads are no bigger than a Nutmeg, in all other things elſe they are like to the other wilde kindes. ‡ This hath the lower leaues deeply cut in with one gaſh on each ſide at the bottome of the leafe, which little ears are omitted in the figure: the leaues alſo are leſſe than the former, and narrower at the ſetting on, and hold no water as the two former do: the whole plant is alſo much leſſe. ‡

¶ *The Place.*

The firſt called the tame Teaſell is ſowne in this countrey in gardens, to ſerue the vſe of Fullers and Clothworkers.

The ſecond kinde groweth in moiſt places by brookes, riuers, and ſuch like places.

The third I found growing in moiſt places in the high way leading from Braintree to Henningham caſtle in Eſſex, and not in any other place except here & there a plant vpon the high way from Much-Dunmow to London. ‡ I found it growing in great plentie at Edgecombe by Croyden, cloſe by the gate of the houſe of my much honoured friend Sir *Iohn Tunſtall*.

¶ *The Time.*

Theſe floure for the moſt part in Iune and Iuly.

¶ *The Names.*

Teaſell is called in Greeke δίψακος, and likewiſe in Latine, *Dipſacus*, *Labrum Veneris*, and *Carduus Veneris*: it is termed *Labrum Veneris*, and *Lauer Lauacrum*, of the forme of the leaues made vp in faſhion of a baſon, which is neuer without water: they commonly call it *Virga paſtoris minor*, and *Carduus fullonum*: in high Dutch, **Karden Diſtell**: in low Dutch, **Caerden**: in Spaniſh, *Cardencha*. and *Cardo Pentcador*: in Italian, *Diſſaco*, and *Cardo*: in French, *Chardon de foullon*, *Verge à bergier*: in Engliſh, Teaſell, Carde Teaſell, and Venus baſon.

The third is thought to be *Galedragon Plinij*: of which he hath written in his 27. book the tenth Chapter.

A ¶ *The Temperature.*

The rootes of theſe plants are drie in the ſecond degree, and haue a certaine clenſing faculties.

¶ *The*

¶ *The Vertues.*

There is ſmall vſe of Teaſell in medicines: the heads (as we haue ſaid) are vſed to dreſſe woollen cloth with. A

Dioſcorides writeth, that the root being boiled in wine, & ſtamped till it is come to the ſubſtance of a ſalue, healeth chaps and fiſtulaes of the fundament, if it be applied thereunto; and that this medicine muſt be reſerued in a box of copper, and that alſo it is reported to be good for all kindes of warts. B

It is needleſſe here to alledge thoſe things that are added touching the little wormes or magots found in the heads of the Teaſell, and which are to be hanged about the necke, or to mention the like thing that *Pliny* reporteth of Galedragon: for they are nothing elſe but moſt vaine and trifling toies, as my ſelfe haue proued a little before the impreſſion hereof, hauing a moſt grieuous ague, and of long continuance: notwithſtanding Phyſicke charmes, theſe worms hanged about my neck, ſpiders put into a walnut ſhell, and diuers ſuch fooliſh toies that I was conſtrained to take by fantaſticke peoples procurement; notwithſtanding I ſay, my helpe came from God himſelfe, for theſe medicines and all other ſuch things did me no good at all. C

† The figure which formerly was put into the ſecond place, was of the *Dipſacus ſecundus* of *Tabernæmontanus*, which differs from our common one, in that the leaues are deeply diuided, or cut in on their edges.

CHAP. 488. *Of Baſtard Saffron.*

‡ 1 *Carthamus ſiue Cnicus.*
Baſtard Saffron.

† 2 *Cnicus alter cæruleus.*
Blew floured Baſtard Saffron.

¶ *The Deſcription.*

1 *Cnicus*, called alſo baſtard Saffron, which may very wel be reckoned among the Thiſtles, riſeth vp with a ſtalke of a cubite and a halfe high, ſtraight, ſmooth, round, hard, and wooddy, & branched at the top: it is defended with long leaues, ſomthing broad, ſharp

pointed, and with prickles in the edges: from the tops of the ſtalks ſtand out little heads or knops of the bigneſſe of an Oliue or bigger, ſet with many ſharpe pointed and prickly ſcales: out of which come forth floures like threds, cloſely compact, of a deepe yellow ſhining colour, drawing neere to the colour of Saffron: vnder them are long ſeeds, ſmooth, white, ſomewhat cornered, bigger than a Barly corne, the huske whereof is ſomething hard, the inner pulpe or ſubſtance is fat, white, ſweet in taſte: the root ſlender and vnprofitable.

2 There is alſo another kinde of Baſtard Saffron, that may very well be numbred amongſt the kindes of Thiſtles, and is very like vnto the former, ſauing that his flockie or threddie floures, are of a blew colour: the root is thicker, and the whole plant is altogether more ſharpe in prickles: the ſtalks alſo are more creſted and hairie.

¶ *The Place.*

It is ſowne in diuers places of Italy, Spaine, and France, both in gardens and in fields: *Pliny, lib. 25. cap. 15.* ſaith, that in the raigne of *Veſpaſian* this was not knowne in Italy; being in Egypt onely of good account, and that they vſed to make oile of it, and not meat.

¶ *The Time.*

The floures are perfected in Iuly and Auguſt: the root after the ſeed is ripe, the ſame yeare it is ſowne withereth away.

¶ *The Names.*

It is called in Greeke κνικος: in Latine alſo *Cnicus*, or *Cnecus*: in ſhops, *Cartamus*, or *Carthamum*: of diuers, *Crocus hortenſis*, and *Crocus Saracenicus*: in Italian, *Zaffarano Saracineſco*, and *Zaffarano ſaluatico*: in Spaniſh, *Alaſor*, and *Semente de papagaios*: in high Dutch, **wilden Zaffran**: in French, *Safran Sauuage*: in Engliſh, Baſtard Saffron: of ſome, Mocke Saffron, and Saffron D'orte, as though you ſhould ſay Saffron *de horte*, or of the garden. *Theophraſtus* and *Pliny* call it *Cnecus vrbana*, and *ſatiua*, or tame and garden baſtard Saffron, that it may differ from *Atractilis*, which they make to be a kinde of *Cnicus ſyluęſtris*, or wilde Baſtard Saffron, but rather a *ſpecies* of the Holy Thiſtle.

¶ *The Temperature.*

We vſe ſaith *Galen*, the ſeed onely for purgations: it is hot, and that in the firſt degree, as *Meſues* writeth.

¶ *The Vertues.*

A The iuice of the ſeed of baſtard Saffron bruiſed and ſtrained into honied water or the broth of a chicken, and drunke, prouoketh to the ſtoole, and purgeth by ſiege ſlimy flegme, and ſharp humors: Moreouer it is good againſt the collicke, and difficultie of taking breath, the cough, and ſtopping of the breſt, and is ſingular againſt the dropſie.

B The ſeed vſed as aforeſaid, and ſtrained into milke, cauſeth it to curdle and yeeld much cruds, and maketh it of great force to looſe and open the belly.

C The floures drunke with honied water open the liuer, and are good againſt the iaundice: and the floures are good to colour meat in ſtead of Saffron.

D The ſeed is very hurtfull to the ſtomacke, cauſing deſire to vomite, and is of hard ſlow digeſtion, remaining long in the ſtomacke and entrailes.

E Put to the ſame ſeed things comfortable to the ſtomacke, as Anniſe ſeed, Galingale, or Maſtick, Ginger, *Salgemmæ*, and it ſhall not hurt the ſtomacke at all, and the operation thereof ſhall be the more quicke and ſpeedy.

F Of the inward pulpe or ſubſtance hereof is made a moſt famous and excellent compoſition to purge water with, commonly called *Diachartamon*, a moſt ſingular and effectual purgation for thoſe that haue the dropſie.

G The perfect deſcription hereof is extant in *Guido* the Surgion, in his firſt Doctrine, and the ſixt Tractate.

H We haue not read, or had in vſe that Baſtard Saffron with the blew floure, and therefore can ſay nothing of his vertues.

† The figure formerly was of the *Cnicus cæruleus*.

Chap. 489. *Of Wilde Baſtard Saffron.*

¶ *The Deſcription.*

1 *Atractylis*, otherwiſe called wilde Baſtard Saffron, bringeth forth a ſtraight and firme ſtalke, verie fragile or brittle, diuided at the toppe into certaine branches: it hath long,

long iagged leaues ſet with prickles: the heads on the tops of the branches are very ful of ſharp prickles: out of which grow floures all of threds, like thoſe of baſtard Saffron, but they are of a light yellow colour, and ſometimes purple: the ſeed is ſomewhat great, browne, and bitter, otherwiſe like that of baſtard Saffron: the root is of a meane bigneſſe.

1 *Atractylis.*
Wilde Baſtard Thiſtle.

2 *Carduus Benedictus.*
The bleſſed Thiſtle.

2 The ſtalkes of *Carduus Benedictus*, or Bleſſed Thiſtle, are round, rough, and pliable, and being parted into diuers branches, do lie flat on the ground: the leaues are iagged round about, and full of harmleſſe prickles in the edges: the heads on the tops of the ſtalks are ſet with prickles, and inuironed with ſharpe prickling leaues, out of which ſtandeth a yellow floure: the ſeed is long, and ſet with haires at the top like a beard: the root is white, and parted into ſtrings: the whole herb, leaues and ſtalks, and alſo the heads, are couered with a ſoft and thin downe.

¶ *The Place.*

Atractylis groweth in Candie, and in diuers prouinces and Iſlands of Greece, and alſo in Languedocke: and is an herbe growing in our Engliſh gardens.

Carduus Benedictus is found euery where in Lemnos, an Iſland of the Midland Sea, in Champion grounds, as *Petrus Bellonius* teſtifieth: it is diligently cheriſhed in Gardens in theſe Northerne parts.

¶ *The Time.*

Atractylis is very late before it floureth and ſeedeth.

Carduus Benedictus floureth in July and Auguſt, at which time it is eſpecially to be gathered for Phyſicke matters.

¶ *The Names.*

Atractylis is called in Greeke Ἀτρακτυλὶς ἡμερος: of the Latins likewiſe, *Atractylis*, and *Cnicus ſylueſtris*; and becauſe women in the old time were wont to vſe the ſtiffe ſtalk thereof *pro fuſo aut colo*, for a ſpindle or a diſtaffe, it is named *Fuſus agreſtis*, and *Colus Ruſtica*; which thing *Petrus Bellonius* reporteth the women in Greece do alſo euen at this day; who call *Atractylis* by a corrupt name *Ardactyla*: diuers of the later herbariſts name it *Sylueſtris Carthamus*: that is to ſay in low Dutch, **wilden Carthamus**: and in Engliſh, wilde Baſtard Saffron: or Spindle Thiſtle.

Bleſſed Thiſtle is called in Latine euery where *Carduus Benedictus*, and in ſhops by a compound word,

word, *Cardo-benedictus*: it is moſt plaine, that it is *Species Atractylidis*, or a kind of wilde baſtard Saffron: it is called *Atractylis hirſutior*, hairie wilde baſtard Saffron: *Valerius Cordus* nameth it *Cnicus ſupinus*: it is called in high Dutch, **Beſeegnete diſtell, Kardo Benedict**; the later name whereof is knowne to the low Countrey men: in Spaniſh it is called *Cardo Sancto*: in French, *Chardon benoiſt*, or *beniſt*: in the Iſle Lemnos, *Garderacantha*: in Engliſh, Bleſſed Thiſtle, but more commonly by the Latine name *Carduus Benedictus*.

¶ *The Temperature.*

Wilde baſtard Saffron doth drie and moderately digeſt, as *Galen* witneſſeth.

As *Carduus Benedictus* is bitter, ſo is it alſo hot and drie in the ſecond degree, and withall cleanſing and opening.

¶ *The Vertues.*

A The tops, ſeed, and leaues of *Atractylis*, ſaith *Dioſcorides*, being beaten and drunk with pepper and wine, are a remedie for thoſe that are ſtung of the ſcorpion.

B Bleſſed Thiſtle taken in meat or drinke, is good for the ſwimming and giddineſſe of the head, it ſtrengthneth memorie, and is a ſingular remedie againſt deafeneſſe.

C The ſame boiled in wine and drunke hot, healeth the griping paines of the belly, killeth and expelleth wormes, cauſeth ſweat, prouoketh vrine, and driueth out grauel, clenſeth the ſtomack, and is very good againſt the Feuer quartaine.

D The iuice of the ſaid *Carduus* is ſingular good againſt all poiſon, as *Hierome Bocke* witneſſeth, in what ſort ſoeuer the medicine be taken; and helpeth the inflammation of the liuer, as reporteth *Ioachimus Camerarius* of Noremberg.

E The pouder of the leaues miniſtred in the quantitie of halfe a dram, is very good againſt the peſtilence, if it be receiued within 24. houres after the taking of the ſickneſs and the party ſweat vpon the ſame: the like vertue hath the wine, wherein the herbe hath been ſodden.

F The green herb pounded and laid to, is good againſt all hot ſwellings, as *Eryſipelas*, plague-ſores, and botches, eſpecially thoſe that proceed of the peſtilence, and is alſo good to be laied vpon the bitings of mad dogs, ſerpents, ſpiders, or any venomous beaſt whatſoeuer; and ſo is it likewiſe if it be inwardly taken.

G The diſtilled water thereof is of leſſe vertue.

H It is reported that it likewiſe cureth ſtubborne and rebellious vlcers, if the decoction be taken for certaine daies together; and likewiſe *Arnoldus de Villa noua* reporteth, that if it be ſtamped with Barrows greaſe to the form of an vnguent, adding thereto a little wheat floure, it doth the ſame, being applied twice a day.

I The herbe alſo is good being ſtamped and applied, and ſo is the iuice thereof.

K The extraction of the leaues drawne according to Art, is excellent good againſt the French diſeaſe, and quartaine agues, as reporteth the foreſaid *Camerarius*.

L The ſame Author reporteth, that the diſtilled water taken with the water of Louage, and Dodder, helpeth the ſauce-flegme face, if it be drunke for certaine daies together.

Chap. 490. *Of Thiſtle vpon Thiſtle, and diuers other Wilde Thiſtles.*

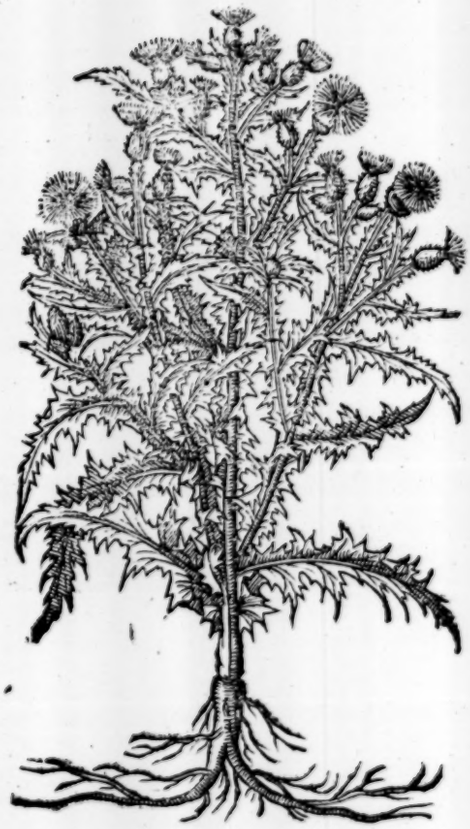
¶ *The Deſcription.*

1 AMong all the Thornes and Thiſtles, this is moſt full of prickles; the ſtalks thereof are verie long, and ſeem to be cornered by reaſon of certaine thin skins growing to them, being ſent downe forth of the leaues: the leaues are ſet round about with many deep gaſhes, being very full of prickles as well as the ſtalks: the heads are very thicke ſet in euery place with ſtiffe prickles, and conſiſt of a multitude of ſcales; out of which grow purple floures, as they do out of other Thiſtles, ſeldome white: the root is almoſt ſtraight, but it groweth not deep.

2 To this alſo may be referred that which *Lobel* writeth to be named of the Italians *Leo*, and *Carduus ferox*, for it is ſo called of the wonderfull ſharpe and ſtiffe prickles, wherewith the whole plant aboundeth: the ſtalke thereof is ſhort, ſcarce a handfull high: the floure groweth forth of a prickly head, and is of a pale yellow colour, like that of wilde baſtard Saffron, and it is alſo inuironed and ſet round about on euery ſide with long hard thornes and prickles.

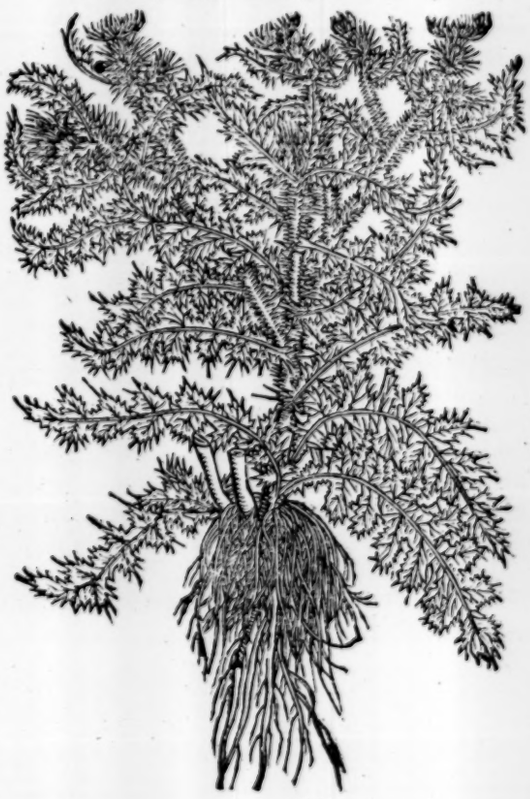
3 The third groweth ſeldome aboue a cubite or two foot high: it bringeth forth many round ſtalkes, parted into diuers branches; the leaues are like thoſe of white Cotton Thiſtle, but leſſer, and blacker, and not couered with downe or Cotton: vpon the tops of the ſtalks grow little heads like

† 1 *Polyacanthos.*
Thiſtle vpon Thiſtle.



2 *Carduus ferox.*
The cruell Thiſtle.

† 3 *Carduus Aſininus ſive Onopyxos.*
The Aſſes Thiſtle, or Aſſes box.



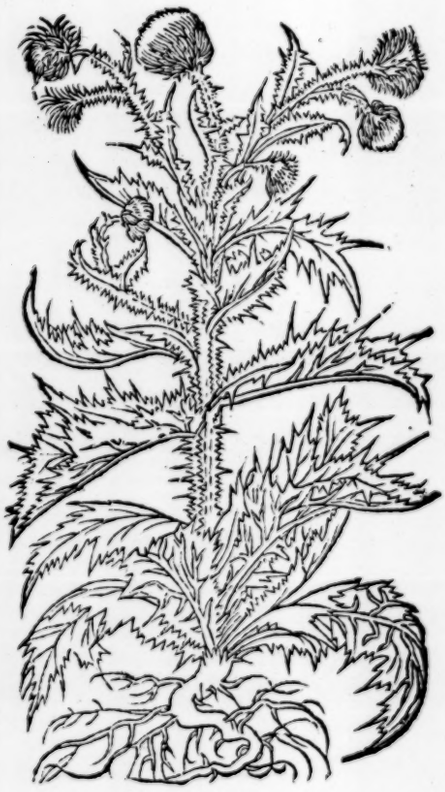
† 4 *Carduus vulgatiſſimus viarum.*
The Way Thiſtle.

like Hedge-hogs; out of which ſpring gallant purple floures, that at length are turned into downe, leauing ſeedes behinde them like thoſe of the other Thiſtles: the root conſiſteth of many ſmall ſtrings.

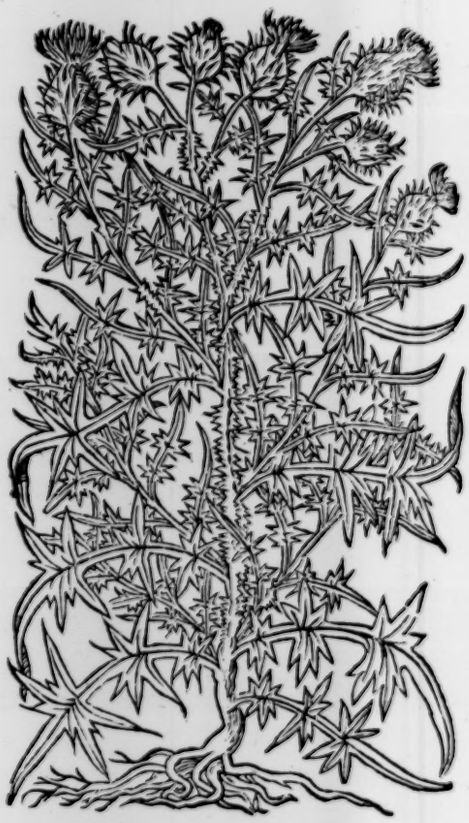
4 The fourth riſeth vp with an higher ſtalke, now and then a yard long, round, and not ſo full of branches nor leaues, which are ſharpe and full of prickles, but leſſer and narrower: the heads be alſo leſſer, longer, and not ſo full of ſtiffe prickles: the floures are of a white colour, and vaniſh into downe: the root is blacke, and of a foot long.

5 This wilde Thiſtle which groweth in the fields about Cambridge, hath an vpright ſtalke, whereon do grow broad prickley leaues: the floures grow on the tops of the branches, conſiſting of a flockie downe, of a white colour tending to purple, of a moſt pleaſant ſweet ſmell, ſtriuing with the ſauour of muske: the root is ſmall, and periſheth at the approch of Winter. ‡ I had no figure directly fitting this; wherefore I put that of *Dodonæus* his *Onopordon*, which may well ſerue for it, if the leaues were narrower, and more diuided. ‡

† 5 *Carduus Muſcatus.*
The musked Thiſtle.



6 Carduus Lanceatus.
The Speare Thiſtle.



6 The Speare Thiſtle hath an vpright ſtalke, garniſhed with a skinnie membrane, full of moſt ſharpe prickles: whereon do grow very long leaues, diuided into diuers parts with ſharp prickles; the point of the leaues are as the point of a ſpeare, whereof it tooke his name: the floures growon the tops of the branches, ſet in a ſcaly prickly head, like vnto the heads of Knapweed in forme, conſiſting of many threds of a purple colour: the root conſiſteth of many tough ſtrings.

7 *Theophraſtus* his fiſh Thiſtle called *Acarna*, which was brought from Illyria to Venice, by the learned *Valerandus Donrez*, deſcribed by *Theophraſtus*, hath horrible ſharpe yellow prickles, ſet vpon his greene indented leaues, which are couered on the backe ſide with an hoarie downe (as all the reſt of the plant) hauing a ſtalke of a cubit and a halfe high, and at the top certaine ſcaly knops containing yellow thrummie floures, armed or fenced with horrible ſharp prickles: the root is long and threddie.

8 The other kinde of fiſh Thiſtle, being alſo another *Acarna* of *Valerandus* deſcription, hath long and large leaues, ſet ful of ſharpe prickles, as though it were ſet full of pins: all the whole plant is couered with a certaine hoarineſſe, like the former: there ariſeth vp a ſtalke nine inches long, yea in ſome fertile grounds a cubite high, bearing the floure of *Carduus benedictus*, ſtanding thicke together, but leſſer.

‡ 9 This

7 *Acarna* Theophraſti.
Theophraſtus his fiſh Thiſtle.

8 *Acarna Valerandi Donrez.*
Donrez his fiſh Thiſtle.

† 9 *Picnomos.*
The thicke or buſh headed Thiſtle.

‡ 9 This Thiſtle in the opinion of *Bauhine*, whereto I much incline, is the ſame with the former. The root is ſmall, the leaues long, welting the ſtalks at their ſetting on, and armed on the edges with ſharpe prickles: the ſtalkes lie trailing on the ground like thoſe of the ſtar-Thiſtle, ſo ſet with prickles, that one knoweth not where to take hold thereof: it hath many cloſely compact vmbels, conſiſting of pale yellowiſh little floures like thoſe of Groundſwell: the ſeed is like that of *Carthamus*, ſmal and chaffie. *Pena* and *Lobel* call this *Picnomos Cretæ Saloneſis*, of a place in Prouince where they firſt found it, called the Crau. being not farre from the city Salon. *Tabernamontanus* ſet it forth for *Chamæleon niger*, and our Author formerly gaue the figure hereof by the ſame title, though his hiſtorie belonged to another, as I haue formerly noted. ‡

¶ *The Time.*

The two firſt grow on diuers banks not farre from mount Apennine, and ſometimes in Italy, but yet ſeldome.

The way Thiſtles grow euery where by highwaies ſides and common paths in great plenty.

The places of the reſt haue beene ſufficiently ſpoken of in their deſcriptions.

¶ *The*

¶ *The Time.*

Theſe kindes of Thiſtles do floure from the beginning of Iune vntill the end of September.

¶ *The Names.*

Theſe Thiſtles comprehended in this preſent chapter are by one generall name called in Latine *Cardui ſylueſtres*, or wilde Thiſtles; and that which is the ſecond in order is named *Scolymus*: but not that *Scolymus* which *Theophr.* declareth to yeeld a milky iuyce (of which wee haue written before) but one of thoſe which *Pliny* in his twentieth booke, *cap.* 23. deſcribeth: of ſome they are taken for kindes of Chamæleon: their ſeuerall titles do ſet forth their ſeuerall Latine names, and alſo the Engliſh.

‡ There was formerly much confuſion in this chapter, both in the figures and hiſtorie, which I will here endeauour to amend, and giue as much light as I can, to the obſcuritie of our Authour and ſome others; to which end I haue made choice of the names as the fitteſt place.

1 This deſcription was taken out of *Dodonæus*, and the title alſo of *Onopordon* which was formerly put ouer the figure, and they belong to the Thiſtle our Author before deſcribed by the name of *Acanthium purp. Illyricum, cap.* 476. I haue therefore changed the title, yet let the deſcription ſtand, for it reaſonable well agrees with the figure which is of the *Carduus ſpinoſiſſimus vulgaris* of *Lobel*, and *Polyacantha Theophraſti* of *Tabern.* Of this Thiſtle I obſerue three kindes: the firſt is a Thiſtle ſome two cubits and a halfe high, with many ſlender ſtalkes and branches exceeding prickly, hauing commonly fiue prickly welts running amongſt the ſtalks: the leaues on the vpper ſides as alſo the ſtalkes are of a reaſonable freſh greene colour, but the vnderſide of the leafe is ſomwhat whitiſh: the heads conſiſt of ſundry hairy greene threds which looke like prickles, but they are weake, and not prickly: the floure is of the bigneſſe, and of the like colour and ſhape as the common Knapweed, yet ſomwhat brighter: it growes on ditch ſides, and floures in Iuly. This I take to be the *Aculeſta Gaſæ* of the *Aduerſ pag.* 3 4. but not that which *Lobel* figures for it in his *Icones.* This is that which *Tabernamontanus* figures for *Polyacantha*, and our Author gaue his figure in this place. The ſecond of theſe I take to be that which *Lobel* hath figured for *Polyacantha*, and *Dodonæus* for *Carduus ſyl.* 3. (which figure we here giue you) and in the *Hiſt. Lugd. pag.* 1473. it is both figured and deſcribed by the name of *Polyacanthos Theophraſti.* In the figure there is little difference: in the things themſelues this; the ſtalkes of this are as high as thoſe of the laſt, but ſlenderer, with fewer and ſtraighter branches, and commonly edged with foure large welts, which haue fewer, yet longer prickles than thoſe of the former: the leaues and ſtalkes of this are of a grayiſh or whitiſh colour: the heads are longiſh, but much ſmaller than thoſe of the former, and they ſeldom open or ſpred abroad their floures, but onely ſhew the tops of diuers reddiſh threds of a feint colour. This growes as frequently as the former, and commonly in the ſame places. The third, which I thinke may fitly be referred vnto theſe, growes on wet heaths and ſuch like places, hauing a ſtalke ſometimes foure or fiue cubits high, growing ſtraight vp, with few branches, and thoſe ſhort ones: the floures are of an indifferent bigneſſe, and commonly purple, yet ſometimes white. I thinke this may be the *Onopyxos alter Lugdunenſ.* or the *Carduus paluſtris* deſcribed in *Bauhinus* his *Prodromus, pag.* 156.

2 The ſecond, which is a ſtranger with vs, is the *Phœnix, Leo & Carduus ferox* of *Lobel* and *Dod. Bauhine* hoth refer'd it to *Acarna*, calling it *Acarna minor caule non folioſo.*

3 The third deſcription was alſo out of *Dodonæus*, being of his *Carduus ſylueſtris primus*, or the *Onopyxos Dodonæi* of the *Hiſt. Lugd.* The figures formerly both in the third and fourth place of this chapter were of the *Acanthium Illyricum* of *Lobel*; or the *Onopordon* of *Dodonæus*, formerly mentioned.

4 This deſcription alſo was out of *Dodonæus*, being of his *Carduus ſylueſtris alter*, agreeing in all things but the colour of the floures, which ſhould be purple. *Lobel* in his Obſeruations deſcribeth the ſame Thiſtle by the name of *Carduus vulgatiſſimus viarum:* but both he and *Dodon.* giue the figure of *Carlina ſylueſtris* for it: but neither the floures nor the heads of that agree with that deſcription. I iudge this to be the Thiſtle that *Fabius Columna* hath ſet forth for the *Ceanothos* of *Theophraſtus*; and *Tabern.* for *Carduus arvenſis:* and our Author, though vnfitly, gaue it in the next place for *Carduus muſcatus.*

5 The Muske-Thiſtle I haue ſeene growing about Deptford, and (as far as my memory ſerues me) it is very like to the third here deſcribed: it growes better than a cubit high, with reaſonable large leaues, and alſo heads which are a little ſoft or downy, large, with purple floures: the heads before the floures open ſmell ſtrong of muske. I haue found no mention of this but only in *Geſner, de Collectione in parte*, where he hath theſe words; *Carduus arvenſis maior purpureo flore (qui flore nondum nato Moſchum olebat) floret Iulio.* Our Author formerly gaue an vnfit figure for this, as I formerly noted.

There is ſufficient of the reſt in their titles and deſcriptions. ‡

¶ *The*

¶ *The Temperature and Vertues.*

Theſe wild Thiſtles (according to *Galen*) are hot and dry in the ſecond degree, and that through A
the propertie of their eſſence they driue forth ſtinking vrine, if the roots be boyled in Wine and
drunke; and that they take away the ranke ſmell of the body and arme-holes.

Dioſcorides ſaith, that the root of the common Thiſtle applied plaiſterwiſe correcteth the filthy B
ſmell of the arme holes and whole body.

And that it workes the ſame effect if it be boyled in wine and drunke, and that it expelleth plen- C
tie of ſtinking vrine.

The ſame Author affirmeth alſo, that the herbe being as yet greene and tender is vſed to be ea- D
ten among other herbes after the manner of Aſparagus.

This being ſtamped before the floure appeareth, ſaith *Pliny*, and the iuyce preſſed forth, cauſeth E
haire to grow where it is pilled off, if the place be bathed with the iuyce.

The root of any of the wilde Thiſtles being boyled in water and drunke, is reported to make F
them dry that drinke it.

It ſtrengthneth the ſtomacke; and it is reported (if we beleeue it) that the ſame is alſo good for G
the matrix, that boyes may be ingendred: for ſo *Chereas* of Athens hath written, and *Glaucias*, who
is thought to write moſt diligently of Thiſtles.

This Thiſtle being chewed is good againſt ſtinking breath. Thus farre *Pliny*, in his twentieth H
booke, *cap.* 23.

CHAP. 491. *Of the Melon or Hedge-hog Thiſtle.*

Melocarduus Echinatus Penæ & Lob.
The Hedge-hog Thiſtle.

¶ *The Deſcription.*

WHo can but maruel at the rare and ſingular workmanſhip which the Lord God almighty hath ſhewed in this Thiſtle, called by the name *Echino-Melocactos*, or *Melo-carduus Echinatus?* This knobby or bunchy maſſe or lump is ſtrangely compact and context together, containing in it ſundry ſhapes and formes, participating of a Pepon or Melon, and a Thiſtle, both being incorporate in one body; which is made after the forme of a cock of hay, broad and flat below, but ſharp toward the top, as big as a mans body from the belly vpward: on the outſide hereof are fourteene hard ribbes, deſcending from the crowne to the loweſt part, like the bunchy or out ſwelling rib of a Melon ſtanding out, and chanelled betweene: at the top or crowne of the plant iſſueth forth a fine ſilken cotton, wherewith it is full fraught; within which cotton or flockes lie hid certain ſmal ſheaths or cods, ſharpe at the point, and of a deep ſanguine colour, anſwering the cods of *Capſicum* or Indian Pepper, not in ſhew only, but in colour, but the cods are ſomewhat ſmaller. The furrowed or chanelled ribs on the outſide are garniſhed or rather armed with many prickly ſtars, ſtanding in a compaſſe like ſharpe crooked hornes or hookes, each ſtar conſiſting of ten or twelue pricks, wherewith the outward barke or pilling is garded, ſo that without hurt to the fingers it cannot be touched: this rinde is hard, thicke, and like vnto Aloes, of the colour of the Cucumber: the fleſh or inner pulpe is white, fat, wateriſh, of taſte ſoure, vnſauory, and cooling, much like vnto the meate of a raw Melon or Pompion. This plant groweth without leafe or ſtalke, as our Northerne Thiſtle doth, called *Carduus Acaulos*, and is bigger than the largeſt Pompion:

Pompion: the roots are ſmall, ſpreading farre abroad in the ground, and conſiſting of blacke and tough twigs, which cannot endure the iniurie of our cold clymate.

¶ *The Place.*

This admirable Thiſtle groweth vpon the cliffes and grauelly grounds neere vnto the ſea ſide, in the Iſlands of the Weſt Indies, called S. *Margarets* and S. *Iohns* Iſle, neere vnto *Puerto rico*, or *Porto rico*, and other places in thoſe countries, by the relation of diuers trauellers that haue iournied into thoſe parts, who haue brought me the plant it ſelfe with his ſeed; the which would not grow in my garden by reaſon of the coldneſſe of the clymate.

¶ *The Time.*

It groweth, floureth, and flouriſheth all the yeare long, as do many other plants of thoſe Countries.

¶ *The Names.*

It is called *Carduus Echinatus*, *Melocarduus Echinatus*, and *Echino Melocactos*: In Engliſh, the Hedge-hog Thiſtle, or prickly Melon Thiſtle. ‡ Such as are curious may ſee more hereof in *Cluſius* his *Exoticks*, *lib.* 4. *cap.* 24. ‡

¶ *The Temperature and Vertues.*

There is not any thing extant ſet forth of the antient or of the later writers, neither by any that haue trauelled from the Indies themſelues: therefore we leaue it to a further conſideration.

Chap. 492. *Of the gummie Thiſtle, called Euphorbium.*

1 *Euphorbium.*
The poyſonous gum Thiſtle.

2 *Antieuphorbium.*
The Antidote againſt the poyſonous Thiſtle.

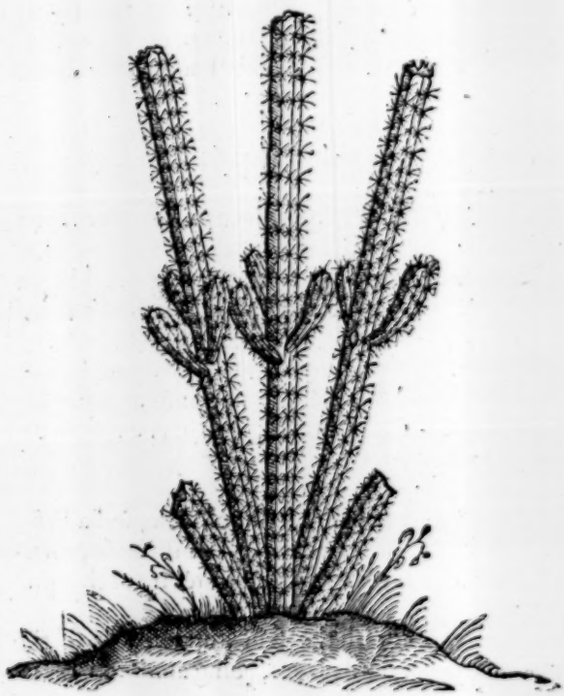
¶ *The Deſcription.*

1 *Euphorbium* (whereout that liquor or gum called in ſhops *Euphorbium* is extracted) hath very great thicke groſſe and ſpreading roots, diſperſed far abroad in the ground: from which ariſe long and round leaues, almoſt like the fruit of a great Cucumber, a foot and a halfe long, ribbed, walled, and furrowed like vnto the Melon: theſe branched ribs are ſet or armed

armed for the moſt part with certaine prickles ſtanding by couples, the point or ſharpe end of one garding one way, and the point of another looking directly a cleane contrarie way: theſe prickes are often found in the gumme it ſelfe, which is brought vnto vs from Libya and other parts: the leaues hereof being planted in the ground will take root well, and bring forth great increaſe, which thing I haue proued true in my garden: it hath periſhed againe at the firſt approch of winter. The ſap or liquor that is extracted out of this plant is of the colour and ſubſtance of the Creame of Milke; it burneth the mouth extremely, and the duſt or pouder doth very much annoy the head and the parts thereabout, cauſing great and vehement ſneeſing, and ſtuffing of all the pores.

2 This rare plant called *Anteuphorbium* hath a very thicke groſſe and farre ſpreading root, very like vnto *Euphorbium*; from which riſeth vp many round greene and fleſhie ſtalkes, whereupon do grow thicke leaues like Purſlane, but longer, thicker, and fatter: the whole plant is full of cold and clammie moiſture, which repreſſeth the ſcortching force of *Euphorbium*; and it wholly ſeemes at the firſt view to be a branch of greene Corall.

3 *Cereus Peruvianus ſpinoſus Lobelij.*
The Torch-Thiſtle or thorny Euphorbium.



4 *Calamus Peruvianus ſpinoſus Lobelij.*
The thorny Reed of Peru.

3 There is not among the ſtrange and admirable plants of the world any one that giues more cauſe of maruell, or more moueth the minde to honor and laud the Creator, than this plant, which is called of the Indians in their mother tongue *Vragua*, which is as much to ſay, a torch, taper, or wax candle; whereupon it hath been called in Latine by thoſe that vnderſtood the Indian tongue, *Cereus*, or a Torch. This admirable plant riſeth vp to the height of a ſpeare of twenty foot long, although the figure expreſſe not the ſame; the reaſon is, the plant when the figure was drawn came to our view broken: it hath diuers bunches and vallies, euen as is to be ſeene in the ſides of the Cucumber, that is, furrowed, guttered, or chamfered alongſt the ſame, and as it were laid by a direct line, with a welt from one end vnto the other: vpon which welt or line do ſtand ſmall ſtar-like Thiſtles, ſharpe as needles, and of the colour of thoſe of the Melon Thiſtle, that is to ſay, of a browne colour: the trunke or body is of the bigneſſe of a mans arme, or a cable rope; from the middle whereof thruſt forth diuers knobby elbowes of the ſame ſubſtance, and armed with the like prickles that the body of the trunke is ſet withall: the whole plant is thicke, fat, and full of a fleſhie ſubſtance, hauing much iuyce like that of Aloes, when it is hardned, and of a bitter taſte: the

floures

floures grow at the top or extreme point of the plant: after which follow fruit in ſhape like a fig, full of a red iuyce, which being touched ſtaineth the hands of the colour of red leade: the taſte is not vnpleaſant.

4 There hath been brought from the Indies a prickly reed of the bigneſſe of a good big ſtaf, of the length of ſix or eight foot, chamfered and furrowed, hauing vpon two ſides growing vnto it an vneuen membrane or skinny ſubſtance, as it were a iag or welt ſet vpon the wing of a garment, and vpon the very point of euery cut or iagge armed with moſt ſharpe prickles: the whole trunke is filled full of a ſpongeous ſubſtance, ſuch as is in the hollownes of the brier or bramble; amongſt the which is to be ſeene as it were the pillings of Onions, wherein are often found liuing things, that at the firſt ſeeme to be dead. The plant is ſtrange, and brought dry from the Indies, therefore we cannot write ſo abſolutely hereof as we deſire; referring what more might be ſaid to a further conſideration or ſecond edition.

¶ *The Place.*

Theſe plants grow vpon Mount Atlas, in Libya, in moſt of the Iſlands of the Mediterranean ſea, in all the coaſt of Barbarie, eſpecially in S. Crux neere vnto the ſea ſide, in a barren place there called by the Engliſh men Halfe Hanneken; which place is appointed for Merchants to confer of their buſineſſe, euen as the Exchange in London is: from which place my friend M^r. *William Martin*, a right expert Surgeon, did procure me the plants of them for my garden, by his ſeruant that he ſent thither as Surgeon of a ſhip. Since which time I haue receiued plants of diuers others that haue trauelled into other of thoſe parts and coaſts: notwithſtanding they haue not endured the cold of our extreme Winter.

¶ *The Time.*

They put forth their leaues in the Spring time, and wither away at the approch of Winter.

¶ *The Names.*

It is called both in Greeke and Latine Εὐφόρβιον, *Euphorbium*: *Pliny* in one place putteth the herbe in the feminine gender, naming it *Euphorbia*: the iuyce is called alſo *Euphorbion*, and ſo it is likewiſe in ſhops: we are faine in Engliſh to vſe the Latine word, and to call both the herbe and iuyce by the name of Euphorbium, for other name we haue none: it may be called in Engliſh, the Gum Thiſtle.

¶ *The Temperature.*

Euphorbium (that is to ſay, the congealed iuyce which we vſe) is of a very hot, and, as *Galen* teſtifieth, cauſticke or burning facultie, and of thinne parts: it is alſo hot and dry in the fourth degree.

¶ *The Vertues.*

A An emplaiſter made with the gumme Euphorbium, and twelue times ſo much oyle, and a little wax, is very ſingular againſt all aches of the ioynts, lameneſſe, palſies, crampes, and ſhrinking of ſinewes, as *Galen, lib. 4. de medicamentis ſecundum genera*, declareth at large, which to recite at this preſent would but trouble you ouermuch.

B Euphorbium mingled with oyle of Bay and Beares greaſe cureth the ſcurfe and ſcalds of the head, and pildneſſe, cauſing the haire to grow againe, and other bare places, being anointed therewith.

C The ſame mingled with oyle, and applied to the temples of ſuch are very ſleepie, and troubled with the lethargie, doth awaken and quicken their ſpirits againe.

D If it be applied to the nuque or nape of the necke, it bringeth their ſpeech againe that haue loſt it by reaſon of the Apoplexie.

E Euphorbium mingled with vineger and applied taketh away all foule and ill fauoured ſpots, in what part of the body ſoeuer they be.

F Being mixed with oyle of Wall-floures, as *Meſues* ſaith, and with any other oyle or ointments, it quickly heateth ſuch parts as are ouer cold.

G It is likewiſe a remedie againſt old paines in the huckle bones, called the Sciatica.

H *Aetius*, *Paulus*, *Actuarius*, and *Meſue* doe report, That if it be inwardly taken it purgeth by ſiege water and flegme; but withall it ſetteth on fire, ſcortcheth and fretteth, not onely the throat and mouth, but alſo the ſtomacke, liuer, and the reſt of the intrals, and inflames the whole bodie.

I For that cauſe it muſt not be beaten ſmal, and it is to be tempered with ſuch things as allay the heate and ſharpeneſſe thereof, and that make glib and ſlipperie; of which things there muſt be ſuch a quantitie, as that it may be ſufficient to couer all ouer the ſuperficiall or outward part thereof.

K But it is a hard thing ſo to couer and fold it vp, or to mix it, as that it will not burne or ſcortch. For though it be tempered with neuer ſo much oyle, if it be outwardly applied it raiſeth bliſters, eſpecially in them that haue ſoft and tender fleſh, and therfore it is better not to take it inwardly.

It is

It is troubleſome to beate it, vnleſſe the noſtrils of him that beats it be carefully ſtopped and defended; for if it happen that the hot ſharpneſſe thereof do enter into the noſe, it preſently cauſeth itching, and moueth neeſing, and after that, by reaſon of the extremitie of the heate, it draweth out aboundance of flegme and filth, and laſt of all bloud, not without great quantity of teares. L

But againſt the hot ſharpneſſe of *Euphorbium*, it is reported that the inhabitants are remedied by a certaine herbe, which of the effect and contrarie faculties is named *Anteuphorbium*. This plant likewiſe is full of iuyce, which is nothing at all hot and ſharpe but coole and ſlimy, allaying the heate and ſharpneſſe of *Euphorbium*. We haue not yet learned that the old writers haue ſet downe any thing touching this herbe; notwithſtanding it ſeemeth to be a kinde of Orpine, which is the antidote or counterpoyſon againſt the poyſon and venome of *Euphorbium*. M

‡ CHAP. 493. *Of ſoft Thiſtles, and Thiſtle gentle.*

‡ THere are certaine other plants by moſt writers referred to the Thiſtles; which being omitted by our Author, I haue thought fit here to giue you.

‡ *Cirſium maximum Aſphodeli radice.*
Great ſoft bulbed Thiſtle.

2 *Cirſium maius alterum.*
Great ſoft Thiſtle.

¶ *The Deſcription.*

1 THe firſt and largeſt of theſe hath roots conſiſting of great longiſh bulbes like thoſe of the Aſphodill: from whence ariſe many large ſtalkes three or foure cubits high, creſted and downy: the leaues are very long and large, iuycie, greeniſh, and cut about the edges, and ſet with ſoft prickles. At the tops of the ſtalkes and branches grow heads round and large, out whereof come floures conſiſting of aboundance of threds, of a purple colour, which flie away in downe. This growes wilde in the mountainous medowes and in ſome wet places of Auſtria. I haue ſeene it growing in the garden of M^r. *Iohn Parkinſon*, and with M^r. *Tuggye*. It floures in Iuly. *Cluſius* hath called it *Cirſium maximum mont. incano folio, bulboſa radice*. But he gaue no figure thereof, nor any elſe, vnleſſe the *Acanthium peregrinum* in *Tabernamont*. (which our Author formerly

formerly, as I before noted, gaue by the name of *Solſtitialis lutea peregrina*) were intended for this plant, as I verily thinke it was. I haue giuen you a figure which I drew ſome yeares agoe by the plant it ſelfe.

2 The root of this is long, yet ſending forth of the ſides creeping fibres, but not bulbous: the leaues are like thoſe of the laſt mentioned, but leſſe, and armed with ſharpe prickles of a greenish co'our, with the middle rib white: the heads ſometimes ſtand vpright, and otherwhiles hang downe; they are very prickly, and ſend forth floures conſiſting of many e'egant purple threds. The ſtalkes are thicke, creſted and welted with the ſetting on of the leaues. This growes wilde vpon the ſea coaſts of Zeeland, Flanders, and Holland: it floures in Iune and Iuly: it is the *Cirſium tertium* of *Dodonæus*; and *Cirſium maius* of *Lobel*.

3 This whoſe root is fibrous and liuing, ſends forth leſſer, narrower, and ſofter leaues than thoſe of the former, not iagged or cut about their edges, nor hoary, yet ſet about with prickles: the ſtalkes are creſted: the heads are ſmaller, and grow three or foure together, carrying ſuch purple floures as the former. This is that which *Matthiolus*, *Geſner*, and others haue ſet forth for *Cirſium*: *Dodonæus*, for *Cirſium* 2. and *Cluſius* hath it for his *Cirſium quartum*, or *Montanum ſecundum*.

‡ 3 *Cirſium foliis non hirſutis.*
Soft ſmooth leaued Thiſtle.

‡ 4 *Cirſium montanum capitulis paruis.*
Small Burre Thiſtle.

4 The leaues of this are ſomewhat like thoſe of the laſt deſcribed, but larger, and welting the ſtalkes further at their ſetting on: they are alſo ſet with prickles about the edges: the ſtalks are ſome two cubits high, diuided into ſundry long ſlender branches: on whoſe tops grow little rough prickly heads, which after the floures come to perfection doe hang downewards, and at the length turne into downe; amongſt which lies hid a ſmooth ſhining ſeed. This groweth wilde in diuers wooddy places of Hungarie and Auſtria. It is the *Cirſium* of *Dodonæus*; the *Cirſium* 2. or *Montanum* 1. of *Cluſius*; and *Cirſium alterum* of *Lobel*. It floures in Iune: the root is about the thickneſſe of ones little finger, fibrous alſo, and liuing.

5 This ſends vp long narrow leaues, hairy, and ſet about the edges with ſlender prickles: out of the middeſt of theſe leaues growes vp a ſtalke ſometimes a foot, otherwhiles a cubit high, ſlender, ſtiffe, and downy: vpon which grow leaues ſomewhat broad at their ſetting on, and there alſo a little nicked or cut in: this ſtalke ſometimes hath no branches, otherwhiles two or three long ſlender ones, at the tops whereof grow out of ſcaly heads ſuch floures as the common Knap-weed, which

‡ 5 *Cirſium montanum Anglicum.*
Single headed Thiſtle.

‡ *Cirſij Anglici alia Icon Pennei.*
Pennies figure of the ſame.

‡ *Cirſij Anglici Icon Lobelij.*
Lobels figure of the ſame.

‡ 6 *Carduus mollis foliis diſſectis.*
Iagged leaued Thiſtle gentle.

which at length turne into downe; among which lies hid a ſmall ſhining ſeed like the other plants of this kind. The root is made of diuers thicke fibres, which run in the ground, and here and there put vp new heads. This plant wants no ſetting forth; for *Cluſius* giues vs the figure and hiſtorie thereof, firſt by the name of *Cirſium Pannonicum* 1. *pratenſe*; then he giues another hiſtorie thereof, with a worſer figure, (which he receiued of Dr. *Thomas Penny* of London) by the name of *Cirſium Anglicum* 2. *Lobel* alſo deſcribed it, and ſet it forth with a figure expreſſing the floure alreadie faded, by the name of *Cirſium Anglicum*. *Bauhine* in his *Pinax*, deceiued by theſe ſeuerall expreſſions, hath made three ſeuerall plants of this one; a fault frequent in many Writers of plants. *Cluſius* found it growing in the mountainous medowes alongſt the ſide of the Danow in Auſtria: *Penny*, in the medowes at the foot of Ingleborow hill in Yorke-ſhire: *Lobel*, in the medowes at a place called Acton in Gloceſter-ſhire. I found this onely once, and that was in a medow on this ſide Highgate, hauing beene abroad with the Companie of Apothecaries, and returning that way home, in the companie of Mr. *Iames Walſall*, *William Broad*, and ſome others. I haue giuen you both the figures of *Cluſius* his owne in the firſt place, and that of Dr. *Penny* in the ſecond, but the former is the better: I haue alſo giuen you that of *Lobel*.

‡ 7 *Carduus mollis folijs Lapathi.*
Docke leaued Thiſtle-gentle.

6 Theſe alſo *Cluſius* (whom I herein follow) addeth to the kindes of Thiſtles. This iagged leafed one, which he calleth *Carduus mollior primus*, hath many leaues at the root, both ſpred vpon the ground, and alſo ſtanding vpright; and they are couered with a white and ſoft downineſſe, yet greene on the vpper ſide: they are alſo much diuided or cut in euen to the middle rib, like to the ſofter or tenderer leaues of the Starre Thiſtle: they haue no prickles at all vpon them: out of the middeſt of theſe leaues grow vp one or two ſtalkes, round, creſted, purpliſh, hoarie, and ſome cubit or better high. The leaues that grow vpon the lower part of the ſtalke are diuided, thoſe aboue not ſo; the tops of the ſtalkes ſometimes, yet very ſeldome, are parted into branches, which cary ſcaly heads containing elegant floures made of many purple ſtrings. The floure decaying, there ſucceeds a cornered ſeed: the root ſomtimes equalls the thickeneſſe of ones finger, browniſh, long, and ſomewhat fibrous. It floures in May, and growes vpon the hilly places of Hungarie.

7 The ſtalke of this is ſome foot or better high, thicke, creſted, and ſomwhat hairy: the leaues about the root are ſomwhat large, aud in ſhape like thoſe of *Bonus Henricus*, (abuſiuely called in Engliſh, Mercurie) ſomewhat ſinuated about the edges, and ſet with harmeleſſe prickles, greene aboue, and verie hoarie vnderneath, like the leaues of the white Poplar: thoſe that grow vpon the ſtalke are leſſer and narrower: out of whoſe boſomes towards the tops of the ſtalke grow out little branches which carry three, foure, or more little ſcaly heads like thoſe of the Blew-Bottle, or Knapweed, whereout grow threddy blewiſh purple floures: the ſeed is wrapped in downe, and not vnlike that of Blew-Bottle: the root is blacke, hard, and liuing, ſending forth ſhoots on the ſides. It growes vpon the higheſt Auſtrian Alpes, and floures in Iuly. *Cluſius* calls this *Carduus mollior Lapathi folio*.

¶ *The Temperature and Vertues.*

Theſe plants ſeeme by their taſte to be of a moderately heating and drying faculties, but none of them are vſed in medicine, nor haue their vertues ſet downe by any Author. ‡

Chap. 494.
Of three leafed Graſſe, or Medow Trefoile.

¶ *The Kindes.*

There be diuers ſorts of three leafed Graſſes, ſome greater, others leſſer; ſome beare floures of one colour, ſome of another: ſome of the water, and others of the land: ſome of a ſweet ſmel, others ſtinking: and firſt of the common medow Trefoiles, called in Iriſh *Shamrockes*.

1 *Trifolium pratenſe.*
Medow Trefoile.

‡ 3 *Trifolium maius flore albo.*
Great white Trefoile.

¶ *The Deſcription.*

1 Medow Trefoile bringeth forth ſtalkes a cubit long, round, and ſomething hairy, the greater part of which creepeth vpon the ground; whereon do grow leaues conſiſting of three ioyned together, one ſtanding a little from another, of which thoſe that are next the ground and roots are rounder, and they that grow on the vpper part longer, hauing for the moſt part in the midſt a white ſpot like a halfe moon. The floures grow on the tops of the ſtalkes in a tuft or ſmall Fox-taile eare, of a purple colour, and ſweet of taſte. The ſeed groweth in little huskes, round and blackiſh: the root is long, wooddy, and groweth deepe.

2 There is another of the field Trefoiles, differing from the precedent eſpecially in the colour of the floures; for as thoſe are of a bright purple, contrariwiſe theſe are very white, which maketh the difference. The leaues, floures, and all the whole plant is leſſe than the former.

3. 4. There is alſo a Trefoile of this kinde which is ſowne in fields of the Low-Countries, in Italy and diuers other places beyond the ſeas, that commeth vp ranker and higher than that which groweth in medowes, and is an excellent food for cattell, both to fatten them, and cauſe them to giue great ſtore of milke.

‡ Of this there is one more with white floures, which hath ſtalks ſome foot high, and narrow hairy leaues, with a root of the thickneſſe of ones little finger. This is *Cluſius* his *Trifolium maius primum*.

‡ 4 *Trifolium maius flo. purpureo.*
Great purple Trefoile.

‡ 5 *Trifolium luteum Lupulinum.*
Hop Trefoile.

‡ 6 *Trifolium luteum minimum.*
Little yellow Trefoile.

primum. The other hath ſtalkes ſome cubit high, with larger ioynts and leaues: the floure or head of floures is alſo larger, of an elegant red colour. This *Cluſius* calls *Trifolium maius tertium*. ‡

5. 6. Likewiſe we haue in our fields a ſmaller Trefoile that bringeth forth yellow floures, a greater and a leſſer, and diuers others alſo, differing from theſe in diuers notable points, the which to diſtinguiſh apart would greatly inlarge our volume, and yet to ſmall purpoſe: therefore we leaue them to be diſtinguiſhed by the curious, who may at the firſt view eaſily perceiue the difference, and alſo that they be of one ſtocke or kindred.

‡ The greater of theſe yellow Trefoiles hath prety large yellow heads, which afterward become of a browniſh colour, and ſomewhat reſemble a Hop: whence *Thalius* called it *Lupulus ſyluaticus*, or *Trifolium luteum alterum lupulinum*: *Dodonæus* cals it *Trifolium agrarium*. The leaues are ſmall, and lightly nickt about the edges. The leſſer hath ſmaller and far leſſer yellow heads, which are ſucceeded by many little crooked cluſtring ſeeds: the leaues of this are ſmall, and alſo ſnipt about the edges: both this & the other haue two little leaues cloſe by the faſtning of the foot-ſtalkes of the leaues to the main ſtalks; wherfore I refer them to the Medicks, and vſually cal this later, *Medica ſem. racemoſo*. It is the *Trifol. luteum minimum* of *Pena* and *Lobel*; and *Trifolium arvenſe* of *Tabern*. ‡

¶ *The*

¶ *The Place.*

Common Medow Trefoile groweth in medowes, fertile paſtures, and wateriſh grounds. The others loue the like ſoile.

¶ *The Time.*

They floure from May to the end of Sommer.

¶ *The Names.*

Medow Trefoile is called in Latine *Trifolium pratenſe*: in High Dutch, **Wilſenklee**: in low Dutch, **Claueren**: in French, *Treffle* and *Trainiere*, and *Viſumarus*, as *Marcellus* an old writer teſtifieth: in Engliſh, Common Trefoile, Three-leafed graſſe: of ſome, Suckles, and Honi-ſuckles, Cocksheads; and in Iriſh, *Shamrocks*.

¶ *The Temperature.*

The leaues and floures of Medow Trefoiles are cold and drie.

¶ *The Vertues.*

The decoction of three leaued Graſſe made with honie, and vſed in a clyſter, is good againſt the A
frettings and paines of the guts, and driueth forth tough and ſlimie humours that cleaue vnto the guts.

The leaues boiled with a little barrowes greaſe, and vſed as a pultis, take away hot ſwellings and B
inflammations.

Oxen and other cattell do feed of the herbe, and alſo calues and young lambs. The floures are C
acceptable to Bees.

Pliny writeth, and ſetteth it downe for certaine, that the leaues hereof do tremble, and ſtand right D
vp againſt the comming of a ſtorme or tempeſt.

The medow Trefoile (eſpecially that with the blacke halfe Moon vpon the leafe) ſtamped with E
a little honie, takes away the pin and web in the eies, ceaſeth the paine and inflammation thereof, if it be ſtrained and dropped therein.

Chap. 495. *Of ſtinking Trefoile, or Treacle Clauer.*

Trifolium bituminoſum,
Treacle Clauer.

¶ *The Deſcription.*

Treacle Clauer groweth vpright like a ſhrubbie plant, with ſtalkes of a cubit and a halfe high, whereupon do grow next the ground broad leaues, 3 ioined together, thoſe vpon the ſtalkes are longer and narrower. The ſtalks are couered ouer with a rough euill coloured hairineſſe: the leaues are of a dark black greene colour, and of a lothſome ſmell, like the pitch called *Bitumen Iudaicum*, whereof it took his name: the floures grow at the toppe of the ſtalks, of a darke purpliſh colour tending vnto blewneſſe, in ſhape like thoſe of Scabious: the ſeed is broad, rough, long, and ſharpe pointed: the root is ſmall and tender, and cannot indure the coldneſſe of our winter, but periſheth at the firſt approch thereof.

¶ *The Place.*

It groweth naturally, ſaith *Hippocrates Hippiatros*, not *Cous*, in rough places, as *Ruellius* tranſlateth it: in Germanie, France and England it neuer commeth vp of it ſelfe, but muſt be ſown in gardens, as my ſelfe haue proued diuers times, and was conſtrained to ſow it yearely, or elſe it would not come vp, neither of his owne ſowing or otherwiſe.

¶ *The Time.*

It floureth not in my garden vntil the end of Auguſt.

¶ *The*

¶ *The Names.*

Nicander calleth this Trefoile ξυλόμηλον: in Latine, *Trifolium acutum*, or ſharpe pointed Trefoile: of *Pliny*, *Trifolium odoratum*, but not properly; of others, *Trifolium Aſphaltæum, ſive Bituminoſum*, or Stone Pitch Trefoile.

Auicen calleth it *Tarſilon*, and not *Handacocha*: *Auicen* doth comprehend *Dioſcorides* his *Loti*, that is to ſay, *Lotus vrbana ſylueſtris*, and *Ægyptia*; which *Dioſcorides* confoundeth one with another in one chapter: in Engliſh it is called Clauer gentle, Pitch Trefoile, ſtinking Trefoile, & Treacle Clauer.

¶ *The Temperature.*

This Trefoile, called *Aſphaltæum*, as *Galen* ſaith, is hot and drie, as *Bitumen* is, and that in the third degree.

¶ *The Vertues.*

A Being drunke, it taketh away the pain of the ſides, which commeth by obſtructions or ſtoppings, prouoketh vrine, and bringeth downe the deſired ſickneſſe.

B *Hippocrates* writeth, that it doth not onely bring them downe, but likewiſe the birth, not onely inwardly taken, but alſo outwardly applied. If a woman, ſaith he, be not well cleanſed after her child bearing, giue her this Trefoile to drinke in white wine.

C *Dioſcorides* ſaith, that the ſeeds and leaues being drunke in water, are a remedie for the pleuriſie, difficultie of making water, the falling ſickneſſe, the dropſie when it firſt beginneth, and for thoſe that are troubled with the mother: the quantity to be taken at once is three drams of the ſeeds, and foure of the leaues.

D The leaues drunke in Oxymel, or a ſyrrup of vineger made with honie, is good for thoſe that are bitten with ſerpents.

E Some affirme that the decoction of the whole plant, root and leaues, taketh away paine from thoſe whom ſerpents haue bitten, if they be waſhed therewith; but if any other man hauing an vlcer be waſhed with that water wherwith he was bathed that was bitten of the ſerpent, they ſay that he ſhall be troubled in the ſame manner that the ſtinged partie was.

F Some alſo giue with wine three leaues, or a ſmall quantitie of the ſeeds in tertian agues, and in quartaine foure, as a ſure remedie againſt the fits.

G The root alſo is put into antidotes or counterpoiſons, ſaith *Dioſcorides*: but other antient Phyſitions do not onely mix the root with them, but alſo the ſeed, as we may ſee in *Galen*, by a great many compoſitions in his 2. booke of Antidotes; that is to ſay, in the Treacles of *Ælius Gallus*, *Zeno Laudoceus*, *Claudius Apollonius*, *Eudemus*, *Heraclides*, *Dorotheus*, and *Heras*.

H The herbe ſtamped and applied vpon any enuenomed wound, or made with poiſoned weapon, it draweth the poiſon from the depth moſt apparantly. But if it be applied vpon a wound where there is no venomous matter to work vpon, it doth no leſſe infect that part, than if it had been bitten with ſome ſerpent or venomous beaſt: which wonderfull effect it doth not performe in reſpect of any vitious qualitie that it hath in it ſelfe, but becauſe it doth not finde that venomous matter to work vpon, which it naturally draweth (as the Load-ſtone doth iron) wherupon it is conſtrained through his attractiue qualitie, to draw and gather together humours from far vnto the place, whereby the paine is greatly increaſed.

Chap. 496. *Of diuers other Trefoiles.*

¶ *The Deſcription.*

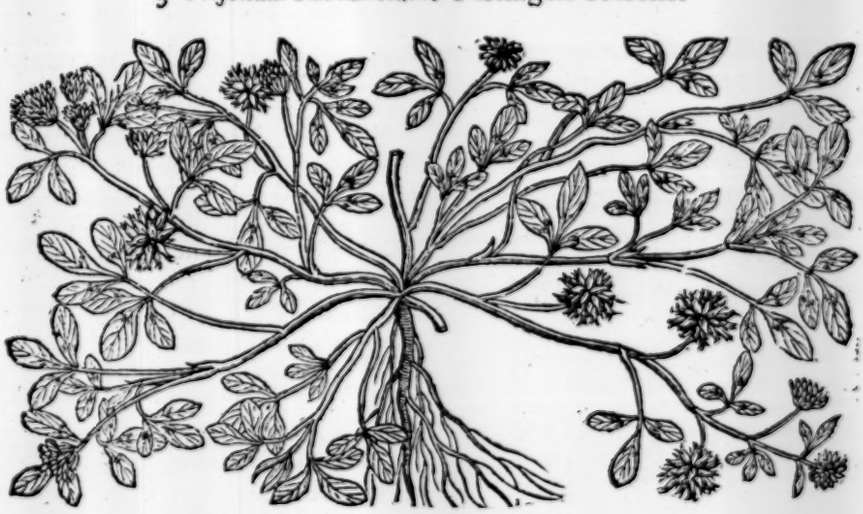
1 THree leauedgraſſe of America hath diuers crooked round ſtalks, leaning this way and that way, and diuided into diuers branches: whereon do grow leaues like thoſe of the medow Trefoile, of a black greene colour, and of the ſmel of Pitch Trefoile, or Treacle Clauer: the floures grow at the top of the branches, made vp in a long ſpiked chaffie eare, of a white colour: after which commeth the ſeed, ſomewhat flat, almoſt like to thoſe of Tares: the roots are long ſtrings of a wooddie ſubſtance.

2 This three leafed graſſe (which *Dodonæus* in his laſt Edition calleth *Trifolium cochleatum primum*: and *Lobel*, *Fanum Burgundiacum*) hath diuers round vpright ſtalks, of a wooddie rough ſubſtance, yet not able of it ſelfe to ſtand without a prop or ſtay: which ſtalks are diuided into diuers ſmall branches, whereupon do grow leaues ioined three together like the other Trefoiles, but of a darke ſwart greene colour: the floures grow at the top of the ſtalks in ſhape like thoſe of the codded Trefoile, but of a darke purple colour: the ſeede followeth, contained in ſmall wrinckled huskes

1 *Trifolium Americum.*
Trefoile of America.

† 2 *Trifolium Burgundiacum.*
Burgundie Trefoile.

3 *Trifolium Salmanticum.* Portingale Trefoile.



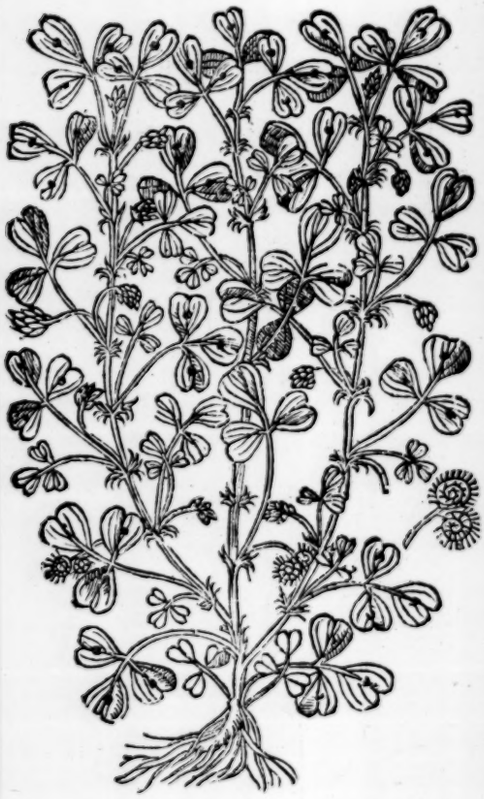
huskes turned round, after the manner of a water ſnaile: the root is thick, compoſed of diuers tough threddie ſtrings, and laſteth long in my garden with great increaſe.

3 This three leaued graſſe of Salmanca, a citie as I take it of Portingale, differeth not much from our field Trefoile: it hath many branches weake and tender, trailing vpon the ground, of two cubites and a halfe high: whereupon doe grow leaues ſet together by three vpon a ſtemme, from the boſome whereof thruſt forth tender foot-ſtalkes, whereon doe ſtand moſt fine floures of a bright red tending vnto purple: after which come the ſeed wrapped in ſmall skinnes, of a red colour.

4 The Hart Trefoile hath very many flexible branches, ſet vpon a ſlender ſtalke, of the length of two or three foot, trailing hither and thither: whereupon doe grow leaues ioined together by

three

4 *Trifolium cordatum.*
Heart Trefoile.



‡ 6 *Coronopus ex Codice Cæſareo.*
Crow-foot Trefoile.

5 *Trifolium ſiliquoſum minus.*
Small codded Trefoile.

three on little ſlender foot-ſtalks, euery little leafe of the faſhion of a heart, whereof it took his name: among which come forth ſcalie, or chaffie yellow floures: the root is thick and threddie. ‡ I take the plant which our Authour here figured and intended to deſcribe vnto vs, to be of that *Medica* which *Camerarius* calls *Arabica*, which growes wilde in many places with vs, hauing the leaues a little dented in at the ends, ſo that they reſemble the vulgar figure of a heart; and each leafe is marked with a blackiſh, or red ſpot: the floures be ſmall and yellow: the ſeeds are contained in rough buttons, wound vp like the other Snaile Trefoiles, whereof it is a kinde. I haue giuen you the figure a little more exquiſite, by the addition of the ſpots and cods. ‡

5 This kinde of three leaued graſſe is a low herb, creeping vpon the ground: the leaues are like thoſe of the common Trefoile, but leſſer, and of a grayiſh greene colour: the floures are faire and yellow, faſhioned like thoſe of broome, but leſſer: after come three or foure cods, wherein is contained round ſeed: the root is long and reddiſh. ‡ This is the *Trifolium corniculatum*, or *Melilotus Coronata* of *Lobel*: *Lotus pentaphyllos* of *Geſner*. ‡

This codded Trefoile is like vnto the laſt deſcribed in euery reſpect, ſauing that this plant is altogether ‡ larger, hauing ſtalks a cubit

bite and a halfe high: the leaues are alſo foure times as large, two roundiſh leaues growing by the ſtalke, and three longiſh ones growing vpon a ſhort foot-ſtalke comming forth betweene the two roundiſh leaues: both the ſtalke and leaues haue a little ſoft downineſſe or hairineſſe on them: the floures grow cluſtering together on the tops of the ſtalks, in ſhape, bigneſſe, and colour like that of the laſt deſcribed, but commonly more in number: they are alſo ſucceeded by ſuch cods as thoſe of the former.

6 The figure which *Dodonæus* hath ſet forth out of an old Manuſcript in the Emperors Library, being there figured for *Coronopus*, ſeemes to be of the laſt deſcribed, or ſome plant very like thereto, though the fiue leaues at each ioint be not put in ſuch order as they ſhould be, yet all the parts are well expreſt, according to the drawing of thoſe times, for you ſhall finde few antient expreſſions come ſo neere as this doth. ‡

7 There is a kinde of Clauer growing about Narbone in France, that hath many twiggie tough branches comming from a woodly root, whereon are ſet leaues three together, after the maner of the other Trefoiles, ſomewhat long, hairy, and of a hoarie or ouerworne greene colour. The floures are yellow, and grow at the tops of the branches like thoſe of Broome.

7 *Lotus incana, ſiue Oxytriphyllon Scribonij Largi.*
Hoarie Clauer.

‡ 8 *Trifolium luteum ſiliqua cornuta.*
Yellow horned Trefoile.

‡ This ſends vp many branches from one root, ſome cubit or more long, commonly lying along vpon the ground, round, flexable, and diuided into ſundrie branches: the leaues ſtand together by threes, and are like thoſe of the true *Medica*, or Burgundie Trefoile, but much leſſe: the floures grow cluſtering together on the tops of the branches, like in ſhape to thoſe of the former; of a yellow colour, and not without ſmell: they are ſucceeded by ſuch, yet narrower crooked coddes, as the Burgundy Trefoile hath (but the Painter hath not wel expreſſed them:) in theſe cods are contained ſeeds like thoſe alſo of that Trefoile, and ſuch alſo is the root, which liues long, and much increaſes. It growes in Hungarie, Auſtria, and Morauia: it floures in Iune and Iuly: *Cluſius* calls it *Medica flore flauo: Tabernamontanus, Lens maior repens*: and *Tragus, Melilotimaioris ſpecies tertia: Bauhine* ſaith that about Nimes in Narbone it is found with floures either yellow white, greene, blew, purple, blacke, or mixed of blew and greene; and hee calleth it *Trifolium ſyluestre luteum ſiliqua cornuta*; or *Medica frutescens*. ‡

¶ *The Place.*

The ſeuerall titles of moſt of theſe plants ſet forth their naturall place of growing: the reſt grow in moſt fertile fields of England.

¶ *The Time.*

They floure and flouriſh moſt of the ſommer moneths.

¶ *The Names.*

There is not much to be ſaid as touching their names, more than hath beene ſet downe.

¶ *The Temperature and Vertues.*

The temperature and faculties of theſe Trefoiles are referred vnto the common medow Trefoiles.

† The figure formerly put in the ſecond place was of the leſſer yellow Trefoile deſcribed in the laſt chapter ſaue one.

Chap. 497. *Of the great Trefoiles, or winged Clauers.*

¶ *The Deſcription.*

† 1 The great Hares foot being a kinde of Trefoile, hath a hard and wooddie root, full of blacke threddie ſtrings: from whence ariſe diuers tough and feebie branches, whereupon do grow leaues, ſet together by threes, making the whole plant to reſemble thoſe of the Medow Trefoile: the floures grow at the top of the ſtalks, compoſed of a bunch of gray haires: among the which ſoft matter commeth forth ſmall floures of a moſt bright purple colour, ſomwhat reſembling the floures of the common medow Trefoile, but far greater. *Lobel* calls this *Lagopus maximus folio, & facie Trifolij pratenſis: Dodonæus, Lagopus maior folio Trifolij.*

‡ 1 *Lagopus maximus.*
The great Hares foot Trefoile.

‡ 2 *Lagopus maior ſpica longiore.*
Great large headed Hares foot.

‡ 2 This

‡ 2 This elegant plant (which *Tragus* hath ſet forth for *Cytiſus*, *Lobel* by the name of *Lagopus altera folio prinnato*, and *Cluſius* for his *Trifolij maioris* 3. *altera ſpecies*) hath ſtalkes ſome foot and better high, whereon grow leaues ſet together by threes, long, hoary and lightly ſnipt about the edges, with elegant nerues or veines, running from the middle rib to the ſides of the leaues, which are moſt conſpicuous in hot Countries, and chiefly then when the leafe begins to decay. At the tops of the branches, in long and large heads grow the floures, of an elegant ſanguine colour. This floures in May and Iune, and growes wilde vpon ſome mountaines of Hungary and Auſtria; I haue ſeene them, both this and the former, growing in the gardens of ſome of our Floriſts.

3 This other great kinde of Hares-foot ſends forth one ſlender, yet ſtiffe ſtalke, whereon grow leaues whoſe foot-ſtalkes are large at the ſetting on, encompaſſing the ſtalkes: the leaues themſelues grow by threes, long, narrow, and ſharpe pointed, of a grayiſh colour like thoſe of the common Hares-foot; the ſpike at the top is ſoft and downy, with little reddiſh floures amongſt the whitiſh hairineſſe. This growes wilde in Spaine: *Cluſius* calls it *Lagopus anguſtifolius Hiſpanicus maior*.

There is another ſort of this deſcribed by *Lobel* and *Pena* in the *Aduerſ.* whoſe leaues are longer and narrower than this, the whole plant alſo is oft times leſſer: they call it *Lagopus altera anguſtifolia*. ‡

‡ 3 *Lagopus anguſtifolius Hiſpanicus.*
Narrow leafed Spaniſh Hare-foot.

4 *Lagopodium, Pes leporis.*
Little Hares-foot Trefoile.

4 The ſmall Hares-foot hath a round rough and hairy ſtalke, diuiding it ſelfe into diuers other branches; whereupon do grow ſmall leaues, three ioined together, like thoſe of the ſmall yellow Trefoile: the floures grow at the very point of the ſtalkes, conſiſting of a rough knap or buſh of haires or downe, like that of *Alopecuros*, or Fox-taile, of a whitiſh colour tending to a light bluſh, with little white floures amongſt the downineſſe: the root is ſmall and hard.

¶ *The Place.*

The firſt groweth in the fields of France and Spaine, and is a ſtranger in England; yet it groweth in my garden.

The ſmall Hare-foot groweth among corne, eſpecially among Barly, and likewiſe in barren paſtures almoſt euery where.

¶ *The Time.*

They floure and flouriſh in Iune, Iuly, and Auguſt.

¶ *The Names.*

The great Hare-foot Trefoile is called of *Tragus*, *Cytiſus*: of *Cordus*, *Trifolium magnum*: of *Lobelius*, *Lagopum maximum*, and *Lagopodium*: in Greeke, λαγώπους: in Engliſh, the great Hares-foot.

The laſt, being the ſmalleſt of theſe kindes of Trefoiles, is called *Lagopus*, and *Pes Leporis*: in Dutch, **Haſen pootkens**: in high Dutch, **Haſen fuſz**: in French, *Pied de lieure*: in Engliſh Hare-foot.

¶ *The Temperature and Vertues.*

A The temperature and faculties are referred vnto the other Trefoiles, whereof theſe are kindes: notwithſtanding *Dioſcorides* ſaith, that the ſmall Hares-foot doth binde and dry. It ſtoppeth, ſaith he, the laske, if it be drunke with red wine. But it muſt be giuen to ſuch as are feueriſh with water.

† Our Author in the firſt place formerly gaue the figure of *Tabern.* his *Lagopodium flore albo*, being only a variety of that plant: you ſhall hereafter finde it deſcribed by the name of *Anthyllu leguminoſa*; now he made the deſcription ſomewhat in the leaues to agree with the figure, though nothing almoſt with the truth of that he intended to deſcribe, for (as it is euident by the names) he intended to deſcribe both the firſt and ſecond (which are here now deſcribed) in the firſt place, for he hath confounded them both together in the names.

Chap. 498. *Of Water Trefoile, or Bucks Beanes.*

Trifolium paludoſum.
Marſh Trefoile.

¶ *The Deſcription.*

1 The great Marſh Trefoile hath thicke fat ſtalkes, weake and tender, full of a ſpungious pith, very ſmooth, and of a cubit long: whereon do grow leaues like to thoſe of the garden Beane, ſet vpon the ſtalkes three ioined together like the other Trefoiles, ſmooth, ſhining, and of a deepe greene colour: among which toward the top of the ſtalkes ſtandeth a buſh of feather like floures of a white colour, daſht ouer ſlightly with a waſh of light carnation: after which the ſeed followeth, contained in ſmall buttons, or knobby huskes, of a browne yellowiſh colour like vnto Millet, and of a bitter taſte: the roots creepe diuers waies in the middle mariſh ground, being full of ioints, white within, and full of pores, and ſpungie, bringing forth diuers by-ſhoots, ſtalkes, and leaues, by which meanes it is eaſily increaſed, and largely multiplied.

2 The ſecond differeth not from the precedent, ſauing it is altogether leſſer, wherein conſiſteth the difference, if there be any: for doubtleſſe I thinke it is the ſelfe ſame in each reſpect, and is made greater and leſſer, according to his place of growing, clymate, and countrey.

¶ *The Place.*

Theſe grow in mariſh and Fenny places, and vpon boggie grounds almoſt euery where.

¶ *The Time.*

They floure and flouriſh from Iune to the end of Auguſt.

¶ *The Names.*

Mariſh Trefoile is called in high Dutch, **Biberklee**, that is to ſay, *Caſtoris Trifolium*, or *Trifolium fibrinum*: in low Dutch, of the likeneſſe that the leaues haue with the garden Beanes, **Boczboomen**, that is to ſay, *Faſelus Hircinus*, or *Boona Hircina*: the later Herbariſts call it *Trifolium paluſtre*, and *Paludoſum*: of ſome, *Iſopyrum*: in Engliſh, marſh-Clauer, marſh-Trefoile, and Buckes-Beanes.

¶ *The Temperature and Vertues.*

A The ſeed of *Iſopyrum*, ſaith *Dioſcorides*, if it be taken with meade or honied water, is good againſt the cough and paine in the cheſt.

B It is alſo a remedy for thoſe that haue weake liuers and ſpet bloud, for as *Galen* ſaith it cleanſeth and cutteth tough humours, hauing alſo adioined with it an aſtringent or binding quality.

Chap.

Chap. 499 Of ſweet Trefoile, or garden Clauer.

Trifolium odoratum.
Sweet Trefoile.

¶ *The Deſcription.*

Sweet Trefoile hath an vpright ſtalk, hollow, and of the height of two cubits, diuiding it ſelfe into diuers branches: whereon do grow leaues by three and three like to the other Trefoiles, ſleightly and ſuperficiouſly nicked in the edges: from the boſom wherof come the floures, euery one ſtanding on his owne ſingle foot-ſtalk; conſiſting of little chaffie husks, of a light or pale blewiſh colour: after which come vp little heads or knops, in which lieth the ſeed, of a whitiſh yellow colour, and leſſer than that of Fenu-greeke: the root hath diuers ſtrings: the whole plant is not onely of a whitiſh green colour, but alſo of a ſweet ſmell, and of a ſtrong aromaticall or ſpicie ſent, and more ſweet when it is dried: which ſmel in the gathered and dried plant doth likewiſe continue long: and in moiſt and rainie weather, it ſmelleth more than in hot and drie weather: and alſo when it is yet freſh and greene it loſeth and recouereth againe his ſmell ſeuen times a day; whereupon the old wiues in Germanie do call it **Sieuen gezeiten kraut**, that is, the herbe that changeth ſeuen times a day.

¶ *The Place.*

It is ſowne in gardens not onely beyond the ſeas, but in diuers gardens in England.

¶ *The Time.*

It is ſowne in May, it floureth in Iune and Iuly, and perfecteth his ſeed in the end of Auguſt, the ſame yere it is ſowne.

¶ *The Names.*

It is commonly called in Latine *Trifolium odoratum*: in high Dutch as we haue ſaid **Sieuen gezeiten**: in low Dutch, **Seuenghetiſcruijt**, that is to ſay, an herb of ſeuen times: it is called in Spaniſh, *Trebol real*: in French, *Treffle oderiferant*: in Engliſh, Sweet Trefoile, and garden Clauer: it ſeemeth to be *Lotus Vrbana*, or *ſatiua*, of which *Dioſcorides* writeth in his fourth booke: neuertheleſſe diuers Authors ſet downe Melilot, for *Lotus vrbana*, and *Trifolium odoratum*, but not properly. ‡ The Gardiners and herbe women in Cheapſide commonly call it, and know it by the name of Balſam, or garden Balſam. ‡

¶ *The Temperature.*

Galen ſaith, that ſweet Trefoile doth in a meane concoct and drie, and is in a meane and temperate facultie betweene hot and cold: the which faculties vndoubtedly are plainely perceiued in this ſweet Trefoile.

¶ *The Vertues.*

The iuice preſſed forth, ſaith *Dioſcorides*, with hony added thereto, clenſeth the vlcers of the eies, A
called in Latine *Argema*, and taketh away ſpots in the ſame, called *Albugines*, and remooueth ſuch things as doe hinder the ſight.

The oile wherein the floures are infuſed or ſteeped, doth perfectly cure greene wounds in very B
ſhort ſpace; it appeaſeth the paine of the gout, and all other aches, and is highly commended againſt ruptures, and burſtings in young children.

The iuice giuen in white wine cureth thoſe that haue fallen from ſome high place, auoideth C
congealed and clotted bloud, and alſo helpeth thoſe that do piſſe bloud, by meanes of ſome great bruiſe, as was prooued lately vpon a boy in Fanchurch ſtreet, whom a cart went ouer, where-

upon he did not onely piſſe bloud, but alſo it moſt wonderfully guſhed forth, both at his noſe and mouth.

D The dried herbe laied among garments keepeth them from Mothes and other vermine.

Chap. 500. *Of Fenugreeke.*

¶ *The Deſcription.*

1 FEnugreeke hath a long ſlender trailing ſtalke, greene, hollow within, and diuided into diuers ſmall branches: whereon do grow leaues like thoſe of the medow Trefoile, but rounder and leſſer, greene on the vpper ſide, on the lower ſide tending to an aſh colour: among which come ſmall white floures, after them likewiſe long ſlender narrow cods, in which do lie ſmall vneuen ſeeds, of a yellowiſh colour: which being dried, haue a ſtrong ſmell, yet not vnpleaſant: the root is ſmall, and periſheth when it hath perfected his ſeed.

1 *Fœnumgræcum.*
Fenugreeke.

‡ 2 *Fœnumgræcum ſylueſtre.*
Wilde Fenugreeke.

2 There is a wilde kinde hereof ſeruing to little vſe, that hath ſmall round branches, full of knees or ioints: from each ioint proceedeth a ſmal tender footſtalk, whereon do grow three leaues and no more, ſomewhat ſnipt about the edges, like vnto thoſe of Burgundie Haie: from the boſoms whereof come forth ſmall yellow floures, which turne into little cods: the root is thicke, tough, and pliant.

¶ *The Place.*

Fenugreeke is ſowne in fields beyond the ſeas: in England wee ſow a ſmall quantitie thereof in our gardens.

¶ *The Time.*

It hath two ſeaſons of ſowing, according to *Columella*, of which one is in September, at what time it is ſowne that it may ſerue for fodder againſt winter; the other is in the end of Ianuarie, or the beginning of Februarie, notwithſtanding we may not ſow it vntill Aprill in England.

¶ *The*

¶ *The Names.*

It is called in Greeke τῆλις, or as it is found in *Pliny* his copies *Carphos*: in Latine, *Fœnum Græcum*: *Columella* ſaith that it is called *Siliqua*: in *Pliny* we read *Silicia*: in *Varro*, *Silicula*: in high Dutch, **Bockshorne**: in Italian, *Fiengreco*: in Spaniſh, *Alfornas*: in French, *Fenegrec*: and in Engliſh, Fenegreeke.

¶ *The Temperature and Vertues.*

It is thought according to *Galen* in his booke of the Faculties of nouriſhments, that it is one of A
thoſe ſimples which do manifeſtly heat, and that men doe vſe it for food, as they do Lupines; for it is
taken with pickle to keep the body ſoluble, and for this purpoſe it is more agreeable than Lupines,
ſeeing it hath nothing in his owne proper ſubſtance, that may hinder the working.

The iuice of boiled Fenegreeke taken with honie is good to purge by the ſtoole all manner of B
corrupt humors that remaine in the guts, making ſoluble through his ſlimineſſe, and mitigating
paine through his warmneſſe.

And becauſe it hath in it a clenſing or ſcouring facultie, it raiſeth humors out of the cheſt: but C
there muſt be added vnto it no great quantitie of honie leaſt the biting qualitie ſhould abound.

In old diſeaſes of the cheſt without a feuer, fat dates are to be boiled with it, but when you haue D
mixed the ſame iuice preſſed out with a great quantitie of hony, and haue againe boiled it on a ſoft
fire to a mean thickneſſe, then muſt you vſe it long before meat.

In his booke of the Faculties of ſimple medicines he ſaith, that Fenegreek is hot in the ſecond E
degree, and dry in the firſt: therefore it doth kindle and make worſe hot inflammations, but ſuch as
are leſſe hot and more hard are thereby cured by being waſted and conſumed away.

The meale of Fenegreeke, as *Dioſcorides* ſaith, is of force to mollifie and waſte away: being boiled F
with mead and applied it taketh away inflammations, as well inward as outward.

The ſame being tempered or kneaded with niter and vineger, doth ſoften and waſte away the G
hardneſſe of the milt.

It is good for women that haue either impoſthume, vlcer, or ſtopping of the matrix, to bathe and H
ſit in the decoction thereof.

The iuice of the decoction preſſed forth doth clenſe the haire, taketh away dandraffe, ſcoureth I
running ſores of the head, called of the Græcians χόρος: being mingled with gooſe greaſe, and put vp
in manner of a peſſarie, or mother ſuppoſititorie, it doth open and mollifie all the parts, about the
mother.

Greene Fenegreeke bruiſed and pounded with vineger, is a remedie for weak and feeble parts, and K
that are without skin, vlcerated and raw.

The decoction thereof is good againſt vlcers in the low gut, and foule ſtinking excrements of L
thoſe that haue the bloudy flix.

The oile which is preſſed out thereof ſcoureth haires and ſcars in the priuie parts. M

The decoction of Fenegreeke ſeed, made in wine, and drunke with a little vineger, expelleth all N
euill humors in the ſtomacke and guts.

The ſeed boiled in wine with dates and hony, vnto the form of a ſyrrup, doth mundifie and clenſe O
the breaſt, and eaſeth the paines thereof.

The meale of Fenegreek boiled in mead or honied water, conſumeth and diſſolueth all cold hard P
impoſthumes and ſwellings, and being mixed with the roots of Marſh Mallows and Linſeed effecteth the ſame.

It is very good for women that haue any griefe or ſwelling in the matrix, or other lower parts, if Q
they bathe thoſe parts with the decoction thereof made in wine, or ſit ouer it and ſweat.

It is good to waſh the head with the decoction of the ſeed, for it taketh away the ſcurfe, ſcailes, R
nits, and all other ſuch like imperfections.

CHAP. 501. *Of Horned Clauer, and blacke Clauer.*

¶ *The Deſcription.*

1 THe horned Clauer, or codded Trefoile, groweth vp with many weake and ſlender ſtalks lying vpon the ground: about which are ſet white leaues, ſomewhat long, leſſer, and narrower than any of the other Trefoiles: the floures grow at the tops, of the faſhion of thoſe of Peaſon, of a ſhining yellow colour: after which come certain ſtraight cods, bigger than thoſe of Fenegreek, but blunter at their ends, in which are contained little round ſeed; the root is hard and woodie, and ſendeth forth young ſprings euery yeare.

1 *Lotus trifolia corniculata.*
Horned or codded Clauer.

2 *Lotus quadrifolia.*
Foure leafed graſſe.

2 This kinde of three leafed graſſe, or rather foure leafed Trefoile, hath leaues like vnto the common Trefoile, ſauing that they bee leſſer, and of a browne purpliſh colour, knowne by the name of Purple-wort, or Purple-graſſe; whoſe floures are in ſhape like the medow Trefoile, but of a duſtie ouerworn colour tending to whiteneſſe; the which doth oftentimes degenerate, ſometime into three leaues, ſometimes in fiue, and alſo into ſeuen, and yet the plant of his nature hath but foure leaues & no more. ‡ I do not thinke this to be the purple leaued Trefoile with the white floure, which is commonly called Purple-graſſe, for I could neuer obſerue it to haue more leaues than three vpon a ſtalke. ‡

‡ 3 The root of this is ſmall and white, from which ariſe many weake hairie branches ſome cubit long: wheron grow ſoft hairy leaues three on one foot-ſtalke, with two little leaues at the root therof, & out of the boſoms of theſe vpon like footſtalkes grow three leſſer leaues, as alſo floures of the bignes and ſhape of thoſe of a Vetch, but of a braue deep crimſon veluet colour: after theſe are paſt come cods ſet with foure thinne welts or skins which make them ſeem foure ſquare; whence *Camerarius* called it *Lotus pulcherrima tetragonolobus:* the ſeed is of an aſh colour, ſomewhat leſſe than a peaſe. It floures moſt of the Sommer moneths, and is for the prettineſſe of the floure preſerued in many Gardens by yearely ſowing the ſeede, for it is an annuall plant. *Cluſius* hath it by the name of *Lotus ſiliquoſus rubello flore:* and hee ſaith the ſeeds were diuers times ſent out of Italy by the name of *Sandalida.* It is alſo commonly called in Latine *Piſum quadratum.* ‡

¶ *The Place.*

The firſt groweth wilde in barren ditch bankes, paſtures, and drie Mountaines.

‡ 3 *Lotus ſiliqua quadrata.* Square crimſon veluet peaſe.

The

The ſecond groweth likewiſe in paſtures and fields, but not ſo common as the other; and is planted in gardens.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The ſecond is called *Lotus Trifolia:* in Engliſh, horned Clauer, or codded Trefoile.

The other is called *Lotus quadrifolia,* or foure leafed Graſſe, or Purple-wort: of *Pena* and *Lobel, Quadrifolium phæum fuſcum hortorum.*

¶ *The Temperature and Vertues.*

Their faculties in working are referred vnto the medow Trefoiles: notwithſtanding it is reported, that the leaues of Purple-wort ſtamped, and the iuyce giuen to drinke, cureth young children of the diſeaſe called in Engliſh the Purples. A

Chap. 502. *Of Medicke Fodder, or ſnaile Clauer.*

¶ *The Deſcription.*

1 THis kinde of Trefoile, called *Medica,* hath many ſmall and ſlender ramping branches, crawling and creeping along vpon the ground, ſet full of broad leaues ſlightly indented about the edges: the floures are very ſmall, and of a pale yellow colour, which turne into round wrinkled knobs, like the water Snaile, or the fiſh called Periwinckle: wherein is contained flat ſeed faſhioned like a little kidney, in colour yellow, in taſte like a Vetch or peaſe: the root is ſmall, and dieth when the ſeed is ripe: it growes in my garden, and is good to feed cattell fat.

1 *Trifolium Cochleatum.*
Medicke Fodder.

‡ 2 *Medica fructu cochleato ſpinoſo.*
Prickly Snaile Trefoile.

‡ There are many varieties of theſe plants, and they chiefely conſiſt in the fruit; for ſome are ſmooth and flat, as this firſt deſcribed: other ſome are rough and prickely, ſome with leſſer, and other-

other ſome with bigger prickles; as alſo with them ſtanding diuers wayes, ſome are onely rough, and of thoſe ſome are as big as a ſmall nut, other ſome no bigger than a peaſe. I giue you here the deſcriptions of three rough ones, (as I receiued them from Mr. *Goodyer*) whereof the laſt is of the ſea, which, as you may ſee, our Author did but ſuperficially deſcribe.

2 *Medicæ maioris Bæticæ ſpecies prima, ſpinulis intortis.*

This hath foure ſquare reddiſh ſtreaked hairy trailing branches, like the ſmall Engliſh *Medica*, greater and longer, foure or fiue foot long: the leaues are alſo ſmooth, growing three together, neither ſharpe pointed, nor yet ſo broad at the top as the ſaid Engliſh Medica, but blunt topped, with a ſmall blacke ſpot in the midſt, not crooked: the floures are alſo yellow, three, foure, or fiue on a foot-ſtalke: after commeth a round writhed fruit fully as big as a haſell nut, with ſmall prickles not ſtanding fore-right, but lying flat on the fruit, finely wrapped, plaited, folded, or interlaced together, wherein lieth wrapped the ſeed in faſhion of a kidney, very like a kidney beane, but foure times ſmaller, and flatter, of a ſhining blacke colour without, like poliſhed Ieat; containing a white kernell within: the root is like the former, and periſheth alſo at Winter.

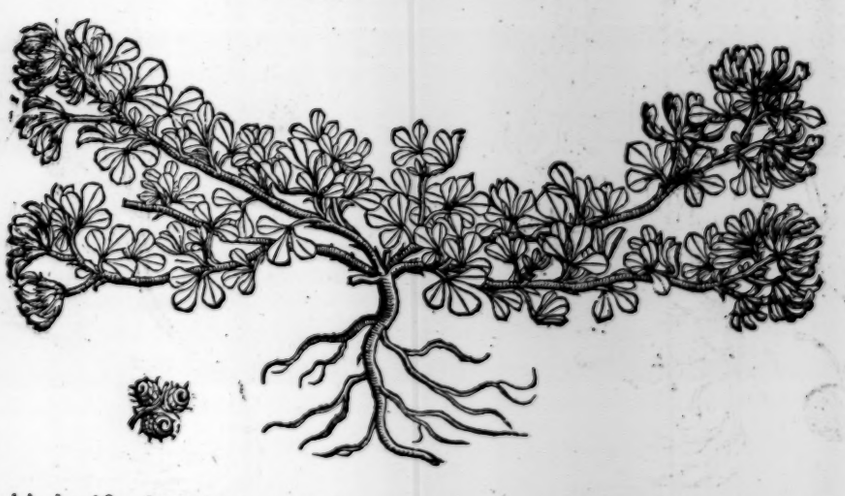
Medica maioris Bæticæ ſpinoſæ ſpecies altera.

The branches alſo creepe on the ground, and are ſtraked ſmooth foure ſquare, reddiſh here and there, three or foure foot long: the leaues are ſmooth, finely notched about the edges, ſharp pointed, without blacke ſpots, very like *Medica pericarpio plano*: the floures are ſmall and yellow like the other: the fruit is round, writhed or twined in alſo, fully as big as a haſell nut, ſomewhat cottonie or woolly, with ſhort ſharpe prickles: wherein lyeth alſo wrapped a ſhining blacke kidney-like ſeed, ſo like the laſt deſcribed, that they are not to be diſcerned apart: the root is alſo alike, and periſheth at Winter.

Medicæ marinæ ſpinoſæ ſpecies.

The branches of this are the leaſt and ſhorteſt of all the reſt, little exceeding a foot or two in length, and are foure ſquare, greene, ſomewhat hairie, and trailing on the ground: the leaues are like to thoſe of *Medica pericarpio plano*, not fully ſo ſharpe pointed, without blacke ſpots, ſoft, hairy, three on a foot-ſtalke: the floures grow alongſt the branches, on very ſmall foot-ſtalkes, forth of the boſomes of the leaues, (not altogether on or neere the tops of the branches) and are very ſmall and yellow, but one on a foot-ſtalke: after commeth ſmall round writhed fruit, no bigger than a peaſe, with very ſhort ſharpe prickles, wherein is contained yellowiſh ſeed of the faſhion of a kidney like the former, and is the hardeſt to be plucked forth of any of the reſt: the root is alſo whitiſh like the roots of the other, and alſo periſheth at Winter. Aug. 2. 1621. *Iohn Goodyer.* ‡

3 *Trifolium Cochleatum marinum.*
Medick Fodder of the ſea.



3 This kinde alſo of Trefoile, (called *Medica marina*: in Engliſh, ſea Trefoile, growing naturally by the ſea ſide about Weſtcheſter, and vpon the Mediterranean ſea coaſt, and about Venice) hath leaues very like vnto the common medow Trefoile, but thicker, and couered ouer with a flockie

flockie hoarineſſe like *Gnaphalium*, after the manner of moſt of the ſea herbes: the floures are yellow: the ſeeds wrinkled like the former, but in quantitie they be leſſer.

¶ *The Place.*

The firſt is ſowne in the fields of Germanie, Italy, and other countries, to feed their cattell, as we in England do Bucke-wheat: we haue a ſmall quantitie thereof in our gardens, for pleaſures ſake

The third groweth neere vnto the ſea ſide in diuers places.

¶ *The Time.*

Medica muſt be ſowne in Aprill; it floureth in Iune and Iuly: the fruit is ripe in the end of Auguſt.

¶ *The Names.*

Medick fodder is called of ſome *Trifolium Cochleatum*, and *Medica*: in French, *L'herbe à Limaſſon*: in Greeke, Μηδικὴ: in Spaniſh, *Mielguas*: of the Valentians and Catalons, *Alfafa*, by a word either barbarous or Arabicke: for the chiefe of the Arabian writers, *Auicen*, doth call *Medica*, *Cot*, *Alaſeleti*, and *Alfasfaſa*.

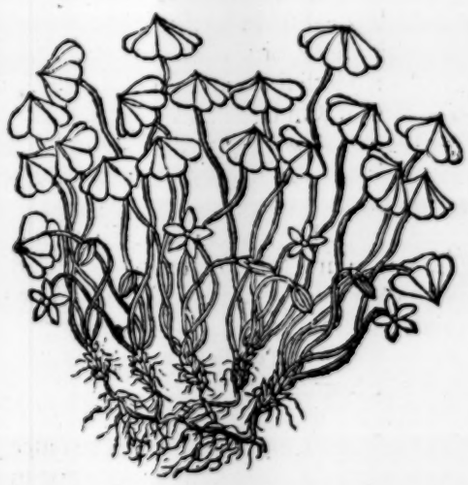
The other is called Sea Clauer, and Medick fodder of the ſea.

¶ *The Temperature and Vertues.*

Medick fodder is of temperature cold, for which cauſe it is applied greene to ſuch inflammati- A
ons and infirmities as haue need of cooling.

CHAP. 503. *Of Wood Sorrell, or Stubwort.*

1 *Oxys alba.*
Whitewood Sorrell.



¶ *The Deſcription.*

1 OXys *Pliniana*, or *Trifolium acetoſum*, being a kind of three leafed graſſe, is a low and baſe herbe without ſtalk; the leaues immediately riſing from the root vpon ſhort ſtems at their firſt comming forth folded together, but afterward they do ſpred abroad, and are of a faire light greene colour, in number three, like the reſt of the Trefoiles, but that each leafe, hath a deepe cleft or rift in the middle: amongſt theſe leaues come vp ſmall and weake tender ſtems, ſuch as the leaues do grow vpon, which beare ſmall ſtar-like floures of a white colour, with ſome brightnes of carnation daſht ouer the ſame: the floure conſiſteth of fiue ſmall leaues; after which come little round knaps or huskes full of yellowiſh ſeed: the root is very threddy, and of a reddiſh colour: the whole herbe is in taſte like Sorrell, but much ſharper and quicker, and maketh better greene ſauce than any other herbe or Sorrell whatſoeuer.

‡ My oft mentioned friend Mr. *George Bowles* ſent me ſome plants of this with very faire red floures, which he gathered in Aprill laſt, in a wood of Sir *Thomas Walſingham* at Chiſſelhurſt in Kent, called Stockwell wood, and in a little round wood thereto adioyning. ‡

2 The ſecond kinde of *Oxys* or wood Sorrell is very like the former, ſauing that the floures are

of

2 *Oxys lutea.*
Yellow wood Sorrell.

of a yellow colour, and yeeld for their ſeed veſſels ſmall and long horned cods; in other reſpects alike.

¶ *The Place.*

Theſe plants grow in woods and vnder buſhes, in ſandie and ſhadowie places in euery countrie.
‡ I haue not as yet found any of the yellow growing with vs. ‡

¶ *The Time.*

They floure from the beginning of Aprill vnto the end of May and midſt of Iune.

¶ *The Names.*

Wood Sorrell or Cuckow Sorrell is called in Latine *Trifolium acetoſum*: the Apothecaries and Herbariſts call it *Alleluya*, and *Panis Cuculi*, or Cuckowes meate, becauſe either the Cuckow feedeth thereon, or by reaſon when it ſpringeth forth and floureth the Cuckow ſingeth moſt, at which time alſo *Alleluya* was wont to be ſung in Churches. *Hieronymus Fracaſtorius* nameth it *Lujula*. *Alexander Benedictus* ſaith that it is called *Alimonia*: in high-Dutch, **Saurelklee**: in Low-Dutch, **Coeckcoecxbzoot**: in French, *Pain de Cocu*: in Engliſh, wood Sorrel, wood Sower, Sower Trefoile, Stubwort, Alleluia, and Sorrell du Bois.

It is thought to be that which *Pliny*, *lib.* 27. *cap.* 12. calleth *Oxys*; writing thus: *Oxys* is three leafed, it is good for a feeble ſtomacke, and is alſo eaten of thoſe that are burſten. But *Galen* in his fourth booke of Simples ſaith, that *Oxys* is the ſame which *Oxalis* or Sorrell is: and *Oxys* is found in *Pliny* to be alſo *Iunci ſpecies*, or a kinde of Ruſh.

¶ *The Nature.*

Theſe herbes are cold and dry like Sorrell.

¶ *The Vertues.*

A Sorrell du Bois or wood Sorrell ſtamped and vſed for greene ſauce, is good for them that haue ſicke and feeble ſtomackes; for it ſtrengthneth the ſtomacke, procureth appetite, and of all Sorrel ſauces is the beſt, not onely in vertue, but alſo in the pleaſantneſſe of his taſte.

B It is a remedie againſt putrified and ſtinking vlcers of the mouth, it quencheth thirſt, and cooleth mightily an hot peſtilentiall feuer, eſpecially being made in a ſyrrup with ſugar.

Chap. 504. *Of noble Liuer-wort, or golden Trefoile.*

¶ *The Deſcription.*

1 Noble Liuerwort hath many leaues ſpred vpon the ground, three cornered, reſembling the three leaued graſſe, of a perfect graſſe greene colour on the vpper ſide, but grayiſh vnderneath: among which riſe vp diuers ſmall tender foot-ſtalkes of three inches long; on the ends whereof ſtands one ſmal ſingle blew floure, conſiſting of ſix little leaues, hauing in the middle a few white chiues: the ſeed is incloſed in little round knaps, of a whitiſh colour; which being ripe do ſtart forth of themſelues: the root is ſlender, compoſed of an infinite number of blacke ſtrings.

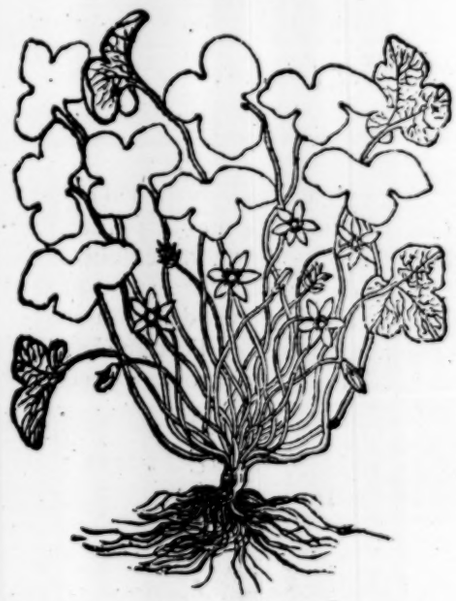
2 The ſecond is like vnto the precedent in leaues, roots, and ſeeds: the floures hereof are of a ſhining red colour, wherein conſiſteth the difference.

3 This

This ſtrange three leaued Liuerwort differeth not from the former, ſauing that this brings forth double blew floures tending to purple, and the others not ſo.

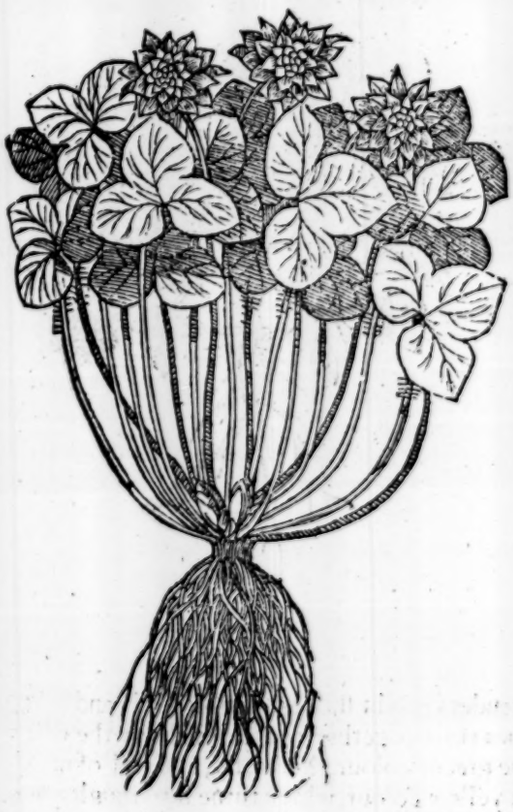
There is another in my garden with white floures, which in ſtalks and euery other reſpect is like the others.

1 *Hepaticum trifolium.*
Noble Liuerwort.



2 *Hepatica trifolia rubra.*
Noble red Liuerwort.

3 *Hepatica multiflora Lobelij.*
Noble Liuerwort with double floures.



¶ *The Place.*

Theſe pretty floures are found in moſt places of Germanie in ſhadowie woods among ſhrubs, and alſo by high-waies ſides: in Italy likewiſe, and that not onely with the blew floures, but the ſame with double floures alſo, by the report of *Alphonſus Pancius* Dr. of Phyſicke in the Vniuerſity of Ferrara, a man excellently well ſeen in the knowledge of Simples. They do all grow likewiſe in my garden, except that with double floures, which as yet is a ſtranger in England: ‡ it is now plentiful in many gardens. ‡

¶ *The Time.*

They floure in March and April, and perfect their ſeed in May.

¶ *The Names.*

Noble Liuerwort is called *Hepatica trifolia*, *Hepatica aurea*, *Trifolium aureum*: of *Baptiſta Sardus*, *Herba Trinitatis*: in high-Dutch, **Edel Leber kraut**: in low-Dutch, **Edel leuer cruit**: in French, *Hepatique*: in Engliſh, Golden Trefoile, three leaued Liuerwort, noble Liuerwort, and herbe Trinitie.

¶ *The Temperature.*

Theſe herbes are cold and drie, with an aſtringent or binding qualitie.

¶ *The*

¶ *The Vertues.*

A It is reported to be good againſt the weakeneſſe of the liuer which proceedeth of an hot cauſe; for it cooleth and ſtrengtheneth it not a little.

B *Baptiſta Sardus* commendeth it, and writeth that the chiefe vertue is in the roote; if a ſpoonfull of the pouder thereof be giuen certaine dayes together with wine, or with ſome kinde of broth, it profiteth much againſt the diſeaſe called *Enterocele.*

Chap. 505. *Of Melilot, or plaiſter Clauer.*

¶ *The Deſcription.*

1 THe firſt kinde of Melilot hath great plenty of ſmall tough and twiggy branches, and ſtalkes full of ioynts or knees, in height two cubits, ſet full of leaues three together, like vnto Burgondie hay. The floures grow at the top of the ſtalke, of a pale yellow colour, ſtanding thickly ſet and compact together, in order or rowes, very like the floures of *Securidaca altera:* which being vaded, there follow certaine crooked cods bending or turning vpward with a ſharpe point, in faſhion not much vnlike a Parrets bill, wherein is contained ſeed like Fenugrecke, but flatter and ſlenderer: the whole plant is of a reaſonable good ſmell, much like vnto honey, and very full of iuyce: the root is very tough and pliant.

1 *Melilotus Syriaca odora.*
Aſſyrian Clauer.

2 *Melilotus Italica & Patauina.*
Italian Clauer.

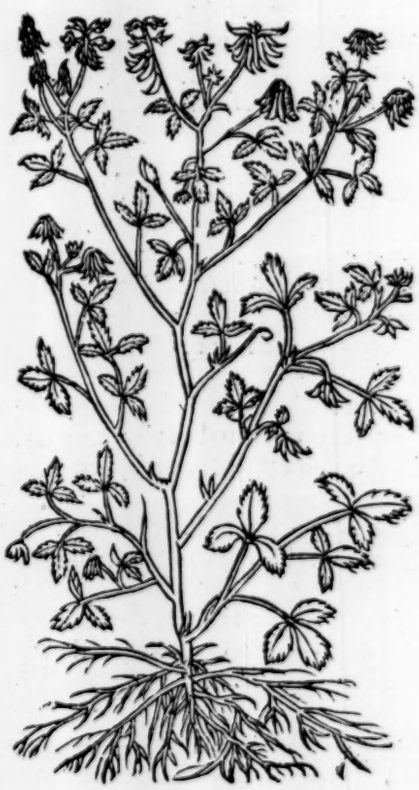
2 The ſecond kinde of Melilot hath ſmall and tender vpright ſtalkes, a cubit high, and ſomewhat more, of a reddiſh colour, ſet full of round leaues three together, not ſnipt about the edges like the other Trefoiles; and they are of a very deepe greene colour, thicke, fat, and full of iuyce. The floures grow alongſt the tops of the ſtalkes, of a yellow colour, which turne into rough round ſeeds as big as a Tare, and of a pale colour. The whole plant hath alſo the ſauour of honey, and periſheth when it hath borne his ſeed.

3 The

3 The third kind of Melilot hath round ſtalks and iagged leaues ſet round about, not much vnlike the leaues of Fenugreeke, alwaies three growing together like the Trefoiles, and oftentimes couered ouer with an hoarineſſe, as though meale had been ſtrewed vpon them. The floures be yellow and ſmall, growing thicke together in a tuft, which turne into little cods, wherein the ſeed is contained: the root is ſmall, tough, and pliant.

4 The fourth kinde of Melilot growes to the height of three cubits, ſet full of leaues like the common Melilot, and of the ſame ſauour: the floures grow alongſt the top of the ſtalks, of a white colour, which turne into ſmall ſoft huskes, wherein is contained little blackiſh ſeed: the root is alſo tough and pliant.

3 *Melilotus Coronata.*
Kings Clauer.



4 *Melilotus Germanica.*
Germane Clauer.

‡ Although out Author intended this laſt deſcription for our ordinarie Melilot, yet he made it of another which is three times larger, growing in ſome gardens (where it is onely ſowne) aboue two yards high, with white floures and many branches: the whole ſhape thereof is like the common kinde, as far as I remember. The common Melilot hath weake cornered greene ſtalkes ſome two foot and better high; whereon grow longiſh leaues ſnipt and oftentimes eaten about the edges, of a freſh greene colour: out of the boſomes of the leaues come little ſtalkes ſome handfull long, ſet thicke on their tops with little yellow floures hanging downe and turning vp again, each floure being compoſed of two little yellow leaues, whereof the vppermoſt turnes vp again, and the vndermoſt ſeemes to be parted into three. The floures paſt, there ſucceed little cods wherein is the ſeed. ‡

¶ *The Place.*

Theſe plants grow in my garden: the common Engliſh Melilot *Pena* ſetteth forth for *Melilotus Germanica*: but for certaintie no part of the world doth enioy ſo great part thereof as England, and eſpecially Eſſex; for I haue ſeene betweene Sudbury in Suffolke, and Clare in Eſſex, and from Clare to Heningham, and from thence to Ouendon, Bulmare, and Pedmarſh, very many acres of earable paſture overgrowne with the ſame; inſomuch that it doth not onely ſpoyle their land, but the corne alſo, as Cockle or Darnel, and as a weed that generally ſpreadeth ouer that corner of the Shire.

¶ *The Time.*

Theſe herbes do floure in Iuly and Auguſt.

¶ *The Names.*

Plaiſter Clauer is called by the generall name, *Melilotus*, of ſome, *Trifolium odoratum*; yet there is another ſweet Trefoile, as hath been declared. Some call it *Trifolium Equinum*, and *Caballinum*, or Horſe-Trefoile, by reaſon it is good fodder for horſes, who do greedily feed thereon: likewiſe *Trifolium Vrſinum*, or Beares Trefoile: of *Fuchſius*, *Saxifraga lutea*, and *Sertula Campana*: of *Cato*, *Serta Campana*, which moſt do name *Corona Regia*: in high Dutch, **Groote Steencleueren**: of the Romanes and Hetrurians, *Tribolo*, as *Matthiolus* writeth: in Engliſh, Melilot, and Plaiſter-Clauer: in Yorkeſhire, Harts-Clauer.

¶ *The Temperature.*

Melilote, ſaith *Galen*, hath more plenty of hot ſubſtance than cold (that is to ſay, hot and dry in the firſt degree) it hath alſo a certaine binding qualitie, beſides a waſting and ripening facultie. *Dioſcorides* ſheweth, that Melilote is of a binding and mollifying qualitie, but the mollifying qualitie is not proper vnto it, but in as much as it waſteth away, and digeſteth humors gathered in hot ſwellings, or otherwiſe: for ſo far doth it mollifie or ſupple that thing which is hard, which is not properly called mollifying, but digeſting and waſting away by vapors: which kinde of quality the Grecians call διαφορητικὸν.

¶ *The Vertues.*

A Melilote boiled in ſweet wine vntill it be ſoft, if you adde thereto the yolke of a roſted egge, the meale of Fenegreeke and Lineſeed, the roots of Marſh Mallowes and hogs greace ſtamped together, and vſed as a pultis or cataplaſma, plaiſterwiſe, doth aſſwage and ſoften all manner of ſwellings, eſpecially about the matrix, fundament and genitories, being applied vnto thoſe places hot.

B With the juice hereof, oile, wax, roſen and turpentine, is made a moſt ſoueraigne healing and drawing emplaſter, called Melilote plaiſter, retaining both the colour and ſauour of the herbe, being artificially made by a skilfull Surgion.

C The herbe boiled in wine and drunke prouoketh vrine, breaketh the ſtone, and aſſwageth the paine of the kidnies, bladder and belly, and ripeneth flegme, and cauſeth it to be eaſily caſt forth.

D The juice thereof dropped into the eies cleereth the ſight, conſumeth, diſſolueth, and cleane taketh away the web, pearle, and ſpot in the eies.

E Melilote alone with water healeth *Recentes meliceridas*, a kinde of wens or rather apoſtems conteyning matter like honey; and alſo the running vlcers of the head, if it be laid to with chalke, wine and galls.

It likewiſe mitigateth the paine of the eares, if the juice be dropped therein mixed with a little wine, and taketh away the paine of the head, which the Greekes call κεφαλαλγία, eſpecially if the head be bathed therewith, and a little vineger and oile of Roſes mixed amongſt it.

‡ Chap. 506. *Of certaine other Trefoiles.*

‡ THoſe Trefoiles being omitted by our Author, I haue thought good to put into a chapter by themſelues, though they haue little affinity with one another, the two laſt excepted.

¶ *The Deſcription:*

1 THe firſt of thoſe in roots, ſtalkes, and manner of growing is like the Medicke or ſnaile Trefoiles formerly deſcribed: the leaues are hairie; the floures yellow and ſmall: after which follow crooked flat cods, of an indifferent bredth, wherein is contained ſeeds made after the faſhion of little kidnies; this the Italians, according to *Lobel*, call *Lunaria radiata*; in the *Hiſt. Lugd.* it is called *Medica ſyl. altera lunata.*

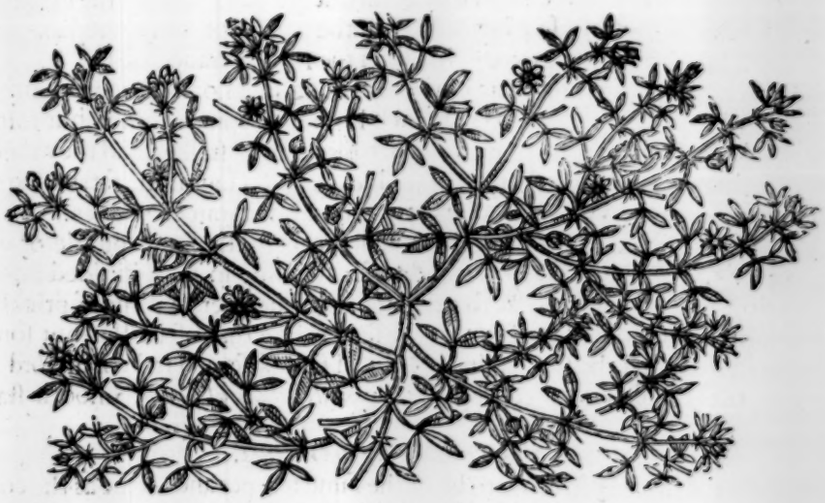
2 The root of this is long and thicke, couered with a yellowiſh rinde, and hauing a white ſweet pith in the inſide, couered with a hairineſſe on the top, and ſending forth ſundry fibres: from this riſe vp many weake long foot-ſtalkes, whereon grow leaues ſet together by threes, long, narrow, ſmooth, lightly nickt on the edges: amongſt theſe riſes vp commonly one ſtalke (yet ſometimes two) ſmooth and naked, three or foure inches long; on the top thereof grow ſpike faſhion, 8. or ten pretty large light purple floures, each of them being ſet in a cup diuided into 5. parts. This growes vpon diuers parts of the Alpes: and *Pena* in his *Mons Baldus* ſet it forth by the name of *Trifolium anguſtifolium Alpinum*. *Bauhinus* ſaith, the root hereof taſts like Liquorice, wherefore it may be called *Glycyrhiza Aſtragaloides*, or *Aſtragalus dulcis*: and he receiued it out of Spaine by the name of *Glycyrhiza*. He calls it in his *Prodromus*, *Trifolium Alpinum flore magno radice dulci.*

This

‡ 1 *Trifolium ſiliqua lunata.*
Moone Trefoile.

‡ 2 *Trifol. anguſtifol. Alpinum.*
Liquorice Trefoile.

‡ 3 *Trifolium ſpinoſum Creticum.*
Prickly Trefoile.



3 This thornie Trefoile hath a long threddy root, from which ariſe many ſhort branched ſtalkes ſome two handfulls high, cornered, and ſpred vpon the ground; the ioynts, which are many, are commonly red, and armed with foure ſharpe prickles, and out of each of them, vpon ſhort foot-ſtalkes grow two trifoile leaues, greene, longiſh, and ending in a little prickle: out of theſe ioynts alſo grow little foot-ſtalkes, which carry ſingle floures made of fiue little leaues, of the ſhape and colour of the little blew Bell-floure, with ten chiues in the middle tipt with yellow: after theſe follow fiue cornered ſharpe pointed heads, containing a ſingle flat red ſeed in each corner. *Cluſius* ſet forth this by the name of *Trifolium ſpinoſum Creticum*: the ſeed was ſent out of Candy by the name of φθιμχρι: he queſtions whether it may not be the true *Tribulus terreſtris* of *Dioſcorides*.

4 The roots, ſtalkes, and leaues of this pretty Trefoile do not much differ from the common

‡ 4 *Trifolium fragiferum.*
Straw-berry Trefoile.

white Trefoile, but there is ſome difference in the floures and ſeed; for the floures of this are ſmall, grow thick together, & are of a whitiſh bluſh colour: after which follow heads made of little bladders or thinne skins, after ſuch a manner as they reſemble a Strawberrie or Raſpas, and they are of a grayiſh colour, here and there marked with red: the ſtalkes ſeldome grow aboue three inches high. It growes in moſt ſalt mariſhes, as in Dartford ſalt mariſh, in thoſe below Purfleet, and ſuch like: it floures in Iuly and Auguſt. *Cluſius* hath ſet it forth by the name of *Trifolium fragiferum Friſicum:* ſome had rather call it *Trifolium veſicarium*, Bladder Trefoile.

5 There are two other Trefoiles with which I thinke good to acquaint you, and thoſe by the ſimilitude of the cups, which containe the floures, and become the ſeed veſſels, may be fitly called *Stellata*; and thus *Bauhine* calls the firſt *Trifolium ſtellatum*; whereto for diſtinctions ſake I adde *hirſutum*, calling it *Trifol. ſtellatum hirſutum*, Rough ſtarrie headed Trefoile: it hath a ſmal long white root, from which ariſe ſtalkes ſome foot high, round, ſlender, hairie, and reddiſh, hauing few leaues or branches: the leaues ſtand three on a ſtalke, as in other Trefoiles, ſmooth on the vpper ſide, and hairy below: the floures are ſmall and red, like in ſhape to thoſe of the common red Trefoile, but leſſer; and they ſtand each of them in a cup reddiſh and rough below, and on the vpper part cut into fiue long ſharpe leaues ſtanding open as they commonly figure a ſtarre: the floures fallen, theſe cups dilate themſelues, and haue in the middle a longiſh tranſuerſe whitiſh ſpot. I ſaw this flouring in May in the garden of M^r. *Tradeſcant*, who did firſt bring plants hereof from Fermentera a ſmall Iſland in the Mediterranean ſea.

6 This other (which for any thing that I know is not figured nor deſcribed by any) hath ſtalks ſometimes a foot, otherwhiles little aboue an inch high, hairy, and diuided but into few branches: the leaues, which ſtand by threes, are faſtned to long foot-ſtalkes, and they themſelues are ſomewhat longiſh, hauing two little ſharpe pointed leaues growing at the ſetting on of the foot-ſtalkes to the ſtalkes: they are greene of colour, and not ſnipt about the edges. The heads that grow on the tops of the ſtalkes are round, ſhort, and greene, with ſmall purple or elſe whitiſh floures like thoſe of the common Trefoile, but leſſer, ſtanding in cups diuided into fiue parts, which when the floures are fallen become ſomewhat bigger, harſher, and more prickly, but open not themſelues ſo much as thoſe of the former: the ſeed is like that of Millet, but ſomwhat rounder. This floures in Iune, and the ſeed is ripe in Iuly. I firſt obſerued it in Dartford ſalt mariſh, the tenth of Iune, 1633. I haue named this *Trifolium ſtellatum glabrum*, Smooth ſtarrie headed Trefoile. ‡

¶ *The Temperature and Vertues.*

Theſe, eſpecially the three laſt, ſeeme to be of the ſame temper and vertue as the common Medow Trefoiles, but none of them are at this day vſed in Phyſicke, or knowne, vnleſſe to ſome few. ‡

Chap. 597. *Of Pulſe.*

¶ *The Kindes.*

THere be diuers ſorts of Pulſe, as Beanes, Peaſon, Tares, Chiches, and ſuch like, comprehended vnder this title Pulſe: and firſt of the great Beane, or garden Beane.

¶ *The*

¶ *The Deſcription.*

1 THe great Beane riſeth vp with a foure ſquare ſtalke, ſmooth, hollow, without ioynts, long and vpright, which when it is thicke ſowne hath no need of propping, but when it is ſowne alone by it ſelfe it ſoone falleth downe to the ground: it bringeth forth long leaues one ſtanding from another, conſiſting of many growing vpon one rib or ſtem, euerie one whereof is ſomewhat fat, ſet with veines, ſlipperie, more long than round. The floures are eared, in forme long, in colour either white with blacke ſpots, or of a blackiſh purple: after them come vp long cods, thicke, full of ſubſtance, ſlenderer below, frized on the inſide with a certaine white wooll as it were, or ſoft flockes; which before they be ripe are greene, and afterwards being dry they are blacke and ſomewhat hard, as be alſo the cods of broome, yet they be longer than thoſe, and greater: in which are contained three, foure, or fiue Beanes, ſeldome more, long, broad, flat, like almoſt to a mans naile, great, and oftentimes to the weight of halfe a dram; for the moſt part white, now and then of a red purpliſh colour; which in their vpper part haue a long black nauell as it were, which is couered with a naile, the colour whereof is a light greene: the skin of the fruit or beane is cloſely compacted, the inner part being dry is hard and ſound, and eaſily cleft in ſunder; and it hath on the one ſide an euident beginning of ſprouting, as haue alſo the little peaſe, great Peaſe, Ciches, and many other Pulſes. The roots hereof are long, and faſtned with many ſtrings.

1 *Faba maior hortenſis.*
The great garden Beane.

2 *Faba ſylueſtris.*
The wilde Beane.

2 The ſecond kinde of Beane (which *Pena* ſetteth forth vnder the title of *Sylueſtris Græcorum Faba*, and *Dodonæus*, *Bona ſylueſtris*; which may be called in Engliſh Greeke Beanes) hath ſquare hollow ſtalkes like the garden Beanes, but ſmaller. The leaues be alſo like the common Beane, ſauing that the ends of the rib whereon thoſe leaues do grow haue at the very end ſmall tendrels or claſpers, ſuch as the peaſe leaues haue. The floures are in faſhion like the former, but of a darke red colour: which being vaded, there ſucceed long cods which are blacke when they be ripe, within which is incloſed blacke ſeed as big as a Peaſe, of an vnpleaſant taſte and ſauour.

‡ 3 The common Beane in ſtalkes, leaues, floures, and cods is like the former great garden Beane, but leſſer in them all; yet the leaues are more, and grow thicker, and out of the boſomes of the leaues vpon little foot-ſtalkes grow the floures, commonly ſix in number, vpon one ſtalk, which are ſucceeded by ſo many cods, leſſer and rounder than thoſe of the former: the beans themſelues are alſo leſſe, and not ſo flat, but rounder, and ſomewhat longiſh: their colour are either whitiſh, yellowiſh, or elſe blacke. This is ſowne in moſt places of this kingdome, in corne fields, and known both to man and beaſt. I much wonder our Author forgot to mention ſo common and vulgarly knowne a Pulſe. It is the *Bona* or *Faſelus minor* of *Dodonæus*; and the *Faba minor* of *Pena* and *Lobel*. ‡

¶ *The Place.*

The firſt Beane is ſowne in fields and gardens euery where about London.

This blacke Beane is ſowne in a few mens gardens who be delighted in varietie and ſtudy of herbes, whereof I haue great plenty in my garden.

¶ *The Time.*

They floure in Aprill and May, and that by parcels, and they be long in flouring: the fruit is ripe in Iuly and Auguſt.

¶ *The Names.*

The garden Beane is called in Latine *Faba*: in Engliſh, the garden Beane: the field Beane is of the ſame kinde and name, although the fertilitie of the ſoile hath amended and altered the fruit into a greater forme. ‡ The difference betweene the garden and field Beane is a ſpecificke difference, and not an accidentall one cauſed by the ſoile, as euery one that knoweth them may well perceiue. ‡

The blacke Beane, whoſe figure we haue ſet forth in the ſecond place, is called *Faba ſylueſtris*: of ſome thought to be the true phyſicke Beane of the Antients; whereupon they haue named it *Faba Veterum*, and alſo *Faba Græcorum*, or the Greeke Beane. Some would haue the garden Beane to be the true *Phaſeolus*, or Kidney Bean; of which number *Dodonæus* is chiefe, who hath ſo wrangled and ruffled among his relatiues, that all his antecedents muſt be caſt out of dores: for his long and tedious tale of a tub we haue thought meet to commit to obliuion. It is called in Greeke κύαμος, whereupon the Athenians feaſt dayes dedicated to *Apollo* were named κυαμίτια, in which Beans and Pulſes were ſodden: in Latine it is alſo called *Faba freſa* or *fracta*, broken or bruiſed Beane.

‡ *Dodonæus* knew well what he did, as any that are either iudicious or learned may ſee, if they looke into the firſt chapter of the ſecond booke of his fourth *Pemptas*. But our Authors words are too iniurious, eſpecially being without cauſe, & againſt him, from whom he borrowed all that was good in this his booke, except the figures of *Tabernamontanus*: It may be Dr. *Prieſt* did not fit his tranſlation in this place to our Authors capacitie; for *Dodonæus* did not affirme it to be the *Phaſeolus*, but *Phaſelus*, diſtinguiſhing betweene them. ‡

¶ *The Temperature and Vertues.*

A The Beane before it be ripe is cold and moiſt: being dry it hath power to bind and reſtraine, according to ſome Authors: further of the temperature and vertues out of *Galen*.

B The Beane (as *Galen* ſaith in his booke of the Faculties of nouriſhments) is windie meate, although it be neuer ſo much ſodden and dreſſed any way.

C Beanes haue not a cloſe and heauy ſubſtance, but a ſpongie and light, and this ſubſtance hath a ſcouring and clenſing facultie; for it is plainly ſeene, that the meale of Beanes clenſeth away the filth of the skin; by reaſon of which qualitie it paſſeth not ſlowly through the belly.

C And ſeeing the meale of Beanes is windie, the Beanes themſelues if they be boyled whole and eaten are yet much more windie.

E If they be parched they loſe their windineſſe, but they are harder of digeſtion, and doe ſlowly deſcend, and yeeld vnto the body thicke or groſſe nouriſhing iuyce; but if they be eaten green before they be ripe and dried, the ſame thing hapneth to them which is incident to all fruits that are eaten before they be fully ripe; that is to ſay, they giue vnto the body a moiſt kinde of nouriſhment, and therefore a nouriſhment more full of excrements, not onely in the inward parts, but alſo in the outward, and whole body thorow: therefore thoſe kindes of Beans do leſſe nouriſh, but they do more ſpeedily paſſe thorow the belly, as the ſaid Author in his booke of the Faculties of ſimple Medicines ſaith, that the Beane is moderately cold and dry.

F The pulpe or meate thereof doth ſomewhat clenſe, the skin doth a little binde.

G Therefore diuers Phyſitians haue giuen the whole Beane boyled with vineger and ſalt to thoſe that were troubled with the bloudy flix, with laskes and vomitings.

H It raiſeth flegme out of the cheſt and lungs: being outwardly applied it drieth without hurt the watery humors of the gout. We haue oftentimes vſed the ſame being boiled in water, and ſo mixed with ſwines greaſe.

We

We haue laid the meale therof with Oxymel, or ſyrrup of vineger, both vpon bruiſed and wounded ſinewes, and vpon the wounded parts of ſuch as haue been bitten or ſtung, to take away the fierie heat. I

It alſo maketh a good plaiſter and pultis for mens ſtones and womens paps: for theſe parts when they are inflamed, haue need of moderate cooling, eſpecially when the paps are inflamed through the cluttered and congealed milke contained in them. K

Alſo milke is dried vp with that pultis. L

The meale thereof (as *Dioſcorides* further addeth) being tempered with the meale of Fenugreek and hony, doth take away blacke and blew ſpots, which come by drie beatings, and waſteth away kernels vnder the eares. M

With Roſe leaues, Frankincenſe, and the white of an egge, it keepeth backe the watering of the eies; the pin and the web, and hard ſwellings. N

Being tempered with wine it healeth ſuffuſions, and ſtripes of the eies.

The Beane being chewed without the skin, is applied to the forehead againſt rheumes and falling downe of humours. O P

Being boiled in wine it taketh away the inflammation of the ſtones. Q

The skins of Beans applied to the place where the hairs were firſt plucked vp, wil not ſuffer them to grow big, but rather conſumeth their nouriſhment. R

Being applied with Barly meale parched and old oile, they waſte away the Kings euill. S

The decoction of them ſerueth to die woollen cloth withall. T

This Beane being diuided into two parts (the skin taken off) by which it was naturally ioined together, and applied, ſtancheth the bloud which doth too much iſſue forth after the biting of the horſeleach, if the one halfe be laied vpon the place. V

The blacke Beane is not vſed with vs at all, ſeeing, as we haue ſaid, it is rare, and ſowne onely in a few mens gardens, who be delighted in varietie and ſtudie of herbes. X

CHAP. 508. *Of Kidney Beane.*

¶ *The Kindes.*

THe ſtocke or kindred of the Kidney Bean are wonderfully many; the difference eſpecially conſiſteth in the colour of the fruit: there be other differences, whereof to write particularly would greatly ſtuffe our volume with ſuperfluous matter, conſidering that the ſimpleſt is able to diſtinguiſh apart the white Kidney Beane from the blacke, the red from the purple, and likewiſe thoſe of mixt colours from thoſe that are onely of one colour: as alſo great ones from little ones. Wherefore it may pleaſe you to be content with the deſcription of ſome few, and the figures of the reſt, with their ſeuerall titles in Latine and Engliſh, referring their deſcriptions vnto a further conſideration, which otherwiſe would be an endleſſe labour, or at the leaſt needleſſe.

¶ *The Deſcription.*

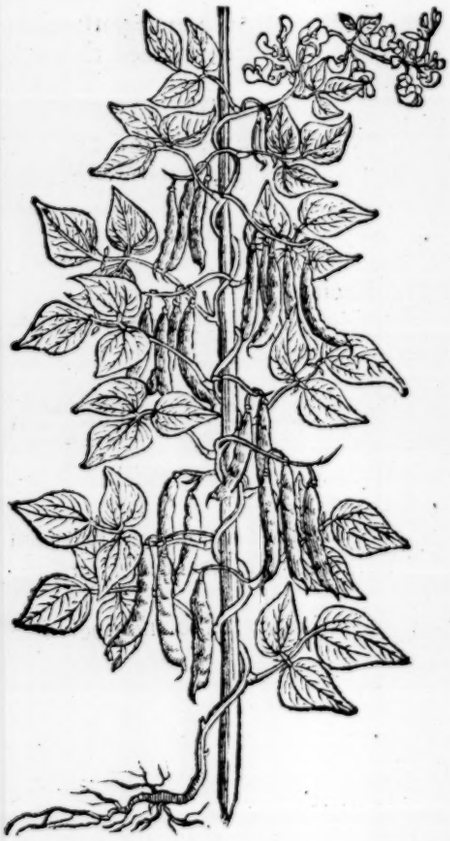
1 THe firſt kinde of *Phaſeolus* or garden Smilax hath long and ſmall branches growing very high, taking hold with his claſping tendrels vpon poles and ſtickes, and whatſoeuer ſtandeth neere vnto him, as doth the hop or vine, which are ſo weake and tender, that without ſuch props or ſupporters they are not able to ſuſtaine themſelues, but will run ramping on the ground fruitleſſe: vpon the branches do grow broad leaues almoſt like Iuie, growing together by three, as in the common Trefoile or three leaued Graſſe: among which come the floures, that do vary and differ in their colours, according to the ſoile where they grow, ſometimes white, ſometimes red, and oftentimes of a pale colour: afterwards there come out long cods, whereof ſome are crooked, and ſome are ſtraight, and in thoſe the fruit is contained, ſmaller than the common Beane, ſomwhat flat, and faſhioned like a Kidney, which are of diuers colours, like vnto the floures: whereto for the moſt part theſe are like.

2 There is alſo another *Dolichus* or Kidney Beane, leſſer, ſhorter, and with ſmaller cods, whoſe floures and fruit are like in forme to the former Kidney Beanes, but much leſſer, and of a blacke colour.

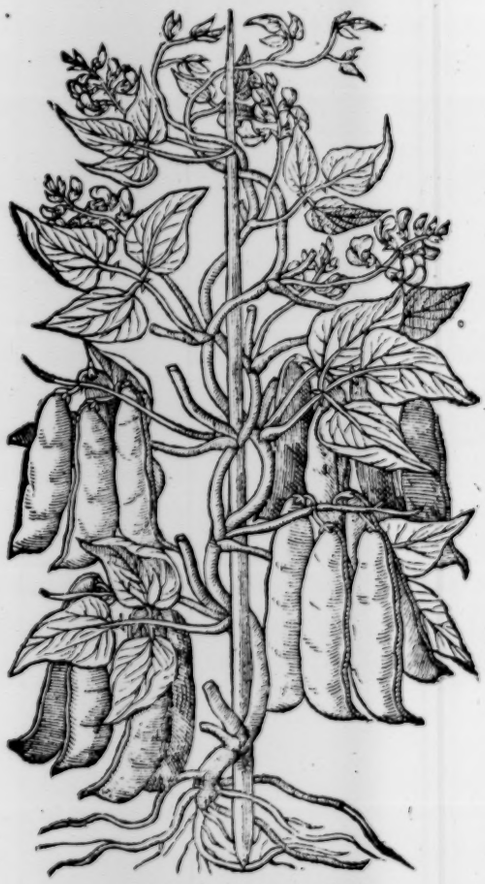
3 There is likewiſe another ſtrange Kidney Beane, which doth alſo winde it ſelfe about poles and props neere adioining, that hath likewiſe three leaues hanging vpon one ſtem, as haue the other Kidney Beans, but euery one is much narrower and alſo blacker: the cods be ſhorter, plainer, and flatter, and containe fewer ſeeds.

4 This

1 *Phaſeolus albus.*
White Kidney Beane.

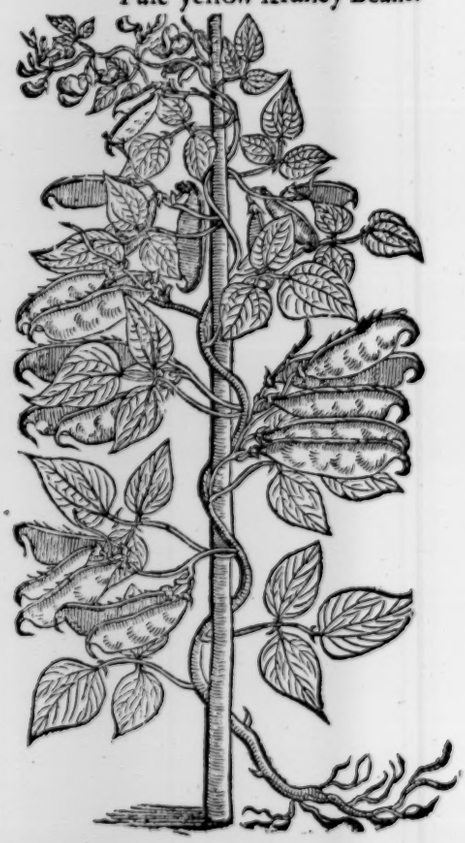


2 *Phaſeolus niger.*
Blacke Kidney Beane.



3 *Smilax hortenſis rubra.*
Red Kidney Beane.

4 *Smilax hortenſis flava.*
Pale yellow Kidney Beane.



‡ 5 *Phaſeolus peregrinus fructu minore albo.*
Indian Kidney Beane with a ſmall white fruit.

‡ 6 *Phaſeolus peregrinus fructu minore ruteſcens.*
Indian Kidney Beane with a ſmall red fruit.

‡ 7 *Phaſeolus peregrinus anguſtifolius.*
Narrow leafed Kidney Beane.

4 This Kidney Bean differeth not from the others, but onely in the colour of the fruit, which are of a pale yellow colour, wherein conſiſteth the difference.

‡ Beſides the varieties of theſe Kidney Beans mentioned by our Author, there are diuers other reckoned vp by *Cluſius*, which haue been brought out of the Eaſt and Weſt Indies, and from ſome parts of Africa; I will only giue you the figures of two or three of them out of *Cluſius*, with the colours of their floures and fruit.

5 The ſtalke of this is low and ſtiffe, the floures of a whitiſh yellow on the outſide, and of a violet colour within: the fruit is ſnow white, with a blacke ſpot in the eye: This is *Phaſeolus peregrinus* 4. of *Cluſius*.

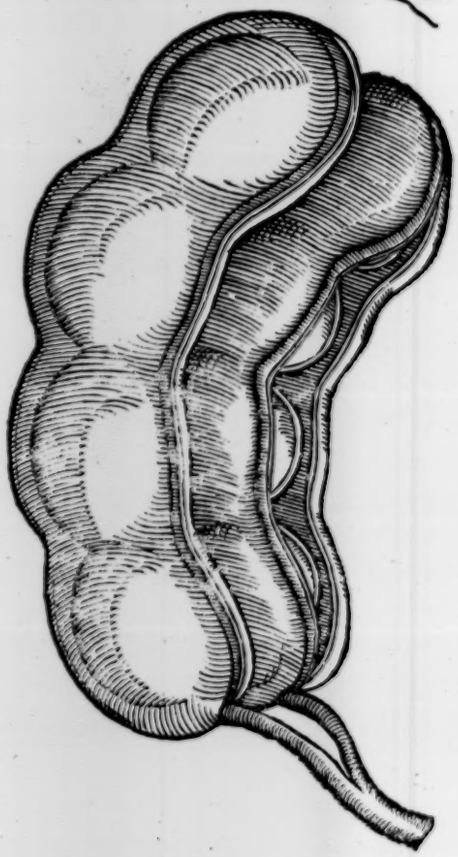
6 This hath leaues like the Marſh Trefoile, floures growing many together, in ſhape and magnitude like thoſe of common Peaſe: the cods were narrow, and contained three or foure ſeeds, which were ſmall, no bigger than the ſeeds of *Laburnum*; the Painter expreſſed two of them in the leafe next vnder the vppermoſt tuft of floures: this is *Cluſius* his *Phaſeolus peregrinus*. 5.

7 This growes high, winding about poles or other ſupporters: the leaues are narrower than the former: the fruit leſſer and flatter, of a reddiſh colour. This is the *Phaſeolus peregrinus* 6. of *Cluſius*.

8 This windes about poles, and growes to a great

8 *Phaſeolus Braſilianus.*
Kidney Beane of Braſile.

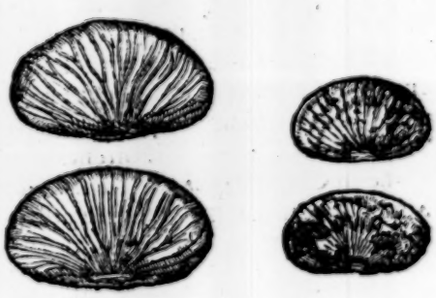
8 *Phaſeoli Braſiliani ad vivum.*
The Braſile Kidney Bean in his ful bigneſſe.



9 *Phaſeolus Ægyptiacus.* The party coloured Beane of Egypt.

10 *Phaſeoli Americi purgantes.*
Purging Kidney Bean of America.

Phaſeoli magni lati albi.



Phaſeoli Braſiliani.

Phaſeoli parui ex America delati.

Phaſeoli parui pallido albi ex America delati.

Phaſeoli rubri.

Phaſeoli rubri Indiani duriſſimi.

great height, with ſoft hairy leaues and large cods, wherein are contained ſeeds of diuers colours; ſometimes they are red, otherwhiles of a whitiſh aſh colour, ſometimes wholly black, and otherwhiles ſpotted.

9 The Egyptian Beane is ſomewhat like the other Kidney Beanes in his growing: his fruit is of the bigneſſe of a ſmall Haſell nut, blacke on one ſide, and of a golden yellow or Orenge colour on the other.

Beſides theſe you finde here figured, and diuers others deſcribed by *Cluſius*, I think it not amiſſe to mention two more. The firſt of theſe, which was procured by Mr. *Tradſcant*, and groues in our Gardens, is a large plant, not differing in manner of growth from the former Indian Kidney Beanes, but his floures are large, many, and of an elegant ſcarlet colour: whence it is vulgarly termed by our Flouriſts, the Scarlet Beane. The other I haue ſeene grow to a little height, but it would not indure; but the cods of it which were brought to vs were ſome three inches long, and couered with a hairie downe of a reddiſh colour, which put vpon the hands or skin in any part of the body would ſting like a Nettle, and this was called the Stinging Beane: I thinke it came from ſome part of the Eaſt Indies. ‡

¶ *The*

¶ *The Place.*

Kidney Beanes doe easily and soone spring vp, and grow into a very great length, being sowne neere to long poles fastned hard by them, or hard by arbors or banqueting places, otherwise they lie flat on the ground, slowly come vp, hardly bring forth fruit, and become faultie and smitted, as *Theophrastus* writeth.

¶ *The Time.*

It is sowne in the Spring, especially in the midst of April, but not before: the fruit is ripe about the end of Sommer.

¶ *The Names.*

Hippocrates, *Diocles*, *Theophrastus*, and most of the other old Writers do call it φάσηλος: diuers of the bigneſſe of the seed do name it λόβος and λόβιον: in Latine, *Siliqua*: *Dioscorides* calleth it *Smilax*, because it climeth vp as *Smilax* doth, and taketh hold of props, staies, and shrubbes standing neere vnto it: others name it φασίολος, a Diminitiue deriued from φάσηλος: for φάσηλος and φασίολος are not one and the selfe same pulse called by diuers names, as some suppose, but sundry fruits one differing from the other, as *Galen* in his first booke of the Faculties of Nourishments doth sufficiently declare, where he intreateth of them both. For first he disputeth of *Phaseli* and *Ochri*, Beans, and Peaſe; then afterward others comming betweene, he writeth of *Dolichus*, which also is named *Phaseolus*: and though hee may be thought to doubt what manner of pulse that is which *Theophrastus* calleth *Dolichus*: notwithstanding he gathereth and concludeth that it is a fruit of a garden plant in Italy, and in Caria, growing in the fields, which is in forme longer than the Cichlings, and was commonly called in his time *Faseolus*. Of his opinion is *Paulus Ægineta*, writing of *Phaselus*, which hee nameth *Dolichus*, in the 79. chap. of his first booke. Moreouer, *Faselus* was in times past a common pulse in Italy and Rome, and *Dolichus* a strange pulse: for *Columella* and *Palladius*, writers of husbandry, haue made mention of the sowing of *Phaselus*: and *Virgil* calleth it *Vilis* in the first of his Georgicks: but concerning the sowing of *Dolichus* or Kidney Beane, none of the Latines haue written, by reason that the same was rare in Italy, and sowne onely in gardens, as *Galen* hath affirmed, naming it oftentimes a garden plant, and shewing that the same, as we haue said, is sowne in Caria; and likewise *Dioscorides* nameth it σμίλαξ κηπαία that is to say, *Smilax hortensis*, or garden Smilax, because it groweth in gardens: who also writing of this in another seuerall chapter, sheweth plainely, that *Smilax hortensis*, or *Dolichus* is another plant differing from *Faselus*, which he nameth *Phaseolus*.

For which causes it is not to be doubted, but that *Phaselus* with three syllables, differeth from *Faseolus* with foure syllables, no otherwise than *Cicer*, *Cicercula*, and *Cicera* differ, which notwithstanding be neere one to another in names: and it is not to be doubted but that they are deceiued, who thinke it to be one and the selfe same Pulse called by sundry names.

This plant is named in English, Kidney Beane, Sperage Beanes: of some, Faselles, or long Peason, French Beanes, garden Smilax, and Romane Beanes: in French, *Feues de Romme*: in Dutch, **Turckſboonen.**

¶ *The Temperature.*

Kidney Beanes, as *Dioscorides* teacheth, do more loose the belly than Peason; they are lesse windy, and nourish well, and no lesse than Peason, as *Diocles* saith: they be also without ingendring windinesse at all: the Arabian Physitions say that they are hot and moist of nature.

¶ *The Vertues.*

A The fruit and cods of Kidney Beanes boiled together before they be ripe; and buttered, and so eaten with their cods, are exceeding delicate meat, and do not ingender winde as the other Pulses doe.

B They doe also gently loose the belly, prouoke vrine, and ingender good bloud reasonably well; but if you eat them when they be ripe, they are neither toothsome nor wholsome. Therefore they are to be taken whilest they are yet greene and tender, which are first boiled vntill they be tender; then is the tib or sinew that doth run alongst the cod to be taken away; then must they be put into a stone pipkin, or some other vessell with butter, and set to the fire againe to stew, or boile gently: which meat is very wholsome, nourishing, and of a pleasant taste.

Chap. 509. *Of the flat Beane called Lupine.*

¶ *The Description.*

1 THe tame or garden Lupine hath round hard stems, which of themselues do stand vpright without any succour, help or stay: the leaues consist of fiue, six, or seuen ioined together,

1 *Lupinus ſativus.*
Garden Lupines.

2 *Lupinus flore luteo.*
Yellow Lupines.

3 *Lupinus flore cæruleo.*
Blew Lupine.

‡ 4 *Lupinus maior flo. cæruleo.*
The great blew Lupine.

gether, like thoſe of the Chaſt tree, green on the vpper ſide, and on the nether ſide white and downy; and in the euening about the ſetting of the Sun they hang flagging downwards as though they were withered: among theſe there commeth vp a tuft of floures of a pale or light bluſh colour, which turne into great rough cods, wherein is the fruit, which is flat and round like a cake, of a white colour, and bitter in taſte: and where they cleaue vnto the cod, in that part they haue a certaine dent like a little nauell. This Lupine hath but one root, which is ſlender and wooddie, hauing hanging on it a few ſmall threds like haires.

2 The yellow Lupine is like to the garden one in ſtalke and leaues, yet both of theſe leſſer and ſhorter. It hath beautifull floures of an exceeding faire gold yellow colour, ſweet of ſmell, made vp into an eare, of the colour of the yellow violet, and ſomewhat of the ſmell: the coddes are ſmall, hard, ſomewhat hairy: the ſeeds be little, flat, round, in taſte extreme bitter, of ſundry colours, ill fauored, far leſſer than the tame one.

3 The blew Lupines are longer than the yellow, and diuided into more wings and branches: the leaues be leſſer and thinner: the floures ſmall, and leſſer than the yellow, of a blew colour: the ſeeds be alſo of diuers colours, bitter, and leſſer than any of them all.

‡ 4 There is alſo another blew Lupine, whoſe leaues, ſtalks, floures, and cods are like, but larger than thoſe of the firſt deſcribed: the floures are of colour blew, with ſome whiteneſſe here and there intermixt. ‡

¶ *The Place and Time.*

They require (ſaith *Theophraſtus*) a ſandy and bad ſoile: they hardly come vp in tilled places, being of their owne nature wilde: they grow in my garden, and in other mens gardens about London. They are planted in Aprill, and bring forth their fruit at two or three ſundrie times, as though it did floure often, and bring forth many crops: the firſt in May, the ſecond in Iuly, the laſt in September, but it ſeldome commeth to ripeneſſe.

¶ *The Names.*

This pulſe is named in Greeke θέρμος ἥμερος: in Latine, *Lupinus*, and *Lupinus ſatiuus*: in high Dutch, **Feigbonen**: in Italian, *Lupino domeſtico*: in Spaniſh, *Entramocos*: in the Brabanders language, **Wilch boonen**, and **Lupinen**: in French, *Lupins*: in Engliſh, Garden Lupine, tame Lupine, and of ſome after the German name Fig-beane.

¶ *The Temperature and Vertues.*

A The ſeed of the garden Lupine is πολύχρηστον, that is to ſay, much and often vſed, as *Galen* ſaith in his books of the Faculties of Nouriſhments: for the ſame being boiled and afterwards ſteeped in faire water, vntill ſuch time as it doth altogether loſe his naturall bitternes, and laſtly being ſeaſoned with a reaſonable quantitie of ſalt, it is eaten with pickle. The Lupine is of an hard and earthy ſubſtance, wherefore it is neceſſarily of hard digeſtion, and containeth in it a thicke iuice; of which being not perfectly concocted in the veines, is ingendred a bloud or iuice which is properly called crude, or raw: but when it hath loſt all his bitternes by preparing or dreſſing of it (as aforeſaid) it is like τοῖς ἀνοσμοις, that is to ſay, to ſuch things as are without reliſh, which is perceiued by the taſte; & being ſo prepared, it is, as *Galen* writeth in his books of the Faculties of ſimple medicines, one of the emplaiſtickes or clammers.

B But whileſt the naturall bitterneſſe doth as yet remaine, it hath power to clenſe and to conſume or waſte away; it killeth wormes in the belly, being both applied in manner of an ointment and giuen with hony to licke on, and alſo drunke with water and vineger.

C Moreouer, the decoction thereof inwardly taken, voideth the wormes; and likewiſe if it be ſundry times outwardly vſed as a bath, it is a remedy againſt the morphew, ſore heads, the ſmall Pox, wilde ſcabs, gangrenes, venomous vlcers, partly by clenſing, and partly by conſuming and drying without biting; being taken with Rew and Pepper, that it may be the pleaſanter, it ſcoureth the liuer and milt.

D It bringeth downe the menſes, and expelleth the dead childe if it be layed to with myrrh and honie.

E Moreouer, the meale of Lupines doth waſte or conſume away without any biting qualitie, for it doth not onely take away blacke and blew ſpots that come of dry beatings, but alſo it cureth *Cheradas*, and *Phymata*: but then it is to be boiled either in vineger or oxymell, or elſe in water and vineger, and that according to the temperature of the grieued parties, and the diuerſities of the diſeaſes, *Quod ex vſu eſt eligendo*: and it alſo taketh away blew marks, and what thing ſoeuer elſe we haue ſaid the decoction could do, all the ſame doth the meale likewiſe performe.

F Theſe Lupines, as *Dioſcorides* doth furthermore write, being boiled in raine water till they yeeld a certaine creame, are good to clenſe and beautifie the face.

G They cure the ſcabs in ſheepe with the root of blacke Chameleon Thiſtle, if they be waſhed with the warme decoction.

The

The roote boiled with water and drunke, prouoketh vrine. H

The Lupines being made ſweet and pleaſant, mixed with vineger and drunk, take away the loth- I
ſomneſſe of the ſtomacke, and cauſe a good appetite to meat.

Lupines boiled in that ſtrong leigh which Barbars do vſe, and ſome Wormwood, Centorie, and K
bay ſalt added thereto, ſtay the running and ſpreading of a *Gangræna*, and thoſe parts that are de-
priued of their nouriſhment and begin to mortifie, and ſtaieth the ambulatiue nature of running
and ſpreading vlcers, being applied thereto very hot, with ſtuphes of cloth or tow.

CHAP. 510. *Of Peaſon.*

¶ *The Kindes.*

THere be diuers ſorts of Peaſon, differing very notably in many reſpects; ſome of the garden, and others of the field, and yet both counted tame: ſome with tough skinnes or membranes in the cods, and others haue none at all, whoſe cods are to be eaten with the Peaſe when they be young as thoſe of the young Kidney Beane: others carrying their fruit in the tops of the branches, are eſteemed and taken for Scottiſh Peaſon, which is not very common. There be diuers ſorts growing wild, as ſhall be declared.

1 *Piſum maius.*
Rownciuall Peaſe.

2 *Piſum minus.*
Garden and field Peaſe.

¶ *The Deſcription.*

1 THe great Peaſe hath long ſtalks, hollow, brickle, of a whitiſh green colour, branched, and ſpread vpon the ground, vnleſſe they be held vp with proppes ſet neere vnto them: the leafe thereof is wide and long, made vp of many little leaues which be ſmooth, white, growing vpon one little ſtalke or ſtem, and ſet one right againſt another: it hath alſo in the vpper part long claſping tendrels, wherewith it foldeth it ſelfe vpon props and ſtaies ſtanding next vnto

3 *Piſum vmbellatum.*
Tufted or Scottiſh Peaſe.

4 *Piſum excorticatum.*
Peaſe without skins in the cod.

5 *Piſum ſylueſtre.*
Wilde Peaſe.

6 *Piſum perenne ſylueſtre.*
Euerlaſting wilde Peaſe.

it: the floure is white and hath about the middle of it a purple ſpot: the cods be long, round *Cilindriforma*: in which are contained ſeeds greater than *Ochri*, or little Peaſon; which being drie are cornered, and that vnequall, of colour ſometimes white and ſometimes gray: the roots are ſmall.

2 The field Peaſe is ſo very well knowne to all, that it were a needleſſe labour to ſpend time about the deſcription.

3 Tufted Peaſe are like vnto thoſe of the field, or of the garden in each reſpect, the difference conſiſteth onely in that, that this plant carrieth his floures and fruit in the tops of the branches in a round tuft or vmbel, contrary to all other of his kinde, which bring forth their fruit in the midſt, and alongſt the ſtalks: the root is thicke and fibrous.

4 Peaſe without skins, in the cods differ not from the precedent, ſauing that the cods hereof want that tough skinny membrane in the ſame, which the hogs cannot eat by reaſon of the toughneſſe; whereas the other may be eaten cods and all the reſt, euen as Kidney beanes are: which being ſo dreſſed are exceeding delicate meat.

5 The wilde Peaſe differeth not from the common field Peaſe in ſtalke and leaues, ſauing that this wilde kinde is ſomewhat leſſer: the floures are of a yellow colour, and the fruit is much leſſer.

6 The Peaſe whoſe root neuer dies, differeth not from the wilde Peaſe, onely his continuing without ſowing, being once ſowne or planted, ſetteth forth the difference.

¶ *The Place.*

Peaſe are ſet and ſown in gardens, as alſo in the fields in all places of England. The tufted Peaſe are in reaſonable plenty in the Weſt part of Kent about Sennocke or Seuenock, in other places not ſo common.

The wilde Peaſe do grow in paſtures and earable fields in diuers places, ſpecially about the field belonging vnto Biſhops Hatfield in Hartfordſhire.

¶ *The Time.*

They be ſowne in the Spring time, like as be alſo other pulſes, which are ripe in Summer: they proſper beſt in warme weather, and eaſily take harme by cold, eſpecially when they floure.

¶ *The Names.*

The great Peaſe is called in Latine *Piſum Romanum*, or *Piſum maius*: in Engliſh, Roman Peaſe, or the greater Peaſe, alſo garden Peaſe: of ſome, Branch Peaſe, French Peaſe, and Rounſuals. *Theophraſtus* and other old Writers do call it in Greeke [illegible]: in Latine alſo *Piſum*: in low Dutch, **Roomſche erwiten**: in French *des Pois*. The little Peaſe is called of the Apothecaries euery where *Piſum*, and *P. ſummians*: it is called in Engliſh, little Peaſe, or the common Peaſe.

¶ *The Temperature and Vertues.*

The Peaſe, as *Hippocrates* ſaith, is leſſe windie than Beans, but it paſſeth ſooner through the belly. A *Galen* writeth, that Peaſon are in their whole ſubſtance like vnto Beanes, and be eaten after the ſame manner that Beans are, notwithſtanding they differ from them in theſe two things, both becauſe they are not ſo windie as be the beanes, and alſo for that they haue not a clenſing faculty, and therefore they do more ſlowly deſcend through the belly. They haue no effectuall qualitie manifeſt, and are in a meane between thoſe things which are of good and bad iuice, that nouriſh much and little, that be windie and without winde, as *Galen* in his booke of the Faculties of Nouriſhments hath written of theſe and of beans.

Chap. 511. *Of the tame or Garden Ciche.*

¶ *The Deſcription.*

Garden Ciche bringeth forth round ſtalks, branched and ſomewhat hairy, leaning on the one ſide: the leaues are made of many little ones growing vpon one ſtem or rib, and ſet one right againſt another: of which euery one is ſmall, broad, and nicked on the edges, leſſer than the leaues of wilde Germander: the floures be ſmal, of colour either white, or of a reddiſh purple: after which come vp little ſhort cods, puffed vp as it were with winde like little bladders, in which doe lie two or at the moſt three ſeeds cornered, ſmall towards the end, with one ſharp corner, not much vnlike to a Rams head, of colour either white, or of a reddiſh blacke purple; in which is plainly ſeen the place where they begin firſt to ſprout. The root is ſlender, white and long: For as *Theophraſtus* ſaith, the Ciche taketh deepeſt root of all the Pulſes.

¶ *The Place.*

It is ſowen in Italy, Spaine and France, euery where in the fields. It is ſowen in our London gardens, but not common.

Cicer ſatiuum.
Garden Ciche.

¶ *The Time.*

It is ſowne in Aprill, being firſt ſteeped in water a day before: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke ἐρέβινθος: in Latine, *Cicer arietinum*, or Rams Ciches, & of the blackiſh purple colour, *Cicer nigrum, vel rubrum*, blacke or red Ciche: and the other is named *Candidum vel album Cicer*: or white Ciche: in Engliſh, Common Cich, or Ciches, red Cich, of ſome, Sheepes Ciche Peaſe, or Sheepes Ciche Peaſon.

¶ *The Temperature and Vertues.*

The Ciche, as *Galen* writeth in his booke of the Faculties of nouriſhments, is no leſſe windie than the true Bean, but it yeeldeth a ſtronger nouriſhment than that doth: it prouoketh luſt, and it is thought to ingender ſeed.

Some giue the ſame to ſtalion horſes. Moreouer, Ciches do ſcoure more than do the true Beanes: inſomuch as certaine of them do manifeſtly diminiſh or waſte away the ſtones in the Kidneyes: thoſe be the blacke and little Ciches called *Arietina*, or Rams Ciches, but it is better to drinke the broth of them ſodden in water.

Both the Rams Ciches, as *Dioſcorides* ſaith, the white and the blacke prouoke vrine, if the decoction therof be made with Roſemary and giuen vnto thoſe that haue either the Dropſie or yellow iaundice; but they are hurtfull vnto the bladder and Kidneies that haue vlcers in them.

Chap. 512. *Of wilde Ciches.*

¶ *The Kindes.*

The wilde Ciche is like to the tame (ſaith *Dioſcorides*) but it differeth in ſeed: the later writers haue ſet downe two kindes hereof, as ſhall be declared.

¶ *The Deſcription.*

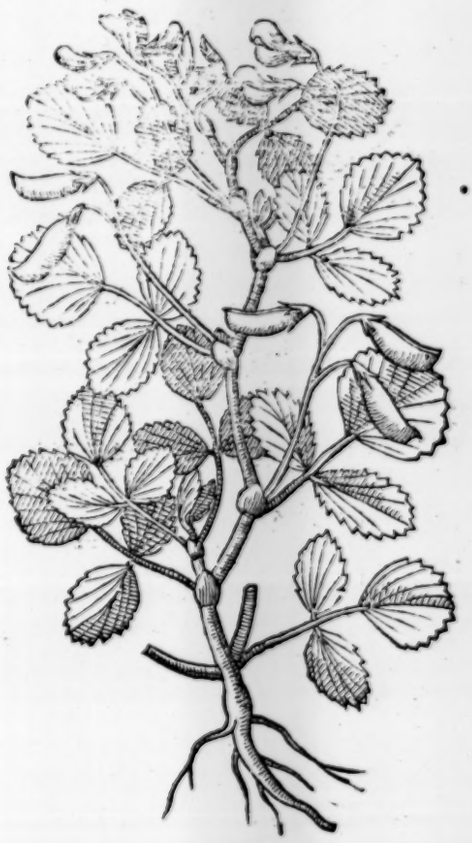
1 The firſt wilde Cich bringeth forth a great number of ſtalks branched, lying flat on the ground: about which be the leaues, conſiſting of many vpon one rib as do thoſe of the garden Ciche, but not nicked in the edges, more like to the leaues of Axeich: the floures come forth faſtned on ſmall ſtems, which grow cloſe to the ſtalks, of a pale yellow colour, and like vnto eares: in their places come vp little cods, in forme and bigneſſe of the fruit of garden Ciches, black and ſomething hairie, in which lieth the ſeed, that is ſmal, hard, flat, and glittering, in taſte like that of Kidney Beane: the root groweth deepe, faſtened with many ſtrings.

2 There is another kinde of wilde Cich that hath alſo a great number of ſtalks lying vpon the ground, about which ſtand ſoft leaues, ſomething hairy and white, conſiſting of three broad leaues ſtanding vpon a middle rib, the leaſt of which ſtand neereſt to the ſtem, and the greateſt at the very top: the floures come forth at the bottome of the leaues many together, of colour yellow; after which grow ſmall long huskes, ſoft and hairy, in euery one whereof is a little cod, in which lie two ſeeds like little Cichlings.

¶ The

1 *Cicer ſyluestre.*
The wilde Cich.

2 *Cicer ſyluestre latifolium.*
Broad leafed wilde Cich.



¶ *The Place.*

Theſe plants are ſowne in the parts beyond the ſeas for to feed their cattell with in winter, as we do tares, vetches, and ſuch other baſe pulſe.

¶ *The Time.*

The time anſwereth the Vetch or tare.

¶ *The Names.*

The wild Cich hath no other name in Latine but *Cicer ſyluestre*: the later writers haue not found any name at all.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the garden Cich, as *Theophraſtus* affirmes; and *Galen* ſaith that the wilde Cich is in all things like vnto that of the garden, but in Phyſicks vſe more effectuall, by reaſon it is more hotter and drier, and alſo more biting and bitter.

CHAP. 513. *Of Lentils.*

¶ *The Deſcription.*

1 THe firſt Lentil growes vp with ſlender ſtalks, and leaues which be ſomwhat hard, growing aſlope from both ſides of the rib or middle ſtalke, narrow and many in number like thoſe of Tares, but narrower and leſſer: the floures be ſmall, tending ſomewhat towards a purple: the cods are little and broad: the ſeeds in theſe are in number three or foure, little, round, plaine, and flat: the roots are ſmall and threddy.

2 The ſecond kinde of Lentill hath ſmall tender and pliant branches a cubit high, wheron do grow leaues diuided or conſiſting of ſundry other ſmall leaues, like the wilde Vetch, ending at the middle rib with ſome claſping tendrels, wherewith it taketh hold of ſuch things as are neere vnto it: among theſe come forth little browniſh floures mixed with white, which turne into ſmall flat cods, containing little browne flat ſeed, and ſometimes white.

¶ *The*

1 *Lens maior.*
Great Lentils.

2 *Lens minor.*
Little Lentils.

¶ *The Place.*

Theſe Pulſes do grow in my garden; and it is reported vnto me by thoſe of good credit, that about Watford in Middleſex and other places of England the husbandmen do ſow them for their cattell, euen as others do Tares.

¶ *The Time.*

They both floure and wax ripe in Iuly and Auguſt.

¶ *The Names.*

They are called in Greeke φακὸς, or ὀθὺς: in Latine, *Lens*, and *Lenticula*: in high-Dutch, Linſen: in French, *Lentille*: in Italian, *Lentichia*: in Spaniſh, *Lenteia*: in Engliſh, Lentils.

¶ *The Temperature and Vertues.*

A Lentils, as *Galen* ſaith, are in a meane betweene hot and cold, yet are they dry in the ſecond degree: their skin is aſtringent or binding, and the meate or ſubſtance within is of a thicke and earthy iuyce, hauing a qualitie that is a little auſtere or ſomething harſh, much more the skin thereof; but the iuyce of them is quite contrarie to the binding qualitie; wherefore if a man ſhal boile them in faire water, and afterwards ſeaſon the water with ſalt and pickle, *aut cum ipſis oleo condiens*,

B and then take it, the ſame drinke doth looſe the belly.

The firſt decoction of Lentils doth looſe the belly; but if they be boyled againe, and the firſt decoction caſt away, then doe they binde, and are good againſt the bloudy flixe or dangerous laskes.

C They do their operation more effectually in ſtopping or binding, if all or any of theſe following be boyled therewith, that is to ſay, red Beets, Myrtles, pils of Pomegranats, dried Roſes, Medlars, Seruice berries, vnripe Peares, Quinces, Plantaine leaues, Galls, or the berries of Sumach.

D The meale of Lentils mixed with honey doth mundifie and clenſe corrupt vlcers and rotten ſores, filling them with fleſh againe; and is moſt ſingular to be put into the common digeſtiues vſed among our London Surgeons for greene wounds.

E The Lentil hauing the skin or coat taken off, as it loſeth that ſtrong binding qualitie, and thoſe accidents that depend on the ſame, ſo doth it more nouriſh than if it had the skin on.

F It ingendreth thicke and naughty iuyce, and ſlowly paſſeth thorow the belly, yet doth it not ſtay the looſneſſe as that doth which hath his coat on; and therefore they that vſe to eat too much

thereof

thereof do neceſſarily become Lepers, and are much ſubiect to cankers, for thicke and dry nouriſhments are apt to breed melancholy.

Therefore the Lentill is good food for them that through wateriſh humours be apt to fall into the dropſie, and it is a moſt dangerous food for dry and withered bodies; for which cauſe it bringeth dimneſſe of ſight, though the ſight be perfect, through his exceſſiue drineſſe, whereby the ſpirits of the ſight be waſted; but it is good for them tha t are of a quitecontrarie conſtitution. G

It is not good for thoſe that want their termes; for it breedeth thicke bloud, and ſuch as ſlowly paſſeth through the veines. H

But it is ſingular good to ſtay the menſes, as *Galen* in his booke of the faculties of nouriſhments affirmeth. I

It cauſeth troubleſome dreames (as *Dioſcorides* doth moreouer write) it hurteth the head, ſinewes, and lungs. K

It is good to ſwallow downe thirty graines of Lentils ſhelled or taken from their husks, againſt the ouercaſting of the ſtomacke. L

Being boyled with parched barly meale and laid to, it aſſwageth the paine and ach of the gout. M

With honey it filleth vp hollow ſores, it breaketh aſchares, clenſeth vlcers: being boyled in wine it waſteth away wens and hard ſwellings of the throat. N

With a Quince, and Melilot, and oyle of Roſes it helpeth the inflammation of the eyes and fundament; but in greater inflammations of the fundament, and great deep vlcers, it is boyled with the rinde of a pomegranat, dry Roſe leaues, and honey. O

And after the ſame maner againſt eating ſores that are mortified, if ſea water be added; it is alſo a remedie againſt puſhes, the ſhingles, and the hot inflammation called S. Anthonies fire, and for kibes, in ſuch manner as we haue written: being boyled in ſea water and applied, it helps womens breſts in which the milke is cluttered, and cannot ſuffer too great aboundance of milke. P

Chap. 514. *Of Cich or true Orobus.*

Orobus receptus Herbariorum.
The true Orobus.

¶ *The Deſcription.*

THis Pulſe, which of moſt Herbariſts is taken for the true Orobus, and called of ſome, bitter Fitch, is one of the Pulſes whoſe tender branches traile vpon the ground, as *Theophraſtus* ſaith, and whoſe long tender branches ſpred far abroad, whereon doe grow leaues like thoſe of the field Vetch: among which grow white flowres: after which come long cods, that appeare bunched on the outſide againſt the place where the ſeeds do lie, which are ſmall, round, ruſſet of colour, and of a bitter taſte: the root is ſmall and ſingle.

¶ *The Place.*

It proſpereth beſt in a leane ſoile, according to *Columella*: it groweth in woods and copſes in ſundry places of Spaine and Italy, but here only in gardens.

¶ *The Time.*

This is ſowne early and late, but if it be ſowne in the ſpring it eaſily commeth vp, and is pleaſant, and vnpleaſant if it be ſowne in the fall of the leafe.

¶ *The Names.*

This is called in Greeke ὄροβος: the ſhops of Germanie haue kept the name *Orobus*: the Italians cal it *Macho*: the Spaniards, *Yeruo*, and *Yeruos*: in Engliſh it is called bitter Vetch, or bitter Fitch, and Orobus, after the Latine name. Of ſome Ers, after the French name.

¶ *The*

¶ *The Temperature and Vertues.*

A *Galen* in his firſt booke of the Faculties of nouriſhments ſaith, That men do altogether abſtaine from the bitter Vetch, for it hath a very vnpleaſant taſte, and naughty iuyce; but Kine in Aſia and in moſt other countries do eate thereof, being made ſweet by ſteeping in water; notwithſtanding men being compelled through neceſſitie of great famine, as *Hippocrates* alſo hath written, do oftentimes feed thereof; and we alſo dreſſing them after the manner of Lupines, vſe the bitter Vetches with honey, as a medicine that purgeth thicke and groſſe humors out of the cheſt and lungs.

B Moreouer, among the bitter Vetches the white are not ſo medicinable, but thoſe which are neere to a yellow, or to the colour of Okar; and thoſe that haue beene twice boyled, or ſundrie times ſoked in water, loſe their bitter and vnpleaſant taſte, and withall their clenſing and cutting qualitie, ſo that there is onely left in them an earthy ſubſtance, which ſerues for nouriſhment, that drieth without any manifeſt bitterneſſe.

C And in his booke of the Faculties of ſimple medicines he ſaith, That bitter Vetch is dry in the later end of the ſecond degree, and hot in the firſt: moreouer, by how much it is bitter, by ſo much it clenſeth, cutteth, and remoueth ſtoppings: but if it be ouermuch vſed it bringeth forth bloud by vrine.

D *Dioſcorides* writeth, that bitter Vetch cauſeth head-ache and heauy dulneſſe, that it troubles the belly, and driueth forth bloud by vrine; notwithſtanding being boyled it ſerueth to fatten Kine.

E There is made of the ſeed a meale fit to be vſed in medicine, after this maner: the full and white graines are choſen out, and being mixed together they are ſteeped in water, and ſuffered to lie till they be plumpe, and afterwards are parched till the skinne be broken; then are they ground, and ſearſed or ſhaken thorow a meale ſieue, and the meale reſerued.

F This looſeth the belly, prouoketh vrine, maketh one well coloured: being ouermuch eaten or drunke it draweth bloud by the ſtoole, with gripings, and alſo by vrine.

G With honey it clenſeth vlcers, taketh away freckles, ſun-burnes, blacke ſpots in the skinne, and maketh the whole body faire and cleane.

H It ſtayeth running vlcers or hard ſwellings, and gangrens or mortified ſores; it ſofteneth the hardneſſe of womens breaſts, it taketh away and breaketh eating vlcers, carbuncles, and ſores of the head: being tempered with wine and applied it healeth the bitings of dogs, and alſo of venomous beaſts.

I With vineger it is good againſt the ſtrangurie, and mitigateth paine that commeth thereof.

K It is good for them that are not nouriſhed after their meat, being parched and taken with hony in the quantitie of a nut.

L The decoction of the ſame helpeth the itch in the whole body, and taketh away kibes, if they be waſhed or bathed therewith.

M *Cicer* boyled in fountaine water with ſome *Orobus* doth aſſwage the ſwelling of the yard and priuie parts of man or woman, if they be waſhed or bathed in the decoction thereof; and the ſubſtance hereof may alſo be applied plaiſterwiſe.

N It is alſo vſed for bathing and waſhing of vlcers and running ſores, and is applied vnto the ſcurfe of the head with great profit.

Chap. 515. *Of the Vetch or Fetch.*

¶ *The Deſcription.*

1 THe Vetch hath ſlender and foure ſquared ſtalkes almoſt three foot long: the leaues be long, with claſping tendrels at the end made vp of many little leaues growing vpon one rib or middle ſtem; euery one whereof is greater, broader, and thicker than that of the Lentil: the floures are like to the floures of the garden beane, but of a blacke purple colour: the cods be broad, ſmall, and in euery one are contained fiue or ſix graines, not round, but flat like thoſe of the Lentil, of colour blacke, and of an vnpleaſant taſte.

‡ 2 There is another of this kinde which hath a creeping and liuing root, from which it ſendeth forth creſted ſtalkes ſome cubit and halfe high: the leaues are winged, commonly a dozen growing vpon one rib, which ends in a winding tendrel: each peculiar leafe is broader toward the bottome, and ſharper towards the top, which ends not flat, but ſomewhat round. Out of the boſomes of the leaues towards the tops of the ſtalkes, on ſhort foot-ſtalkes grow two, three or more pretty large peaſe-faſhioned blewiſh purple floures, which are ſucceeded by ſuch cods as the former, but ſomewhat leſſer; which when they grow ripe become blacke, and fly open of themſelues,

and

‡ 1 *Vicia.*
Tare, Vetch, or Fetch.

† 2 *Vicia maxima dumetorum.*
Buſh Vetch.

‡ 3 *Vicia ſyl. flo. albo.*
White floured Vetch.

4 *Vicia ſylueſtris, ſiue Cracca maior.*
Strangle Tare, Tine, or wilde Fetch.

and ſo ſcatter their ſeed. This growes in many places wilde among buſhes, both here and in Germanie, as appeares by that name *Bauhine* thence giues it, calling it *Vicia maxima dumetorum*. *Tragus* makes it his *Vicia ſyl. altera*; and iudges it to be the *Aphace* of *Dioſcorides*; and he ſaith the Latines call it *Os mundi*: the high-Dutch, **S. Criſtoffels kraut**, and **Schwarts Linſen.** *Tabern.* calls it *Cracca maior*.

‡ 5 *Vicia ſyl. ſiue Cracca minima.*
Small wilde Tare.

3 This alſo hath a laſting root, which ſendeth vp round creſted branches, a foot and ſomtimes a cubit high, whereon grow ſuch leaues as thoſe of the former, but more white and downie: the floures, which grow on ſhort foot-ſtalkes, out of the boſomes of the leaues, towards the top of the ſtalks, are of a whitiſh colour, with veines of a dusky colour, diuaricated ouer the vpper leafe: the cods are like thoſe of the common Fetch. *Cluſius* found this in ſome wilde places of Hungarie; it floured in May: he calls it *Vicia ſylueſtris albo flore*. ‡

4 Strangle Tare, called in ſome countries Tine, and of others wilde Vetch, is a ramping herbe like vnto the common Tare, ramping and clymbing among corne where it chanceth, that it plucketh it downe to the ground, and ouergroweth the ſame in ſuch ſort, that it ſpoileth and killeth not only wheat, but all other graine whatſoeuer: the herbe is better known than deſired, therefore theſe few lines ſhall ſuffice for the deſcription. ‡ This groweth pretty long, with many ſlender weake branches: the leaues are much ſmaller than the former, and end in claſping tendrels: the floures are of a purple colour, and commonly grow but one at a ioint, and they are ſucceeded by flat ſharpe pointed cods which containe ſome nine or ten ſeeds apiece.

5 This alſo growes a good height, with ſlenderer ſtalks than the former, which is diuided into ſundry branches: the leaues grow foure or ſix vpon foot-ſtalkes, ending alſo in claſping tendrels: the floures grow vpon pretty long but very ſlender foot-ſtalkes, ſometimes two or three, otherwhiles more, very ſmall, and of a whitiſh colour inclining to blewneſſe: which are ſucceeded by little ſhort flat cods, containing commonly foure or fiue little ſeeds of a blackiſh colour: this is the *Arachus, ſiue Cracca minima* of *Lobel*; but I queſtion whether it be that which *Bauhine* in his *Pinax* hath made the ſame with it, calling it *Vicia ſegetum cum ſiliquis plurimis hirſutis*: for that which I haue deſcribed, and which exactly agrees with this figure of *Lobel* and that deſcription in the *Aduerſ.* hath cods very ſmooth without any hairineſſe at all. This floures moſt part of Sommer, and growes in moſt places both in corne fields and medowes. ‡

¶ *The Place.*

The Tare is ſowne in any ground or ſoile whatſoeuer.

¶ *The Time.*

It floureth in May, and perfecteth his ſeed toward September.

¶ *The Names.*

It is called in Latine *Vicia, à vinciendo*, of binding or wrapping, as *Varro* noteth, becauſe, ſaith he, it hath likewiſe claſping tendrels ſuch as the vine hath, by which it crawles vpward vpon the ſtalks of the weeds which are next vnto it: of ſome, *Cracca*, and *Arachus*, and alſo *Aphaca*: it is called in high-Dutch, **Wicken**: in low-Dutch, **Witſen**: in French, *Veſce*: in moſt ſhops it is falſely termed Ὄροβος, and *Eruum*; for *Eruum* doth much differ from *Vicia*: it is called in Engliſh, Vetch, or Fetch. The countrey men lay vp this Vetch with the ſeeds and whole plant, that it may be a fodder for their cattell.

¶ *The Temperature and Vertues.*

A Notwithſtanding I haue knowne, ſaith *Galen*, ſome, who in time of famin haue fed hereof, eſpecially in the ſpring, it being but greene; yet is it hard of digeſtion, and bindeth the belly.

Therefore

Therefore ſeeing it is of this kinde of nature, it is manifeſt that the nouriſhment which comes thereof hath in it no good iuyce at all, but ingendreth a thicke bloud, and apt to become melancholy.

† The figure of the common Fetch was formerly wanting, and in the ſtead thereof was put that of the other, deſcribed here in the ſecond place.

Chap. 516. *Of Chichlings, Peaſe, and Tare euerlaſting.*

¶ *The Deſcription.*

1 THere is a Pulſe growing in our high and thicke woods, hauing a very thicke tough and wooddy root; from which riſe vp diuers long weake and feeble branches, conſiſting of a tough middle rib, edged on both ſides with a thin skinny membrane, ſmooth, and of a graſſe greene colour; whereon do grow at certaine diſtances ſmall flat ſtems, vpon which ſtand two broad leaues ioyning together at the bottome: from betwixt thoſe leaues come forth tough claſping tendrels which take hold of ſuch things as grow next vnto them: from the boſome of the ſtem, whereon the leaues do grow, ſhooteth forth a naked ſmooth foot-ſtalke, on which doe grow moſt beautifull floures like thoſe of the Peaſe, the middle part whereof is of a light red, tending to a red Purple in graine; the outward leaues are ſomewhat lighter, inclining to a bluſh colour: which being paſt, there ſucceed long round cods, wherein is contained ſeed of the bigneſſe of a Tare, but rounder, blackiſh without, and yellowiſh within, and of a bitter taſte.

‡ 5 *Lathyrus maior latifolius.*
Peaſe euerlaſting.

‡ 2 *Lathyrus anguſtifolius flore albo.*
White floured Chichelings.

† 2 Of which kinde there is likewiſe another like vnto the precedent in each reſpect, ſauing that the leaues hereof are narrower and longer, and therefore called of moſt which ſet forth the deſcription, *Lathyrus anguſtifolia*: the floures of this are white, and ſuch alſo is the colour of the fruit: the root is ſmall, and not laſting like that of the former.

‡ 3 The ſtalks, leaues, and floures of this are like thoſe of the precedent, but the floures are of a reddiſh purple colour: the cods are leſſer than thoſe of the former, and in them are contained

leſſer, harder, and rounder ſeeds, of a darke or blackiſh colour. This growes not wilde with vs, but is ſometimes ſowne in gardens, where it floures in Iune and Iuly.

4 This Egyptian differs not in ſhape from the reſt of his kinde, but the floures are of an elegant blew on the inſide, but of an aſh colour inclining to purple on the outſide: the cods grow vpon long foot-ſtalkes, and are a little winged or welted, and containe but two or three little cornered ſeeds ſpotted with blacke ſpots. This floures in Iune and Iuly; and the ſeed thereof was ſent to *Cluſius* from Conſtantinople, hauing been brought thither out of Egypt.

‡ 3 *Lathyrus anguſtifol. flo. purp.*
Purple floured Chichelings.

‡ 4 *Lathyrus Ægyptiacus.*
Egyptian Chichelings.

5 The ſtalkes of this are ſome two or three foot long, winged, weake, and lying on the ground vnleſſe they haue ſomewhat to ſupport them Vpon theſe at certaine diſtances grow winged leaues with two little eares at their ſetting on to the ſtalke: theſe leaues conſiſt of ſix long and narrow greene leaues like thoſe of the other plants of this kinde; and theſe ſix leaues commonly ſtand vpright, by couples one againſt another; otherwhiles alternately: the footſtalke whereon theſe ſtand ends in claſping tendrels: the floures are in ſhape like the former, but the outer leafe is of a faire red or crimſon colour, and the inner leafe white: after the floures come the cods, containing ſome foure or fiue pretty large flat ſeeds, which ſwell out of the cods where they lie, which in the ſpaces betweene each ſeed are depreſt, like that of *Orobus*. This is only a garden plant with vs, and floures in Iune and Iuly, the ſeed is ripe in Auguſt. I haue for this giuen you *Lobels* figure of his *Lathyris anguſtiore gramineo folio*; which may ſerue, if you but make the leaues and cods to agree with this deſcription. ‡

6 The yellow wilde Tare or Fetch hath diuers very ſmall ramping ſtalkes, tough, and leaning this way and that way, not able to ſtand of it ſelfe without the helpe of props or things that ſtand by it: the leaues are very thin and ſharpe pointed: the floures grow alongſt the leaues in faſhion of the peaſe floures, of a bright yellow colour: the roots are very ſmall, long, tough, and in number infinite, inſomuch that it is impoſſible to root it forth, being once gotten into the ground, vnleſſe the earth be digged vp with the roots, and both caſt into the riuer, or burned. Doubtleſſe it is the moſt pernicious and hurtfull weed of all others, vnto all manner of greene wholſome herbes or any wood whatſoeuer.

¶ *The*

‡ 5 *Lathyrus annuus siliquis Orobi.*
Party coloured Cicheling.

‡ 6 *Lathyrus sylvestris flo. luteo.*
Tare euerlasting.

¶ *The Place.*

The first growes in shadowie woods, and among bushes: there groweth great store thereof in Swainscombe wood, a mile and a halfe from Greenhithe in Kent, as you go to a village thereby called Betsome, and in diuers other places.

The sixth groweth in most grassie pastures, borders of fields, and among graine almost euerie where.

¶ *The Time.*

The time answereth the other Pulses.

¶ *The Names.*

The first is called *Lathyrus*, to make a difference betweene it and *Lathyris*, or Spurge: of *Matthiolus*, *Clymenum*: of *Cordus*, *Eruum sativum*: of *Tragus*, *Pisum Græcorum*: in English, Pease euerlasting, great wilde Tare, and Cichling.

‡ The second is the *Evum album sativum* of *Fuchsius*: *Lathyrus* or *Cicercula* of *Dodonæus*: *Lathyrus angustiore gramineo folio* of *Lobel*.

The third is the *Aracus siue Cicera* of *Dodonæus*: the *Lathyrus flore purpureo* of *Camerarius*.

The fourth by *Clusius* is called *Cicercula Ægyptiaca*: by *Camerarius*, *Aracus Hispanicus, siue Lathyrus Ægyptiacus*.

The fifth is not mentioned by any (that I remember) but M^r. *Parkinson*, in his garden of floures, and that by the name I giue you it.

The sixth is the *Lathyrus sylvestris flo. luteis* of *Thalius*: *Legumen terræ glandibus simile* of *Dodonæus*: *Vicia* of *Tabernamontanus*: and it may be, the *Aracus flore luteo* of the *Aduers.* Howeuer, I haue put *Lobels* figure of *Aracus* for it, which well enough agrees with it. I vse for some resemblance it hath to *Aphaca* to call it *Aphacoides*. ‡

¶ *The Temperature and Vertues.*

The temperature and vertues are referred to the manured Tare or Vetch; notwithstanding they are not vsed for meate or medicine.

Chap. 517.
Of the oylie Pulſe called Seſamum.

Seſamum, ſiue Siſamum.
The Oylie Graine.

¶ *The Deſcription.*

† *Seſamum* hath a thicke and fat vpright ſtalke a cubit and a halfe high, garniſhed with leaues much like the Peach or Almond, but rougher, and cut in with ſomwhat deepe gaſhes on their ſides: amongſt theſe leaues come forth large white or elſe red floures, ſomewhat ſhaped like thoſe of Foxgloues, which turne into round long creſted cods, containing white flat oileous ſeed. *Theophraſtus* affirmeth that there is a kinde thereof which is white, bearing only one root. No kinde of beaſt will eate this plant while it is greene, becauſe of his bitterneſſe; but being withered and dried, the ſeed thereof becommeth ſweet, and the cattell will feed on the whole plant.

¶ *The Place.*

It groweth both in Egypt and in India: *Seſama*, ſaith *Pliny*, came from the Indies; they make an oile of it. It is a ſtranger in England.

¶ *The Time.*

It is one of the Sommer grains, and is ſowne before the riſing of the ſeuen ſtarres, as *Pliny* writeth; yet *Columella* ſaith, that *Seſamum* muſt be ſowne after the Autumne Æquinoctial, againſt the Ides of October: they require for the moſt part a rotten ſoile, which the husbandmen of Campania do call a blacke mold.

¶ *The Names.*

The Grecians cal this grain σήσαμον: the Latines alſo *Seſamum*, and *Siſamum*, and often in the fœminine gender *Seſama*: we are conſtrained for want of an Engliſh name to vſe the Latine: it is vnknowne to the Apothecaries, eſpecially the plant it ſelfe; but the ſeed and oyle thereof is to be found among them in other countries: we may call it Turky Millet.

¶ *The Temperature and Vertues.*

A According to ſome it is hot and dry in the firſt degree: the ſeed thereof, as *Galen* ſaith, is fat, and therefore being layd vp it commeth to be oylie very quickly; wherfore it ſpeedily filleth and ſtuffeth vp thoſe that feed thereof, and ouerthroweth the ſtomacke, and is ſlow of digeſtion, and yeeldeth to the body a fat nouriſhment: therefore it is manifeſt that it cannot ſtrengthen the ſtomack, or any part thereof, as alſo no other kind of fat thing: and the iuice that commeth thereof is thick, and therefore it cannot ſpeedily paſſe thorow the veines. Men do not greedily feed of it alone, but make cakes thereof with honey, which they call σησαμίδας: it is alſo mixed with bread, and is of an hot temperature, for which cauſe it procureth thirſt: and in his booke of the faculties of ſimple Medicines he ſaith, that *Seſamum* is not a little clammy and fat, and therefore it is an emplaſticke, and a ſoftner, and is moderately hot: the oile which commeth thereof is of like temperature, and ſo is the decoction of the herbe alſo.

B *Dioſcorides* writeth, That *Seſamum* is an enemie to the ſtomacke, it cauſeth a ſtinking breath, if it remaine ſticking betweene the teeth after it is chewed.

C It waſteth away groſſenes of the ſinewes; it is a remedie againſt bruiſes of the eares, inflammations, burnings and ſcaldings, pains of the ioynts, and biting of the poyſonſom horned ſerpent called *Ceraſtes*. Being mixed with oile of Roſes it takes away the head-ache which commeth of heate.

D Of the ſame force is the herbe boyled in wine, but it is eſpecially good for the heate and paine of the eyes.

E Of the herb is made an oile vſed of the Egyptians, which as *Pliny* ſaith is good for the eares.

F It is a remedie againſt the ſounding and ringing of the eares.

CHAP.

Chap. 518. *Of Hatchet Fetch.*

¶ *The Deſcription.*

1 THe firſt kinde of Hatchet Fetch hath many ſmall branches trailing here and there vpon the ground: vpon which grow ſmall leaues ſpred abroad like the leaues of the wilde Fetch; among which come forth cluſters of ſmall yellow floures, which fade away, and turne into little flat thin and browne cods, wherein is contained ſmall reddiſh ſeed of a bitter taſte.

2 The ſecond kinde of hatchet Fetch hath many round tough and flexible branches, trailing vpon the ground: whereupon do grow leaues like the former, but more like the leaues of Liquorice, and hauing the taſte of the Liquorice root; which hath giuen occaſion to ſome to deeme it a kinde of Liquorice: among theſe leaues come forth pale yellow floures, after which there ſucceed ſmall crooked cods, turning their points inwardly, one anſwering another like little hornes, containing ſmall flat ſeeds foure cornered, and faſhioned like a little wedge: the root is tough, of a wooddy ſubſtance, and doth continue fruitfull a very long time.

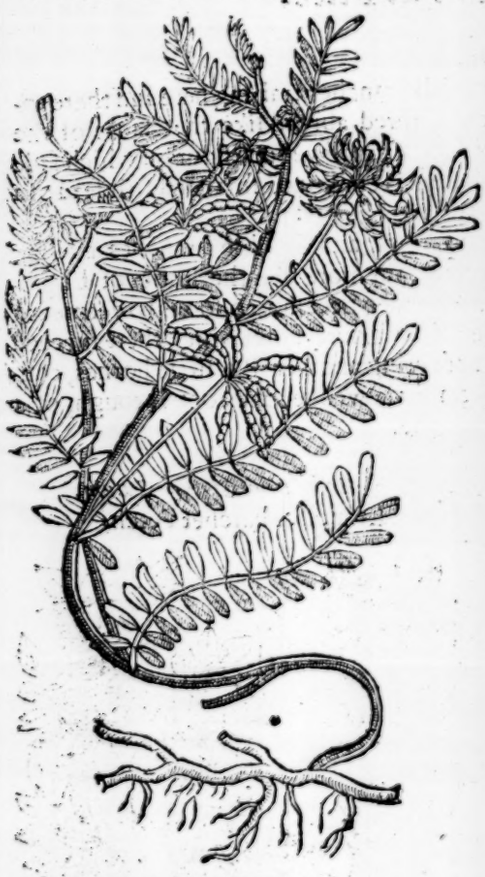
† 1 *Hedyſarum maius.*
Hatchet Fetch.

‡ 2 *Hedyſarum Glycyrhizatum.*
Liquorice hatchet Fetch.

3 There is another kind of *Securidaca* or hatchet Fetch, which hath branches, leaues, and roots like the laſt before remembred, and differeth in that, that the floures of this plant are mixed, and do vary into ſundry colours, being on the vpper part of a fleſh colour, and on the lower of a white or ſnowie colour, with a purple Storks bill in the middle: the leaues are in taſte bitter: the cods are ſmall like thoſe of Birds foot, and not much vnlike the cods of *Orobus*.

4 There is likewiſe another kinde of *Securidaca* or hatchet Fetch, which is dedicated vnto *Carolus Cluſius* by the aforenamed Dr. *Penny*, who found it in the North parts of England, hauing leaues, roots, and branches like vnto the former: but the floures of this are white, and mixed with ſome purple, and bitter alſo in taſte: the cods are like the claw of a crab, or (as *Cluſius* ſaith) like the knife which ſhoo-makers do vſe in Flanders; in which cods are contained ſmall reddiſh ſeed: this root alſo is of long continuance. ‡ *Cluſius* doth not ſay that Dr. *Penny* found this in the North of England, but in the territorie of Geneua not far from Pontetremile, amongſt the buſhes, and no where elſe. ‡

‡ 3 *Hedyſarum maius ſiliquis articulatis.*
Hatchet Fetch with ioynted cods.



‡ 4 *Securidaca minor pallide cærulea.*
Small blew floured hatchet Fetch.

‡ 5 *Securidaca minor lutea.*
Small yellow hatchet Fetch.

‡ 6 *Securidaca ſiliquis planis dentatis.*
Indented hatchet Fetch.

‡ 5 This in the ſtalks, leaues, colour, and ſhape of the floures is like, yet leſſe than the firſt deſcribed; the cods are alſo ſmaller, leſſer, and more crooked: and herein onely conſiſts the chiefe difference; it is an annuall plant, and grows onely in ſome gardens. *Matthiolus*, *Lobel*, *Dodonæus*, and other, make this their *Hedyſarum*, or *Securidaca minor*.

6 This hath many creſted branches, whereon great winged leaues, that is, ſome twentie or more faſtened to one rib: the floures are like thoſe of the other plants of this kinde; but the cods are of an inch long, flat, or indented or toothed on their ſides. But of what colour the floures and ſeeds are of it is not expreſt by *Cluſius*, who onely ſet this forth by a picture, and ſome pieces of a dried plant thereof, which he receiued from *Cortuſus*, by the name of *Scolopendria leguminoſa*, or *Hedyſarum peregrinum*: *Cortuſus* had it from *Honorius Bellus*, who obſerued it growing vpon the Rocks at Seberico, a citie of Illyria. ‡

7 There is alſo another ſort of Hatchet Fetch, which hath very long and tough branches traiſing vpon the ground, beſet with leaues like the former, but much greater: the floures do grow at the top of the branches, of a pale colour, and turne into rough round and flat cods, faſhioned like little bucklers: the root of this (as of the firſt) dieth at the firſt approch of winter, as ſoone as the ſeed is ripe: ‡ The ſtalks of this are ſtiffe and creſted, growing to the height of two cubits, with leaues as large as thoſe of Liquorice: the floures are of a faire bright red colour: the cods are made as it were of many rough buckler-like ſeeds, or rather ſeed veſſels wherin are contained ſmal brown ſeeds. ‡

‡ 7 *Hedyſarum Clypeatum.*
French Honyſuckle.

8 *Ferrum Equinum.*
Horſe-ſhoo.

8 Horſe-ſhoo hath many ſtalks ſlender and lying vpon the ground: the leaues be thinne, and leſſer than thoſe of Axſeed: the floures along the ſtalks are little: after which come vp long cods ſomething broad, and a little bowing; which haue vpon the one ſide deepe round and indented cuts, like after a ſort to an Horſe-ſhoo: the root is ſomewhat long.

¶ *The Place.*

Theſe plants do grow in my garden: the ſecond kinde I found growing in Suffolke, in the high-way on the right hand, as you goe from Sudbury to Corner Church, about an hundred paces from the end of the towne, as alſo in ſundry other places of the ſame countrey; and in Eſſex about Dun-

mow,

mow,and in the townes called Clare and Hennyngham. ‡ Alſo it growes by Purfleet, about the foot of the hill whereon the Wind-mill ſtands; and in diuers parts of Kent. ‡

Horſe-ſhooe commeth vp in certaine vntilled and ſunnie places of Italy and Languedocke: it groweth likewiſe in my garden.

¶ *The Time.*

Theſe plants do floure in Iune,and their ſeed is ripe in Auguſt.

¶ *The Names.*

The Grecians name this,whether it be a pulſe or an infirmitie among corne, Ἕρυμα: the Latines, of the forme of the ſeed, *Securidaca*, and *Hedyſarum*: in Engliſh, Axſeed, Axwoort, Ax-fitch, and Hatchet Fitch: it is vnknowne to the Apothecaries.

‡ The ſecond is the *Fænugræcum ſylueſtre* of *Tragus* and *Dodonæus*: the *Glycyrhiza ſylueſtris* of *Geſner*; and the *Glaux vulgaris* of *Lobel*. ‡

Horſe-ſhooe is commonly called in Italian *Sferro de cauallo*: you may name it in Latine *Ferrum equinum*: in Engliſh,Horſe-ſhooe.

¶ *The Temperature.*

The ſeeds of theſe plants are hot and drie of complexion.

¶ *The Vertues.*

A Being drunke it is acceptable to the ſtomacke,and remoueth ſtoppings out of the intrailes, and of like vertue be the new leaues and tender crops of the whole plant.

B *Dioſcorides* ſheweth that it is alſo good for the ſtomacke being taken in drink,and is mixed with counterpoiſons.

C And it is thought to hinder conception, if it be applied with honie before the act.

D The ſeed of Axwoort openeth the ſtoppings of the liuer,the obſtruction of the ſpleen,and of all the inward parts.

E Horſe-ſhooe is bitter and like in nature to Axſeed.

† The figure which formerly was in the firſt place,agreed with the third deſcription: that which was in the ſecond place was of the *Hedyſarum minus*, of *Tabermontanus*, beeing a kinde of *Ferrum equinum*, which carries the cods many together on the tops of the branches,and growes in Germanie: whence *Bauhine* calls it *Ferrum equinum Germanicum ſiliquis in ſummitate.*

Chap. 519. *Of Peaſe Earth-Nut.*

¶ *The Deſcription.*

1 THe Peaſe Earth nut commeth vp with ſlender and weake ſtalkes:the leaues be thin,and little,growing vpon ſlender ſtems,with claſping tendrels at the ends,with which it imbraceth and taketh hold of ſuch things as ſtand neere vnto it:the floures on the tops of the ſtalkes are like to thoſe of Peaſe, but leſſer,of a red purple colour, in ſmell not vnpleaſant: in their places come vp long cods,in which are three or foure round ſeeds:the roots be thicke,long,like after a ſort to acorns,but much greater,blacke without, gray within, in taſte like to the Cheſſe-nut: out of which beneath doth hang a long ſlender ſtring: there grow out of the ſame alſo other ſtrings, hard to the ſetting on of the ſtalk,vnto which creeping a ſlope do grow other kernelled roots whilſt the plant doth thus multiplie it ſelfe.

‡ 2 This with *Thalius* in his *Sylua Harcynia*, ſet forth by the name of *Aſtragalus ſyluaticus*, was by our Author taken for,and confounded with the *Terræ glandes*, and therefore I haue put it with it, that the difference might the better appeare,which is not a little to ſuch as heedfully obſerue it: But our Author in this is to be pardoned,ſeeing Dr. *Turner*,a man more exquiſite in the knowledge of plants,and who had ſeene the true *Terræ glandes* in Germany,miſtooke this for it, as may appeare by that little Tract of his of the names of plants in Latine and Engliſh,ſet forth *Anno*, 1548; for there he ſaith,[I haue ſeene this herbe of late in Come parke more aſtringent than it of Germany:] and indeed this growes there,and is much more aſtringent and wooddie than that of Germany,and no wiſe fit to be eaten. The root conſiſts of many blacke tuberous particles,here and there ſending forth fibers:from hence ariſe cornered ſtalks ſome foot high,ſmal below,& ſomwhat larger aboue: the leaues grow forth of the ſtalks,conſiſting ſometimes of two,& otherwhiles of 4. longiſh narrow leaues faſtned to one footſtalk, which at the ſetting on hath two little leaues or eares: forth of the boſomes of theſe leaues grow ſtalks ſome two inches long,each of which vſually carry a couple of Peaſe-faſhioned floures of a purple colour:which fading, vſually become blew: after theſe follow cods,ſtraight,roundand, blacke; and in each of them are commonly contained nine or ten white round

round seeds: it floures most part of Summer, and perfects the seed in Iuly and August. ‡

1 *Terræ glandes.*
Peaſe Earth-nut.

‡ 2 *Astragalus syluaticus.*
Wood Peaſe, or Heath Peaſe.

¶ *The Place.*

† 1 This groweth in corne fields, both with the corne it ſelfe, and alſo about the borders of fields among briers and brambles: it is found in diuers places of Germany, but not with vs that I can yet learne.

2 This is found in the woods and paſtures of England, eſpecially in Hampſtead wood neere London: it groweth in Richmond Heath, and in Come parke likewiſe.

¶ *The Time.*

It floureth in Iune and Iuly, the nuts after harueſt be digged vp and gathered.

¶ *The Names.*

It is called in high Dutch, **Erdnuſſen**: in low Dutch, **Eerdnoten, Eerdeeckelen**, and **Muyſen metſteerten**, that is to ſay, tailed Miſe, of the ſimilitude or likeneſſe of domeſticall miſe, which the blacke, round, and long nuts, with a piece of the ſlender ſtring hanging out behind, do repreſent: the later writers do call it in Latine *Terræ glandes* or *Terreſtres glandes:* and in Greeke, [illegible], *Chamæ balani:* in Engliſh, Peaſe Earth nut.

¶ *The Temperature and Vertues.*

The Nuts of this Peaſe being boiled and eaten, are hardlier digeſted than be either Turneps or Parſneps, yet do they nouriſh no leſſe than the Parſneps: they are not ſo windie as they, they doe more ſlowly paſſe through the belly, by reaſon of their binding qualitie, and being eaten raw they be yet harder of digeſtion, and do hardlier and ſlowlier deſcend. A

They be of temperature meanly hot, and ſomewhat drie, being withall not a little binding: wherupon alſo they do not onely ſtay the fluxes of the belly, but alſo all iſſues of bloud, eſpecially from the mother or bladder. B

The root of Peaſe Earth-nut ſtoppeth the belly, and the inordinate courſe of womens ſickneſſe. C

CHAP.

Chap. 520. *Of Milke Vetch.*

¶ *The Kindes.*

There be diuers ſorts of herbes contained vnder the title of *Aſtragalus*; whether I may, without breach of promiſe made in the beginning, inſert them among the *Legumina*, pulſes, or herbie plants, it is doubtfull: but ſeeing the matter is diſputable, I think it not amiſſe to ſuffer them thus to paſſe, vntill ſome other ſhall finde a place more conuenient and agreeing vnto them in neighbourhood.

¶ *The Deſcription.*

1 The firſt kinde of *Aſtragalus* hath reddiſh ſtalks, a cubit high, a finger thicke, ſomewhat creſted or furrowed, and couered ouer with an hairy moſſines; which diuide themſelues into ſundry ſmal branches, beſet with leaues conſiſting of ſundry little leaues ſet vpon a middle rib, like the wilde Vetch placed on the ſmall pliant branches like feathers, which are likewiſe couered ouer with a woollie hoarineſſe; in taſte aſtringent at the firſt, but afterwards burning hot: among theſe leaues come forth many ſmall white floures, in faſhion like the floures of Lupines, which before their opening ſeeme to be ſomewhat yellow: the root is maruellous great and large, conſidering the ſmalneſſe of the plant; for ſometimes it groweth to the bigneſſe of a mans arme, keeping the ſame bigneſſe for the ſpace of a ſpan in length, and after diuideth it ſelfe into two or more forks or branches, blacke without, and wrinckled; white within, hard and wooddie, and in taſte vnpleaſant, which being dried becommeth harder than an horne.

1 *Aſtragalus Luſitanicus Cluſij.*
Portingale milke Vetch.

2 *Aſtragalus Syriacus.*
Aſſyrian milke Vetch.

2 The ſecond kinde of *Aſtragalus* is a rare and gallant plant, and may well be termed *Planta Leguminoſa*, by reaſon that it is accounted for a kinde of *Aſtragalus*, reſembling the ſame in the ſimilitude of his ſtalkes and leaues, as alſo in the thickneſſe of his rootes, and the creeping and folding thereof

thereof; and is garniſhed with a moſt thicke and pleaſant comlineſſe of his delectable red floures, growing vp together in great tufts, which are very ſeemly to behold.

3 There hath been ſome controuerſie about this third kinde, which I am not willing to proſecute or enter into: it may very well be *Aſtragalus* of *Matthiolus* his deſcription, or elſe his *Polygala*, which doth exceeding well reſemble the true *Aſtragalus*: his ſmall ſtalkes grow a foot high, beſet with leaues like *Cicer* or *Galega*, but that they are ſomewhat leſſer: among which come forth ſmall Peaſe like floures, of an Orange colour, very pleaſant in ſight: the root is tough and flexible, of a finger thicke.

‡ 3 *Aſtragalus Matthioli.*
Matthiolus his milke Vetch.

‡ 4 *Aſtragaloides.*
Baſtard Milke Vetch.

4 The fourth is called of *Mutonus* and other learned Herbariſts, *Aſtragaloides*, for that it reſembleth the true *Aſtragalus*, which groweth a cubit high, and in ſhew reſembleth Liquorice: the floures grow at the tops of the ſtalks, in ſhape like the Peaſe bloome, of a faire purple colour, which turne into ſmall blacke cods when they be ripe: the root is tough and very long, creeping vpon the vpper part of the earth, and of a wooddy ſubſtance.

The Place.

They grow amongſt ſtones, in open places, or as *Oribaſius* writeth, in places ſubiect to winds, and couered with ſnow: *Dioſcorides* copies do adde, in ſhadowie places: it groweth plentifully in Phenea a citie in Arcadia, as *Galen* and *Pliny* report: in *Dioſcorides* his copies there is read, in Memphis a citie of Arcadia; but Memphis is a citie of Egypt, and in Arcadia there is none of that name: ſome of them grow in my garden, and in ſundrie other places in England wilde; they grow in the medowes neere Cambridge, where the ſchollers vſe to ſport themſelues: they grow alſo in ſundrie places of Eſſex, as about Dunmow and Clare, and many other places of that countrey.

‡ I ſhould be glad to know which or how many of theſe our Authour heere affirmes to grow wilde in England; for as yet I haue not heard of, nor ſeene any of them wilde, nor in gardens with vs, except the laſt deſcribed, which growes in ſome few gardens. ‡

¶ *The Time.*

They floure in Iune and Iuly, and their ſeed is ripe in September.

¶ *The*

¶ *The Names.*

Milke Vetch is called of *Matthiolus*, *Polygala*, but not properly: of moſt it is called *Aſtragalus*; in Spaniſh, *Garauancillos*: in the Portingales tongue, *Alphabeca*: in Dutch, **Cleyne Ciceren.**

A ¶ *The Temperature and Vertues.*

Aſtragalus, as *Galen* ſaith, hath aſtringent or binding roots, and therefore it is of the number of thoſe ſimples that are not a little drying; for it glueth and healeth vp old vlcers, and ſtaieth the flux of the belly, if they be boiled in wine and drunke: the ſame things alſo touching the vertues of *Aſtragalus Dioſcorides* hath mentioned: the root, ſaith he, being drunke in wine ſtaieth the laske, and prouoketh vrine, being dried and caſt vpon old vlcers it cureth them: it likewiſe procureth great
B ſtore of milke in cattell that do eat thereof, whence it tooke his name.

It ſtoppeth bleeding, but it is with much ado beaten, by reaſon of his hardneſſe.

Chap. 521. *Of Kidney Vetch.*

¶ *The Deſcription.*

1 Kidney Vetch hath a ſtalke of the height of a cubit, diuiding it ſelfe into other branches; whereon do grow long leaues, made of diuers leaues, like thoſe of the Lentill, couered as it were with a ſoft white downineſſe: the floures on the tops of the ſtalks of a yellow colour, verie many ioined together, as it were in a ſpokie rundle: after which grow vp little cods, in which is contained ſmall ſeed: the root is ſlender, and of a wooddie ſubſtance. ‡ This is ſometimes found with white floures: whereupon *Tabernamontanus* gaue two figures, calling the one *Lagopodium flore luteo*, and the other *Lagopodium flo. albo*. Our Author vnfitly gaue this later mentioned figure in the chapter of *Lagopus*, by the name of *Lagopum maximum*. ‡

1 *Anthyllis Leguminoſa.*
Kidney Vetch.

2 *Stella leguminoſa.*
Starry Kidney Vetch.

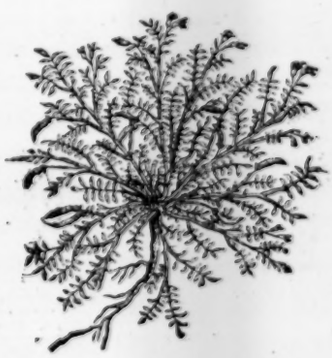
2 The Starry Kidney Vetch, called *Stella leguminoſa*, or according to *Cortuſus*, *Arcturo* hath many

many ſmall flexible tough branches, full of ſmall knots or knees, from each of which ſpringeth forth one long ſmall winged leafe, like birds foot, but bigger: from the boſome of thoſe leaues come forth little tender ſtems, on the ends whereof do grow ſmall whitiſh yellow floures, which are very ſlender, and ſoone vaded, like vnto them of Birds-foot: theſe floures turne into ſmall ſharpe pointed cods, ſtanding one diſtant from another, like the diuiſions of a ſtar, or as though it conſiſted of little hornes; wherein is contained ſmall yellowiſh ſeeds: the root is tough, and deeply growing in the ground.

3 There is another ſort of Kidney Vetch called Birds-foot, or *Ornithopodium*, which hath very many ſmall and tender branches, trailing here and there cloſe vpon the ground, ſet full of ſmall and ſoft leaues, of a whitiſh greene, in ſhape like the leaues of the wilde Vetch, but a great deale leſſer, and finer, almoſt like ſmall feathers: amongſt which the floures doe grow, that are very ſmall, yellowiſh, and ſometimes whitiſh; which being vaded there come in place thereof little crooked cods, fiue or ſix growing together, which in ſhew and ſhape are like vnto a ſmall birds foot, and each and euery cod reſembling a claw; in which are incloſed ſmall ſeed like that of Turneps.

‡ 3 *Ornithopodium maius.*
The great Birds-foot.

‡ 4 *Ornithopodium minus.*
Small Birds-foot.



‡ 5 *Scorpoides Leguminoſa.*
Small Horned pulſe.

4 There is alſo another kinde of *Ornithopodium*, or Birds-foot, called ſmall Birds-foot, which is very like vnto the firſt, but that it is much ſmaller: the branches or ſprigs grow not aboue a hand or halfe an hand in length, ſpreading themſelues vpon the ground with his ſmall leaues and branches, in maner of the leſſer *Arachus*: the floures are like vnto thoſe of the former, but very ſmall, and of a red colour.

‡ 5 This ſmall horned pulſe may fitly here take place: The root thereof conſiſts of many little fibres, from which ariſe two or three little ſlender ſtraight ſtalkes ſome handfull and halfe or foot high: at the tops of theſe grow little ſharpe pointed crooked hornes, rounder and ſlenderer than thoſe of Fenugreeke, turning their ends inwards like the tailes of Scorpions and ſo jointed; the floures are ſmall and yellow; the leaues little, and winged like thoſe of Birds-foot. *Pena* and *Lobel* found this amongſt the corne in the fields in Narbon in France, and they ſet it forth by the name as I haue here giuen you it. ‡

¶ *The Place.*

3. 4. Theſe plants I found growing vpon Hampſtead Heath neere London, right againſt

the Beacon, vpon the right hand as you go from London, neere vnto a grauell pit: they grow alſo vpon blacke Heath, in the high way leading from Greenwich to Charleton, within halfe a mile of the towne.

¶ *The Time.*

They floure from Iune to the middle of September.

¶ *The Names.*

‡ 1 This *Geſner* calls *Vulneraria ruſtica: Dodonæus*, *Lobel*, and *Cluſius*, call it *Anthyllis*, and *Anthyllus leguminoſa*. ‡

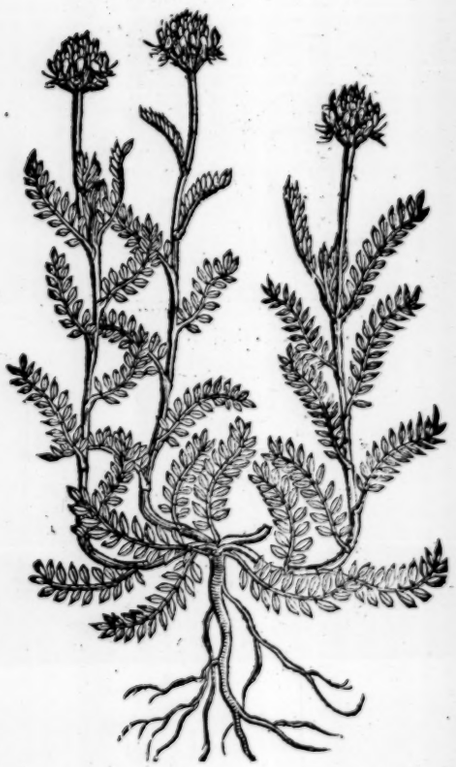
3. 4. I cannot finde any other name for theſe plants, but *Ornithopodium*: the firſt is called in Engliſh, great Birds-foot; the ſecond ſmall Birds-foot.

¶ *The Nature and Vertues.*

Theſe herbes are not vſed either in meate or medicine, that I know of as yet; but they are very good food for cattel, and procure good ſtore of milke, whereupon ſome haue taken them for kindes of *Polygala*.

Chap. 522. *Of Blacke milke Tare.*

Glaux Dioſcoridis.
Dioſcorides his milke Tare.



¶ *The Deſcription.*

THe true *Glaux* of *Dioſcorides* hath very many tough and wooddy branches trailing vpon the ground, ſet full of ſmall winged leaues, in ſhape like the common *Glaux*, but a great deale ſmaller, reſembling the leaues of Tares, but rather like Birds-foot, of a very gray colour: amongſt which come forth knobby and ſcaly, or chaffie heads, very like the Medow Trefoile, of a faire purple colour: the root is exceeding long and wooddy, which the figure doth not expreſſe and ſet forth.

¶ *The Place.*

The true *Glaux* groweth vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the declination of the hill.

¶ *The Time.*

Theſe plants do floure and flouriſh about Midſommer.

¶ *The Names.*

Theſe plants haue in times paſt been called *Glaux*, *i. folia habens glauca, ſiue pallentia*; that is, hauing skie coloured, or pale leaues. Sithens that in times paſt, ſome haue counted *Glaux* among the kindes of *Polygala*, or Milkewoorts, we may therefore call this kinde of *Glaux*, blacke Milke-woort.

¶ *The Nature.*

Theſe herbes are dry in the ſecond degree.

¶ *The Vertues.*

A The ſeeds of the common *Glaux* are in vertue like the Lentils, but not ſo much aſtringent: they ſtop the flux of the belly, dry vp the moiſture of the ſtomacke, and ingender ſtore of milke.

† Our Author either not knowing, or forgetting what he had done, againe in this chapter, deſcribed the *Glaux Vulgaris*, whoſe hiſtory he gaue vs but foure chapters before, by the name of *Hedyſarum glycyrhizatum*; wherefore I haue omitted it here as not neceſſary.

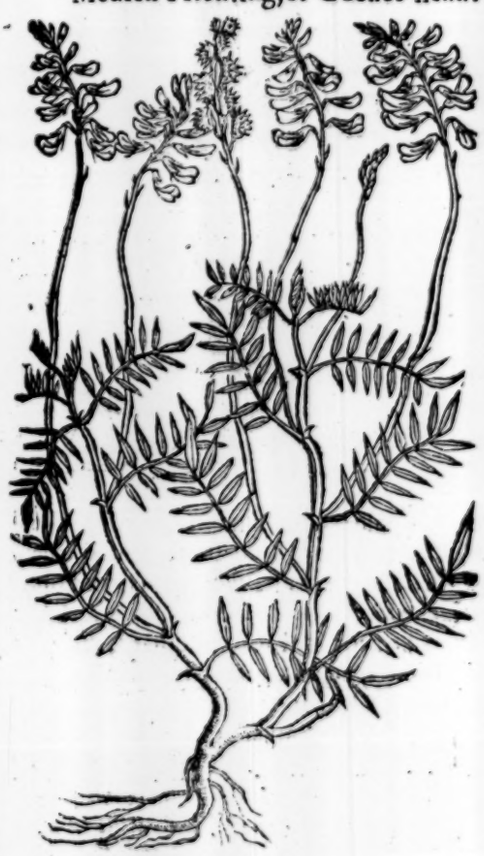
Chap.

Chap. 523. *Of red Fitchling, Medick Fitch, and Cockes-head.*

¶ *The Deſcription.*

1 THe firſt kinde of *Onobrychis* hath many ſmall and twiggie pliant branches, ramping and creeping through and about buſhes, or whatſoeuer it groweth neere vnto: the leaues and all the reſt of the pulſe or plant is very like to the wilde Vetch or Tare: the floures grow at the top of ſmall naked ſtalks, in ſhape like the peaſe bloome, but of a purple colour layed ouer with blew, which turne into ſmall round prickly husks, that are nothing elſe but the ſeed.

1 *Onobrychis, ſiue Caput Gallinaceum.*
Medick Fitchling, or Cockes-head.



2 *Onobrychis flore purpureo.*
Purple Cockes-head.

2 The ſecond kind of Fitchling or Cocks-head, of *Cluſius* his deſcription, hath very many ſtalks, eſpecially when it is growne to an old plant, round, hard, and leaning to the ground like the other pulſes; and leaues very like *Galega*, or the wilde Vetch, of a bitter taſte and lothſome ſauour: among which come forth ſmall round ſtems, at the ends whereof do grow floures ſpike faſhion, three inches long, in ſhape like thoſe of the great *Lazopus*, or medow Trefoile, but longer, of an excellent ſhining purple colour, but without ſmell: after which there follow ſmall coddes, containing little hard and blacke ſeed, in taſte like the Vetch. The root is great and long, hard, and of a wooddy ſubſtance, ſpreading it ſelfe far abroad, and growing very deep into the ground.

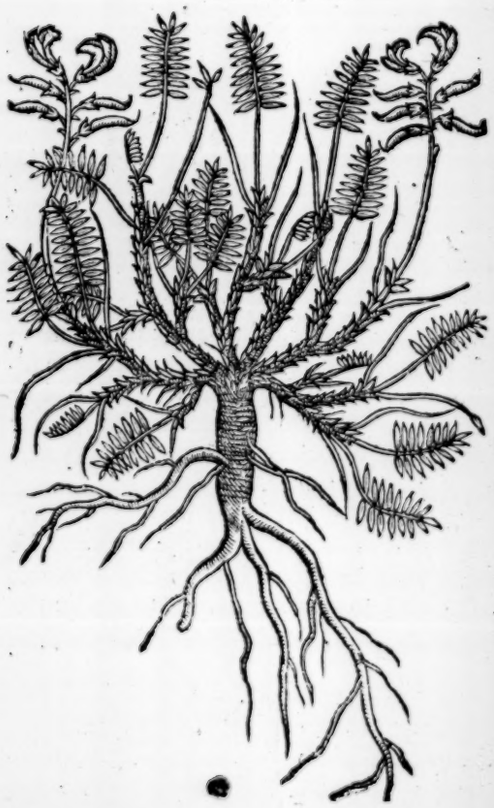
3 The third kinde of Fitchling or Cocks-head hath from a tough ſmal and wooddie root, many twiggie branches growing a cubit high, full of knots, ramping and creeping on the ground. The leaues are like the former, but ſmaller and ſhorter: among which come forth ſmal tender ſtemmes, whereupon do grow little floures like thoſe of the Tare, but of a blew colour tending to purple: the floures being vaded, there come the ſmall eods, which containe little blacke ſeed like a Kidney, of a blacke colour.

4 The fourth kinde of Fitchling hath firme green hard ſtalks a cubit and a halfe high, whereupon grow leaues like to the wilde Tare or *Galega*, but ſmaller and ſomewhat hairie, bitter and vnpleaſant in taſte, and in the end ſomewhat ſharpe. At the top of the ſtalks come forth long ſpiked

3 *Onobrychis 2. Cluſij.*
Blew Medicke Fitch.

4 *Onobrychis 3. Cluſij flore pallido.*
Pale coloured Medicke Fitch.

5 *Onobrychis montana 4. Cluſij.*
Mountaine Medick Fetch.



floures, of a pale colour, and in ſhape like thoſe of the ſecond kinde; which being vaded, there follow ſmall bottle cods, wherein is contained little blacke ſeed like the ſeed of Fenegreek, but ſmaller. The root is thicke and hard, and of a wooddie ſubſtance, and laſting very long.

5 The fifth kinde of *Onobrychis* hath many groſſe and wooddie ſtalks, proceeding immediatly from a thick, fat, and fleſhie tough root: the vpper part of which are ſmall, round, and pliant, garniſhed with little leaues like thoſe of Lentils, or rather *Tragacantha*, ſomewhat ſoft, and couered ouer with a woollie hairineſſe: amongſt which come forth little long and naked ſtems, eight or nine inches long, whereon do grow many ſmall floures of the faſhion of the Vetch or Lentill, but of a blew colour tending to purple, and after them come ſmal cods, wherein the ſeed is contained.

¶ *The Place.*

The firſt and ſecond grow vpon Barton hill, foure miles from Lewton in Bedfordſhire, vpon both the ſides of the hill: and likewiſe vpon the graſſie balks between the lands of corn two miles from Cambridge, neere to a water mill towards London; & diuers other places by the way from London to Cambridge: the reſt are ſtrangers in England.

¶ *The Time.*

Theſe plants do floure in Iuly, & their ſeed is ripe ſhortly after. ¶ *The*

¶ *The Names.*

It is ἀνώνυμος, or without a name among the later writers: the old and antient Physitions do call it ὀνοβρυχὶς: for all those things that are found written in *Dioscorides* or *Pliny* concerning *Onobrychis*, doe especially agree hereunto. *Dioscorides* writeth thus; *Onobrychis* hath leaues like a Lentill, but longer; a stalk a span high; a crimson floure; a little root: it groweth in moist and vntilled places: and *Pliny* in like manner; *Onobrychis* hath the leaues of a Lentill, somwhat longer, a red floure, a small and slender root: it groweth about springs or founta ines of water.

All which things and euery particular are in this ἀνώνυμος, or nameless herbe, as it is manifest: and therefore it is not to be doubted at all, but that the same is the *Onobrychis* of the old Writers: it may be called in English red Fetchling, or as some suppose Medick Fitch, or Cockes-head.

¶ *The Temperature.*

These herbs as *Galen* hath written in his books of the Faculties of simple Medicines, do rarifie or make thin and waste away.

¶ *The Vertues.*

Therefore the leaues thereof when it is greene, being but as yet layed vpon hard swellings, waxen kernals, in manner of a salue, do waste and consume them away, but beeing dried and drunke in wine they cure the strangurie; and laied on with oile it procureth sweat. A

Which things also concerning *Onobrychis*, *Dioscorides* hath in these words set downe: the herbe stamped and applied wasteth away hard swellings of the kernels; but beeing drunke with wine it helpeth the strangurie, and rubbed on with oile it causeth sweatings. B

CHAP. 524. *Of Bastard Dittanie.*

Fraxinella.
Bastard Dittanie.

¶ *The Description.*

BAstard Dittanie is a very rare and gallant plant, hauing many browne stalks, somwhat rough, diuided into sundry small branches, garnished with leaues like Liquorice, or rather like the leaues of the Ash tree, but blacker, thicker, and more ful of iuice, of an vnpleasant sauor: among which grow floures, consisting of fiue whitish leaues stripped with red, whereof one which groweth vndermost hangeth downe low; but the four which grow vppermost grow more stiffe and vpright: out of the midst of this floure commeth forth a tassell, which is like a beard, hanging also downwards, and somewhat turning vp at the lower end: which beeing vaded, there come in place foure huskes ioined together, much like the husks or coddes of Columbines, somewhat rough without, slimie to handle, and of a lothsome sauour, almost like the smell of a goat; whereupon some Herbarists haue called it *Tragium*: in the cods are contained small black shining seeds like Peonie seeds in colour: the roots are white, a finger thicke, one twisting or knotting within another, in tast somwhat bitter.

There is another kinde hereof growing in my garden, not very much differing: the leaues of the one are greater, greener, harder, and sharper pointed: of the other blacker, not so hard, nor so sharpe pointed: the floures also hereof be somthing more bright coloured, and of the other a little redder.

¶ *The Place.*

Bastard Dittany groweth wilde in the mountaines of Italy and Germanie, and I haue it growing in my garden.

¶ *The Time.*

It floureth in Iune and Iuly: the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The later Herbariſts name it *Fraxinella:* moſt, χαμαιμελιον, as though they ſhould ſay *Humilis Fraxinus* or a low Aſh: in Engliſh, baſtard, or falſe Dittanie: the ſhops call it *Dictamnum*, and *Diptamum*, but not truly, and vſe oftentimes the roots hereof in ſtead of the right Dittanie. That it is not the right Dittanie it is better knowne than needfull at all to be confuted; and it is as euident that the ſame is not *Dioſcorides* his *Pſeudodictamnum*, or baſtard Dittanie: but it is plaine to be a kinde of *Tragium* of the old Writers, wherewith it ſeemeth to agree in ſhew, but not in ſubſtance.

‡ The root of this is onely vſed in ſhops, and there knowne by the name of *Radix Diptamni*, or *Dictamni*. ‡

¶ *The Temperature.*

The root of baſtard Dittanie is hot and dry in the ſecond degree, it is of a waſting, attenuating, and opening facultie.

¶ *The Vertues.*

A It bringeth downe the menſes, it alſo bringeth away the birth and after birth; it helpeth cold diſeaſes of the matrix: and it is reported to be good for thoſe that haue ill ſtomackes and are ſhort winded.

B They alſo ſay, that it is profitable againſt the ſtingings and bitings of venomous ſerpents, againſt deadly poiſons, againſt contagious and peſtilent diſeaſes, and that it is with good ſucceſſe mixed with counterpoiſons.

C The ſeed of Baſtard Dittanie taken in the quantitie of a dram is good againſt the ſtrangury, prouoketh vrine, breaketh the ſtone in the bladder, and driueth it forth.

D The like vertue hath the leaues and iuice taken after the ſame ſort; and being applied outwardly, it draweth thornes and ſplinters out of the fleſh.

E The root taken with a little Rubarb killeth and driueth forth wormes.

F *Dioſcorides* reporteth, that the wilde Goats being ſtricken with darts or arrowes, will eat *Dictam*, and thereby cauſe them to fall out of their bodies; which is meant of the right *Dictam*, though *Dodonæus* reporteth that this plant will do the like (which I do not beleeue) ‡ nor *Dodonæus* affirme. ‡

Chap. 525. *Of Land Caltrops.*

Tribulus terreſtris.
Land Caltrops.

¶ *The Deſcription.*

Land Caltrops hath long branches full of ioints, ſpred abroad vpon the ground, garniſhed with many leaues ſet vpon a middle rib, after the manner of Fetches; amongſt which grow little yellow branches, conſiſting of fiue ſmal leaues, like vnto the floures of Tormentill: I neuer ſaw the plant beare yellow, but white floures, agreeing with the deſcription of *Dodonæus* in each reſpect, ſaue in the colour of the floures, which doe turne into ſmall ſquare fruit, rough, and full of prickles, wherein is a ſmall kernell or ſeed: the root is white, and full of ſtrings.

¶ *The Place.*

It groweth plentifully in Spain in the fields: it is hurtful to corne, but yet as *Pliny* ſaith, it is rather to be accounted among the diſeaſes of corne, than among the plagues of the earth: it is alſo found in moſt places of Italy & France; I found it growing in a moiſt medow adioyning to the wood or Park of Sir *Francis Carew*, neere Croidon, not far from London, and not elſewhere; from whence I brought plants for my garden.

¶ *The*

¶ *The Time.*

It floureth in Iune and Iuly: the fruit is ripe in Auguſt.

¶ *The Names.*

It is called in Greeke τριβολος, and in Latine *Tribulus*: and that it may differ from the other which groweth in the water, it is named τριβολος χερσαιος, or *Tribulus terreſtris*: it may be called in Engliſh, land Caltrops, of the likeneſſe which the fruit hath with Caltrops, that are inſtruments of Warre caſt in the way to annoy the feet of the Enemies horſes, as is before remembred in the Water Saligot.

¶ *The Temperature and Vertues.*

In this land Caltrop there is an earthy and cold qualitie abounding, which is alſo binding, as *Galen* ſaith. A

The fruit thereof being drunke waſteth away ſtones in the kidneyes, by reaſon that it is of thin parts. B

Land Caltrops, ſaith *Dioſcorides*, being drunke to the quantitie of a French crowne weight, and ſo applied, cureth the bitings of the Viper. C

And if it be drunke in wine it is a remedie againſt poyſons: the decoction thereof ſprinckled about killeth fleas. D

‡ Chap. 526. *Of Spring or mountaine Peaſe or Vetches.*

‡ 1 *Orobus Venetus.*
Venice Peaſe.

‡ 2 *Orobus ſyluaticus vernus.*
Spring Peaſe.

¶ *The Deſcription.*

‡ 1 THis, which *Cluſius* calls *Orobus Venetus*, hath many cornered ſtalkes ſome foot long; whereon grow winged leaues, foure or ſix faſtned to one rib, ſtanding by couples one againſt another, without any odde leafe at the end: theſe leaues are of an indifferent largeneſſe,

and

and of a light greene colour: the floures grow vpon long foot-ſtalks comming forth of the boſoms of the leaues, many together, hanging downe, ſmall, yet ſhaped like thoſe of other Pulſes, and of a purple colour: after theſe follow cods almoſt like thoſe of Fetches, but rounder, red when they be ripe, and containing in them a longiſh white ſeed: the root is hard and wooddy, running diuers wayes with many fibres, and liuing ſundry yeares: this varies ſomtimes with yellower green leaues and white floures. It floures in May, and growes onely in ſome few gardens with vs.

2 The ſtalkes of this alſo are a foot or more high, ſtiffe, cornered, and green; on theſe do grow winged leaues ſix or eight on a rib, after the manner of thoſe of the laſt deſcribed: each of theſe leaues hath three veines running alongſt it: the floures in ſhape and manner of growing are like thoſe of the former, but of a moſt elegant purple colour: which fading, they become blew. The floures are ſucceeded by ſuch cods as the former, wherein are contained longiſh ſmall variegated ſeed: which ripe, the cods fly open, and twine themſelues round, as in moſt plants of this kinde: the root is blacke, hard, tuberous and wooddy, ſending forth each yeare new ſhouts. This floures in April and May, and ripeneth the ſeed in Iune. This was found by *Cluſius* in diuers mountainous wooddie places of Hungarie: he calls it *Orobus Pannonicus* 1.

‡ 3 *Orobus montanus flo. albo.*
White mountaine Peaſe.

‡ 4 *Orobus montanus anguſtifolius.*
Narrow leafed mountaine Peaſe.

3 This hath ſtalkes ſome cubit high, ſtiffe, ſtraight, and creſted; whereon by turnes are faſtned winged leaues, conſiſting of foure ſufficiently large and ſharpe pointed leaues, whereto ſometimes at the very end growes a fifth: the veines in theſe run from the middle rib towards their edges: their taſte is firſt ſomewhat ſouriſh, afterwards bitteriſh. The floures grow vpon ſhort ſtalks comming forth of the boſomes of the leaues, fiue or ſix together, like thoſe of the Fetch, but of colour white, with ſome little yellowneſſe on the two little leaues that turne vpwards. The cods are like thoſe of the laſt deſcribed, and containe in them a browniſh ſeed, larger than in any of the other kindes. This is an annuall plant, and periſhes as ſoone as it hath perfected the ſeed. *Cluſius* giues vs this by the name of *Orobus Pannonicus* 4. *Dodonæus* giues the ſame figure for his *Arachus latifolius*: and *Bauhine* affirmes this to be the *Galega montana*, in the *Hiſt. Lugd. pag.* 1139. But theſe ſeeme to be of two ſeuerall plants; for *Dodonæus* affirmes his to haue a liuing root, and ſuch ſeemes alſo that in the *Hiſt. Lugd.* to be: yet *Cluſius* ſaith expreſſely that his is an annuall, and floureth in

Aprill

Aprill and May, and groweth in ſome wooddy mountainous places of the kingdom of Hungarie.

4 This fourth hath ſtraight firme cornered ſtalkes ſome foot or more high, whereupon grow leaues vſually foure on a foot-ſtalke, ſtanding two againſt two, vpright, being commonly almoſt three inches long, at firſt of a ſouriſh taſte, but afterwards bitter: it hath no clauicles, becauſe the ſtalkes need no ſupporters: the floures grow vpon long foot-ſtalkes, ſpike-faſhion like thoſe of Peaſe, but leſſe, and white of colour: after theſe follow long blackiſh cods, full of a blacke or elſe ſpotted ſeed: the roots are about the length of ones little finger, faſhioned like thoſe of the Aſphodill or leſſer female Peionie, but leſſer, blacke without, and white within. *Cluſius* found this on the mountainous places nigh the baths of Baden, and in the like places in Hungarie: he calls it *Orobus Pannonicus* 3.

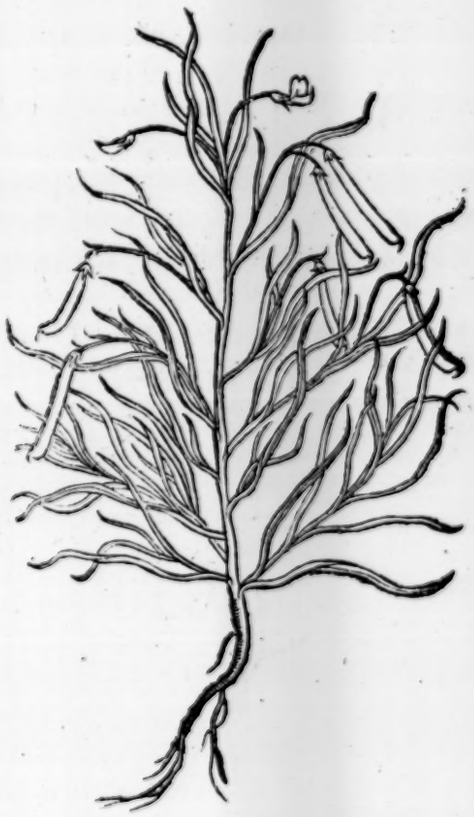
¶ *The Temperature and Vertues.*

Theſe are not knowne nor vſed in phyſicke; yet if the third be the *Galega montana* of the *Hiſtoria Lugd.* then it is there ſaid to be effectuall againſt poyſon, the wormes, the falling ſickneſſe, and the Plague. ‡

‡ CHAP. 527. *Of ſome other Pulſes.*

‡ 1 *Ochrus, ſiue Ervilia.*
Birds Peaſe.

‡ 2 *Ervum ſyluestre.*
Crimſon graſſe Fetch.



¶ *The Deſcription.*

‡ 1 THe firſt of theſe hath cornered broad ſtalks like thoſe of euerlaſting Peaſe, and they are weake, and commonly lie vpon the ground, vnleſſe they haue ſomething to ſupport them: the lower leaues are broad, and commonly welt the ſtalke at their ſetting on, and at the end of the firſt leafe do vſually grow out after an vnuſuall manner, two, three, or more other prety large leaues more long than broad, and the middle rib of the firſt leafe runnes out beyond the ſetting on of the higheſt of the out-growing leaues, and then it ends in two or three claſping tendrels. Thoſe leaues that grow the loweſt vpon the ſtalkes haue commonly the feweſt comming out of them;

them. The floures are like thoſe of other Pulſes, of colour white: the cods are ſome inch and halfe long, containing ſome halfe dozen darke yellow or blackiſh ſmall Peaſe: theſe cods grow one at a ioynt, on ſhort foot-ſtalkes comming forth of the boſomes of the leaues, and are welted on their broader ſide, which ſtands towards the maine ſtalke. This growes with vs only in gardens. *Dodonæus*, *Pena*, and *Lobel* call it *Ochrus ſylueſtris, ſiue Ervilia.*

2 The ſtalkes of this grow vp ſometimes a cubit high, being very ſlender, diuided into branches, and ſet vnorderly with many graſſe-like long narrow leaues: on the tops of the ſtalkes and branches, vpon pretty long foot-ſtalkes grow pretty peaſe-faſhioned floures of a faire and pleaſant crimſon colour: which fallen, there follow cods, long, ſmall, and round, wherein are nine, ten, or more round hard blacke ſhining graines: the root is ſmall, with diuers fibres, but whether it die when the ſeed is perfected, or no, as yet I haue not obſerued. This growes wilde in many places with vs, as in the paſture and medow grounds about Pancridge Church. *Lobel* and *Dodon.* call this *Ervum ſylueſtre*; and they both partly iudge it to be the firſt *Catanance* of *Dioſcorides*, and by that name it is vſually called. It floures in Iune and Iuly, and the ſeed is ripe in Auguſt.

3 This alſo, though it be not frequently found, is no ſtranger with vs; for I haue found it in the corne fields about Dartford in Kent and ſome other places. It hath long ſlender ioynted creeping ſtalkes, diuided into ſundry branches, whereon ſtand pretty greene three cornered leaues two at a ioynt, in ſhape and bigneſſe like thoſe of the leſſer Binde-weed. Out of the boſomes of theſe leaues at each ioynt comes a claſping tendrel, and commonly together with it a foot-ſtalke ſome inch or more long, bearing a pretty little peaſe-faſhioned yellow floure, which is ſucceeded by a ſhort flattiſh cod containing ſix or ſeuen little ſeeds. This floures in Iune, Iuly, and Auguſt, and ſo ripens the ſeed. It is by *Lobel* and others thought to be the *Aphace* of *Dioſcorides*, *Galen*, and *Pliny*: and the *Pitine* of *Theophraſtus*, by *Anguillara.*

‡ 3 *Aphaca.*
Small yellow Fetch.

I finde mention in *Stowes* Chronicle, in *Anno* 1555, of a certaine Pulſe or Peaſe, as they term it, wherewith the poore people at that time, there being a great dearth, were miraculouſly helped: he thus mentions it; In the moneth of Auguſt (ſaith he) in Suffolke, at a place by the ſea ſide all of hard ſtone and pibble, called in thoſe parts a ſhelfe, lying betweene the townes of Orford and Aldborough, where neither grew graſſe, nor any earth was euer ſeene; it chanced in this barren place ſuddenly to ſpring vp without any tillage or ſowing, great aboundance of Peaſon, whereof the poore gathered (as men iudged) aboue an hundred quarters, yet remained ſome ripe and ſome bloſſoming, as many as euer there were before: to the which place rode the Biſhop of Norwich and the Lord *Willoughby*, with others in great number, who found nothing but hard rockie ſtone the ſpace of three yards vnder the roots of theſe Peaſon: which roots were great and long, and very ſweet.

Geſner alſo, *de Aquatilibus*, *lib.* 4. *pag.* 256. making mention, out of Dr. *Cajus* his letters, of the ſpotted Engliſh Whale, taken about that time at Lin in Norfolke, alſo thus mentions thoſe peaſe: *Piſa* (ſaith he) *in littore noſtro Britannico quod Orientem ſpectat, certo quodam in loco Suffolciæ, inter Alburnum & Ortfordium oppida, ſaxis inſidentia (mirabile dictu) nulla terra circumfuſa, autumnali tempore Anno* 1555, *ſponte natu ſunt, adeo magna copia, vt ſufficerent vel millibus hominum.* Theſe Peaſe, which by their great encreaſe did ſuch good to the poore that yeare, without doubt grew there for many yeares before, but were not obſerued till [*Magiſter artis, ingenique largitor Venter*]—— hunger made them take notice of them, and quickned their inuention, which commonly in our people is very dull, eſpecially in finding out food of this nature.

My

My Worſhipfull friend Dr. *Argent* hath told me, that many yeares ago he was in this place, and cauſed his man to pull away the beach with his hands, and follow the roots ſo long, vntill hee got ſome equall in length vnto his height, yet could come to no ends of them: hee brought theſe vp with him to London, and gaue them to Dr. *Lobel*, who was then liuing; and he cauſed them to be drawne, purpoſing to ſet them forth in that Worke which he intended to haue publiſhed, if God had ſpared him longer life. Now whether theſe Peaſe be truly ſo called, and be the ſame with the *Piſum ſylueſtre Perenne*, or different; or whether they be rather of the ſtocke of the *Lathyrus maior*, or of ſome other Pulſe here formerly deſcribed, I can affirme nothing of certaintie, becauſe I haue ſeene no part of them, nor could gather by any that had, any certaintie of their ſhape or figure: yet would I not paſſe them ouer in ſilence, for that I hope this may come to be read by ſome who liue thereabout, that may by ſending me the things themſelues, giue me certaine knowledge of them; that ſo I may be made able, as I am alwaies willing, to impart it to others.

¶ *The Temperature and Vertues.*

I haue not haue not found any thing written of the facultie of the two firſt; but of *Aphace*, *Galen* A
ſaith it hath an aſtringent facultie like as the Lentill, and alſo is vſed to be eaten like as it, yet it is harder of concoction, but it dries more powerfully, and heates moderately. The ſeeds (ſaith hee) haue an aſtringent facultie; wherefore parched, broken, and boyled, they ſtay fluxes of the belly. We know (ſaith *Dodonæus*) by certaine experience, that the *Aphace* here deſcribed hath this aſtringent force and facultie. ‡

Chap. 528. *Of baſtard Rubarb.*

1 *Thalictrum, ſiue Thalictrum maius.*
Great baſtard Rubarb.

2 *Thalictrum minus.*
Small baſtard Rubarb.

¶ *The Deſcription.*

1 THe great *Thalictrum* or baſtard Rubarb hath large leaues parted or diuided into diuers other ſmall leaues, ſomewhat ſnipt about the edges, of a blacke or darke green colour: the

the ſtalkes are creſted or ſtreaked, of a purple colour, growing to the height of two cubits: at the top whereof grow many ſmall and hairy white floures, and after them come ſmall narrow huskes like little cods, foure or fiue growing together: the root is yellow, long, round, and knotty, diſperſing it ſelfe far abroad on the vpper cruſt of the earth.

2 The ſmall baſtard Rubarb is very like vnto the precedent, but that it is altogether leſſer: his ſtalkes are a ſpan or a foot long: his leaues be thin and tender; the root fine and ſlender: the little floures grow together in ſmall bundles or tufts, of a light yellow colour, almoſt white, and are of a grieuous ſauour.

‡ 3 There is kept in ſome gardens a plant of this kinde growing vp with large ſtalkes to the height of three cubits: the leaues are very like thoſe of Columbines: the floures are made of many white threds: it floures in Iune, and is called *Thalictrum maius Hiſpanicum*, Great Spaniſh Baſtard Rubarb. ‡

¶ *The Place.*

Theſe Plants doe grow alongſt the Ditch ſides leading from Kentiſh ſtreet vnto Saint Thomas a-Waterings (the place of Execution) on the right hand. They grow alſo vpon the bankes of the Thames, leading from Blacke-wall to Woolwich, neere London, and in ſundry other places alſo.

¶ *The Time.*

The floure for the moſt part in Iuly and Auguſt.

¶ *The Names.*

Diuers of the later Herbariſts do call it *Pigamum*, as though it were πήγανον, that is, Rue; whereupon moſt call it *Ruta paluſtris*, or Fen Rue: others, *Pſeudo-Rhabarbarum*, and *Rhabarbarum Monachorum*, by reaſon of the yellow colour of the root. But neither of their iudgements is greatly to be eſteemed of: they iudge better that would haue it to be *Thalietrum*, which *Dioſcorides* deſcribeth to haue leaues ſomething flatter than thoſe of Coriander; and the ſtalke like that of Rue, vpon which the leaues doe grow. *Pena* calleth it *Thalietrum*, *Thalictrum*, and *Ruta pratenſis*: in Engliſh, baſtard Rubarb, or Engliſh Rubarb: which names are taken of the colour, and taſte of the roots.

¶ *The Temperature.*

Theſe herbes are hot and dry of complexion.

¶ *The Vertues.*

A The leaues of baſtard Rubarb with other pot-herbes do ſomewhat moue the belly.
B The decoction of the root doth more effectually.
C *Dioſcorides* ſaith, that the leaues being ſtamped do perfectly cure old vlcers. *Galen* addeth, that they dry without biting.

Chap. 529. *Of Goats Rue.*

¶ *The Deſcription.*

Galega or Goats Rue hath round hard ſtalkes two cubits or more high, ſet full of leaues diſplayed or winged abroad; euerie leafe conſiſting of ſundrie ſmall leaues ſet vpon a ſlender rib, reſembling the leaues of the field Vetch or Tare, but greater and longer. The floures grow at the top of the ſtalke, cluſtering together after the manner of the wilde Vetch, of a light skie colour, which turne into long cods ſmall and round, wherein the ſeed is contained. The root is great, thicke, and of a white colour.

¶ *The Place.*

It groweth plentifully in Italy euery where in fat grounds and by riuers ſides: it groweth likewiſe in my garden.

¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

The Italians call it *Galega*, and *Ruta Capraria*: diuers name it corruptly *Gralega*: *Hieronymus Fracaſtorius*

Galega.
Goats Rue.

Fracaſtorius calleth it *Herba Gallecca*: the Hetruſcians, *Lauaneſe*; and it is alſo called by diuers other names in ſundry places of Italy, as *Geſner* ſaith, as are *Caſtracane*, *Lauanna*, *Thorina*, or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbaneſa*, *Fœnum græcum ſylueſtre*, and as *Braſſauolus* witneſſeth, *Giarga*. It is named in Engliſh, Italian Fitch, and Goats Rue.

Some iudge that the old Phyſitions were wont to call it *Onobrychis*: others, *Glauce*: diuers would haue it to be *Polemonium*, but not ſo much *Petr. And. Matthiolus* in his commentaries, as euery one of the deſcriptions mentioned by *Dioſcorides* do gainſay them; as alſo thoſe, who thinke that *Galega*, is *Polygalon*, & that the name of *Galega* came of *Polygalon*, the very deſcription alſo of *Polygalon* is againſt them: for *Galega* is higher and greater than that it may be called a little ſhrub onely of an hand bredth high.

¶ *The Temperature.*

This plant is ina meane temperature betweene hot and cold.

¶ *The Vertues.*

Goats Rue is a ſingular herbe againſt all venome and poiſon, and againſt wormes, to kill and driue them forth, if the juice be giuen to little children to drinke. A

It is of like vertue if it be fryed with Lineſeed oyle, and bound vpon the childes nauell. B

It is miniſtred vnto children which are poſſeſſed with the falling euill, a ſpoonefull euery morning in milke. C

Being boiled in vineger, and drunke with a little Treacle, it is very good againſt the infection of the plague, eſpecially if the medicine be taken within twelue houres. D

The herbe it ſelfe is eaten, being boiled with fleſh, as we vſe to eate Cabbage and other woorts, and likewiſe in ſallades, with oile, vineger and pepper, as we do eate boiled Spinage, and ſuch like; Which is moſt excellent being ſo eaten, againſt all poiſon and peſtilence, or any venomous infirmitie whatſoeuer, and procureth ſweat. E

It alſo helpeth the bitings and ſtingings of venomous beaſts, if either the juice or the herbe ſtamped be laid vpon the wound. F

Halfe an ounce of the juice inwardly taken is reported to helpe thoſe that are troubled with convulſions, crampes, and all other the diſeaſes aforeſaid. G

The ſeedes do feed pullen exceedingly, and cauſe them to yeeld greater ſtore of egs than ordinary. H

‡ The juice of the leaues, or the leaues themſelues bruiſed and applied to any part ſwollen by the ſting of a bee or waſpe, mitigate the paine, and are a preſent remedy, as M^r. *Cannon* a louer of Plants, and frind of mine, hath aſſured me he hath ſeen by frequent experience. ‡ I

Chap. 530. *Of* Pliny *his Leadwoot.*

¶ *The Deſcription.*

Dentaria or *Dentillaria* hath offended in the ſuperlatiue degree, in that he hath hid himſelfe like a runnagate ſouldier, when the aſſault ſhould haue been giuen to the plant *Lepidium*, whereof doubtleſſe it is a kinde. But if the fault be mine, as without queſtion it is, I craue pardon for the ouerſight, and do intreate thee gentle reader to cenſure me with fauour, whereby I may more boldly inſert it in this place, rather than to leaue it vntouched. The learned of Narbone (eſpecially *Rondeletius*) haue not without good cauſe accounted this goodly plant for a kinde

Plumbago Plinij.
Leadwoort.

thereof, becauſe the whole plant is of a biting taſte, and a burning faculty, and that in ſuch extremity, that it will raiſe bliſters vpon a mans hand: for which cauſe ſome of the learned ſort haue accounted it *Plinies Molybdæna*, or *Æginetæ* his *Lepidium*: but the new Herbariſts call it *Dentaria*, or *Dentillaria Rondeletij*, who made the like vſe hereof, as he did of *Pyrethrum*, & ſuch burning plants, to appeaſe the immoderate pain of the tooth-ache and ſuch like. This plant hath great thicke tough roots, of a wooddy ſubſtance, from whence ſpring vp long and tough ſtalkes two cubits high, confuſedly garniſhed and beſet with long leaues, in colour like Woad, of a ſharpe and biting taſte. The floures grow at the top of the ſtalkes of a purple colour; which being paſt, there ſucceed cloſe gliſtering and hairy huskes, wherein is contained ſmall blackiſh ſeed.

¶ *The Place.*

Pena reporteth that *Dentillaria* groweth about Rome, nigh the hedges and corne fields: it likewiſe groweth in my Garden in great plenty.

¶ *The Time.*

It floureth in Iuly and Auguſt.

¶ *The Names.*

Leadwoort is called *Molybdæna*, *Plumbago Plinij*, & *Dentillaria Rondeletij*: in Italian, *Crepanella*, the Romanes, *Herba S. Antonij*: in Illyria, *Cucurida*: in Engliſh, Leadwoort.

¶ *The Temperature.*

Dentillaria is of a cauſticke quality.

¶ *The Vertues.*

A It helpeth the tooth-ache, and that as ſome ſay if it be holden in the hand ſome ſmall while.

Chap. 531. *Of Rue, or herbe Grace.*

¶ *The Deſcription.*

1 Garden Rue or planted Rue, is a ſhrub full of branches, now and then a yard high, or higher: the ſtalkes whereof are couered with a whitiſh barke, the branches are more green: the leaues hereof conſiſt of diuers parts, and be diuided into wings, about which are certaine little ones, of an odde number, ſomething broad, more long than round, ſmooth and ſomewhat fat, of a gray colour, or greeniſh blew: the floures in the top of the branches are of a pale yellow, conſiſting of foure little leaues, ſomething hollow: in the middle of which ſtandeth vp a little head or button foure ſquare, ſeldome fiue ſquare, containing as many little coffers as it hath corners, being compaſſed about with diuers little yellow threds: out of which hang pretie fine tips of one colour; the ſeed groweth in the little coffers: the root is wooddy, and faſtned with many ſtrings: this Rue hath a very ſtrong and ranke ſmell, and a biting taſte.

2 The ſecond being the wilde or mountaine Rue, called *Ruta ſylueſtris*, is very like to garden Rue, in ſtalkes, leaues, floures, ſeed, colour, taſte, and ſauour, ſauing that euery little leafe hath ſmaller cuts, and is much narrower: the whole plant dieth at the approch of winter, being an annuall plant, and muſt either ſtand till it do ſow himſelfe, or elſe muſt be ſowne of others. ‡ This ſecond is a variety of the garden Rue differing from the former onely in ſmallneſſe. ‡

3 This plant is likewiſe a wilde kinde of Rue, and of all the reſt the ſmalleſt, and yet more virulent, biting, and ſtinking than any of the reſt: the whole plant is of a whitiſh pale greene, agreeing with the laſt before mentioned in each reſpect, ſaue in greatneſſe, and in that the venomous fumes or vapors that come from this ſmall wilde Rue are more noiſome and hurtfull than the former. ‡ The leaues lie ſpred vpon the ground, & are very finely cut and diuided: the whole plant is of ſuch

1 *Ruta hortenſis.*
Garden Rue.

3 *Ruta ſylueſtris minima.*
The ſmalleſt wilde Rue.

4 *Ruta montana.*
Mountaine Rue.

5 *Harmala.*
Wilde Rue with white floures.

‡ 6 *Ruta Canina.*
Dogs Rue.

such acrimonie, that *Clusius* saith he hath oftner than once obserued it to pierce through three paire of gloues to the hand of the gatherer; and if any one rub his face with his hand that hath newly gathered it, forthwith it will mightily inflame his face. He tells a history of a Dutch Student of Mompelier that went with him a simpling, who putting some of it betweene his hat and his head to keepe him the cooler, had by that meanes all his face presently inflamed and blistred whereſoeuer the sweat ran downe. ‡

4 There is another wilde Rue growing vpon the mountaines of Sauoy and other places adioyning, hauing a great thicke root, from which do arise great shoots or stalkes; whereon do grow leaues very thicke and fat, parted into diuers longish sections, otherwise resembling the leaues of the first described, of a strong and stinking smell: the floures grow on the tops of the stalkes, consisting of foure small yellow leaues: the seeds are like the other.

5 *Harmel* is one of the wilde Rues: it bringeth forth immediatly from the root diuers little stalks of a cubit high; whereupon do grow greene leaues diuersly cut into long pieces, longer and narrower than those of the wild strong smelling Rue: the floures be white, composed of fiue white leaues: the fruit is three square, bigger than that of the planted Rue, in which the seed lieth: the root is thick, long, and blackish: this Rue in hot countries hath a maruellous strong smell; in cold Countries not so.

‡ 6 This, which *Matthiolus* gaue for *Sideritis* 2. and *Lobel*, *Clusius*, and others for *Ruta canina*, hath many twiggy branches some cubit and halfe high; whereon grow leaues resembling those of the *Papauer Rhœas* or *Argemone*, lesser, thicker, and of a blackish greene: the floures are of a whitish purple colour, fashioned somewhat like those of *Antirrhinum*: the seed is small, and contained in such vessels as those of Rue, or rather those of *Blattaria*. The whole plant is of a strong and vngratefull smell: it growes in the hot and dry places about Narbon in France, Rauenna and Rome in Italy. ‡

¶ *The Place.*

Garden Rue ioyeth in sunny and open places: it prospereth in rough and brickie ground, and among ashes: it cannot in no wise away with dung.

The wilde are found on mountaines in hot countries, as in Cappadocia, Galatia, and in diuers prouinces of Italy and Spaine, and on the hills of Lancashire and Yorke.

Pliny saith that there is such friendship betweene it and the fig tree, that it prospers no where so well as vnder the fig tree. The best for physicks vse is that which groweth vnder the fig tree, as *Dioscorides* saith: the cause is alledged by *Plutarch* in the first booke of his *Sympoſiacks* or Feasts, for he saith it becommeth more sweet and milde in taste, by reason it taketh as it were some part of the sweetnes of the fig tree, whereby the ouer rancke quality of the Rue is allayd; vnlesse it be that the fig tree whilest it draweth nourishment vnto it selfe, it likewise draweth away the ranckneſſe of the Rue.

¶ *The Time.*

They floure in these cold countries in Iuly and August; in other countries sooner.

¶ *The Names.*

The first, which is *Hortensis Ruta*, garden Rue: in high-Dutch, **Rauten**: in low-Dutch, **Ruite**: the Italians and Apothecaries keepe the Latine name: in Spanish, *Aruda*: in French, *Rue de Iardin*: in English, Rue, and Herbe-Grace.

Wilde Rue is called in Greeke πήγανον, *Peganon*: in Latine, *Ruta syluestris*, or wilde Rue: in Galatia and Cappadocia, μόλυ: of diuers, *Harmala*: of the Arabians, *Harmel*: of the Syrians, *Besara*.

¶ *The Temperature.*

Rue is hot and dry in the later end of the third degree, and wild Rue in the fourth: it is of thin and

and ſubtill parts: it waſts and conſumes winde, it cutteth and digeſteth groſſe and tough humors.

¶ *The Vertues.*

Rue or Herbe-Grace prouokes vrine, brings downe the ſicknes, expels the dead child and after- A
birth, being inwardly taken, or the decoction drunke; and is good for the mother, if but ſmelled to.

Plin. lib. 20. ca. 13. ſaith it opens the matrix, and brings it into the right place, if the belly all ouer B
and the ſhare (the breſt ſay the old falſe copies) be anointed therewith: mixed with hony it is a remedie againſt the inflammation and ſwelling of the ſtones, proceeding of long abſtinence from venerie, called of our Engliſh Mountebanks the Colts euill, if it be boyled with Barrowes greaſe, Bay leaues, and the pouders of Fenugreeke and Linſeed be added thereto, and applied pultis wiſe.

It takes away crudity and rawneſſe of humors, and alſo windines and old paines of the ſtomack. C

Boiled with vineger it eaſeth paines, is good againſt the ſtitch of the ſide and cheſt, and ſhortnes D
of breath vpon a cold cauſe, and alſo againſt the paine in the ioynts and huckle bones.

The oile of it ſerues for the purpoſes laſt recited: it takes away the collicke and pangs in the E
guts, not only in a cliſter, but alſo anointed vpon the places affected. But if this oile be made of the oile preſſed out of Lineſeed it will be ſo much the better, and of ſingular force to take away hard ſwellings of the ſpleene or milt.

It is vſed with good ſucceſſe againſt the dropſie called in Greeke ὑδρωπικὸν, being applied to the F
belly in manner of a pultis.

The herb a little boiled or ſcalded, and kept in pickle as Sampier, and eaten, quickens the ſight. G

The ſame applied with honey and the iuyce of Fennell is a remedie againſt dim eyes. H

The iuyce of Rue made hot in the rinde of a pomegranat and dropped into the eares, takes away I
the paine thereof.

S. Anthonies fire is quenched therewith: it killeth the ſhingles, and running vlcers and ſores in K
the heads of yong children, if it be tempered with Ceruſe or white Lead, vineger, and oile of roſes, and made into the forme of *Nutritum* or *Triapharmacon*.

Dioſcorides ſaith, that Rue put vp in the noſthrils ſtayeth bleeding. L

Of whoſe opinion *Pliny* alſo is; when notwithſtanding it is of power rather to procure bleeding M
through the ſharpe and biting qualitie that it hath.

The leaues of Rue beaten and drunke with wine, are an antidote againſt poiſons, as *Pliny* ſaith. N

Dioſcorides writeth, that a twelue penny weight of the ſeed drunke in wine is a counterpoyſon a- O
gainſt deadly medicines or the poyſon of Wolfs-bane, *Ixia*, Muſhroms, or Tode-ſtooles, the biting of Serpents, ſtinging of Scorpions, ſpiders, bees, hornets, and waſps; and it is reported, that if a man be anointed with the iuyce of Rue theſe will not hurt him; and that the Serpent is driuen away at the ſmell thereof when it is burned, inſomuch that when the Weeſell is to fight with the Serpent, ſhe armeth her ſelfe by eating Rue againſt the might of the Serpent.

The leaues of Rue eaten with the kernels of wallnuts or figs ſtamped together and made into a P
maſſe or paſte, is good againſt all euill aires, the peſtilence or plague, reſiſts poyſon and all venom.

Rue boiled with Dil, Fennell ſeed, and ſome Sugar, in a ſufficient quantitie of wine, ſwageth the Q
torments and griping paines of the belly, the paines in the ſides and breaſt, the difficulty of breathing, the cough, and ſtopping of the lungs, and helpeth ſuch as are declining to a dropſie.

The iuyce taken with Dill, as aforeſaid, helpeth the cold fits of agues, and alters their courſe: it R
helpeth the inflammation of the fundament, and paines of the gut called *Rectum inteſtinum*.

The iuyce of Rue drunke with wine purgeth women after their deliuerance, driuing forth the S
ſecondine, the dead childe, and the vnnaturall birth.

Rue vſed very often either in meate or drinke, quencheth and drieth vp the naturall ſeed of ge- T
neration, and the milke of thoſe that giue ſucke.

The oile wherein Rue hath beene boyled, and infuſed many dayes together in the Sun warmeth V
and chafeth all cold members if they be anointed therewith: alſo it prouoketh vrine if the region of the bladder be anointed therewith.

If it be miniſtred in cliſters it expells windineſſe, and the torſion or gnawing paines of the guts. X

The leaues of garden Rue boiled in water and drunke, cauſeth one to make water, prouoketh the Y
termes, and ſtoppeth the laske.

Ruta ſyluestris or wilde Rue is much more vehement both in ſmell and operation, and therefore Z
the more virulent or pernitious; for ſomtimes it fumeth out a vapor or aire ſo hurtfull that it ſcorcheth the face of him that looketh vpon it, raiſing vp bliſters, wheales, and other accidents: it venometh their hands that touch it, and will infect the face alſo, if it be touched with them before they be cleane waſhed; wherefore it is not to be admitted vnto meate or medicine.

The end of the ſecond Booke.

THE THIRD BOOKE OF THE HISTORIE OF PLANTS.

Containing the Deſcription, Place, Time, Names, Nature, and Vertues, of Trees, Shrubs, Buſhes, Fruit-bearing Plants, Roſins, Gums, Roſes, Heath, Moſſes: ſome Indian Plants, and other rare Plants not remembred in the Proeme to the firſt Booke. Alſo Muſhroms, Corall, and their ſeuerall kindes, &c.

The Proeme.

HAuing finiſhed the Treatiſe of Herbes and Plants in generall, vſed for meat, medicine, or ſweet ſmelling vſe, onely ſome few omitted for want of perfect inſtruction, and alſo being hindered by the ſlackeneſſe of the Cutters or Grauers of the thoſe; which wants we intend to ſupplie in this third and laſt part. The Tables as well generall as particular ſhall be ſet forth in the end of this preſent Volume.

CHAP. I. *Of Roſes.*

¶ *The Kindes.*

THe Plant of Roſes, though it be a ſhrub full of prickles, yet it had been more fit and conuenient to haue placed it with the moſt glorious floures of the world, than to inſert the ſame here among baſe and thornie ſhrubs: for the Roſe doth deſerue the chiefeſt and moſt principall place among all floures whatſoeuer; beeing not onely eſteemed for his beautie, vertues, and his fragrant and odoriferous ſmell; but alſo becauſe it is the honour and ornament of our Engliſh Scepter, as by the coniunction appeareth in the vniting of thoſe two moſt royall houſes of Lancaſter and Yorke. Which pleaſant floures deſerue the chiefeſt place in Crownes and garlands, as *Anacreon Thius* a moſt antient Greeke Poet (whom *Henricus Stephanus* hath tranſlated in a gallant Latine verſe) affirmes in thoſe verſes of a Roſe, beginning thus

Τὸν ἄνθεα βασιλῆα, &c.

Roſa honos, decuſq; florum,
Roſa, cura, amorq; Veris.
Roſa, cælitum voluptas,
Roſeis puer Cytheres.
Caput implicat Corollis,
Charitum Choros frequentans.

The

The Roſe is the honour and beautie of floures,
The Roſe is the care and loue of the Spring,
The Roſe is the pleaſure of th'heauenly powres:
The Boy of faire *Venus*, *Cytheras* darling,
Doth wrap in his head round with garlands of Roſe,
When to the dances of the Graces he goes.

Augerius Busbeckius ſpeaking of the eſtimation and honor of the Roſe, reporteth that the Turks can by no meanes indure to ſee the leaues of Roſes fall to the ground, becauſe that ſome of them haue dreamed, that the firſt or moſt antient Roſe did ſpring of the bloud of *Venus*; and others of the Mahumetans ſay, that it ſprang of the ſweat of *Mahumet*.

But there are many kindes of Roſes differing either in the bigneſſe of the floures, or the plant it ſelfe, roughneſſe or ſmoothneſſe, or in the multitude of the floures, or in the fewneſſe, or elſe in colour and ſmell: for diuers of them are high and tall, others ſhort and low; ſome haue fiue leaues, others very many. *Theophraſtus* telleth of a certaine Roſe growing about Philippi, with an hundred leaues, which the inhabitants brought forth of Pangæum, and planted it in Campania, as *Pliny* ſaith; which wee hold to be the Holland Roſe, that diuers call the Prouince Roſe, but not properly.

Moreouer, ſome be red, others white, and moſt of them or all, ſweetly ſmelling, eſpecially thoſe of the garden.

1 *Roſa alba.*
The White Roſe.

¶ *The Deſcription.*

1 IF the curious could ſo be content, one generall deſcription might ſerue to diſtinguiſh the whole ſtocke or kindred of the Roſes, beeing things ſo well knowne: notwithſtanding I thinke it not amiſſe to ſay ſomething of them ſeuerally, in hope to ſatisfie all. The white Roſe hath very long ſtalkes of a wooddie ſubſtance, ſet or armed with diuers ſharpe prickles: the branches whereof are likewiſe full of prickles, whereon doe grow leaues conſiſting of fiue leaues for the moſt part, ſet vpon a middle rib by couples; the old leafe ſtanding at the point of the ſame, and euery one of thoſe ſmall leaues ſomewhat ſnipt about the edges, ſomewhat rough, and of an ouerworne green colour: from the boſom wherof ſhoot forth long foot-ſtalks, whereon do grow very faire double floures, of a white colour, and very ſweet ſmell, hauing in the middle a few yellow threds or chiues; which being paſt there ſucceedeth a long fruit, greene at the firſt, but red when it is ripe, and ſtuffed with a downie choaking matter, wherein is contained ſeed as hard as ſtones. The root is long, tough, and of a wooddie ſubſtance.

2 The Red Roſe groweth very low in reſpect of the former: the ſtalkes are ſhorter, ſmoother, and browner of colour: the leaues are like, yet of a worſe duſtie colour: the floures grow on the tops of the branches, conſiſting of many leaues, of a perfect red colour: the fruit is likewiſe red when it is ripe: the root alſo wooddie.

3 The common Damaske Roſe in ſtature, prickley branches, and in other reſpects is like the white

2 *Roſa rubra.*
The red Roſe.

3 *Roſa Prouincialis, ſive Damaſcena.*
The Prouince, or Damaske Roſe.

5 *Roſa ſine ſpinis.*
The Roſe without prickles.

white Roſe; the eſpeciall difference conſiſteth in the colour and ſmell of the floures; for theſe are of a pale red colour, and of a more pleaſant ſmell, and fitter for meate or medicine:

4 The *Roſa Provincialis minor*, or leſſer Prouince Roſe differeth not from the former, but is altogether leſſer: the floures and fruit are like: the vſe in phyſick alſo agreeth with the precedent.

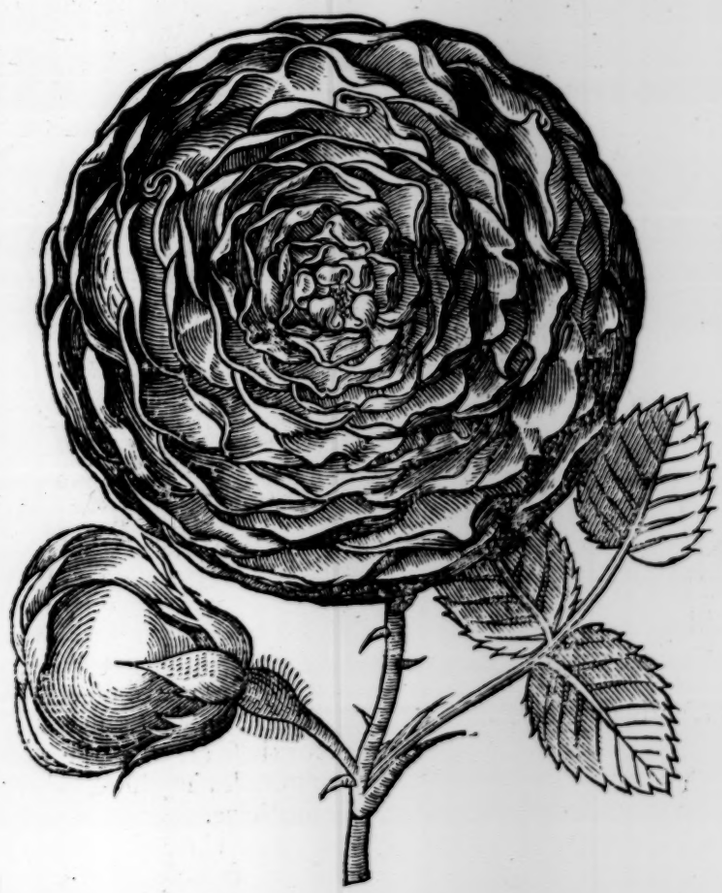
5 The Roſe without prickles hath many young ſhootes comming from the root, diuiding themſelues into diuers branches, tough, and of a woody ſubſtance as are all the reſt of the Roſes, of the hight of two or three cubites, ſmooth and plaine without any roughneſſe or prickles at all; whereon do grow leaues like thoſe of the Holland Roſe; of a ſhining deepe greene colour on the vpper ſide, vnderneath ſomewhat hoarie and hairy. The floures grow at the toppes of the branches, conſiſting of an infinite number of leaues, greater than thoſe of the Damaske Roſe, more double, and of a colour betweene the Red and Damaske Roſes, of a moſt ſweet ſmell. The fruit is round, red when it is ripe, and ſtuffed with the like flockes and ſeeds of thoſe of the Damask Roſe. The root is great, wooddie, and far ſpreading.

6 The

6 The Holland or Prouince Roſe hath diuers ſhoots proceeding from a wooddie root, full of ſharpe prickles, diuiding it ſelfe into diuers branches, whereon do grow leaues conſiſting of fiue leaues ſet vpon a rough middle rib, and thoſe ſnipt about the edges: the floures grow on the tops of the branches, in ſhape and colour like the Damaske Roſe, but greater and more double, inſomuch that the yellow chiues in the middle are hard to be ſeene; of a reaſonable good ſmell, but not ful ſo ſweet as the common Damaske Roſe: the fruit is like the other of his kinde.

6 Roſa Hollandica, ſiue Batana.

The great Holland Roſe, commonly called the great Prouince Roſe.



We haue in our London gardens one of the red Roſes, whoſe floures are in quantitie and beauty equal with the former, but of greater eſtimation, of a perfect red colour, wherein eſpecially it differeth from the Prouince Roſe; in ſtalks, ſtature, and manner of growing it agreeth with our common red Roſe.

¶ *The Place.*

All theſe ſorts of Roſes we haue in our London gardens, except that Roſe without prikles, which as yet is a ſtranger in England. The double white Roſe doth grow wilde in many hedges of Lancaſhire in great abundance, euen as Briers do with vs in theſe Southerly parts, eſpecially in a place of the countrey called Leyland, and in a place called Roughford, not far from Latham. Moreouer, in the ſaid Leyland fields doth grow our garden Roſe wilde, in the plowed fields among the corne in ſuch abundance, that there may be gathered daily, during the time, many buſhels of Roſes, equall with the beſt garden Roſe in each reſpect: the thing that giueth great cauſe of wonder is, that in a field in the place aforeſaid, called Glouers field, euery yeare that the field is plowed for corne, that yeare the field will be ſpred ouer with Roſes; and when it lyeth as they call it ley, and not plowed, then ſhall there be but few Roſes to be gathered, by the relation of a curious Gentleman there dwelling, ſo often remembred in our Hiſtorie.

‡ I haue heard that the Roſes which grow in ſuch plenty in Glouers field euery yeare the field is plowed, are no other than corne Roſe, that is, red Poppies, howeuer our Author was informed. ‡

¶ *The Time.*

Theſe floure from the end of May to the end of Auguſt, and diuers times after, by reaſon the tops and ſuperfluous branches are cut away in the end of their flouring: & then do they ſometimes flou re euen vntill October, and after.

¶ *The*

¶ *The Names.*

The Roſe is called in Latine *Roſa*: in Greeke ῥόδον: and the plant it ſelfe ῥόδος: (which in Latine keepeth the ſame name that the floure hath) and it is called *Rodon* (as *Plutarch* ſaith) becauſe it ſendeth forth plenty of ſmell.

The middle part of the Roſes, that is, the yellow chiues, or ſeeds and typs, is called *Anthos*, and *Flos Roſæ*, the floure of the Roſe: in ſhops, *Anthera*, or the blowing of the roſe.

The white parts of the leaues of the floure it ſelfe, by which they are faſtened to the cups, be named *Vngues* or nailes. That is called *Calix*, or the cup, which containeth and holdeth in together the yellow part and leaues of the floure.

Alabaſtri, are thoſe parts of the cup which are deeply cut, & that compaſſe the floure cloſe about before it be opened, which be in number fiue, two haue beards and two haue none, and the fift hath but halfe one: moſt do call them *Cortices Roſarum*, or the husks of the roſes: the ſhoots of the plant of roſes, *Strabo Gallus* in his little garden doth call *Viburna*.

The white Roſe is called *Roſa alba*: in Engliſh, the white Roſe: in high Dutch, **Weiſz Rooſen**: in low Dutch, **Witte Rooſen**: in French, *Roſe Blanche*: of *Plinie*, *Spineola Roſa*, or *Roſa Campana*.

The red Roſe is called in Latine, *Roſa rubra*: the Frenchmen, *Roſe Franche*, *Roſe de Prouins*, a towne in Campaigne: of *Plinie*, *Trachinia*, or *Præneſtina*.

The Damaske Roſe is called of the Italians *Roſa incarnata*: in high Dutch, **Leibfarbige Rooſen**: in low Dutch, **Prouencie Rooſe**: of ſome, *Roſa Provincialis*, or Roſe of Prouence: in French of ſome, *Meleſia*: the Roſe of Melaxo, a citie in Aſia, from whence ſome haue thought it was firſt brought into thoſe parts of Europe.

The great Roſe, which is generally called the great Prouence roſe, which the Dutch men cannot endure; for ſay they, it came firſt out of Holland, and therefore to be called the Holland Roſe: but by all likelihood it came from the Damaske roſe, as a kinde thereof, made better and fairer by art, which ſeemeth to agree with truth.

The roſe without prickles is called in Latine, *Roſa ſine ſpinis*, and may be called in Engliſh, the roſe without thornes, or the roſe of Auſtrich, becauſe it was firſt brought from Vienna, the Metropolitan citie of Auſtrich, and giue nto that famous Herbariſt *Carolus Cluſius*.

¶ *The Temperature.*

The leaues of the floures of roſes, becauſe they doe conſiſt of diuers parts, haue alſo diuers and ſundry faculties: for there be in them certain that are earthy and binding, others moiſt and watery, and ſundrie that are ſpirituall and airie parts, which notwithſtanding are not all after one ſort, for in one kinde theſe excell, in another thoſe, all of them haue a predominant or ouerruling cold temperature, which is neereſt to a meane, that is to ſay, of ſuch as are cold in the firſt degree, moiſt, airie, and ſpirituall parts are predominant in the White roſes, Damaske and Muske.

¶ *The Vertues.*

The diſtilled water of roſes is good for the ſtrengthning of the heart, & refreſhing of the ſpirits, A
and likewiſe for all things that require a gentle cooling.

The ſame being put into iunketting diſhes, cakes, ſauces, and many other pleaſant things, giueth B
a fine and delectable taſte.

It mitigateth the paine of the eies proceeding of a hot cauſe, bringeth ſleep, which alſo the freſh C
roſes themſelues prouoke through their ſweet and pleaſant ſmell.

The iuice of theſe roſes, eſpecially of Damask, doth moue to the ſtoole, and maketh the belly ſo- D
luble: but moſt effectually that of the Muſk roſes: next to them is the iuice of the Damask, which is more commonly vſed.

The infuſion of them doth the ſame, and alſo the ſyrrup made thereof, called in Latine *Droſatum*, E
or *Serapium*: the Apothecaries call it Syrrup of roſes ſolutiue, which muſt be made of the infuſion in which a great number of the leaues of theſe freſh roſes are diuers and ſundry times ſteeped.

It is profitable to make the belly looſe & ſoluble, when as either there is no need of other ſtron- F
ger purgation, or that it is not fit and expedient to vſe it: for beſides thoſe excrements which ſtick to the bowels, or that in the firſt and neereſt veines remaine raw, flegmaticke, and now and then cholericke, it purgeth no other excrements, vnleſſe it be mixed with certaine other ſtronger medicines.

This ſyrrup doth moiſten and coole, and therefore it alayeth the extremitie of heat in hot bur- G
ning feuers, mitigateth the inflammations of the intrails, and quencheth thirſt: it is ſcarce good for a weake and moiſt ſtomacke, for it leaueth it more ſlacke and weake.

Of like vertue alſo are the leaues of theſe preſerued in Sugar, eſpecially if they be onely bruiſed H
with the hands, and diligently tempered with Sugar, and ſo heat at the fire rather than boiled.

¶ *The Temperature of Red Roſes.*

There is in the red Roſes, which are common euery where, and in the other that be of a deep pur- I
ple, called Prouence roſes, a more earthie ſubſtance, alſo a drying and binding qualitie, yet not

without

without certaine moiſture ioined, being in them when they are as yet freſh, which they loſe when they be dried: for this cauſe their iuice and infuſion doth alſo make the bodie ſoluble, yet not ſo much as of the others aforeſaid. Theſe roſes being dried and their moiſture gone, do bind and dry; and likewiſe coole, but leſſer than when they are freſh.

¶ *The Vertues.*

I They ſtrengthen the heart, and helpe the trembling and beating thereof.

K They giue ſtrength to the liuer, kidneies, and other weake intrails; they dry and comfort a weak ſtomacke that is flaſhie and moiſt; ſtay the whites and reds, ſtanch bleedings in any part of the bodie, ſtay ſweatings, binde and looſe, and moiſten the body.

L And they are put into all manner of counterpoiſons and other like medicines, whether they be to be outwardly applied or to be inwardly taken, to which they giue an effectuall binding, and certaine ſtrengthning qualitie.

M Honie of Roſes, or *Mel Roſarum*, called in Greeke ῥοδόμελι, which is made of them, is moſt excellent good for wounds, vlcers, iſſues, and generally for ſuch things as haue need to be cleanſed and dried.

N The oile doth mitigate all kindes of heat, and will not ſuffer inflammations or hot ſwellings to riſe, and being riſen it doth at the firſt aſſwage them.

¶ *The Temperature and Vertues of the parts.*

O The floures or bloomings of Roſes, that is to ſay, the yellow haires and tips, do in like maner dry and binde, and that more effectually than of the leaues of the roſes themſelues: the ſame temperature the cups and beards be of; but ſeeing none of theſe haue any ſweet ſmell, they are not ſo profitable, nor ſo familiar or beneficiall to mans nature: notwithſtanding in fluxes at the ſea, it ſhall auaile the Chirurgion greatly, to carry ſtore thereof with him, which doth there preuaile much more than at the land.

P The ſame yellow called *Anthera*, ſtaieth not onely thoſe lasks and bloudy fluxes which do happen at the ſea, but thoſe at the land alſo, and likewiſe the white flux and red in women, if they bee dried, beaten to pouder, and two ſcruples thereof giuen in red wine, with a little powder of Ginger added thereto: and being at the ſea, for want of red wine you may vſe ſuch liquour as you can get in ſuch extremitie.

Q The little heads or buttons of the Roſes, as *Pliny* writeth, do alſo ſtanch bleeding, and ſtoppe the laske.

R The nailes or white ends of the leaues of the floures are good for watering eies.

S The iuice, infuſion, or decoction of Roſes, are to be reckoned among thoſe medicines which are ſoft, gentle looſing, opening and purging gently the belly, which may be taken at all times and in all places, of euery kinde or ſex of people, both old and yong, without danger or perill.

T The ſyrrup made of the infuſion of Roſes, is a moſt ſingular & gentle looſing medicine, carrying downwards cholericke humors, opening the ſtoppings of the liuer, helping greatly the yellow iaundies, the trembling of the heart, & taking away the extreme heat in agues and burning feuers which is thus made:

V Take two pound of Roſes, the white ends cut away, put them to ſteepe or infuſe in ſix pintes of warme water in an open veſſell for the ſpace of twelue houres: then ſtraine them out, and put thereto the like quantitie of Roſes, and warme the water again, ſo let it ſtand the like time: do thus foure or fiue times; in the end adde vnto that liquor or infuſion, foure pound of fine ſugar in powder; then boyle it vnto the forme of a ſyrrup, vpon a gentle fire, continually ſtirring it vntill it be cold; then ſtraine it, and keepe it for your vſe, whereof may be taken in white wine, or other liquour, from one ounce vnto two.

X Syrrup of the iuice of Roſes is very profitable for the grieſes aforeſaid, made in this manner:

Y Take Roſes, the white nailes cut away, what quantitie you pleaſe, ſtampe them, and ſtraine out the iuice, the which you ſhall put to the fire, adding thereto ſugar, according to the quantity of the iuice: boiling them on a gentle fire vnto a good conſiſtence.

Z Vnto theſe ſyrrups you may adde a few drops of oyle of Vitriol, which giueth it a moſt beautifull colour, and alſo helpeth the force in cooling hot and burning feuers and agues: you likewiſe may adde thereto a ſmall quantitie of the iuice of Limons, which doth the like.

A The conſerue of Roſes as well that which is crude and raw, as that which is made by ebullition or boiling, taken in the morning faſting, and laſt at night, ſtrengthneth the heart, and taketh away the ſhaking and trembling thereof, ſtrengthneth the liuer, kidneies, and other weake intrails, comforteth a weake ſtomacke that is moiſt and raw; ſtaieth the whites and reds in women, and in a word is the moſt familiar thing to be vſed for the purpoſes aforeſaid, and is thus made:

B Take the leaues of Roſes, the nails cut off, one pound, put them into a clean pan; then put thereto a pinte and a halfe of ſcalding water, ſtirring them together with a woodden ſlice, ſo let them ſtand

to

to macerate, cloſe couered ſome two or three houres; then ſet them to the fire ſlowly to boyle, adding thereto three pounds of ſugar in powder, letting them to ſimper together according to diſcretion, ſome houre or more; then keepe it for your vſe.

The ſame made another way, but better by many degrees: take Roſes at your pleaſure, put them C to boyle in faire water, hauing regard to the quantity; for if you haue many roſes, you may take the more water; if fewer, the leſſe water will ſerue: the which you ſhall boyle at the leaſt three or foure houres, euen as you would boyle a piece of meat, vntill in the eating they be very tender, at which time the roſes will loſe their colour, that you would thinke your labour loſt, and the thing ſpoyled. But proceed, for though the Roſes haue loſt their colour, the water hath gotten the tincture thereof; then ſhall you adde vnto one pound of Roſes, foure pound of fine ſugar in pure powder, and ſo according to the reſt of the roſes. Thus ſhall you let them boyle gently after the Sugar is put therto, continually ſtirring it with a woodden Spatula vntill it be cold, whereof one pound weight is worth ſix pound of the crude or raw conſerue, as well for the vertues and goodneſſe in taſte, as alſo for the beautifull colour.

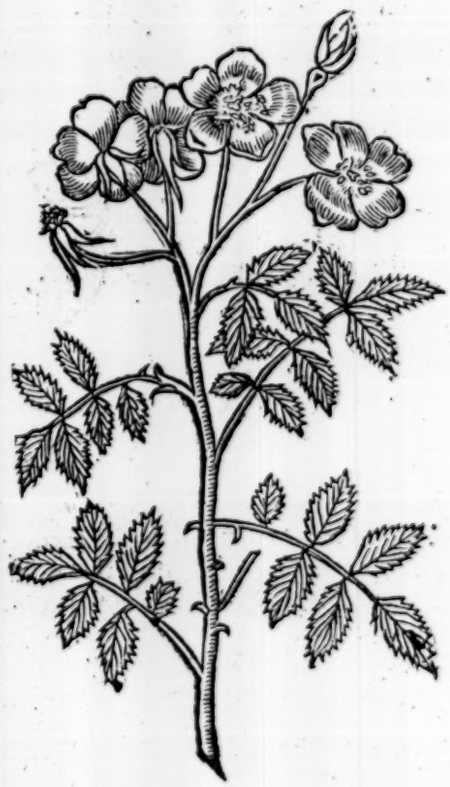
The making of the crude or raw conſerue is very well knowne, as alſo Sugar roſet, and diuers D other pretty things made of roſes and ſugar, which are impertent vnto our hiſtorie, becauſe I intend neither to make thereof an Apothecaries ſhop, nor a Sugar bakers ſtorehouſe, leauing the reſt for our cunning confectioners.

Chap. 2. *Of the Muske Roſes.*

¶ *The Kindes.*

THere be diuers ſorts of Roſes planted in gardens, beſides thoſe written of in the former chapter, which are of moſt writers reckoned among the wilde roſes, notwithſtanding we thinke it conuenient to put them into a chapter betweene thoſe of the garden and the brier roſes, as indifferent whether to make them of the wilde roſes, or of the tame, ſeeing we haue made them denizons in our gardens for diuers reſpects, and that worthily.

1 *Roſa Moſchata ſimplici flore.*
The ſingle Muske roſe.



2 *Roſa Moſchata multiplex.*
The double Muske roſe.

¶ *The Deſcription.*

1 THe ſingle Muske Roſe hath diuers long ſhoots of a greeniſh colour and wooddie ſubſtance, armed with very ſharpe prickles, diuiding it ſelfe into diuers branches: whereon do grow long leaues, ſmooth & ſhining, made of diuers leaues ſet vpon a middle rib, like the other roſes: the floures grow on the tops of the branches, of a white colour, and pleaſant ſweet ſmell, like that of Muske, whereof it tooke his name; hauing certain yellow ſeeds in the middle, as the reſt of the roſes haue: the fruit is red when it is ripe, and filled with ſuch chaffie flocks and ſeeds as thoſe of the other roſes: the root is tough and wooddie.

2 The double Muske roſe differeth not from the precedent in leaues, ſtalks, and roots, nor in the colour of the floures, or ſweetneſſe thereof, but onely in the doubleneſſe of the floures, wherein conſiſteth the difference.

3 Of theſe roſes we haue another in our London gardens, which of moſt is called the bluſh roſe; it floureth when the Damaske roſe doth: the floures hereof are very ſingle, greater than the other Muske roſes, and of a white colour, daſht ouer with a light waſh of carnation, which maketh that colour which wee call a bluſh colour: the proportion of the whole plant, as alſo the ſmell of the floures, are like the precedent.

3 *Roſæ Moſchatæ ſpecies maior.*
The great Muske roſe.

4 *Roſa Holoſericea.*
The veluet roſe.

4 The Veluet roſe groweth alwaies very low, like vnto the red roſe, hauing his branches couered with a certaine hairie or prickley matter, as fine as haires, yet not ſo ſharpe or ſtiffe that it will harme the moſt tender skin that is: the leaues are like the leaues of the white roſe: the floures grow at the top of the ſtalks, doubled with ſome yellow thrums in the midſt, of a deepe and blacke red colour, reſembling red crimſon veluet, whereupon ſome haue called it the Veluet roſe: when the floures be vaded, there follow red berries full of hard ſeeds, wrapped in a downe or woollineſſe like the others.

5 The yellow roſe which (as diuers do report) was by Art ſo coloured, and altered from his firſt eſtate, by graffing a wilde roſe vpon a Broome ſtalke; whereby (ſay they) it doth not onely change his colour, but his ſmell and force. But for my part I hauing found the contrarie by mine owne experience, cannot be induced to beleeue the report: for the roots and off-ſprings of this roſe haue brought

brought forth yellow roſes, ſuch as the maine ſtocke or mother bringeth out, which euent is not to be ſeen in all other plants that haue been graffed. Moreouer, the ſeeds of yellow roſes haue brought forth yellow roſes, ſuch as the floure was from whence they were taken; which they would not do by any coniecturall reaſon, if that of themſelues they were not a naturall kind of roſe. Laſtly, it were contrary to that true principle,

Naturæ ſequitur ſemina quodque ſuæ: that is to ſay;

Euery ſeed and plant bringeth forth fruit like vnto it ſelfe, both in ſhape and nature: but leauing that errour, I will proceed to the deſcription: the yellow roſe hath browne and prickly ſtalks or ſhoots, fiue or ſix cubits high, garniſhed with many leaues, like vnto the Muske roſe, of an excellent ſweet ſmell, and more pleaſant than the leaues of the Eglantine: the floures come forth among the leaues, and at the top of the branches of a faire gold yellow colour: the thrums in the middle, are alſo yellow: which being gone, there follow ſuch knops or heads as the other roſes do beare.

5 *Roſa lutea.*
The yellow roſe.

‡ 6 *Roſa Lutea multiplex.*
The double yellow roſe.

‡ 6 Of this kinde there is another more rare and ſet by, which in ſtalks, leaues, and other parts is not much different from the laſt deſcribed, onely the floure is very double, and it ſeldome fairly ſhewes it ſelfe about London, where it is kept in our chiefe gardens as a prime raritie. ‡

7 The Canell or Cinnamon roſe, or the roſe ſmelling like Cinnamon, hath ſhoots of a brown colour, foure cubits high, beſet with thorny prickles, and leaues like vnto thoſe of Eglantine, but ſmaller and greener, of the ſauour or ſmell of Cinnamon, whereof it tooke his name, and not of the ſmell of his floures (as ſome haue deemed) which haue little or no ſauour at all: the floures be exceeding double, and yellow in the middle, of a pale red colour, and ſometimes of a carnation: the root is of a wooddie ſubſtance.

8 We haue in our London gardens another Cinnamon or Canell roſe, not differing from the laſt deſcribed in any reſpect, but onely in the floures; for as the other hath very double floures, contrariwiſe theſe of this plant are verie ſingle, wherein is the difference.

7 *Roſa Cinnamomea pleno flore.*
The double Cinnamon Roſe.

‡ 8 *Roſa Cinnamomea flore ſimplici.*
The ſingle Cinnamon Roſe.

¶ *The Place.*

Theſe Roſes are planted in our London gardens, and elſewhere, but not found wilde in England.

¶ *The Time.*

The Muske Roſe floureth in Autumne, or the fall of the leafe: the reſt floure when the Damask and red Roſe do.

¶ *The Names.*

The firſt is called *Roſa Moſchata*, of the ſmell of Muske, as we haue ſaid: in Italian, *Roſa Moſchetta*: in French, *Roſes Muſquees*, or *Muſcadelles*: in Low Dutch, **Muſket roosen**: in Engliſh, Musk Roſe: the Latine and Engliſh titles may ſerue for the reſt.

¶ *The Temperature.*

The Muske roſe is cold in the firſt degree, wherein airie and ſpiritual parts are predominant: the reſt are referred to the Brier roſe and Eglantine.

¶ *The Vertues.*

A Conſerue or ſyrrup made of the Muske roſe, in manner as before told in the Damaske and red roſes, doth purge very mightily wateriſh humors, yet ſafely, and without all danger, taken in the quantitie of an ounce in weight.

B The leaues of the floures eaten in the morning, in manner of a ſallad, with oile, vineger and pepper, or any other way according to the appetite and pleaſure of them that ſhall eat it, purge very notably the belly of wateriſh and cholericke humors, and that mightily, yet without all perill or paine at all, inſomuch as the ſimpleſt may vſe the quantitie, according to their owne fancie; for if they do deſire many ſtooles, or ſieges, they are to eat the greater quantity of the leaues; if fewer, the leſſe quantitie; as for example: the leaues of twelue or foureteene floures giue ſix or eight ſtooles, and ſo increaſing or diminiſhing the quantitie, more or fewer, as my ſelfe haue often proued.

C The white leaues ſtamped in a woodden diſh with apeece of Allum and the iuice ſtrained forth into ſome glaſed veſſell, dried in the ſhadow, and kept, is the moſt fine and pleaſant yellow colour that may be diuiſed, not only to limne or waſh pictures and Imagerie in books, but alſo to colour meates and ſauces, which notwithſtanding the Allum is very wholſome.

There

There is not any thing extant of the others, but are thought to be equall with the white Muske Roſe, whereof they are taken and holden to be kindes.

Chap. 3. *Of the wilde Roſes.*

¶ *The Deſcription.*

1 THe ſweet Brier doth oftentimes grow higher than all the kindes of Roſes; the ſhoots of it are hard, thicke, and wooddie; the leaues are glittering, and of a beautifull greene colour, of ſmell moſt pleaſant: the Roſes are little, fiue leaued, moſt commonly whitiſh, ſeldom tending to purple, of little or no ſmell at all: the fruit is long, of colour ſomewhat red, like a little oliue ſtone, and like the little heads or berries of the others, but leſſer than thoſe of the garden: in which is contained rough cotton, or hairie downe and ſeed, folded and wrapped vp in the ſame, which is ſmall and hard: there be likewiſe found about the ſlender ſhoots hereof, round, ſoft, and hairie ſpunges, which we call Brier Balls, ſuch as grow about the prickles of the Dog-roſe.

1 *Roſa ſylueſtris odora:* The Eglantine, or ſweet Brier.

2 We haue in our London gardens another ſweet Brier, hauing greater leaues, and much ſweeter: the floures likewiſe are greater, and ſomewhat doubled, exceeding ſweet of ſmell, wherein it differeth from the former.

3 The Brier Buſh or Hep tree, is alſo called *Roſa canina*, which is a plant ſo common and well knowne, that it were to ſmall purpoſe to vſe many words in the deſcription thereof: for euen children with great delight eat the berries thereof when they be ripe, make chaines and other prettie gewgawes of the fruit: cookes and gentlewomen make Tarts and ſuch like diſhes for pleaſure thereof, and therefore this ſhall ſuffice for the deſcription.

4 The Pimpinell roſe is likewiſe one of the wilde ones, whoſe ſtalks ſhoot forth of the ground in many places, of the height of one or two cubits, of a browne colour, and armed with ſharpe prickles,

‡ 2 *Roſa ſyl. odora flore duplici.*
The double Eglantine.

4 *Roſa Pimpinellæ folio.*
The Pimpinell Roſe.

3 *Roſa Canina inodora.*
The Brier Roſe, or Hep tree.

kles, which diuide themſelues toward the tops into diuers branches, whereon doe grow leaues conſiſting of diuers ſmall ones, ſet vpon a middle rib like thoſe of Burnet, which is called in Latine *Pimpinella*, whereupon it was called *Roſa Pimpinella*, the Burnet Roſe. The floures grow at the tops of the branches, of a white colour, very ſingle, and like vnto thoſe of the Brier or Hep tree: after which come the fruit, blacke, contrarie to all the reſt of the roſes, round as an apple; whereupon ſome haue called it *Roſa Pomifera*, or the Roſe bearing apples: wherein is contained ſeed, wrapped in chaffie or flockie matter, like that of the Brier: the root is tough and wooddie.

¶ *The Place.*

Theſe wilde Roſes do grow in the borders of fields and woods, in moſt parts of England. The laſt groweth very plentifully in a field as you go from a village in Eſſex, called Graies (vpon the brinke of the riuer Thames) vnto Horndon on the hill, inſomuch that the field is full fraught therewith all ouer.

It groweth likewiſe in a paſture as you goe from a village hard by London called Knights bridge, vnto Fulham, a village thereby, and in many other places.

We haue them all except the Brier Buſh in our London gardens, which we thinke vnworthy the place.

¶ The

¶ *The Time.*

They floure and flouriſh with the other Roſes.

¶ *The Names.*

The Englantine Roſe, which is *Cynorrhodi*, or *Caninæ Roſæ ſpecies*, a kinde of Dogs Roſe: and *Roſa ſylueſtris*, the wild Roſe: in low-Dutch, **Eglantier:** in French, *Eſglentine*; and as *Ruellius* teſtifies, *Eglenterium*: who alſo ſuſpects it to be *Cynosbaton*, or *Canirubus*: of which *Dioſcorides* hath written in theſe words; *Cynosbatus*, or *Canirubus*, which ſome call *Oxycantha*, is a ſhrub growing like a tree, full of prickles, with a white floure, long fruit like an oliue ſtone, red when it is ripe, and downie within: in Engliſh we call it Eglantine, or ſweet Brier.

The ſpongie balls which are found vpon the branches are moſt aptly and properly called *Spongiolæ ſylueſtris Roſæ*, the little ſponges of the wilde Roſe. The ſhops miſtake it by the name of *Bedeguar*; for *Bedeguar* among the Arabians is a kinde of Thiſtle, which is called in Greeke Ἀγριόδη λευκή: that is to ſay, *Spina alba* the white Thiſtle, not the white Thorne, though the word doe import ſo much.

The Brier or Hep tree is called *Sylueſtris Roſa*, the wilde Roſe: in high-Dutch, **Wilden Roſen:** in French, *Roſes ſauuages*: *Pliny*, *lib.* 8. *cap.* 25. ſaith that it is *Roſa Canina*, Dogs Roſe: of diuers, *Caninaſentis*, or Dogs Thorne: in Engliſh, Brier buſh, and Hep tree: the laſt hath been touched in the deſcription.

¶ *The Temperature and Vertues.*

The faculties of theſe wilde Roſes are referred to the manured Roſe, but not vſed in phyſicke where the other may be had: notwithſtanding *Pliny* affirmeth, that the root of the Brier buſh is a ſingular remedie found out by oracle, againſt the biting of a mad dog, which he ſets downe in his eighth booke, chap. 41. A

The ſame Author, *lib.* 25. *cap.* 2. affirmeth, that the little ſpongie Brier ball ſtamped with honey and aſhes cauſeth haires to grow which are fallen through the diſeaſe called *Alopecia*, or the Foxes euill, in plaine termes the French pocks. B

Fuchſius affirmes, that the ſpongie excreſcence or ball growing vpon the Brier are good againſt the ſtone and ſtrangurie, if they be beaten to pouder and inwardly taken. C

They are good not as they be diureticks or prouokers of vrine, or as they are wearers away of the ſtone, but as certaine other binding medicines that ſtrengthen the weake and feeble kidneyes; which do no more good to thoſe that be ſubiect to the ſtone, than many of the diuretickes, eſpecially of the ſtronger ſort; for by too much vſing of diureticks or piſſing medicines, it hapneth that the kidneyes are ouer-weakened, and often times too much heated, by which meanes not only the ſtones are not diminiſhed, worne away, or driuen forth, but oftentimes are alſo increaſed and made more hard: for they ſeparate and take away that which in the bloud is thin, wateric, and as it were wheyiſh; and the thicker part, the ſtronger ſorts of diuretickes do draw together and make hard: and in like maner alſo others that are not ſo ſtrong, by the ouermuch vſing of them, as *Galen. lib.* 5. of the faculties of ſimple medicines reporteth. D

The fruit when it is ripe maketh moſt pleaſant meats and banqueting diſhes, as tarts and ſuch like; the making whereof I commit to the cunning cooke, and teeth to eat them in the rich mans mouth. E

Chap. 4. *Of the Bramble or black-Berry buſh.*

¶ *The Deſcription.*

1 THe common Bramble bringeth forth ſlender branches, long, tough, eaſily bowed, tamping among hedges and whatſoeuer ſtands neere vnto it; armed with hard and ſharpe prickles, whereon doe grow leaues conſiſting of many ſet vpon a rough middle rib, greene on the vpper ſide, and vnderneath ſomewhat white: on the tops of the ſtalks ſtand certaine floures, in ſhape like thoſe of the Brier Roſe, but leſſer, of colour white, and ſometimes waſht ouer with a little purple: the fruit or berry is like that of the Mulberry, firſt red, blacke when it is ripe, in taſte betweene ſweet and ſoure, very ſoft, and full of grains: the root creepeth, and ſendeth forth here and there yong ſprings.

‡ *Rubus repens fructu cæſio.*

‡ 2 This hath a round ſtalke ſet full of ſmall crooked and very ſharpe pricking thornes, and creepeth on hedges and low buſhes of a great length, on the vpper ſide of a light red colour, and vnderneath greene, and taketh root with the tops of the trailing branches, whereby it doth mightily

encreaſe:

encreaſe: the leaues grow without order, compoſed of three leaues, and ſometimes of fiue, or elſe the two lower leaues are diuided into two parts, as Hop leaues are now and then, of a light greene colour both aboue and vnderneath. The floures grow on the tops of the branches, *racematim*, many together, ſometimes white, ſometimes of a very light purple colour, euery floure containing fiue leaues, which are crompled or wrinkled, and do not grow plaine: the fruit followes, firſt green, and afterwards blew, euerie berry compoſed of one or two graines, ſeldome aboue foure or fiue growing together, about the bigneſſe of corans; wherein is contained a ſtony hard kernell or ſeed, and a iuyce of the colour of Claret wine, contrarie to the common *Rubus* or Bramble, whoſe leaues are white vnderneath: the berries being ripe are of a ſhining blacke colour, and euery berry containes vſually aboue forty graines cloſely compacted and thruſt together. The root is wooddy and laſting. This growes common enough in moſt places, and too common in ploughed fields. Sept. 6. 1619. *Iohn Goodyer.* ‡

3 The Raſpis or Framboiſe buſh hath leaues and branches not much vnlike the common Bramble, but not ſo rough nor prickly, and ſometimes without any prickles at all, hauing onely a rough hairineſſe about the ſtalkes: the fruit in ſhape and proportion is like thoſe of the Bramble, red when they be ripe, and couered ouer with a little downineſſe; in taſte not very pleaſant. The root creepeth far abroad, whereby it greatly encreaſeth. ‡ This growes either with prickles vpon the ſtalkes, or elſe without them: the fruit is vſually red, but ſometimes white of colour. ‡

1 *Rubus.*
The Bramble buſh.

2 *Rubus Idæus.*
The Raſpis buſh or Hinde-berry.

4 Stone Bramble ſeldome groweth aboue a foot high, hauing many ſmall flexible branches without prickles, trailing vpon the ground, couered with a reddiſh barke, and ſomwhat hairy: the leaues grow three together, ſet vpon tender naked foot-ſtalkes ſomewhat ſnipt about the edges: the floures grow at the end of the branches, conſiſting of foure ſmall white leaues like thoſe of the Cherry tree: after which come ſmall Grape-like fruit, conſiſting of one, two, or three large tranſparent berries, ſet together as thoſe of the common Bramble, of a red colour when they be ripe, and of a pleaſant taſte, but ſomewhat aſtringent. The roots creepe along in the ground very farre abroad, whereby it greatly increaſeth.

4 *Chamæmorus* (called in the North part of England, where they eſpecially doe grow, Knotberries, and Knought-berries) is likewiſe one of the Brambles, though without prickles: it brings forth

forth ſmall weake branches or tender ſtems of a foot high; whereon do grow at certaine diſtances rough leaues in ſhape like thoſe of the Mallow, not vnlike to the leaues of the Gooſeberrie buſh: on the top of each branch ſtandeth one floure and no more, conſiſting of fiue ſmall leaues of a dark purple colour: which being fallen, the fruit ſucceedeth, like vnto that of the Mulberrie, whereof it was called *Chamæmorus*, dwarfe Mulberry; at the firſt white and bitter, after red and ſomwhat pleaſant: the root is long, ſomething knotty; from which knots or ioynts thruſt forth a few threddie ſtrings. ‡ I take that plant to which our Author hereafter hath allotted a whole chapter, and called *Vaccinia nubis*, or Cloud-berries, to be the ſame with this, as I ſhall ſhew you more largely in that place. ‡

4 *Rubus Saxatilis.*
Stone blacke-Berry buſh.

5 *Chamæmorus.*
Knot berry buſh.

¶ *The Place.*

The Bramble groweth for the moſt part in euery hedge and buſh.

The Raſpis is planted in gardens: it groweth not wilde that I know of, except in the field by a village in Lancaſhire called Harwood, not far from Blackburne.

I found it among the buſhes of a cauſey, neere vnto a village called Wiſterſon, where I went to ſchoole, two miles from the Nantwich in Cheſhire.

The ſtone Bramble I haue found in diuers fields in the Iſle of Thanet, hard by a village called Birchinton, neere Queakes houſe, ſometimes Sir *Henry Criſpes* dwelling place. ‡ I feare our Author miſtooke that which is here added in the ſecond place, for that which he figured and deſcribed in the third (now the fourth) which I know not yet to grow wilde with vs. ‡

Knot-berries do loue open ſnowie hills and mountaines; they grow plentifully vpon Ingleborow hils among the heath and ling, twelue miles from Lancaſhire, being thought to be the higheſt hill in England.

They grow vpon Stane-more betweene Yorkſhire and Weſtmerland, and vpon other wet Fells and mountaines.

¶ *The Time.*

Theſe floure in May and Iune with the Roſes: their fruit is ripe in the end of Auguſt and September.

¶ *The*

¶ *The Names.*

The Bramble is called in Greeke Βάτος: in French, *Ronges, Loi Duyts Brelmers:* in Latine, *Rubus*, and *Sentis*, and *Vepres*, as *Ouid* writeth in his firſt booke of Metamorpho ſis.

Aut Lepori qui vepre latens hoſtilia cernit
Ora canum. ——

Or to th' Hare, that vnder Bramble cloſely lying, ſpies
The hoſtile mouthes of Dogs. ——

Of diuers it is called *Cynosbatus*, but not properly; for *Cynosbatus* is the wild Roſe, as we haue written: in high-Dutch, **Bzemen:** in low-Dutch, **Bzeemen:** in French, *Rouce:* in Italian, *Garza:* in Engliſh, Bramble buſh, and Black-berry buſh.

The fruit is named in Latine *Morum rubi*; and as *Fuchſius* thinketh, *Vacinium*, but not properly: in ſhops, *Mora Bati:* and in ſuch ſhops as are more barbarous, *Mora Baſſi:* in Engliſh, Blacke-berries.

The Raſpis is called in Greeke Βάτος ἰδαία: in Latine, *Rubus Idæus*, of the mountaine Ida on which it groweth: in Engliſh, Raſpis, Framboiſe, and Hinde-berry.

¶ *The Temperature and Vertues.*

A The yong buds or tender tops of the Bramble bu[illegible], the floures, the leaues, and the vnripe fruit, do very much dry and binde withall: being chewed they take away the heate and inflammation of the mouth, and almonds of the throat: they ſtay the bloudy flix, and other fluxes, and all maner of bleedings: of the ſame force is their decoction, with a little honey added.

B They heale the eyes that hang out, hard knots in the fundament, and ſtay the hemorrhoids, if the leaues be layd thereunto.

C The iuyce which is preſſed out of the ſtalks, leaues, and vnripe berries, and made hard in the Sun, is more effectuall for all thoſe things.

D The ripe fruit is ſweet, and containeth in it much iuyce of a temperate heate, therefore it is not vnpleaſant to be eaten.

E It hath alſo a certaine kinde of aſtriction or binding qualitie.

F It is likewiſe for that cauſe wholſome for the ſtomack, and if a man eat too largely therof, ſaith *Galen*, he ſhall haue the head-ache: but being dried whileſt it is yet vnripe it bindeth and drieth more than the ripe fruit.

G The root beſides that it is binding containeth in it much thin ſubſtance, by reaſon whereof it waſteth away the ſtone in the kidnies, ſaith *Galen*.

H *Pliny* writeth, that the berries and floures do prouoke vrine, and that the decoction of them in wine is a preſent remedie againſt the ſtone.

I The leaues of the Bramble boiled in water, with honey, allum, and a little white wine added thereto, make a moſt excellent lotion or waſhing water to heale the ſores in the mouth, the priuie parts of man or woman, and the ſame decoction faſtneth the teeth.

K The Raſpis is thought to be like the Bramble in temperature and vertues, but not ſo much binding or drying. The Raſpis, ſaith *Dioſcorides*, performeth thoſe things which the Bramble doth. The fruit is good to be giuen to thoſe that haue weake and queaſie ſtomacks.

Chap. 5. *Of Holly Roſes, or* Ciſtus.

¶ *The Kindes.*

Ciſtus hath been taken of diuers to be a kinde of Roſe: the old Writers haue made two ſorts thereof, male and female; and likewiſe a third ſort, which is called *Ledum:* the later Herbariſts haue diſcouered diuers more, as ſhall be declared.

¶ *A generall Deſcription, wherein all the ſorts of Ciſtus are compriſed.*

Ciſtus and his kindes are wooddy ſhrubs full of branches, of the height of two or three cubits: ſome haue broad leaues, others rough, vneuen, wrinkled, ſomewhat downy, and moſt like the leaues of Sage; although ſome haue the leaues of Roſemary, others the forme of thoſe of the Poplar tree: the floures grow on the tops of the branches, like vnto the wild Roſe, yet ſuch as very quickly fade, periſh, and fall away: thoſe of the male are moſt of a reddiſh blew or purple colour; and of the female white: in their places come vp little heads or knops ſomwhat round, in which is contained ſmall ſeed: the roots of them all are wooddy.

There

There groweth vp ſometimes vnder the ſhrub hard to the roots, a certaine excreſcence or hypociſt, which is thicke, fat, groſſe, full of iuyce, without leaues, wholly conſiſting of many little caſes or boxes, as do thoſe of Henbane or of the Pomegranat tree; of a yellowiſh red colour in one kinde, and in another white, and in certaine other greene or graſſie, as *Dioſcorides* ſaith.

¶ *The Deſcription.*

1 THe firſt kinde of *Ciſtus* groweth vp like a ſmall buſh or ſhrub, of a wooddy ſubſtance, three or foure cubits high, garniſhed with many ſmall and brittle branches, ſet full of crumpled or rugged leaues very like vnto Sage leaues: at the top of the branches come floures of a purple colour, in ſhape like vnto a ſingle Brier Roſe, hauing leaues ſomwhat wrinkled like a cloath new dried before it be ſmoothed, and in the midſt a few yellow chiues or thrums: the floures for the moſt part do periſh and fall away before noone, and neuer ceaſe flouring in ſuch maner from the moneth of May vnto the beginning of September, at which time the ſeed is ripe, being of a reddiſh colour, and is contained in an hard hairie huske not much vnlike the husk of Henbane.

1 *Ciſtus mas anguſtifolius.*
The male Holly Roſe.

2 *Ciſtus mas cum Hypociſtide.*
The male Holly Roſe with his excreſcence.

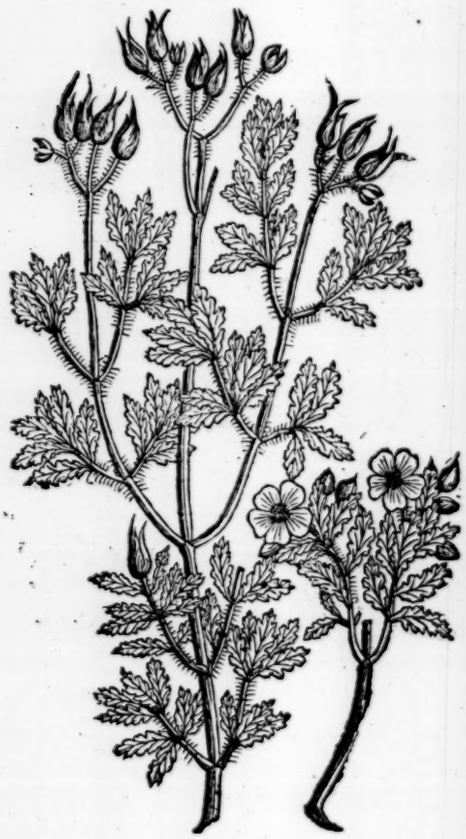
2 The ſecond ſort of *Ciſtus*, being another kind of the male *Ciſtus*, which *Pena* calls *Ciſtus mas cum Hypociſtide*, is like vnto the former, but that from the root of this kinde there commeth a certaine excreſcence or out-growing, which is ſometimes yellow, ſometimes greene, and ſometimes white; from which is drawne by an artificiall extraction a certaine iuyce called in ſhops *Hypociſtis*.

3 This kinde of *Ciſtus* hath many wooddy ſtalks diuided into diuers brittle branches of a ruſſet colour; whereon do grow rough leaues ſomewhat cut or toothed on the edges, and of an ouerworne colour: the floures grow on the tops of the branches, in forme of a Muske Roſe, but of an excellent bright purple colour: after which come round knops, wherein is contained ſmal reddiſh ſeed: the root is tough and wooddy,

4 This fourth ſort of *Ciſtus* hath diuers wooddy branches, whereon are ſet, thicke thruſt together, diuers ſmal leaues narrow like thoſe of Winter Sauorie, but of an ouerworne ruſſet colour: the root and floures are like the precedent.

3 *Ciſtus*

3 *Ciſtus mas dentatus.*
Toothed or ſnipt male Ciſtus.



4 *Ciſtus mas tenuifolius.*
Thin leafed Ciſtus.

5 *Ciſtus fœmina.*
The female Ciſtus.

7 *Ciſtus folio Halimi.*
Ciſtus with leaues like Sea Purſlane.

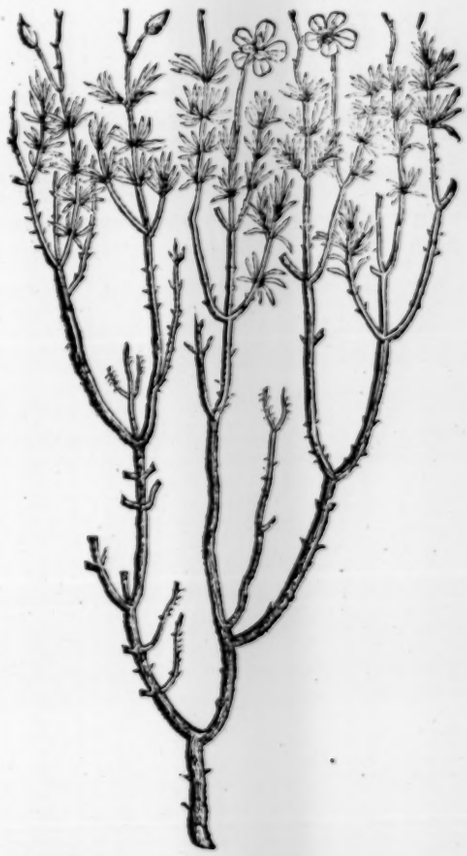
5 The firſt of the females is like vnto the male Ciſtus in each reſpect, ſauing that the floures hereof are of a white colour, with diuers yellow thrummes in the middle, and the others purple, wherein conſiſteth the difference.

6 The ſecond female of *Matthiolus* deſcription hath many hard and wooddie ſtalks, branched with diuers armes or wings: whereon are ſet by couples rough hoary and hairy leaues, of a darke ruſſet colour: among which come forth ſmall white floures like vnto thoſe of the Iaſmin: the root is tough and wooddy. † This I iudge all one with the former, and therefore haue omitted the figure as impertinent, although our Authour followed it, making the floure ſo little in his deſcription. ‡

† 7 The ſeuenth ſort of Ciſtus groweth vp to the height of a ſmall hedge buſh, hauing diuers brittle branches full of pith: whereon are ſet leaues by couples, like thoſe of ſea Purſlane, that is to ſay, ſoft, hoary, and as it were couered ouer with a kinde of mealineſſe: the floures are yellow, and leſſe than thoſe of the former.

8 *Ciſtus folio Lauandulæ.*
Lauander leaued Ciſtus.

9 *Ciſtus folio Thymi.*
Ciſtus with the leaues of Tyme.



8 The eighth Ciſtus hath likewiſe ſhrubbie ſtalks in maner of a hedge tree, whereon do grow at certaine diſtances diuers leaues cloſe ioyned together at the ſtalke, like thoſe of the former, but ſomewhat lower and narrower: the floures we haue not expreſſed in the figure, by reaſon we haue no certaine knowledge of them.

9 This ninth Ciſtus is likewiſe a wooddy ſhrub ſome foot high: the ſtalks are very brittle, as are all the reſt of his kinde, whereon do grow very ſmall leaues like thoſe of Tyme: the floures are white, which maketh it one of the females.

10 The low or baſe Ciſtus with broad leaues, groweth like a ſmall ſhrub, of a wooddy ſubſtance: the leaues are many, of a darke greene colour: the floures are in forme like the other, but of a yellow colour: the roots are likewiſe wooddy.

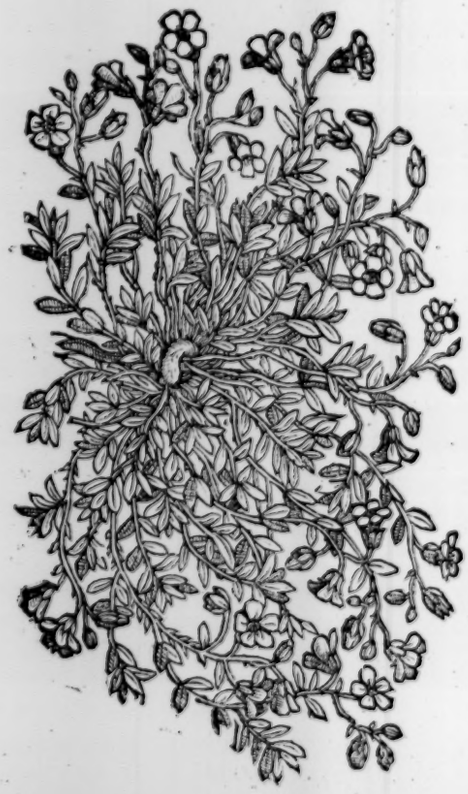
11 This narrow leafed low Ciſtus hath diuers tough branches leaning to the ground, whereon do grow without order many ſmall narrow leaues ſomewhat long, of a gummy taſte at the firſt, afterwards bitter: the floures grow on the tops of the branches, of a yellow colour, conſiſting of fiue leaues, with certaine chiues in the middle; after which follow three ſquare cods or ſeed-veſſels: the root is tough and wooddy.

10 *Ciſtus humilis latifolius.*
Low Ciſtus with broad leaues.

11 *Ciſtus humilis anguſtifolius.*
Low Ciſtus with narrow leaues.

12 *Ciſtus humilis Auſtriaca Cluſij.*
Low Ciſtus of Auſtria.

13 *Ciſtus humilis ſerpilli folio.*
Low Ciſtus with leaues like wilde Tyme.



12 The low or baſe Ciſtus of Auſtria groweth likewiſe leaning to the ground, hauing many wooddy branches very firme and tough, couered with a blackiſh barke; whereon do grow very many rough and hairy leaues in ſhape like thoſe of the ſmall myrtle, of a ſhining greene on the vpperſide, and of an aſtringent taſte: on euery branch ſtandeth one floure, ſeldome two, in forme like the other, but conſiſting of one leafe deeply diuided into fiue parts, and of a white colour tending to a fleſh colour.

13 This low ſort of Ciſtus hath many long tough branches trailing vpon the ground, of a reddiſh colour, whereon do grow ſmall leaues like thoſe of wilde Tyme, of a darke green colour, very thicke and fat, and ſomewhat hairy: the floures grow at the top of the branches, of a yellow gold colour, conſiſting of fiue ſmall leaues of a very ſweet ſmell. The root is thicke, hard, and wooddie.

14 This ſtrange and rare plant of *Lobels* obſeruation I haue thought meet to be inſerted amongſt the kindes of Ciſtus, as a friend of theirs, if not one of the kinde: it hath leaues like vnto the male Ciſtus (the firſt in this chapter deſcribed) but more hairy, bearing at the top of his branches a ſmall knop in ſhape like a rotten Strawberry, but not of the ſame ſubſtance; for it is compact of a ſcaly or chaffie matter ſuch as is in the middeſt of the Camomill floures, and of a ruſſet colour.

14 *Ciſtus exoticus Lobely.*
Lobels ſtrange Ciſtus.

16 *Myrtociſtus Tho. Pennei Angli.*
Dr. *Penny* his Ciſtus.

15 This adulterine or counterfeit or forged Ciſtus growes to the height of a hedge buſh: the branches are long or brittle, whereon do grow long leaues like thoſe of the Willow, of an ouerworne ruſſet colour: the floures are ſmall, conſiſting of fiue little yellow leaues: the whole plant being well viewed ſeemeth to be a Willow, but at the firſt ſight one of the Ciſtus; ſo that it is a plant participating of both: the root is wooddy. ‡ *Bauhine* iudges this (which our Author out of *Tabern.* figured and named *Ciſtus adulterinus*) to be the Ciſtus ſet forth in the eighth place of the next chapter ſaue one: but I rather iudge it to be of the *Ledum Sileſiacum* ſet forth in the eleuenth place of that chapter, and againe in the twelfth, where you may finde more thereof. ‡

16 This kinde of Ciſtus, which Dr. *Penny* (a famous Phyſitian of London deceaſed) did gather vpon the Iſlands of Majorica or Majorca, and called it by the name Μυρτοκίστον, in Latine, *Myrtociſtus Balearica*, is a ſhrub growing to the height of three cubits, hauing a very rough barke, beſet round about with rough and ſcabbed warts; which bark wil of it ſelfe eaſily fall away from the old

old branches or boughes of the tree. The leaues of this tree are almoſt like them of *Myrtus*, very rough vnderneath like the branches aforeſaid; but the leaues that grow higher, and toward the top of the branches, are ſmooth, growing about the branches very thicke together, as in the other kindes of Ciſtus. The floures are yellow, growing on the top of the twigs, conſiſting of fiue long leaues full of many very long chiues within. When the floures be vaded, there followeth a verie long and fiue ſquare head or huske full of ſeed. The whole tree is very ſweet, out of which iſſueth a gum or roſine, or rather a thicke clammy and fat iuyce, ſuch as commeth forth of the kindes of *Ledum*.

17 This annual Ciſtus groweth vp from ſeed with one vpright ſtalke to the height of a cubit, oft times diuided into other ſmall branches; whereon grow rough leaues ſomwhat long, of a dark greene colour. The floures grow at the top of the ſtalks, conſiſting of 5 ſmall yellow leaues: which being paſt, there followeth a three ſquare ſeed veſſell full of ſmall reddiſh ſeed. The root is ſmall and wooddy, and periſheth when the ſeed is perfected.

17 *Ciſtus annuus.*
Ciſtus laſting one yeare.

18 *Ciſtus annuus longifolius Lobelij.*
Long leafed yearely Ciſtus.

18 This other Ciſtus that laſteth but one yeare hath long ſtalks diuided into other branches of the height of two cubits; whereon do grow long rough leaues, ſet three together at certain diſtances, the middlemoſt whereof is longer than the other two: the floures grow on the ſides of the branches, like the female Ciſtus, of a white colour: the root is of a wooddy ſubſtance, as are all the reſt of his kinde.

‡ 19 This growes ſome foot high, with a ſquare rough greeniſh ſtalke, whereon by couples at certaine ſpaces ſtand little longiſh rough leaues, yet toward the top of the ſtalk they ſtand ſomtimes three together: vpon the top of the little branches grow floures like thoſe of the other Ciſtus, of colour yellow, with a fine ſanguine ſpot vpon each leafe of the floure. It groweth in ſome parts of France, as alſo on the Alps in Italy. *Cluſius* deſcribes it by the name of *Ciſtus annuus 2*. *Pona* in his *Mons Baldus* calls it *Ciſtus annuus flore guttato*.

20 This hath many ſlender branches whereon grow ſmall roundiſh leaues, hoarie, and ſomewhat like thoſe of Marjerome, ſomwhat leſſe, with the middle rib ſtanding out. The floures grow vpon the tops of the branches, and conſiſt of fiue white leaues, with a darke purple ſpot in the middle of each leafe: the threds in the middle of the floure are of a yellow colour; their ſeed-veſſels

are

are of the bigneſſe of thoſe of flax, but three ſquare, containing a ſeed of the bigneſſe of that of Henbane. *Cluſius* found this in diuers parts of Spaine, and ſets it forth by the name of *Ciſtus folio Sampſuchi.* ‡

‡ 19 *Ciſtus annuus flore maculato.*
Spotted annuall Ciſtus.

‡ 20 *Ciſtus folio Sampſuchi.*
Marjerome leaued Ciſtus.

¶ *The Place.*

Holly Roſes grow in Italy, Spaine, and Languedoc, and in the countries bordering vpon the riuer Padus, in all Hetruria and Maſſiles, and in many other of the hotter prouinces of Europe, in dry and ſtony places, varying infinitely according to the diuerſitie of the regions where they doe grow; of which I haue two ſorts in my garden, the firſt, and the *Ciſtus annuus.*

¶ *The Time.*

They floure from May to September.

¶ *The Names.*

The Holly Roſe is called in Greeke ῥόδος, or ἄγριος: in Latine alſo *Ciſtus*, and *Roſa ſyluatica*: of diuers, *Roſa Canina*, as *Scribonius Largus* writeth, but not properly: in Spaniſh, *Eſtepa*: of the Portugals, *Roſella*: in Engliſh, Holly Roſe, and Ciſtus, after the Greeke name. The fungous excreſcence growing at the root of Ciſtus, is called in Greeke κυνόσβατος, becauſe it groweth vnder the ſhrub Ciſtus: it is alſo called *Limodoron*: ſome call it κύμινος: among whom is *Paulus Ægineta*, who alſo doth not call that *Hypociſtis* which groweth vnder the ſhrub Ciſtus, but the iuyce hereof; whereupon might grow the word *Hypociſtus*, by which name the Apothecaries call this iuyce when it is hardned: of ſome it is called *Erithanon*, *Citinus*, and *Hypoquiſtidos.*

¶ *The Temperature.*

Ciſtus, as *Galen* ſaith, doth greatly dry, neere hand in the ſecond degree, and it is of that coldneſſe, that it hath withall a temperate heate: the leaues and the firſt buds being beaten do only dry and binde, in ſuch ſort as they may cloſe vp vlcers, and ioyne together greene wounds.

¶ *The Vertues.*

The floures are of moſt force, which being drunke with wine are good againſt the bloudy flix, A weakeneſſe of the ſtomacke, fluxes, and ouerflowings of moiſt humors.

They cure putrified vlcers being applied in manner of a pultis: *Dioſcorides* teacheth that they B are a remedie for eating vlcers, called in Greek νόμαι, being anointed therewith; and that they cure burnings, ſcaldings, and old vlcers.

C *Hypociſtis* is much more binding: it is a ſure remedie for all infirmities that come of fluxes, as voiding of bloud, the whites, the laske, and the bloudy flix: but if it be requiſit to ſtrengthen that part which is ouerweakned with a ſuperfluous moiſture, it doth notably comfort and ſtrengthen the ſame.

D It is excellent to be mixed with fomentations that ſerue for the ſtomacke and liuer.

E It is put into the Treacle of Vipers, to the end it ſhould comfort and ſtrengthen weake bodies, as *Galen* writeth.

Chap. 6. *Of other Plants reckoned for dwarfe kindes of* Ciſtus.

1. 2. *Helianthemum Anglicum luteum vel album.* Engliſh yellow or white dwarfe Ciſtus.

¶ *The Deſcription.*

1 THe Engliſh dwarfe Ciſtus, called of *Lobel*, *Panax Chironium* (but there is another *Panax* of *Chiron's* deſcription, which I hold to be the true and right *Panax*, notwithſtanding he hath inſerted it amongſt the kindes of Ciſtus, as being indifferent to ioyne with vs and others for the inſertion) is a low and baſe plant creeping vpon the ground, hauing many ſmal tough branches, of a browne colour; whereupon do grow little leaues ſet together by couples, thicke, fat, and ful of ſubſtance, and couered ouer with a ſoft downe: from the boſome whereof come forth other leſſer leaues: the floures before they be open are ſmall knops or buttons, of a browne colour mixed with yellow; and being open and ſpred abroad are like thoſe of the wild Tanſie, and of a yellow colour, with ſome yellower chiues in the middle: the root is thicke, and of a wooddy ſubſtance.

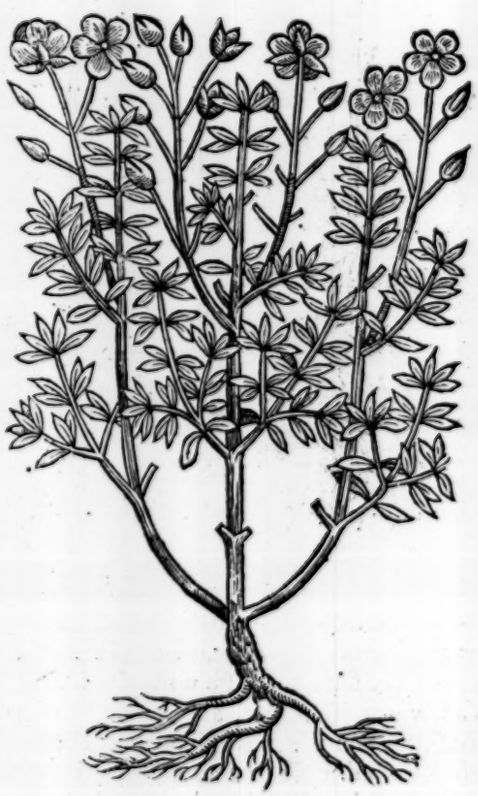
2 The ſecond is very like vnto the precedent, ſauing that the leaues are long, and doe not grow ſo thicke thruſt together, and are more woolly: the floures are greater, and of a white colour, wherein the eſpeciall difference conſiſteth. The root is like the former.

3 *Helianthemum luteum Germanicum.* The yellow dwarfe Ciſtus of Germanie.

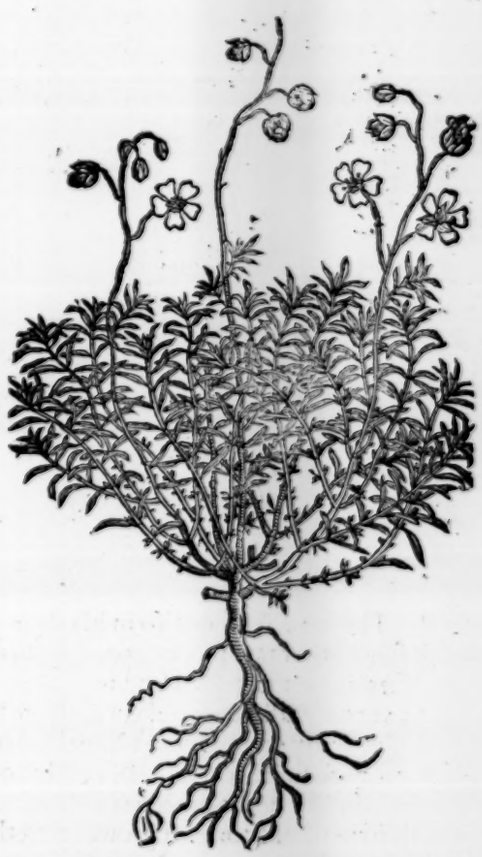
3 There is found in Germanie, a certaine plant like to Ciſtus, and *Ledon*, but much leſſer, creeping vpon the ground, vnleſſe it be propped vp, hauing a multitude of twiggie branches, ſlender, and fine: whereupon do grow leaues leſſer than thoſe of Ledon or Ciſtus, very like to that of our Engliſh white dwarfe Ciſtus, of a full ſubſtance, ſleightly haired; wherein is contained a tough iuice: the floures are ſmall like little Roſes, or the wilde Tanſie, of a yellow colour: the roots be ſlender, wooddie, and ſomething red.

4 *Helianthemum album Germanicum.* The white dwarfe Ciſtus of Germanie.

5 *Helianthemum Sabaudicum.*
The dwarfe Ciſtus of Sauoy.



6 *Helianthemum anguſtifolium.*
Narrow leafed dwarfe Ciſtus.



4 This differeth not from the laſt deſcribed, ſauing that the floures hereof are very white, and the others yellow, wherein they eſpecially differ.

5 The

5 The Dwarfe Ciſtus of Sauoy hath diuers tough branches, of a reddiſh colour, very tough and wooddy, diuided into diuers other branches: whereon are ſet ſmall leaues, foure together, by certain ſpaces; the floures grow at the top of the branches like thoſe of our yellow Dwarfe Ciſtus, of a yellow colour: the root is very wooddie.

6 This dwarfe Ciſtus with narrow leaues, hath very many ſmall flexible branches, of a browne colour, very ſmooth, and ramping vpon the ground; whereon do grow ſmall, long, narrow leaues, like thoſe of Time of Candie; from the boſome whereof come forth diuers other ſmaller leaues: the floures grow on the tops of the branches, of a bleak yellow colour: the root is likewiſe wooddy.

‡ 7 To theſe I may fitly adde two more: the firſt of theſe hath creeping ſtalks, ſome foot or two long, blackiſh, and diuided into ſundry ſmaller branches: the leaues grow thick and many together, ſet by couples (though the figure do not wel expreſſe ſo much:) theſe leaues are ſmal, of the bignes of thoſe of Time, thick, green aboue, and whitiſh vnderneath, and of a bitter taſt: at the ends of the branches grow two or foure floures neere together, very ſmall, compoſed of fiue little leaues, of a kinde of fleſh colour: to theſe ſucceed heads opening themſelues when they come to ripeneſſe into fiue parts, and containing a very ſmall ſeed: the root is hard and wooddie, ſending out certaine fibres: alſo the branches here and there put forth ſome fibres. This plant dryed hath a pretty pleaſing ſmell. This growes vpon the higheſt Auſtrian and Styrian alpes, and is ſet forth by *Cluſius* by the name of *Chamæciſtus ſeptimus*.

‡ 7 *Chamæciſtus ſerpilliſolius.*
Tyme leaued dwarfe Ciſtus.

‡ 8 *Chamæciſtus Friſicus.*
Friſian Dwarfe Ciſtus.

8 The ſame Author alſo in his *Curæ poſteriores* giues vs the hiſtorie of this, which he receiued with ſome other rare plants from *Iohn Dortman*, a famous and learned Apothecarie of Groeningen: This little plant is in leafe and root almoſt like and neere of the ſame bigneſſe with the Celticke Nard, yet the ſtalks are vnlike, which are ſmall, ſet with a few longiſh leaues, and at the tops they carry fiue or ſix pretty floures like thoſe of Crowfeet, conſiſting of ſix leaues apiece, of a yellow colour, yet with ſome few ſpots of another colour, and theſe ſet in a double ring about the middle; after theſe follow heads or ſeed veſſels with forked tops, filled with a chaffie ſeed: the whole plant ſmells ſomewhat ſtrong. It growes together with *Gramen Parnaſſi* in rotten mooriſh places about a village in the county of Drent. *Dortman* called this *Hirculus Friſicus*: *Cluſius* addes, *qui Chamæciſti genus*. ‡

¶ *The*

¶ *The Place.*

Their seuerall titles haue touched their naturall countries: they grow in rough, drie, and sunnie places, in plaine fields and vpon mountaines.

Those of our English growing, I haue found in very many places, especially in Kent, vpon the chalkie bankes about Grauef-end, Southfleet, and for the most part all the way from thence vnto Canturburie and Douer.

¶ *The Time.*

They floure from Iuly to the end of August.

¶ *The Names.*

Tragus calleth dwarfe Cistus in the high Dutch tongue, Heyden Rose: in Latine, *Gratia Dei*; but there is another herbe called also of the later Herbarists *Gratia Dei*, which is *Gratiola*: *Valerius Cordus* nameth it *Helianthemum*, and *Solis flos*, or Sunne floure: of *Clusius*, *Chamæcistus*, or Dwarfe Cistus.

Pliny writeth, that *Helianthe* groweth in the champion countrey Temiscyra in Pontus, and in the mountaines of Cilicia neere to the sea: and he saith further, that the wise men of those countries, and the kings of Persia do annoint their bodies herewith, boiled with Lions fat, a little Saffron, and wine of Dates, that they may seeme faire and beautiful; and therefore haue they called it *Heliocaliden*, or the beautie of the Sun: *Matthiolus* saith, that *Helianthemum* is taken of some to be *Panaces Chironium*, or *Chirons* All-heale: but it is nothing likely, as we haue said.

¶ *The Temperature and Vertues.*

The faculties and temperature are referred to the kindes of Cistus, for it healeth wounds, stancheth bloud, and stoppeth the spittings of bloud, the bloudie flixe, and all other issues of bloud. A

The same boiled in wine healeth vlcers in the mouth and priuie parts, if they be washed therewith: to be briefe, it ioineth together and strengthneth: which things doe plainely and euidently shew, that it is not onely like to Cistus and Ledon in forme, but in vertues and faculties also, and therefore it is manifest, that it is a certaine wilde kinde of Cistus and Ledon. B

Chap. 7. *Of Cistus Ledon, and Ladanum.*

¶ *The Kindes.*

There be diuers sorts of Cistus, whereof that gummy matter is gathered, called in shops *Ladanum*, and *Labdanum*, but vnproperly.

¶ *The Description.*

1 Cistus Ledon is a shrub, growing to the height of a man, and sometimes higher; hauing many hard wooddie branches, couered with a blackish bark: wherupon do grow leaues set together by couples, one right against another like vnto wings, of an inch broad, of a blacke swart greene on the vppersides, and whitish vnderneath: whereon is gathered a certain clammie transparent or through shining liquour, of a very hot sweet smell, which being gathered and hardned, is that which in shops is called *Labdanum*: the floures grow at the ends of the branches like little roses, consisting of fiue white leaues, euery one decked or beautified toward the bottome with pretty darke purplish spots tending to blackenesse, hauing in the middle very many yellow chiues, such as are in the middle of the Rose: after come the knaps or seed vessels, full of most smal reddish seed; the whole plant being dried, groweth somewhat whitish, and of a pleasant smell, the which it retaineth many yeares.

2 The second groweth likewise to the height of an hedge bush, the branches are long, and very fragile or easie to breake, whereon do grow leaues greener than any other of his kinde, yet vnderneath of a hoarie colour; growing toward winter to be somewhat reddish, of a sower and binding taste: the floures are like the precedent: the forme whereof the Grauer hath omitted, in other respects like the former.

3 The third sort of Cistus Ledon groweth vp to the height of a small hedge bush, hauing many twiggie branches; whereon do grow leaues like those of the Poplar tree, sharpe at the point, couered ouer with that clammie dew that the others are: the floures grow at the tops of the branches; of a white colour like the precedent.

The Polonian Ciſtus Ledon.

4 The fourth of *Cluſius* deſcription groweth likewiſe to the height of a ſhrubby buſh, hauing many branches, flexible, hoarie, and hairie: the leaues are like the reſt of his kind, but ſofter, more hairy, of a ſwart green colour, daſht ouer with that dewie fatneſſe, not onely in the ſpring time, but in the heat of Sommer likewiſe: the floures are white, with yellow thrums in the middle: the reſt anſwereth the laſt deſcribed.

5 The fift groweth vp like a hedge buſh with many tough branches, whereon are ſet long rough leaues, hoarie vnderneath, ſomewhat daſht ouer with that fattie dew or humour that the reſt are poſſeſſed of: the floures are likewiſe of a white colour, with certaine yellow chiues in the middle: the root is wooddie.

† 6 The ſixth hath diuers ſmall branches couered with a blackiſh bark: the floures are ſet together at the tops of the branches by certaine ſpaces: they are yellow, and like the former in each reſpect.

7 The ſeuenth is a low ſhrub growing to the height of two cubits, hauing many branches couered with a barke of the colour of aſhes; whereon are confuſedly ſet diuers leaues at certaine diſtances, ſmall, narrow, like thoſe of winter Sauory, of an ouerworne ruſſet colour, very thick, fat, and glutinous: the floures are white, & differ not, nor the ſeed from the reſt.

8 The

8 The eighth groweth vp like a little hedge bush, hauing leaues like the common female Cistus, saue that those of this plant are sprinckled ouer with that clammy moisture, and the other not so: the floures and seed are also like. From the root of this plant commeth such like excrescence called *Limodron, Orobanche*, or *Hypocistis*, as there doth from the first male Cistus, wherein it differeth from all the rest vnder the name Ledon.

9 The ninth hath diuers brittle stalkes of an ash colour tending to a russet; whereon are set very many leaues like those of Thyme, of an ouerworne colour: the floures are white, with certaine yellow chiues in the middle, which the grauer hath omitted in the figure.

10 The tenth groweth vp like a small shrub, hauing brittle stalkes, couered with a blackish barke, and diuided into diuers branches; whereon are set vpon short truncheons or fat footstalkes, foure or fiue like those the Myrtle tree, of a strong smell: the floures are likewise of a white colour.

12 *Cistus Ledum Rorismarini folio.*
Cistus Ledon with leaues like Rosemarie.

13 *Cistus Ledum Matthioli.*
Cistus Ledon of *Matthiolus* description.

11. 12. The twelfth kinde of Cistus Ledon groweth vpright with a straight body or stocke, bringeth at the top many small twigs or rods of a cubit long, couered with a barke of the colour of ashes, which diuide themselues into other branches, of a purplish colour, beset with long and narrow leaues, not much vnlike to Rosemary, but longer; of a greene colour aboue, but vnderneath hauing as it were a long rib, made or compact of wooll or downe; of a sweet and pleasant smell, and somewhat sharpe in taste: on the tops of the branches grow knops or heads, compact as it were of many scales, of an iron or rustie colour: out of which commeth and proceedeth a certaine round and long mane, or hairy panickled tuft of floures, with many long, tender, greene, and somewhat woolly stalkes or twigs growing vnto them, of a sweet sent and smell: the floures consist of fiue little white leaues, within which are contained ten white chiues with a long stile or pointal in the midst of the floure: when the floures be vaded, there succeed long knops or heads which are fiue cornered, in shape and bignesse like vnto the fruite and berries of *Cornus*; which being greene, are bespeckled with many siluer spots, but being ripe, are of a red colour; conteining within them a long yellow seed, which is so small and slender, that it is like to the dust or powder that falleth out of worme holes. ‡ This is the *Ledum Silesiacum* of *Clusius*; and the *Ledum Rorismarini folio* of *Tabernamontanus*: it is also the *Rosmarinum syluestre* of *Matthiolus*; and *Chamæpeuce* of *Cordus*: and I am

deceiued if the figure which *Tabernamontanus* and our Author out of him gaue by the name of *Ciſtus adulterinus*, were not of this. ‡

13 Among the ſhrubby buſhes comprehended vnder the title of *Ciſtus Ledum*, *Matthiolus* hath ſet forth one, whereof to write at large were impoſſible, conſidering the Author is ſo briefe, and of our ſelues we haue not any acquaintance with the plant it ſelfe: *Dioſcorides* to helpe what may be, ſaith, that it is a ſhrub growing like vnto the ſtocke or kindred of the *Ciſti*: from whoſe leaues is gathered a clammy dew which maketh that gummie matter that is in ſhops called *Lapdanum*: it groweth, ſaith he, in hot regions (but not with vs:) the Mauritanians call the juice or clammy matter, *Leden*, and *Laden*: of ſome, *Ladano* and *Odano*: in Spaniſh, *Xara*: and further ſaith, it groweth in Arabia, where the buſh is called *Chaſus*: thus much for the deſcription. ‡ Our Author here ſeems to make *Dioſcorides* to comment vpon *Matthiolus*, which ſhewes his learning, and how well he was exerciſed in reading or vnderſtanding any thing written of Plants. But of this enough; The plant here figured which *Matthiolus* iudges to be the true *Ledon*, or *Ciſtus Ladanifera* of *Dioſcorides*, hath large ſtalkes and branches, whereon grow very thicke leaues, broad alſo and long, with the nerues running along ſt the leaues, the floure of this conſiſts of fiue white leaues, and the ſeed is contained in a three cornered ſeed veſſel. ‡

14 *Ciſtus Ledum Alpinum Cluſij.*
The Mountaine Ciſtus.

‡ 15 *Ciſtus Ledon folijs Roriſmarini.*
Roſemary leaued Ciſtus Ledon.

14 The foureteenth Ciſtus, being one of thoſe that do grow vpon the Alpiſh mountaines, which *Lobel* ſetteth downe to be *Balſamum alpinum* of *Geſner*: notwithſtanding I thinke it not amiſſe to inſert it in this place, hauing for my warrant that famous Herbariſt *Carolus Cluſius*: this plant is one of beautifulleſt, differing in very notable points, and yet reſembleth them in the wooddy branches and leaues: it riſeth vp hauing many weake branches leaning to the ground, yet of a wooddy ſubſtance, couered ouer with an aſh coloured barke: the leaues are broad, and very rough, of a ſhining greene colour, and a binding taſte: the floures grow at the tops of the branches like little bels, hanging downe their heads, diuided at the lips or brims into fiue diuiſions, of a deepe red color on the out ſide, and daſht ouer here and there with ſome ſiluer ſpots; on the inſide of a bright ſhining red colour, with certaine chiues in the middle, and of a very ſweet ſmell, as is all the reſt of the plant; after which come ſmall heads or knaps, full of ſeed like duſt, of a very ſtrong ſmell, making the head of them to ake that ſmel thereto: the root is long, hard, and very woody: oftentimes there is

found

found vpon the trunke or naked part of the ſtalks certaine excreſcences, or out-grewings in manner of galls, of a fungous ſubſtance, like thoſe of Touchwood, white within, and red without, of an aſtringent or binding taſte.

‡ 15 This growes ſome cubite and better high, and hath long narrow glutinous leaues like in ſhape to thoſe of Roſemarie, ſet by couples, but not very thick: the branches whereon the floures do grow are ſlender, and the ſeed veſſels are diuided into fiue parts as in other plants of this kinde. This *Cluſius* found in Spaine, and ſets forth for his *Ledum nonum* ‡.

¶ *The Place.*

Ciſtus Ledon groweth in the Iſland of Candie, as *Bellonius* doth teſtifie, in vntilled places euery where: it is alſo found in Cyprus, as *Pliny* ſheweth, and likewiſe in many places of Spaine that lie open to the Sun: moreouer both the forme and bigneſſe of the leaues, and alſo of the plants themſelues, as well of thoſe that bring forth *Ladanum*, as the other Ciſtus, do varie in this wonderful maner, according to the diuerſitie of the places and countries where they grow: they are ſtrangers in theſe Northerly parts, being very impatient of our cold clymate.

¶ *The Time.*

They floure for the moſt part from May to the end of Auguſt: the clammie matter which falleth vpon the leaues, which is a liquid kinde of Roſen of a ſweet ſmell, is gathered in the Spring time as *Dioſcorides* ſaith: but as *Petrus Bellonius* affirmeth (being an eye witnes of the gathering) in the midſt of ſommer, and in the extreme heat of the Dog-daies, the which in our time not without great care and diligence, and as great labour, is gathered from the whole plant (with certain inſtruments made in manner of tooth pickes, or eare pickes, which in their tongue they call *Ergaſtiri*) and not gathered from the beards of Goats, as it is reported in the old fables of the lying Monks themſelues, called *Calohieros*, that is to ſay Greekiſh Monkes, who of very mockerie haue foiſted that fable among others extant in their workes.

‡ I thinke it not amiſſe for the better explanation of the matter here treated of, as alſo to ſhew you after what manner our Author in diuers places gaue the teſtimonies of ſundry Writers, and how well he vnderſtood them, here to ſet downe in Engliſh the words of *Bellonius* concerning the gathering of *Ladanum*, which are theſe. [The Greekes (ſaith he) for the gathering of *Ladanum*, prouide a peculiar inſtrument which in their vulgar tongue they terme *Ergaſtiri:* This is an inſtrument like to a Rake without teeth, to this are faſtened ſundry thongs cut out of a raw and vntanned hide; they gently rub theſe vpon the *Ladanum* bearing ſhrubs, that ſo the liquid moiſture concrete about the leaues may ſticke to them, which afterwards with kniues they ſhaue off theſe thongs in the heat of the day. Wherefore the labour of gathering *Ladanum* is exceeding great, yea intollerable, ſeeing they muſt of neceſſitie ſtay in the mountaines all the day long in the greateſt heat of the Dog-daies: neither vſually ſhall you finde any other who will take the paines to gather it, beſides, the *Calohieroi*, that is the Greeke Monkes. It is gathered no where in the whole Iſland of Candy in greater plenty, than at the foot of the mountaine Ida at a village called Cogualino, and at Milopotamo.‡]

¶ *The Names.*

The ſhrub it ſelfe is called in Greeke λήδον, or λήδων: the Latines keep the name *Ledon* or *Ladon*, and is a kinde of *Ciſtus* or Hollie Roſes: the fat or clammie matter which is gathered from the leaues, is named *Ladanon* and *Ledanon*, according to the Greeke: the Apothecaries corruptly call it *Lapdanum*: *Dioſcorides* counteth that to be the beſt which is ſweet of ſmell, and ſomewhat greene, that eaſily waxeth ſoft, is fat, without ſand, and is not eaſily broken, but very full of Roſine or Gumme.

¶ *The Temperature.*

Ladanum, ſaith *Galen*, is hot in the later end of the firſt degree, hauing alſo a little aſtrictiue or binding qualitie; it is likewiſe of a thin ſubſtance, and therefore it ſofteneth, and withall doth moderately digeſt, and alſo concoct.

¶ *The Vertues.*

Ladanum hath a peculiar property againſt the infirmities of the mother, it keepeth haires from A
falling; for it waſteth away any ſetled or putrified humour that is at their roots.

Dioſcorides ſaith, that *Ladanum* doth bind, heat, ſouple, & open, being tempered with wine, Myrrhe, B
and oile of Myrtles; it keepeth haires from falling, being annointed therewith; or laied on mixed with wine, it maketh the markes or ſcars of wounds faire and well coloured.

It taketh away the paine in the eares if it be powred or dropped therein, mixed with honied wa- C
ter, or with oile of Roſes.

A fume made thereof draweth forth the afterbirth, and taketh away the hardneſſe of the ma- D
trix.

E It is with good ſucceſſe mixed with mollifying plaiſters that mitigate paine.
F Being drunke with wine, it ſtoppeth the laske, and prouoketh vrine.
G There is made hereof diuers ſorts of Pomanders, chaines, and bracelets, with other ſweets mixed therewith.

Chap. 8. *Of Roſemarie.*

¶ *The Deſcription.*

1 Roſemarie is a wooddie ſhrub, growing oftentimes to the height of three or foure cubits, eſpecially when it is ſet by a wall: it conſiſteth of ſlender brittle branches, whereon do grow verie many long leaues, narrow, ſomewhat hard, of a quicke ſpicy taſte, whitiſh vnderneath, and of a full greene colour aboue, or in the vpper ſide, with a pleaſant ſweet ſtrong ſmell; among which come forth little floures of a whitiſh blew colour: the ſeed is blackiſh: the roots are tough and woody.

1 *Roſmarinum Coronarium.*
Garden Roſemarie.

2 *Roſmarinum ſyluestre.*
Wilde Roſemarie.

2 The wilde Roſemarie *Cluſius* hath referred vnto the kindes of Ciſtus Ledon; we haue as a poore kinſman thereof inſerted it in the next place, in kinred or neighbourhood at the leaſt. This wilde Roſemarie is a ſmall wooddie ſhrub, growing ſeldome aboue a foot high, hauing hard branches of a reddiſh colour, diuiding themſelues into other ſmaller branches of a whitiſh color: whereon are placed without order diuers long leaues, greene aboue, and hoarie vnderneath, not vnlike to thoſe of the dwarfe Willow, or the common Roſemarie, of a drie and aſtringent taſte, of little ſmel or none at all: the floures ſtand on the tops of the branches, ſet vpon bare or naked footſtalks, conſiſting of fiue ſmall leaues of a reddiſh colour, ſomewhat ſhining; after which appeare little knaps full of ſmall ſeed: the root is tough and wooddie.

3 This plant grows vp like an hedge ſhrub of a wooddie ſubſtance, to the height of two or three cubits;

3 *Caſia Poetica, Lobelij.*
The Poets Roſemarie or Gardrobe.

cubits; hauing many twiggie branches of a green colour: wherupon do grow narrow leaues like vnto *Linaria* or Toad-flax, of a bitter taſte; among which come forth ſmall moſſie floures, of a greeniſh yellow colour like thoſe of the Cornell tree, and of the ſmell of Roſemarie: which hath mouedme to place it with the Roſemaries as a kinde thereof, not finding any other plant ſo neere vnto it in kinde and neighbourhood: after the floures be paſt, there ſucceed fruit like thoſe of the Myrtle tree, greene at the firſt, and of a ſhining red colour when they bee ripe, like Corall, or the berries of *Aſparagus*, ſoft and ſweet in taſte, leauing a certaine acrimonie or ſharpe taſte in the end: the ſtone within is hard as is the nut, wherein is contained a ſmal white kernel, ſweet in taſt: the root is of a woodie ſubſtance: it floureth in the Sommer; the fruit is ripe in the end of October: the people of Granade, Montpelier, and of the kingdom of Valentia, doe vſe it in their preſſes and Wardrobes, whereupon they call it *Guardalobo*.‡ This in *Cluſius* his time when he liued about Montpelier was called *Oſyris*; but afterwards they called it *Caſia*, thinking it that mentioned by the Poet *Virgil*; the which it cannot be, for it hath no ſweet ſmell. *Pena* and *Lobel* iudge it to be the *Caſia* of *Theophraſtus*, wherewith alſo it dothnot well agree.‡

¶ *The Place.*

Roſemarie groweth in France, Spaine, and in other hot countries; in woods, and in vntilled places: there is ſuch plentie thereof in Languedocke, that the inhabitants burne ſcarce any other fuell: they make hedges of it in the gardens of Italy and England, being a great ornament vnto the ſame: it groweth neither in the fields nor gardens of the Eaſterne cold countries; but is carefully and curiouſly kept in pots, ſet into the ſtoues and ſellers, againſt the iniuries of their cold Winters.

Wilde Roſemarie groweth in Lancaſhire in diuers places, eſpecially in a field called Little Reed, amongſt the Hurtleberries, neere vnto a ſmall village called Maudſley; there found by a learned Gentleman often remembred in our hiſtorie (and that worthily) Mr. *Thomas Hesketh*.

¶ *The Time.*

Roſemarie floureth twice a yeare, in the Spring, and after in Auguſt.
The wilde Roſemarie floureth in Iune and Iuly.

¶ *The Names.*

Roſemarie is called in Greeke λιβανωτὶς στεφανωματικὴ: in Latine, *Roſmarinus Coronaria*: it is ſurnamed *Coronaria*, for difference ſake betweene it and the other *Libanotides*, which are reckoned for kindes of Roſemarie, and alſo becauſe women haue been accuſtomed to make crownes and garlands thereof: in Italian, *Roſmarino coronario*: in Spaniſh, *Romero*: in French and Dutch *Roſmarin*.
Wilde Roſemarie is called *Roſmarinus ſylueſtris*: of *Cordus*, *Chamæpeuce*.

¶ *The Temperature.*

Roſemarie is hot and drie in the ſecond degree, and alſo of an aſtringent or binding quality, as being compounded of diuers parts, and taking more of the mixture of the earthy ſubſtance.

¶ *The Vertues.*

Roſemarie is giuen againſt all fluxes of bloud; it is alſo good, eſpecially the floures thereof, for all infirmities of the head and braine, proceeding of a cold and moiſt cauſe; for they dry the brain, quicken the ſences and memorie, and ſtrengthen the ſinewie parts. A

Serapio witneſſeth, that Roſemarie is a remedie againſt the ſtuffing of the head, that commeth through coldneſſe of the braine, if a garland thereof be put about the head, whereof *Abin Meſuai* giueth teſtimonie. B

Dioſcorides teacheth that it cureth him that hath the yellow iaundice, if it be boiled in water and drunk before exerciſe, & that after the taking therof the patient muſt bathe himſelfe & drink wine. C

D The diſtilled water of the floures of Roſemarie being drunke at morning and euening firſt and laſt, taketh away the ſtench of the mouth and breath, and maketh it very ſweet, if there be added thereto, to ſteep or infuſe for certaine daies, a few Cloues, Mace, Cinnamon, and a little Anniſe ſeed.

E The Arabians and other Phyſitions ſucceeding, do write, that Roſemarie comforteth the brain the memorie, the inward ſenſes, and reſtoreth ſpeech vnto them that are poſſeſſed with the dumbe palſie, eſpecially the conſerue made of the floures and ſugar, or any other way confected with ſugar, being taken euery day faſting.

F The Arabians, as *Serapio* witneſſeth, giue theſe properties to Roſemarie: it heateth, ſay they, is of ſubtill parts, is good for the cold rheume which falleth from the braine, driueth away windines, prouoketh vrine, and openeth the ſtoppings of the liuer and milt.

G *Tragus* writeth, that Roſemarie is ſpice in the Germane Kitchins, and other cold countries. Further, he ſaith, that the wine boiled with Roſemarie, and taken of women troubled with the mother, or the whites, helpeth them, the rather if they faſt three or foure houres after.

H The floures made vp into plates with ſugar after the manner of Sugar Roſet and eaten, comfort the heart, and make it merry, quicken the ſpirits, and make them more liuely.

I The oile of Roſemarie chimically drawne, comforteth the cold, weake and feeble braine in moſt wonderfull maner.

K The people of Thuringia do vſe the wilde Roſemarie to prouoke the deſired ſickneſſe.

L Thoſe of Marchia vſe to put it into their drinke the ſooner to make their clients drunke, and alſo do put it into cheſts and preſſes among clothes, to preſerue them from mothes or other vermine.

† The vertues in the two laſt places properly belong to the *Roſmarinum ſylueſtre* of *Matthiolus*, which is the *Chamæpeuce* of *Cordus*, and is deſcribed in the 11. place of the foregoing Chapter, by the name of *Ciſtus Ledum Sileſiacum*.

Chap. 9. *Of Vpright Wood-binde.*

1 *Periclymenum rectum Sabaudicum.*
Sauoy Honiſuckles.

2 *Periclymenum rectum Germanicum;*
Germane Honiſuckles.

¶ The

¶ *The Deſcription.*

1 THis ſtrange kinde of Hony-ſuckle, found in the woods of Sauoy, repreſents vnto vs that ſhrub or hedge-buſh called *Cornus fœmina*, the Dog-berry tree, or Pricke-timber tree, hauing leaues and branches like the common Wood-binde, ſauing that this doth not clamber or clymbe as the others do, but contrariwiſe groweth vpright, without leaning to one ſide or other, like a ſmall tree or hedge-buſh: the floures grow vpon the tender ſprayes or twiggie branches by couples, not vnlike in ſhape and colour to the common Wood-binde, but altogether leſſer, and of a white colour, hauing within the ſame many hairy chiues like the other of his kinde: after which come red berries ioyned together by couples: the root is tough and wooddy.

2 The ſtalkes of the ſecond be oftentimes of a meane thickneſſe, the wooddy ſubſtance ſomwhat whitiſh and ſoft: the branches be round, and couered with a whitiſh barke, notwithſtanding in the beginning when the ſprayes be yong they are ſomewhat reddiſh. The leaues be long, like thoſe of the common Hony-ſuckle, ſoft, and of a white greene: on the lower ſide they be whiter, and a little hairy: the floures be leſſer than any of the Wood-bindes, but yet of the ſame faſhion, and of a whitiſh colour, ioyned together by couples vpon ſeuerall ſlender foot-ſtalkes, like little wilde Cherries, of a red colour, the one leſſer oftentimes than the other.

3 *Periclymenum rectum fructu cæruleo.*
Vpright Wood-binde with blew berries.

4 *Periclymenum rectum fructu rubro.*
Cherry Wood-binde.

3 This ſtrange kinde of Wood-binde, which *Carolus Cluſius* hath ſet forth in his Pannonicke Obſeruations, riſeth vp oftentimes to the height of a man, euen as the former doth; which diuides it ſelfe into many branches, couered with a rough blacke barke, that choppeth and gapeth in ſundrie clefts as the barke of the Oke. The tender branches are of a whitiſh greene colour, couered with a woolly hairineſſe, or an ouerworne colour, whereupon do grow leaues ſet by couples one againſt the other, like vnto the common Wood-binde, of a drying bitter taſte: the floures grow by couples likewiſe, of a whitiſh colour. The fruit ſucceedeth, growing like little Cherries, each one on his owne foot-ſtalke, of a bright and ſhining blew colour; which being bruiſed, doe die the hands of a reddiſh colour, and they are of a ſharpe winie taſte, and containe in them many ſmall flat ſeeds. The root is wooddy, diſperſing it ſelfe far abroad.

4 This

4 This kind of vpright Wood-bind groweth vp likewiſe to the height of a man, and oftentimes more high, like to the laſt deſcribed, but altogether greater. The berries hereof are very blacke, wherein eſpecially is the difference. ‡ The leaues of this are as large as Bay leaues, ſharpe pointed, greene aboue, and whitiſh vnderneath, but not hairy, nor ſnipt about the edges: the floures grow by couples, of a whitiſh purple, or wholly purple: to theſe paires of floures there commonly ſucceeds but one berry, larger than any of the former, of the bigneſſe of a little cherry, and of the ſame colour, hauing two marks vpon the top therof, where the floures ſtood. ‡

Periclymeni 3. & 4. flores.
The floures of the third and fourth.

5 *Chamæpericlymenum.*
Dwarfe Hony-ſuckle.

5 To the kindes of Wood-bindes this plant may likewiſe be referred, whoſe picture with this deſcription was ſent vnto *Cluſius* long ſince by that learned Doctor in phyſicke *Thomas Penny* (of our London colledge of famous memorie:) it riſeth vp with a ſtalke of a foot high; whereupon are ſet by couples faire broad leaues one right againſt another, ribbed with certaine nerues like thoſe of Plantaine, ſharpe pointed, and ſomewhat hollowed in the middle like Spoon-wort: from the boſome of which leaues come forth ſmall floures, not ſeene or deſcribed by the Author: after which commeth forth a cluſter of red berries, thruſt hard together as thoſe of Aaron or prieſts pint. The root is tough and very ſlender, creeping far abroad vnder the vpper cruſt of the earth, whereby it occupieth much ground.

¶ *The Place.*

Theſe plants are ſtrangers in England: they grow in the woods and mountaines of Switzerland, Germany, Sauoy, and other thoſe parts tending to the Eaſt, Eaſt North-Eaſt, and Eaſt and by South.

I haue a plant of the firſt kinde in my garden: the reſt as yet I haue not ſeene, and therefore cannot write ſo liberally thereof as I could wiſh.

‡ The dwarfe Hony-ſuckle growes in the maritime parts of Norway and Sweden, & the countries thereabout. ‡

¶ *The Time.*

They floure for the moſt part when the others do, that is to ſay in May and Iune, and their fruit is ripe in September.

¶ *The*

¶ *The Names.*

Vpright Wood-binde or Hony-ſuckle is called *Periclymenum ſtans*, and *Periclymenum rectum*, or vpright Wood-binde: of *Dodonæus*, *Xyloſteum*: in high-Dutch, **Hondts kirſen**, that is to ſay, *Canum Ceraſa*, or Dog Cherries. The Engliſh names are expreſſed in their ſeuerall titles. It hath bin called *Chamæceraſus*, but not truly.

¶ *The Temperature and Vertues.*

Touching the temperature and vertues of theſe vpright Wood-bindes, we haue no experience at all our ſelues, neither haue we learned any thing of others.

Chap. 10. *Of Sene.*

Sena foliis obtuſis.
Italian Sene.

¶ *The Deſcription.*

Sene bringeth forth ſtalks a cubit high, ſet with diuers branches: the leaues are long, winged, conſiſting of many ſmall leaues like thoſe of Liquorice, or of baſtard Sene: the floures come forth of the bottom of the wings, of colour yellow, ſtanding vpon ſlender foot-ſtalks; from which after the floures be gone hang forked cods, the ſame bowing inward like a halfe-moone, plain and flat, in which are contained ſeeds like to the ſeeds or kernells of grapes, of a blackiſh colour. The root is ſlender, long, and vnprofitable, which periſheth when the leaues are gathered for medicine, and the ſeeds be ripe, and muſt be ſowne againe the next yeare, euen as we do corne.

There is another kinde of Sene growing in Italy, like the other in each reſpect, ſauing that it is greater, and hath not that force in purging that the other hath.

¶ *The Place and Time.*

This is planted in Syria and Egypt, alſo in Italy, in Prouince in France, in Languedoc. It hardly groweth in high and low Germany, neither in England: it proſpereth in hot Regions, and cannot away with cold; for that cauſe it is in Italy ſowne in May, and continueth no longer than Autumne: the beſt is brought from Alexandria and Egypt. The Arabians were the firſt that found it out.

¶ *The Names.*

The Perſians call it *Abalzemer*, as *Meſue* his copy teacheth: the Apothecaries *Sena*, by which name it was knowne to *Actuarius* the Grecian, and to the later Latines: it is called in Engliſh, Sene.

¶ *The Temperature.*

Sene is of a meane temperature, neither hot nor cold, yet inclining to heate, and dry almoſt in the third degree: it is of a purging facultie, and that by the ſtoole, in ſuch ſort as it is not much troubleſome to mans nature, hauing withall a certaine binding qualitie, which it leaueth after the purging.

¶ *The Vertues.*

It voideth forth flegmaticke and cholericke humors, alſo groſſe and melancholike, if it be helped with ſomething tending to that end.

It is a ſingular purging medicine in many diſeaſes, fit for all ages and kindes. A

It purgeth without violence or hurt, eſpecially if it be tempered with Aniſe ſeed or other like ſweet ſmelling things added, or with gentle purgers or lenitiue medicines. It may be giuen in pouder, but commonly the infuſion thereof is vſed. B C

The

D The quantitie of the pouder is a dram weight, and in the infuſion, foure, fiue, or more. It may be mixed in any liquor.

E It is in the decoction or in the infuſion tempered with cold things in burning agues and other hot diſeaſes: in cold and long infirmities it is boyled with hot opening ſimples and ſuch like; or elſe it is ſteeped in wine, in which manner, as familiar to mans nature, it draweth forth gently by the ſtoole, almoſt without any kinde of paine, crude and raw humors.

F Moſt of the Arabians commend the cods, but our Phyſitions the leaues rather; for vnleſſe the cods be full ripe they ingender winde, and cauſe gripings in the belly. For they are oftentimes gathered before they be ripe, and otherwiſe eaſily fall away being ſhaken downe by the wind, by reaſon of their weake and ſlender ſtalks.

G Some alſo thinke that Sene is hurtfull to the ſtomacke, and weakneth the ſame, for which cauſe they ſay that Ginger or ſome ſweet kinde of ſpice is to be added, whereby the ſtomacke may be ſtrengthned. Likewiſe *Meſue* noteth that it is ſlow in operation, and therefore Salgem is to be mixed with it. Moreouer, Sene purgeth not ſo ſpeedily as ſtronger medicines do.

H Notwithſtanding it may be helped not only by Salgem, but alſo by other purging things mixed therewith, that is to ſay with ſimple medicines, as Rubarb, Agaricke, and others; and with compounds, as that which is called *Catholicon*, or the Electuarie *Diaphœnicon*, or that which is made of the iuyce of Roſes, or ſome other, according as the condition or qualitie of the diſeaſe and of the ſicke man requireth.

I The leaues of Sene are a familiar purger to all people, but they are windie, and do binde the bodie afterwards, very much diſquieting the ſtomack with rumbling and belching: for the auoiding of which inconuenience there muſt be added Cinnamon, Ginger, Anniſe ſeed, and Fennell ſeed, Raiſins of the Sun, and ſuch like that do breake winde, which will the better help his purging qualitie.

K Sene doth better purge when it is infuſed or ſteeped, than when it is boyled: for doubtleſſe the more it is boiled the leſſe it purgeth, and the more windie it becommeth.

L Take Borage, Bugloſſe, Balme, Fumitorie, of each three drams, Sene of Alexandria very wel prepared and pouned, two ounces, ſtrow the pouder vpon the herbes and diſtill them: the water that commeth thereof reſerue to your vſe to purge thoſe that liue delicately, being miniſtred in white wine, with ſugar, in condited confections, and ſuch dainty waies, wherein delicate and fine people do greatly delight: you may alſo (as was ſaid before) adde hereunto according to the maladie, diuers purgers, as Agaricke, Mirobalans, &c.

M The pouder of Sene after it is well prepared two ounces, of the pouder of the root of Mechoacan foure drams, pouder of Ginger, Aniſe ſeeds, of each a little, a ſpoonfull of Aniſe ſeeds, but a very little Ginger, and a modicum or ſmall quantitie of *Salgemmæ*: this hath beene proued a verie fit and familiar medicine for all ages and ſexes. The patient may take one ſpoonful or two thereof faſting, either in pottage, ſome ſupping in drink, or white wine. This is right profitable to draw both flegme and melancholy from the breſt and other parts.

N The leaues of Sene and Cammomil are put in baths to waſh the head.

O Sene opens the inward parts of the body which are ſtopped, and is profitable againſt all griefes of the principall members of the body.

P Take Sene prepared according to art one ounce, Ginger half a quarter of an ounce, twelue cloues, Fenell ſeed two drams, or in ſtead thereof Cinnamon and Tartar, of each halfe a dram, pouder all theſe; which done, take thereof in white wine one dram before ſupper, which doth maruellouſly purge the head.

Q Handle Sene in maner aboue ſpecified, then take halfe an ounce thereof, which don, adde thereto ſixty Raiſins of the Sunne with the ſtones pickt out, one ſpoonfull of Aniſe ſeeds braied, boile theſe in a quart of ale till one halfe be waſted, and while it is boiling put in your Sene: let it ſtand ſo till the morning, then ſtraine it, and put in a little Ginger: then take the one halfe of this potion and put thereunto two ſpoonfulls of ſyrrup of Roſes: drinke this together, I meane the one halfe of the medicine at one time, and if the patient canot abide the next day to receiue the other halfe, then let it be deferred vntil the third day after.

R Sene and Fumitorie (as *Raſis* affirmeth) do purge aduſt humors, and are excellent good againſt ſcabs, itch, and the ill affection of the body.

S If Sene be infuſed in whey, and then boyled a little, it becommeth good phyſicke againſt melancholy, clenſeth the braine and purgeth it, as alſo the heart, liuer, milt, and lungs, cauſeth a man to looke yong, ingendreth mirth, and taketh away ſorrow: it cleareth the ſight, ſtrengthneth hearing, and is very good againſt old feuers and diſeaſes ariſing of melancholy.

† There were formerly two figures in this chapter, which differed onely in that the firſt, which was the *Sena Orientalis*, had leſſer, narrower, and ſharper pointed leaues than the *Sena Italica*, which was the ſecond.

Chap. II. *Of baſtard Sene.*

¶ *The Deſcription.*

1 *Colutea* and Sene be ſo neere the one vnto the other in ſhape and ſhew, that the vnskilful Herbariſts haue deemed *Colutea* to be the right Sene. This baſtard Sene is a ſhrubby plant growing to the forme of a hedge buſh or ſhrubby tree: his branches are ſtraight, brittle, and wooddy; which being careleſly broken off, and as negligently prickt or ſtucke in the ground, will take root and proſper at what time of the yeare ſoeuer it be done; but ſlipt or cut, or planted in any curious ſort whatſoeuer, among an hundred one will ſcarcely grow: theſe boughes or branches are beſet with leaues like *Sena* or *Securidaca*, not much vnlike Liquorice: among which come forth faire broome-like yellow floures, which turne into ſmall cods like the ſownd of a fiſh or a little bladder, which will make a cracke being broken betweene the fingers: wherein are contained many blacke flat ſeeds of the bigneſſe of Tares, growing vpon a ſmall rib or ſinew within the cod: the root is hard, and of a wooddy ſubſtance.

1 *Colutea.*
Baſtard Sene.

2 *Colutea Scorpioides.*
Baſtard Sene with Scorpion cods.

2 Baſtard Sene with Scorpion cods is a ſmall wooddy ſhrub or buſh, having leaues, branches, and floures like vnto the former baſtard Sene, but leſſe in each reſpect: when his ſmall yellow floures are fallen there ſucceed little long crooked cods like the long cods or huſks of *Matthiolus* his *Scorpioides*, whereof it tooke his name: the root is like the root of the Box tree, or rather reſembling the roots of *Dulcamara* or Bitter-ſweet, growing naturally in the ſhadowie woods of Valena in Narbone; whereof I haue a ſmall plant in my garden, which may be called Scorpion Sene.

3 The low or dwarfe *Colutea* of *Cluſius* deſcription, hath a thicke wooddy root couered with a yellowiſh barke, with many fibres anexed thereto, which bringeth forth yearely new ſhoots, whereby it greatly encreaſeth, of a cubit and a halfe high, ſmooth, and of a greene colour; whereon doe grow leaues compoſed of ſix or ſeuen leaues, and ſometimes nine, ſet vpon a middle rib like thoſe of the common kinde, of a ſtipticke taſte, with ſome ſharpneſſe or biting: the floures grow vpon

ſlender

3 *Colutea ſcorpioides humilis.*
Dwarfe baſtard Sene.

4 *Colutea ſcorpioides montana Cluſij.*
Mountaine baſtard Sene.

5 *Colutea minima, ſiue Coronilla.*
The ſmalleſt baſtard Sene.

ſlender foot-ſtalkes, long and naked like thoſe of the Peaſe, and of a yellow colour, of little or no ſmell at all, and yet that little nothing pleaſant: after which come forth long cods, wherein is contained ſmall ſeed like thoſe of the Strangle Tare.

4 This mountaine baſtard Sene hath ſtalks, leaues, and roots like the laſt deſcribed. The floures grow on the tops of the branches in maner of a crowne; whereupon ſome haue called it *Coronilla*: in ſhape like thoſe of the peaſe, and of a yellow colour: the cods as yet we haue not ſeen, and therefore not expreſſed in the figure.

5 This ſmall baſtard Sene groweth like a ſmall ſhrub creeping vpon the ground, halfe a cubit high, bringing forth many twiggie branches, in maner of thoſe of the Spaniſh broome; wherupon do grow leaues like thoſe of Lentils or the Strangle Tare, with many ſmal leaues ſet vpon a middle rib, ſomewhat fat or full of iuice, of the colour of the leaues of Rue or Herbe-grace, of an aſtringent and vnpleaſant taſte: the floures grow at the tops of the branches, of a yellow colour, in ſhape like thoſe of the ſmalleſt broome: after which come little crooked cods like the clawes or toes of a bird, wherein is contained ſeed ſomwhat long, blacke, and of an vnſauorie taſte: the root is long, hard, tough, and of a wooddy ſubſtance.

6 There

6 There is alſo found another ſort hereof, not much differing from the former, ſauing that this plant is greater in each reſpect, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

Colutea or baſtard Sene groweth in diuers gardens, and commeth vp of ſeed; it quickly commeth to perfection, inſomuch that if a ſticke thereof be broken off and thruſt into the ground, it quickly taketh root, yea although it be done in the middle of ſummer, or at any other time, euen as the ſticks of Willow or Elder, as my ſelfe haue often prooued; the which bring forth floures and fruit the next yeere after.

The ſecond with Scorpion cods groweth likewiſe in my garden: the laſt doth grow in diuers barren chalky grounds of Kent towards Sittinbourne, Canturbury, and about Southfleet; I haue not ſeene them elſewhere: the reſt are ſtrangers in England.

¶ *The Time.*

They floure from May till ſummer be well ſpent, in the meane ſeaſon the cods bring forth ripe ſeed.

¶ *The Names.*

This ſhrub is called of *Theophraſtus* in Greeke κολουτεα with the diphthong ου in the ſecond ſillable: in Latine, as *Gaza* expoundeth it, *Coloutea* or *Colutea*: in high Dutch, **Welſch linſen**: in French, *Baguenaudier*: they are deceiued that thinke it to be *Sena*, or any kinde thereof, although we haue followed others in giuing it to name Baſtard Sene, which name is very vnproper to it: in low Dutch it is called **Sene boom**: and we may vſe the ſame name Sene tree, in Engliſh.

This *Calutea*, or baſtard Sene, doth differ from that plant κολυτεα with *υ* in the ſecond ſyllable, of which *Colytea*, *Theophraſtus* writeth in his third booke. ‡ The fifth is the *Polygala Valentina* of *Cluſius*. ‡

¶ *The Nature and Vertues.*

Theophraſtus, neither any other hath made mention of the temperature or faculties in working of theſe plants, more than that they are good to fatten cattell, eſpecially ſheepe. A

† There were formerly in the fifth and ſixth places here two figures no waies different, but that which was in the ſixth place was a little larger, and *Lobel* title which he puts in his *Icones*, ouer this was diuided betweene them for as you ſee, *Colutea minima, ſiue Coronilla*, was ouer in the fifth; and *Colutea, ſiue Polygala Valentina Cluſij* was ouer the ſixth.

Chap. 12. *Of Liquorice*

¶ *The Deſcription.*

1 THe firſt kinde of Liquorice hath many wooddy branches, riſing vp to the height of two or three cubits, beſet with leaues of an ouer-worne greene colour, conſiſting of many ſmall leaues ſet vpon a middle rib, like the leaues of *Colutea*, or the Maſtich tree, ſomewhat glutinous in handling: among which come ſmall knops growing vpon ſhort ſtems betwixt the leaues and the branches, cluſtering together, and making a round forme and ſhape: out of which grow ſmall blew floures, of the colour of an Engliſh Hyacinth; after which ſucceed round, rough, prickly heads, conſiſting of diuers rough or ſcaly huskes cloſely and thicke compact together; in which is contained a flat ſeed: the root is ſtraight, yellow within, and browne without: of a ſweet and pleaſant taſte.

2 The common and vſuall Liquorice hath ſtalkes and leaues very like the former, ſauing that his leaues are greener and greater, and the floures of a light ſhining blew colour: but the floures of this are ſucceeded by longiſh cods that grow not ſo thicke cluſtring together in round heads as the former, but ſpike faſhion, or rather like the wilde Vetch called *Onobrychu*, or *Galega*: the cods are ſmall and flat like vnto the Tare: the roots are of a browniſh colour without, and yellow within like Box, and ſweeter in taſte than the former.

¶ *The Place.*

Theſe plants do grow in ſundry places of Germany wilde, and in France and Spaine, but they are planted in gardens in England, whereof I haue plenty in my garden: the poore people of the North parts of England do manure it with great diligence, wherby they obtain great plenty thereof, replanting the ſame once in three or foure yeares.

¶ *The Time.*

Liquorice floureth in Iuly, and the ſeed is ripe in September.

1 *Glycyrrhiza Echinata* Dioſcoridis.
Hedge-hogge Licorice.

‡ 2 *Glycyrrhiza vulgaris.*
Common Licorice.

¶ *The Names.*

The firſt is called in Greeke γλυκυῤῥιζα: in Latine, *Dulcis radix*, or ſweet Root: this Licorice is not knowne either to the Apothecaries or to the vulgar people: we call it in Engliſh, *Dioſcorides* his Licorice.

It is moſt euident that the other is *Glycyrrhiza*, or Licorice: the Apothecaries call it by a corrupt word, *Liquiritia*: the Italians, *Regalitia*: the Spaniards, *Regeliza* and *Regalitia*: in high Dutch, **Sulzhotz, Sulzwurtzel:** in French, *Rigoliſſe, Raigaliſſe*, and *Regliſſe*: in low Dutch, **Calliſſiehout, ſuethout:** in Engliſh, common Licorice: *Pliny* calleth it *Scythica herba*: it is named *Scythice* of the countrey Scythia, where it groweth.

¶ *The Temperature.*

The Nature of *Dioſcorides* his Licorice, as *Galen* ſaith, is familiar to the temperature of our bodies, and ſeeing it hath a certaine binding quality adioined, the temperature thereof ſo much as is hot and binding, is ſpecially of a warme buality, comming neereſt of all to a meane temperature; beſides, for that it is alſo ſweet, it is likewiſe meanely moiſt.

For as much as the root of the common Licorice is ſweet, it is alſo temperately hot and moiſt; notwithſtanding the barke thereof is ſomething bitter and hot, but this muſt be ſcraped away; the freſh root when it is full of juice doth moiſten more than the dry.

¶ *The Vertues.*

A The root of Licorice is good againſt the rough harſhneſſe of the throat and breſt; it openeth the pipes of the lungs when they be ſtuffed or ſtopped, and ripeneth the cough, and bringeth forth flegme.

B The iuice of Licorice made according to Art, and hardned into a lumpe, which is called *Succus Liquiritiæ*, ſerueth well for the purpoſes aforeſaid, being holden vnder the tongue, and there ſuffered to melt.

C Moreouer, with the juice of Licorice, Ginger, and other ſpices, there is made a certaine bread or cakes, called Ginger-bread, which is very good againſt the cough, and all the infirmities of the lungs and breſt: which is caſt into moulds, ſome of one faſhion, and ſome of another.

D The iuice of Licorice is profitable againſt the heate of the ſtomacke, and of the mouth.

The

The ſame is drunke with wine of Raiſons againſt the infirmities of the liuer and cheſt, ſcabs or ſores of the bladder, and diſeaſes of the kidneyes. E

Being melted vnder the tongue it quencheth thirſt: it is good for greene wounds being layed thereupon, and for the ſtomacke if it be chewed. F

The decoction of the freſh roots ſerueth for the ſame purpoſes. G

But the dried root moſt finely poudered is a ſingular remedie for a pin and a web in the eye, if it be ſtrewed thereupon. H

Dioſcorides and *Pliny* alſo report, that Liquorice is good for the ſtomack and vlcers of the mouth, being caſt vpon them. I

It is good againſt hoarſeneſſe, difficultie of breathing, inflammation of the lungs, the pleuriſie, ſpitting of bloud or matter, conſumption or rottennes of the lungs, all infirmities and ruggednes of the cheſt. K

It takes away inflammations, mitigateth and tempereth the ſharpneſſe and ſaltnes of humors, concocteth raw humors, and procureth eaſie ſpitting. L

The decoction is good for the kidnies and bladder that are exulcerated.

It cureth the ſtrangurie, and generally all infirmities that proceed of ſharpe, ſalt, and biting humors. M

Theſe things concerning Liquorice hath alſo *Theophraſtus: viz.* that with this and with cheeſe made of Mares milke the Scythians were reported to be able to liue eleuen or twelue dayes. N

The Scythian root is good for ſhortneſſe of breath, for a dry cough, and generally for all infirmities of the cheſt. O

Moreouer, with honey it healeth vlcers, it alſo quencheth thirſt if it be held in the mouth: for which cauſe they ſay that the Scythians do liue eleuen or twelue dayes with it and *Hippace*, which is cheeſe made of Mares milke, as *Hippocrates* witneſſeth. P

Pliny in his twenty fifth booke, chap. 8. hath thought otherwiſe than truth, that *Hippace* is an herbe ſo called. Q

† Both the figures formerly were of the firſt deſcribed.

CHAP. 13. *Of Milke Trefoile or Shrub Trefoile.*

¶ *The Kindes.*

THere be diuers kindes or ſorts of the ſhrubby Trefoile, the which might very well haue paſſed among the three leaued Graſſes, had it not beene for my promiſe in the proeme of our firſt part, That in the laſt booke of our Hiſtory the ſhrubbie or wooddy plants ſhould be ſet forth, euerie one as neere as might be in kindred and neighbourhood.

¶ *The Deſcription.*

† 1 THe firſt kinde of *Cytiſus* or ſhrubby Trefoile growes to the forme of a ſmall ſhrub or wooddy buſh two or three cubits high, branching into ſundry ſmall boughes or armes, ſet full of leaues like the ſmall Trefoile, darke greene, and not hairie, three growing alwaies together: among theſe come forth ſmal yellow floures like them of French Broome, which doe turne into long and flat cods, containing ſmall ſeed of a blackiſh colour.

2 The ſecond kinde of *Cytiſus* is likewiſe a ſmall ſhrub, in ſhape after the manner of the former, but that the whole plant is altogether ſmaller, and the leaues rounder, ſet together by couples, and the ſmall cods hairy at the ends, which ſets forth the difference. ‡ The leaues of this are almoſt round, and grow three together cloſe to the ſtalke: they are ſmooth, of a freſh greene, and the middlemoſt leafe of the three is the largeſt, and ends in a ſharpe point: the floures are of the bigneſſe and colour of the *Trifolium corniculatum*: it floures in May. ‡

3 The root of this third kinde is ſingle, from whence ſpring vp many ſmooth brittle ſtalks diuided into many wings and branches, whereon grow greene leaues ſmaller than thoſe of medow Trefoile: the floures are yellow, leſſer than Broome floures, otherwiſe very like, growing about the tops of the twiggie branches, diuided into ſpoky tufts: which being vaded, there follow thinne long narrow cods, leſſer than thoſe of the Broome, wherein is contained ſmall blacke ſeed. The root is long, deeply growing into the ground, and ſometimes waxeth crooked in the earth. ‡ This alſo hath ſmooth green leaues, and differs little (if any thing at all) from the firſt deſcribed, wherefore I thought it needleſſe to giue a figure. Our Author called it *Cytiſus ſiliquoſus*, Codded ſhrub Trefoile, becauſe one of the branches was fairely in the figure expreſt with cods; I know no other reaſon, for all the *Cytiſi* are codded as well as this. ‡

1 *Cytiſus.*
The firſt ſhrub Trefoile.

2 *Cytiſus.*
The ſecond ſhrub Trefoile.

4 *Cytiſus hirſutus.*
Hairy ſhrub Trefoile.

5 *Cytiſus incanus.*
Hoary ſhrub Trefoile.

4 The fourth kinde of *Cytiſus* hath a great number of ſmall branches and ſtalkes like the former, but it is a lower plant, and more woolly; whoſe ſtalks and branches grow not very high, but yet very plentifully ſpred about the ſides of the plant: the leaues are greater than the former, but leſſer than thoſe of medow Trefoile: the floures grow cloſe together, as though they were bound vp or compact into one head or ſpokie tuft ſomewhat greater than the former: the cods are alſo greater, and more hairy: the root groweth very deepe into the ground, whereunto are adioyned a few fibres: it falleth out to be more hairy or woolly in one place than in another, and the more hairie and woolly that it is, the whiter it waxeth; for the roughneſſe bringeth it a certain whitiſh colour. ‡ The branches of this oft times lie along vpon the ground: the leaues are ſmooth and greene aboue, and hoarie vnderneath: the floures yellow, which fading ſometimes become orange coloured: the cods are round, and ſeeds browniſh. ‡

5 The fifth kinde of *Cytiſus* groweth to the height of a cubit or more, hauing many ſlender twiggy branches like Broome, ſtreaked and very hard: whereupon grow leaues very like Fenugreeke, yet all hoary, three together: from the boſome of which, or betweene the leaues and the ſtalkes, come forth yellow floures very like Broome, *Spartum*, or Peaſe, but ſmaller: the cods be like vnto Broome cods, of an aſh colour, but ſlenderer, rougher, and flatter; in the ſeueral cels or diuiſions whereof are contained bright ſhining ſeeds like the blacke ſeeds of Broome: all the whole plant is hoarie like *Rhamnus* or *Halymus*.

6 Cytiſus Pinnatus.
Winged ſhrub Trefoile.

7 Cytiſus 7. Cornutus.
The Horned ſhrub Trefoile.

6 The ſixth kinde of *Cytiſus* or buſh Trefoile groweth to the height of a tall man, with long ſtalkes couered ouer with a blackiſh barke, and a few boughes or branches, beſet or garniſhed with leaues like the common Trefoile, but ſmaller, growing alſo three together, whereof the middlemoſt of the three leaues is twice as long as the two ſide leaues; the vpper ſide whereof is green, and the lower ſide ſomwhat reddiſh and hairie: the floures grow along the ſtalks almoſt from the bottome to the top, of a golden yellow colour, faſhioned like the Broome floure, but greater than any of the reſt of his kinde, and of a reaſonable good ſauour: the ſeed hath the pulſie taſte of *Cicer*.

7 The ſeuenth kinde of *Cytiſus* hath many tough and hairy branches riſing from a wooddie root, foure or fiue cubits high, which are diuided into ſundry ſmaller branches beſet with leaues like the medow Trefoiles; among which come forth yellow floures like Broome, that turne into

crooked flat cods like a ſickle; wherein is contained the ſeed taſting like *Cicer* or *Legumen*. The whole plant is hoarie like *Rhamnus*, and being broken or bruiſed ſmelleth like Rocket.

8 This eighth kinde of *Cytiſus*, which *Pena* ſetteth forth, is doubtleſſe another kinde of *Cytiſus*, reſembling the former in leaues, floures, and cods, ſauing that the ſmall leaues (which are alwaies three together) are a little ſnipt about the edges: the whole plant is ſlenderer, ſofter, and greener, rather reſembling an herbe than a ſhrub: the root is ſmall and ſingle.

9 This baſtard or miſ-begotten ſhrub Trefoile, or baſtard *Cytiſus*, groweth vp like a ſhrub, but not of a wooddy ſubſtance, hauing tender ſtalks ſmooth and plaine: whereon do grow hairy leaues like the other, diuers ſet vpon one foot-ſtalke, contrarie to all the reſt: the floures grow along the ſtems like thoſe of the ſtocke Gilloflours, of a yellow colour: the root is tough and wooddy.

8 *Cytiſus* 8.
The eighth ſhrub Trefoile.

9 *Cytiſus adulterinus, ſiue Alyſſon fruticans.*
Baſtard ſhrub Trefoile.

¶ *The Place.*

Theſe plants were firſt brought into Italy and Greece from one of the Iſles of Cyclades, called Cyntho or Cynthuſa, and ſince found in many places of France, as about Montpelier, Veganium, and other places: they are ſtrangers in England, though they grow very plentifully in Scotland, as it is reported; whereof I haue two ſorts in my garden, that is to ſay, *Cytiſus Maranthæ*, or the horned *Cytiſus*, and likewiſe one of the ſmalleſt, that is to ſay, the third in number. ‡ The ſecond groweth in the garden of M^r. *Iohn Tradeſcant*. ‡

¶ *The Time.*

Theſe plants floure for the moſt part in May, Iune, and Iuly, and ſome after: the ſeed is ripe in September.

¶ *The Names.*

The Grecians and Latines do call this ſhrub κυτισος of Cynthuſa an Iſland before mentioned, in which place they are in great eſtimation for that they do ſo wonderfully feed cattell, and encreaſe milke in their dugs, nouriſh ſheepe and goats, which bring yong ones good for ſtore and increaſe. One Author doth call theſe plants in Greeke κυησιμον, that is to ſay in Latine *Fœcundum fœnum*, fertile or fruitfull Hay, for that the kindes hereof cauſe milke to encreaſe, maketh good bloud and iuice, augmenteth ſtrength, and multiplieth the naturall ſeed of generation: they may be called in Engliſh, milke Trefoile, of the ſtore of milke which they encreaſe.

¶ *The*

¶ *The Temperature.*

The leaues of milke Trefoile do coole, as *Dioſcorides* writeth; they aſſwage ſwellings in the beginning, if they be ſtamped and laid vnto them with bread: the decoction thereof drunke prouoketh vrine: *Galen* teacheth, that the leaues of Milke Trefoile haue a digeſting or waſting qualitie mixed with a waterie and temperate facultie, as haue thoſe of the Mallow.

¶ *The Vertues.*

Women, ſaith *Columella*, if they want milke muſt ſteepe dry milke Trefoile in faire water, and A when it is throughly ſoked, they muſt the next day mix a quart or thereabouts of the ſame preſſed or ſtrained forth with a little wine, and ſo let it be giuen vnto them to drinke, and by that meanes they themſelues ſhall receiue ſtrength, and their children comfort by abundance of milke.

Hippocrates reckoneth vp Milk-Trefoile among thoſe things that encreaſe milke, in his booke of B the Nature of women, and of womens diſeaſes.

Alſo *Ariſtomachus* of Athens in *Pliny*, commandeth to giue with wine the dry plant, and the ſame C likewiſe boiled in water, to nurſes to drinke when their milke is gone.

Democritus and *Ariſtomachus* do promiſe that you ſhall want no Bees, if you haue milke Trefoile D for them to feed on: for all writers with one conſent do conclude (as *Galen* ſaith) that Bees doe gather of the floures of Milke Trefoile very great ſtore of honie.

Columella teacheth, that Milke Trefoile is notable good for hennes, Bees, Goats, Kine, and all E kinde of Cattell, which quickely grow fat by eating thereof, and that it yeeldeth very great ſtore of milke.

The people of Betica and Valentia (where there is great ſtore of *Cytiſus*) doe vſe it very much F for the Silke Worms to hang their web vpon after they haue been well fed with the leaues of Mulberries.

Milke Trefoile is likewiſe a maruellous remedie againſt the Sciatica, and all other kindes of G gouts.

† The deſcription that formerly was in the firſt place belonged to that deſcribed and figured in the ſeuenth.

Chap. 12. *Of Baſtard Milke-Trefoiles.*

¶ *The Deſcription.*

1 THis riſeth vp with little ſtalks from the root, brittle, very many in number, parted into wings and branches, about which grow many leaues leſſer than thoſe of the medow Trefoile, of colour greene: the floures about the tops of the twigs be orderly placed in maner like ears, of colour yellow, leſſer than thoſe of broom, otherwiſe all alike: in their places grow vp ſlender cods long, narrow, and leſſer than the cods of Broome: rough alſo and hairy; in which do lie little blackiſh ſeeds: the root is long, and groweth deepe, and oftentimes creepeth aſlope.

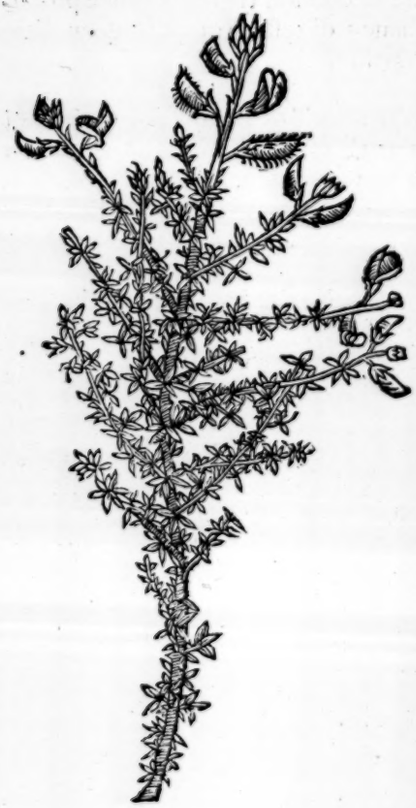
2 The ſecond kinde of baſtard Milke-Trefoile is like vnto the former in plentifull ſtalkes and twigges, but that it is lower and more downie; neither doe the ſtalkes thereof ſtand vpright, but rather incline to the one ſide: the leaues alſo are ſomewhat greater, but yet leſſer than thoſe of the medow Trefoile, wholly white, and they neuer open themſelues out, but keep alwaies folded with the middle rib ſtanding out: the floures likewiſe be cloſelier ioined together, and compacted as it were into a little head, and be alſo ſomething greater: the cods in like manner are a little bigger and hairy, and of a blackiſh purple or murrey: the root groweth deepe in the ground, being diuided into a few ſprigs; it oftentimes happeneth to grow in one place more hairie or downie than in another: the more hairie and downie it is, the more white and hoarie it is; for the hairineſſe doth alſo bring with it a certaine whitiſh colour.

3 The third kinde of baſtard Milke Trefoile bringeth forth a companie of young ſhoots that are ſomewhat writhed and crooked, long leaues of a faire greene colour: the floures are cloſed together, long, white, or elſe galbineous, ſweetly ſmelling, that is to ſay, hauing the ſmel of honie: the ſhrub it ſelfe is alwaies greene both Sommer and Winter. ‡ This growes ſome foot or better high, with ſlender hoarie branches, ſet with leaues three ſtanding together vpon a very ſhort ſtalke, and the middle leafe is as long againe as the other two; they are very white and hoarie, and the yellow floures grow out of the boſomes of the leaues all alongſt the ſtalks. This is that mentioned in the vertues of the former chapter at *F* for the Silke wormes to worke vpon. ‡

4 The fourth ſhrub is likewiſe one of the wilde kinde, though in face and ſtature like the ma-

nured

1 *Pſeudocytiſus* 1.
The firſt baſtard ſhrub Trefoile.



2 *Pſeudocytiſus* 2.
The 2. baſtard ſhrub Trefoile.

3 *Cytiſus ſemper virens.*
The euer-greene ſhrub Trefoile.

4 *Pſeudocytiſus hirſutus.*
The hairie baſtard tree Trefoile.

nured *Cytiſus*: It groweth vp like a ſmall ſhrub or hedge buſh to the height of two or three yards; on whoſe branches do grow three rough or hairie leaues, ſet vpon a ſlender foot-ſtalke, of a graſſe greene colour aboue, with a reddiſh hairineſſe below: the floures grow alongſt the ſtalks from the middle to the toppe, of a bright ſhining yellow colour: the root is likewiſe wooddie.

¶ *The Place.*

Theſe kindes of Milke Trefoiles are found in Morauia, ſo called in our age, which in times paſt was named *Marcomannorum prouincia*, and in the vpper Pannonia, otherwiſe called Auſtria, neere to high waies, and in the borders of fields; for they ſeeme after a ſort to ioy in the ſhade. ‡ Theſe grow (according to *Cluſius*) in ſundry parts of Spaine. ‡

¶ *The Time.*

They floure eſpecially in Iune and Iuly.

¶ *The Names.*

It is euident enough that they are baſtard kindes of Milke Trefoiles, and therefore they may be called and plainly termed *Pſeudocytiſi*, or baſtard Milke Trefoiles, or *Cytiſi ſylueſtres*, that is to ſay, wilde Milke Trefoiles.

¶ *The Temperature and Vertues.*

What temperature theſe ſhrubs are of, or what vertues they haue we know not, neither haue wee as yet found out by our owne experience any thing, and therefore they may be referred to the other Milke-Trefoiles.

Chap. 15. *Of the venomous Tree Trefoile.*

† 1 *Dorycnium Monſpelienſium.*
The venomous Trefoile of Montpelier.

2 *Dorycnium Hiſpanicum.*
The venomous Trefoile of Spain.

¶ *The Deſcription.*

1 THe venomous tree Trefoile of Montpelier hath many tough and pliant ſtalkes, two or three cubits high, diuided into ſundry ſmall twiggie braunches, beſet with leaues three together

together, placed from ioint to ioint by ſpaces, ſomewhat hoarie, very like vnto the leaues of *Cytiſus*, or Rue: among which come forth many ſmall moſſie white floures, tuft faſhion, in ſmall bundles like Noſe-gaies, and very like the floures of the Oliue or Oke tree, which turne into ſmall roundiſh bladders, as it were made of parchment: wherein is contained blacke ſeed like wilde *Lotus*, but in taſte like the wilde tare: the whole plant is of an vnſauorie ſmell; the root is thicke, and of a wooddie ſubſtance.

2 The Spaniſh venomous Trefoile hath a wooddie ſtalke, rough and hoary, diuided into other ſmall branches, whereon do grow leaues like the precedent: the floures grow on the tops of the branches, whereon do grow leaues like thoſe of the Peaſe, and of a yellow, or rather greeniſh colour, wherein it differeth from the precedent.

¶ *The Place.*

Theſe venomous Trefoiles grow in Narbone, on the barren and ſtonie craggie mountaines, at Frontignana, and about the ſea coaſts, and are ſtrangers in England.

¶ *The Time.*

They flouriſh from May to the end of Iune.

¶ *The Names.*

Dorycnium, or Δόρυκνιον, is that poiſonous or venomous plant wherewith in times paſt they vſed to poiſon their arrow heads, or rather weapons, thereby to do the greater hurt vnto thoſe whom they did aſſaile or purſue, whereupon it tooke his name: great controuerſie hath been among Herbariſts, what manner of plant *Dorycnium* ſhould be; ſome ſaying one thing, and ſome another: which controuerſies and ſundry opinions are very well confuted by the true cenſure of *Rondeletius*, who hath for a definitiue ſentence ſet downe the plant deſcribed for the true *Dorycnium*, and none other, which may be called in Engliſh, Venomous tree Trefoile. ‡ Theſe plants do not ſufficiently anſwer to the deſcription of *Dioſcorides*, neither can any one ſay certainly, that they are poiſonous. ‡

¶ *The Temperature.*

Dorycnium is very cold, without moiſtning.

¶ *The Vertues.*

A Venomous Trefoile hath not one good qualitie that I can reade of, but it is a peſtilent venomous plant, as hath been ſaid in the deſcription.

‡ The figures were formerly tranſpoſed.

Chap. 16. *Of the ſhrub Trefoile called alſo Makebate.*

Polemonium ſive Trifolium fruticans.
Shrubby Trefoile, or yellow Iaſmine.

¶ *The Deſcription.*

THis ſhrubby plant called *Polemonium*, hath many wooddie twigges, growing vnto the height of foure or fiue cubits, hauing ſmall twiggie branches, of a darke green colour, garniſhed with ſmall leaues of a deepe greene colour, alwaies three ioined together vpon little footſtalks, like the *Cytiſus* buſh, or the field Trefoile, but ſmaller: the floures be yellow, and round, diuided into fiue or ſix parts, not much vnlike the yellow Iaſmine, which hath cauſed many to call it yellow Iaſmine, euen vnto this day: when the floures be vaded, there ſucceed ſmall round berries as big as a Peaſe, of a black purpliſh colour when they be ripe, which being broken will die or colour the fingers like Elder Berries: within theſe berries are contained a ſmall flat ſeed, like vnto Lentils: the root is long and ſmall, creeping hither and thither vnder the earth, putting forth new ſprings or ſhoots in ſundry places, whereby it wonderfully increaſeth.

¶ *The Place.*

It groweth plentifully in the countrey of Montpellier at New Caſtle vpon the drie hills, and hot banks of the Oliue fields, and in the ſtony fields and wood of Gramuntium: it growes in my garden, and in other Herbariſts gardens in England.

¶ *The*

¶ *The Time.*

It floureth in Sommer: the ſeed is ripe in Autumne; the ſhrub it ſelfe is alwaies greene, and hath a laſting root.

¶ *The Names.*

Moſt do call it *Cytiſus*, but we had rather name it *Trifolium fruticans*: for it doth not agree with *Cytiſus* or Milk-Trefoile, as in the chapter before it is plaine enough by his deſcription, vnleſſe it be *Cytiſus Marcelli*, or *Marcellus* his Milke-Trefoile, with which peraduenture it might be thought to haue ſome likeneſſe, if the floures which are yellow were white, or *galbineous*, that is to ſay, blew.

There be diuers alſo that take this Trefoile to be *Polemonium*, foraſmuch as the leaues hereof ſeeme to be ſomewhat like thoſe of common Rue, but *Polemonium* hath not the leafe of common Rue, otherwiſe called Herb-grace, but of the other, that is to ſay, of S. Iohns Rue: it is called in Engliſh, ſhrubby Trefoile, or Make-bait.

¶ *The Temperature.*

Polemonium is of temperature dry in the ſecond degree, with ſome Acrimonie or ſharpneſſe.

¶ *The Vertues.*

This ſhrubby plant hath ſo many ſingular and excellent vertues contained in it, that ſome haue A
called it by the name *Chiliodunamis*, that is, hauing an hundred properties.

It is very effectuall againſt the ſtinging of Scorpions, and (as ſome write) if a man hold it in his B
hand, he cannot be hurt with the biting of any venomous beaſt.

Being taken in vineger it is very good for thoſe that are ſpleneticke, and whoſe ſpleen or Milt is C
affected with oppilations or ſtoppings.

If the root be taken in wine it helpeth againſt the bloudy flix, it prouoketh vrine being drunke D
with water, ſcoureth away grauell, and eaſeth the paine and ache called the Sciatica.

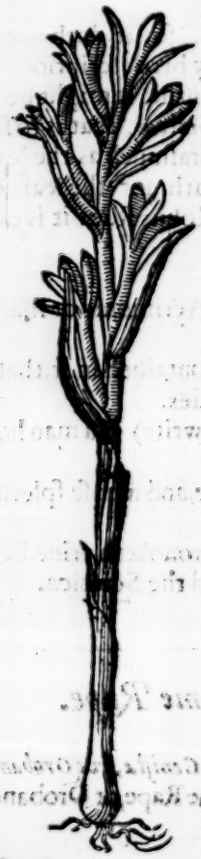
Chap. 17. *Of Broome, and Broome Rape.*

1 *Geniſta.*
Broome.

2 *Rapum Geniſta, ſive Orobanche.*
Broome Rape, or Orobanch.

¶ *The*

‡ *Orobanche Monſpeliaca flo. oblongis.*
Long floured Broome Rape.



‡ *Orobanche ramoſa.*
Branched Broome Rape.

‡ *Orobanche flore maiore.*
Great floured Broome Rape.

¶ *The Deſcription.*

1 BRoome is a buſh or ſhrubby plant, it hath ſtalkes or rather woddie branches: from which do ſpring ſlender twigs, cornered, greene, tough, and that be eaſily bowed, many times diuided into ſmall branches: about which do grow little leaues of an obſcure green colour, and braue yellow floures; and at the length flat cods, which being ripe are blacke, as be thoſe of the common Vetch, in which do lie flat ſeeds, hard, ſomething browniſh, and leſſer than Lentils: the root is hard and wooddie, ſending forth diuers times another plant of the colour of an Oken leafe, in ſhape like vnto the baſtard Orchis, called Birds neſt, hauing a root like a Turnep or Rape, whereupon it is called *Rapum Geniſta*, or Broom Rape.

2 This is a certaine bulbed plant growing vnto the roots of broome, big below, and ſmaller aboue, couered with blackiſh ſcales, and of a yelowiſh pulpe within: from which doth riſe a ſtalke a ſpan long, hauing whitiſh floures about the top, like almoſt to thoſe of Dead Nettle: after which grow forth long, thicke, and round husks, in which are contained very many ſeeds, and good for nothing: the whole plant is of the colour of the Oken leafe.

‡ Of

3 *Geniſta Hiſpanica.*
Spaniſh Broome.

5 *Chamageniſta Anglica.*
Engliſh Dwarfe Broome.

6 *Chamageniſta Pannonica?*
Dwarfe broome of Hungarie.

‡ Of this *Orobanche* or Broome Rape there are ſome varieties obſerued and ſet forth by *Lobel* and *Cluſius*: the firſt of theſe varieties hath longer and ſmaller floures than the ordinarie. The ſecond hath larger floures, and thoſe of a blewiſh colour, and is ſometimes found among corne. The third is parted towards the top into ſundry branches; the floures of this are either blew, purpliſh, or elſe white, and it willingly growes among hempe. ‡

3 The Spaniſh Broome hath likewiſe wooddy ſtems, from whence grow vp ſlender pliant twigs, which be bare and naked without leaues, or at the leaſt hauing but few ſmall leaues, ſet here and there far diſtant one from another, with yellow floures not much vnlike the floures of common Broome, but greater, which turne into ſmall long cods, wherein is conteined browne and flat ſeed: the roote is tough and wooddy.

4 Small leafed or thin leafed Broome hath many tough pliant ſhoots riſing out of the ground, which grow into hard and tough ſtalks, which are diuided into diuers twiggy branches whereon doe grow very ſmall thin leaues, of a whitiſh colour; whereupon ſome haue called it *Geniſta alba*, white Broome: the floures grow at the top of the ſtalkes, in ſhape like thoſe of the common Broom, but of a white colour, wherein it ſpecially differeth from the other Broomes.

5 English Dwarfe Broome hath many twiggy branches, very greene, tough, somewhat straked or cornered, leaning toward the ground: whereon do grow leaues set without order, sometimes two together, and often three or foure growing fast together, like vnto the common Broome, greene on the vpper side, hoary vnderneath, and of a bitter taste: among which leaues come forth yellow floures like those of common Broome, but lesser, of little or no smell at all: after which appeare small cods somewhat hairy, wherein is contained small seed: the root is tough and woody. ‡ *Bauhine* iudges these two last described to be onely varieties of the common Broome, to whose opinion I do much incline, yet I haue let our Authrs description stand, together with the figure of this later, which seemingly expresseth the greatest difference. ‡

6 The Dwarfe Broome of Hungary hath stalkes and yellow floures like those of the last described: the leaues hereof are different, they are longer, and more in number: the whole plant is altogether greater, wherein especially consisteth the difference.

¶ *The Place.*

The common Broome groweth almost euery where in dry pastures and low woods.

The Broome Rape is not to be found but where Broome doth grow; it groweth in a Broome field at the foot of Shooters hill next to London; vpon Hampstead Heath, and in diuers other places.

Spanish Broome groweth in diuers kingdomes of Spaine and Italy; we haue it in our London gardens.

The White Broome groweth likewise in Spaine and other hot regions; it is a stranger in England; of this *Titus Calphurnius* makes mention in his second Eclog of his Bucolicks, writing thus:

Cernis vt, ecce pater, quas tradidit Ornite vaccæ
Molle sub hirsuta latus explicuere genista.

See father, how the Kine stretch out their tender side
Vnder the hairy broome, that growes in fields so wide.

¶ *The Time.*

Broome floureth in the end of Aprill or May, and then the young buds of the floures are to be gathered, and laid in pickle or salt, which afterwards being washed or boyled, are vsed for sallads, as Capers be, and be eaten with no lesse delight: the cods and seeds be ripe in August; the Rape appeareth and is seene especially in the moneth of Iune.

The Spanish Broome doth floure sooner, and is longer in flouring.

¶ *The Names.*

This shrub is called in Latine, *Genista*, or as some would haue it *Genesta*: in Italian, *Genestra*: in Spanish likewise *Genestra*, or *Giestra*: in high Dutch, Pfrimmen: in low Dutch, Brem: in French, *Genest*: in English, Broome. ‡ The Spanish Broome by most writers is iudged to be the *Spartium* of *Dioscorides*. ‡

¶ *The Temperature and Vertues.*

A The twigs, floures, and seeds of Broome are hot and dry in the second degree: they are also of a thin essence, and are of force to clense and open, and especially the seed, which is dryer and not so full of superfluous moisture.

B The decoction of the twigs and tops of Broome doth clense and open the liuer, milt, and kidnies.

C It driueth away by the stoole watery humours, and therefore it is wholesome for them that haue the dropsie, especially being made with wine; but better for the other infirmities with water.

D The seed also is commended for the same purposes.

E There is also made of the ashes of the stalkes and branches dryed and burnt, a lie with thin white wine, as Rhenish wine, which is highly commended of diuers for the greene sickenesse and dropsie, and this doth mightily expell and driue forth thin and watery humors together with the vrine, and that by the bladder; but withall it doth by reason of his sharpe quality many times hurt and fret the intrailes.

F *Mesue* saith, that there is in the floures and branches a cutting moisture, but full of excrements, and therefore it causeth vomit: and that the plant doth in all his parts trouble, cut, attenuate, and violently purgeth by vomit and stoole, flegme and raw humours out of the ioints.

G But these things are not written of Broome, but of *Spartum*, which purgeth by vomit, after the manner of Hellebor, as both *Dioscorides* and *Pliny* do testifie.

H *Mesue* also addeth, that Broome doth breake the stone of the kidnies and bladder, and suffereth not the matter whereof the stone is made to lie long, or to become a stone.

I The young buds or little floures preserued in pickle, and eaten as a sallad, stir vp an appetite to meate and open the stoppings of the liuer and milt.

The

The ſame being fully blowne, ſtamped and mixed with ſwines greaſe, do eaſe the paine of the gout. L

And *Meſue* writeth, that this tempered with honie of Roſes, or with an egge, doth conſume away the Kings-euill. M

The Rape of the Broom or Broome Rape, being boyled in wine, is commended againſt the pains of the kidnies and bladder, prouoketh vrine, breaketh the ſtone, and expelleth it. N

The iuice preſſed forth of Broom rape healeth green wounds, and clenſeth old and filthy vlcers: the later Phyſitions do affirme that it is alſo good for old venomous and malicious vlcers. O

That worthy Prince of famous memorie *Henry* 8. King of England, was woont to drinke the diſtilled water of Broome floures, againſt ſurfets and diſeaſes thereof ariſing. P

Sir *Thomas Fitzherbert* Knight, was woont to cure the blacke iaundice with this drinke onely. Q

Take as many handfuls (as you thinke good) of the dried leaues of Broom gathered and brayed to pouder in the moneth of May, then take vnto each handfull of the dried leaues, one ſpoonful and a halfe of the ſeed of Broom braied into pouder: mingle theſe together, and let the ſicke drinke thereof each day a quantitie, firſt and laſt, vntill he finde ſome eaſe. The medicine muſt be continued and ſo long vſed, vntil it be quite extinguiſhed: for it is a diſeaſe not very ſuddenly cured, but muſt by little and little be dealt withall. R

Orobanch or Broom rape ſliced and put into oyle Oliue, to infuſe or macerate in the ſame, as ye do Roſes for oile of Roſes, ſcoureth and putteth away all ſpots, lentils, freckles, pimples, wheals and puſhes from the face, or any part of the body, being annointed therewith. S

Dioſcorides writeth, that Orobanch may be eaten either raw or boiled, in manner as we vſe to eat the ſprigs or young ſhoots of *Aſparagus*. T

The floures and ſeeds of Spaniſh Broome are good to be drunke with Mead or honied water in the quantitie of a dram, to cauſe one to vomite with great force and violence, euen as white Hellebor, or neeſing pouder. V

If it be taken alone, it looſeneth the belly, driueth forth great quantitie of waterie and filthie humours. X

Chap. 18. *Of baſe Broome or greening weed.*

¶ *The Deſcription.*

1 THis baſe kinde of Broom called Greene weed or Diers weed, hath many tough branches proceeding from a wooddie root: whereon do grow great ſtore of leaues, of a deep green colour, ſomewhat long like thoſe of Flax: the floures grow at the top of the branches not much vnlike the leaues of Broome, but ſmaller; of an exceeding faire yellow colour, which turne into ſmall flat cods, wherein is contained a little flat ſeed.

2 *Carolus Cluſius* ſetteth forth another kinde of Broome, which *Dodonæus* calleth *Geniſtatinctoria*, being another ſort of Diers weed: it groweth like the Spaniſh Broome: vpon whoſe branches do grow long and ſmall leaues like Flax, greene on the vpper ſide, and of an hoarie ſhining colour on the other. The floures grow at the top of the ſtalks, ſpike faſhion, in forme and colour like the former: the roots are thicke and wooddie.

3 *Carolus Cluſius* ſetteth forth two kindes of Broome. The firſt is a low and baſe plant, creeping and lying flat vpon the ground, whoſe long branches are nothing elſe, but as it were ſtalkes conſiſting of leaues thicke in the middeſt, and thinne about the edges, and as it were diuided with ſmall nicks; at which place it beginneth to continue the ſame leafe to the end, and ſo from leafe to leafe, vntill it haue increaſed a great ſort, all which doe as it were make one ſtalke; and hath none other leaues, ſauing that in ſome of the nicks or diuiſions there commeth forth a ſmall leafe like a little eare. At the end of thoſe flat and leafed ſtalks come forth the floures, much like the floures of the common Greening weed, but leſſer, and of a yellow colour, which turne into ſmall cods. The roots are very long, tough, and wooddie, ful of fibres, cloſing at the top of the root, from whence they proceed as from one body.

4 This kinde of Greenweed called of ſome *Chamæſpartium*, hath a thicke wooddie root: from which riſe vp diuers long leaues, conſiſting as it were of many pieces ſet together like a paire of Beads (as may better be perceiued by the figure, than expreſſed by words) greene on the vpper ſide, and whitiſh vnderneath, very tough, and as it were of a ruſhie ſubſtance: among which riſe vp very ſmall naked ruſhie ſtalkes; on the top whereof groweth an eare or ſpike of a chaffie matter, hauing here and there in the ſaid eare diuers yellow floures like Broome, but very ſmall or little.

1 *Geniſtella tinctoria.*
Greeneweed or Diers weed.

2 *Geniſtella infectoria.*
Wooddie Diers weed.

3 *Geniſtella pinnata.*
Winged Greeneweed.

4 *Geniſtella globulata.*
Globe Greene weed.

5 The fift Greeneweed hath a wooddie tough root, with certaine ſtrings annexed thereto: from which riſe vp diuers long, flat leaues, tough, & very hard, conſiſting as it were of many little leaues, ſet one at the end of another, making of many one entire leafe, of a greene colour: amongſt which come forth diuers naked hard ſtalks, very ſmall and ſtiffe, on the tops whereof ſtand ſpikie eares of yellow floures, like thoſe of Broome, in ſhape like that great three leafed graſſe, called *Lagopus*, or like the Fox-taile graſſe: after which come flat cods, wherein is incloſed ſmall ſeed like to Tares both in taſte and forme.

5 *Geniſtella Lagopoides maior.*
Hares foot Greeneweed.

6 *Geniſtella Lagopoides minor.*
Small Greenweed with Hares foot floure.

6 This differeth not from the precedent in ſtalks, roots and leaues: the floures conſiſt of a flockie ſoft matter, not vnlike to the graſſie tuft of Foxtaile, reſembling the floure of *Lagopus*, or Hares-foot, but hauing ſmall yellow floures leſſer than the former, wherein it chiefely differeth from the other of his kinde.

¶ *The Place.*

The firſt being our common Diers-weed, groweth in moſt fertile paſtures and fields almoſt euery where. The reſt are ſtrangers in England.

¶ *The Time.*

They floure from the beginning of Iuly to the end of Auguſt.

¶ *The Names.*

The firſt of theſe Greenweeds is named of moſt Herbariſts *Flos Tinctorius*, but more rightly, *Geniſta Tinctoria*, of this *Pliny* hath made mention [The Greenweeds, ſaith he, do grow to dye cloths with] in his 18. booke 16. Chapter. It is called in high Dutch, **Ferblumen**, and **Ackerbzem**: in Italian, *Cerretta*, and *Coſaria*, as *Matthiolus* writeth in his chapter of *Lyſimachia*, or Looſe-ſtrife: in Engliſh, Diers Greening weed, baſe Broome, and Woodwaxen.

The reſt we refer to their ſeuerall titles.

¶ *The Temperature and Vertues.*

Theſe plants are like vnto common Broome in bitterneſſe, and therefore are hot and drie in the A
ſecond degree: they are likewiſe thought to be in vertues equall; notwithſtanding their vſe is not ſo well knowne, and therefore not vſed at all where the other may be had: we ſhall not need to ſpeak of that vſe that Diers make thereof, being a matter impertinent to our Hiſtorie.

Chap. 19. *Of Spaniſh baſe Broomes.*

¶ *The Deſcription.*

‡ 1 THis growes to the height of a cubit, and is couered with a creſted and rough barke, and diuided into many longiſh branches creſted & green, which at their firſt ſpringing vp haue ſome leaues vpon them, which fall away as ſoon as the plant comes to floure: from the ſides of the branches come forth long foot-ſtalks whereon hang ſome ſmall yellow floures, which are ſucceeded by ſhort round yellowiſh red cods which commonly containe but one ſeed, ſeldome two, and theſe hard and blacke, and like a little Kidney, which when it is ripe will rattle in the cod being ſhaken. ‡

1 *Pſeudoſpartum Hiſpanicum Aphyllum:* Spaniſh Broome without leaues.

2 *Pſeudoſpartum album Aphyllum:* The white leaſe-leſſe Spaniſh broom,

2 This naked broome groweth vp to the height of a man: the ſtalk is rough, and void of leaues very greene and pliant, which diuideth it ſelfe into diuers twiggie branches, greene, and tough, like ruſhes: the floures grow all along the ſtalks like thoſe of broome, but of a white colour, wherein it differeth from all the reſt of his kinde.

¶ *The Place.*

Theſe grow in the prouinces of Spaine, and are in one place higher and more buſhie, and in an other lower.

¶ *The Time.*

‡ The firſt floures in May, and the ſecond in Februarie. ‡

¶ *The Names.*

Theſe baſe Spaniſh broomes may be referred to the true, which is called in Greeke σπάρτος: the Latines vſe the ſame name, calling it ſometimes *Spartum*, and *Spartium*: in Spaniſh, *Retama*: in Engliſh, Spaniſh broome, and baſtard Spaniſh broome.

¶ *The Temperature and Vertues.*

A Both the ſeeds and iuice of the branches of theſe baſe broomes, wherewith they in Spaine and other hot regions do tie their vines, do mightily draw, as *Galen* writeth.

Dioſcorides

Dioſcorides ſaith, that the ſeeds and floures being drunke in the quantitie of a dram, with Mede B
or honied water, doth cauſe one to vomit ſtrongly, as the Hellebor or neeſing pouder doth, but yet
without ieopardie or danger of life: the ſeed purgeth by ſtoole.

The iuyce which is drawne from out of the branches ſteeped in water, being firſt bruiſed, is a re- C
medie for thoſe that are tormented with the Sciatica, and for thoſe that be troubled with the
Squincie, if a draught thereof be drunke in the morning; ſome vſe to ſteepe the branches in ſea
water, and to giue the ſame in a cliſter, which purgeth forth bloudy and ſlimie excrements.

† In this chapter formerly in the firſt place was againe figured and deſcribed the true *Spartium* or Spaniſh Broome; which I haue now omitted, becauſe it was figured and deſcribed in the laſt chapter ſaue one before. In the ſecond place was deſcribed that figured in the third: and in the third place was a deſcription to no purpoſe, which I therefore omitted, and as you ſee deſcribed anew and put in the firſt place that which formerly held the ſecond.

CHAP. 20.

Of Furzes, Gorſſe, Whin, or prickley Broome.

¶ *The Kindes.*

THere be diuers ſorts of prickly Broome, called in our Engliſh tongue by ſundry names, according to the ſpeech of the countrey people where they doe grow: in ſome places, Furzes; in others, Whins, Gorſſe, and of ſome, Prickly Broome.

† *Geniſta ſpinoſa vulgaris.*
Great Furze buſh.

2 *Geniſta ſpinoſa minor.*
The ſmall Furze buſh.

¶ *The Deſcription.*

1 THe Furze buſh is a plant altogether a Thorne, fully armed with moſt ſharpe prickles, without any leaues at all except in the ſpring, and thoſe very few and little, and quickly falling away: it is a buſhy ſhrub, often riſing vp with many wooddy branches to the height of foure or fiue cubits, or higher, according to the nature and ſoile where they grow: the greateſt and higheſt that I did euer ſee do grow about Exceſter in the Weſt parts of England, where

where the great ſtalks are dearely bought for the better ſort of people, and the ſmall thorny ſpraies for the poorer ſort. From theſe thorny branches grow little floures like thoſe of Broome, and of a yellow colour, which in hot Regions vnder the extreme heate of the Sunne are of a very perfect red colour: in the colder countries of the Eaſt, as Danzicke, Brunſwicke, and Poland, there is not any branch hereof growing, except ſome few plants and ſeeds which my ſelfe haue ſent to Elbing, otherwiſe called Meluin, where they are moſt curiouſly kept in their faireſt gardens, as alſo our common Broome, the which I haue ſent thither likewiſe, being firſt deſired by diuers earneſt letters: the cods follow the floures, which the Grauer hath omitted, as a German who had neuer ſeen the plant it ſelfe, but framed the figure by heare-ſay: the root is ſtrong, tough, and wooddy.

We haue in our barren grounds of the North parts of England another ſort of Furze, bringing forth the like prickley thornes that the others haue: the onely difference conſiſteth in the colour of the floures; for the others bring forth yellow floures, and thoſe of this plant are as white as ſnow.

† 2 To this may be ioyned another kinde of Furze which bringeth forth certaine branches that be ſome cubit high, ſtiffe, and ſet round about at the firſt with ſmall winged Lentill-like leaues and little harmeleſſe prickles, which after they haue been a yeare old, and the leaues gon, be armed onely with moſt hard ſharpe prickles, crooking or bending their points downwards. The floures hereof are of a pale yellow colour, leſſer than thoſe of Broome, yet of the ſame forme: the cods are ſmall, in which do lie little round reddiſh ſeeds: the root is tough and wooddy.

† 3 *Geniſta Spinoſa minor ſiliqua rotunda.*
Small round codded Furze.

4 *Geniſtella aculeata.*
Needle Furze or petty Whin.

‡ Of this *Cluſius* reckons vp three varieties: the firſt growing ſome cubit high, with deepe yellow floures: the ſecond growes higher, and hath paler coloured floures: the third groweth to the height of the firſt, the floures alſo are yellow, the branches more prickly, and the leaues hairy; and the figure I giue you is of this third varietie.

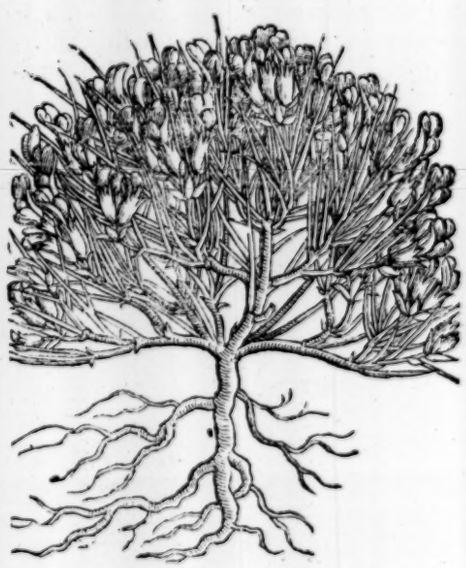
3 This ſeldome exceeds a foot in height, and it is on euerie ſide armed with ſharpe prickles, which grow not confuſedly, as in the common ſort, but keepe a certaine order, and ſtill grow forth by couples: they are of a lighter greene than thoſe of the common Furze: on the tops of each of the branches grow two or three yellow floures like thoſe of the former; which are ſucceeded by little round rough hairy cods of the bigneſſe of Tares. This floures in March, and groweth in the way between Burdeaux and Bayone in France, and vpon the Pyrenean mountaines. *Cluſius* makes it his *Scorpius* 2. or ſecond ſort of Furze: *Lobel* calls it *Geniſta ſpartium ſpinoſum alterum.* ‡

4 This

4 This ſmall kinde of Furze (growing vpon Hampſtead heath neere London, and in diuers other barren grounds, where in manner nothing elſe wil grow) hath many weake and flexible branches of a wooddy ſubſtance: whereon do grow little leaues like thoſe of Tyme: among which are ſet in number infinite moſt ſharpe prickles, hurting like needles, whereof it tooke his name. The floures grow on the tops of the branches like thoſe of Broome, and of a pale yellow colour. The root is tough and wooddy.

‡ 5 This plant (ſaith *Cluſius*) is wholly new and elegant, ſome ſpan high, diuided into many branches, ſome ſpred vpon the ground, others ſtanding vpright, hauing plentifull ſtore of greene prickles: the floures in ſhape are like thoſe of Broome, but leſſe, and of a blewiſh purple colour, ſtanding in rough hairy whitiſh cups, two or three floures commonly growing neere together: ſometimes whileſt it floures it ſendeth forth little leaues, but not very often, and they are few, and like thoſe of the ſecond deſcribed, and quickly fall away, ſo that the whole plant ſeemes nothing but prickles, or like a hedge-hog when ſhe folds vp her ſelfe: the root is wooddy, and large for the proportion of the plant. It growes in the kingdome of Valentia in Spaine, where the Spaniards call it *Erizo*, that is, the Hedge-hog; and thence *Cluſius* alſo termed it *Erinacea*. It floureth in Aprill. ‡

5 *Geniſta ſpinoſa humilis.*
Dwarfe or low Furze.



6 *Geniſta aculeata minor, ſiue Nepa Theophr.*
Scorpion Furzes.

6 The ſmalleſt of all the Furzes is that of the Antients called *Nepa*, or Scorpion Furze, as the word *Nepa* ſeemeth to import: it is a ſtranger in England: it hath beene touched of the Antients in name onely: which fault they haue beene all and euerie of them to be complained of, being ſo briefe that nothing can be gathered from their deſcription: and therefore I refer what might hereof be ſaid to a further conſideration. ‡ This hath a thicke wooddy blacke root ſome halfe foot long, from whence ariſe many ſlender branches ſome foot high, which are ſet with many ſtiffe and ſharpe prickles, growing ſomewhat after the maner of the wilde prickly Sperage: the yong plants haue little leaues like thoſe of Tragacanth; the old ones none: the floures are ſmal, and come forth at the bottome of the prickles, and they are ſucceeded by broad cods wherein the ſeed is contained. It growes in diuers places of France and Spaine, and is thought to be the *Scorpius* of *Theophraſtus*, which *Gaza* tranſlates *Nepa*. ‡

¶ *The Place.*

The common ſort hereof are very well knowne to grow in paſtures and fields in moſt places of England. The reſt are likewiſe well knowne to thoſe that curiouſly obſerue the difference.

¶ *The Time.*

They floure from the beginning of May to the end of September.

¶ *The Names.*

Furze is commonly called *Geniſta ſpinoſa*: in high-Dutch, **Gaſpeldozen**: in Engliſh, Furze, Furzen buſhes, Whinne, Gorſſe, and Thorne-Broome.

This thorny Broome is taken for *Theophraſtus* his *Scorpius*, which *Gaza* nameth *Nepa*: the name *Scorpius* in *Pliny* is πολύσημον, that is to ſay, ſignifying many things, and common to certaine Plants:

for

for beſides this *Scorpius* of which he hath made mention, *lib.* 25. *cap.* 5. ſetting downe *Theophraſtus* his words, where he maketh *Aconitum Thelyphonon* to be *Scorpius*, *lib.* 23. *cap.* 10. and likewiſe other plants vnder the ſame title, but vnproperly.

¶ *The Temperature and Vertues.*

A There is nothing written in *Theophraſtus* concerning the faculties of *Scorpius ſpinoſus*, or Furze: *Pliny* ſeemeth to attribute vnto it the ſame vertues that *Scorpioides* hath: notwithſtanding the later Writers do agree that it is hot and dry of complexion: the ſeeds are vſed in medicines againſt the ſtone, and ſtaying of the laske.

† This chapter hath vndergone a great alteration: as thus; the firſt, third, and fourth deſcriptions belonged to the third figure: the ſecond and fifth deſcription, to the fifth figure: and the firſt, ſecond, and fourth figures had no deſcriptions belonging to them. The figure that was in the firſt place is now in the third: the ſecond ſtill holds his place: the third is in the firſt, belonging thereto of right: and for handſomneſſe ſake I haue made the fourth and fifth change places. That *Nepa* alſo in the ſixth place was formerly mentioned by our Author (but now omitted) in the chapter of Aſparagus.

Chap. 21.

Of Cammocke Furze, Reſt-Harrow, or Petty Whinne.

¶ *The Kindes.*

THere be diuers ſorts of Reſt-Harrow, which ſome haue inſerted among the ſmooth Broomes; others, among thoſe with prickles, whereof ſome haue purple floures and likewiſe ful of prickles; others, white floures, and ſharpe thornes: ſome alſo purple floures, others white, and alſo yellow, and euery of them void of prickles.

1 *Anonis, ſiue Reſta Bouis.*
Cammocke, or Reſt-Harrow.

3 *Anonis non ſpinoſa purpurea.*
Purple Reſt-Harrow without prickles.

¶ *The Deſcription.*

1 CAmmocke or ground Furze riſeth vp with ſtalkes a cubit high, and often higher, ſet with diuers ioynted branches, tough, pliable, and full of hard ſharpe thornes: among which do grow leaues in forme like thoſe of S. Iohns wort, or rather of the Lentill, of a deepe

deep green colour: from the bosome of which thorns and leaues come forth the floures, like those of Peason, of a purple colour: after which do come the cods, in which do lie flat seed: the root is long, and runneth far abroad, very tough, and hard to be torne in pieces with the plough, in so much that the oxen can hardly passe forward, but are constrained to stand still; whereupon it was called Rest-Plough, or Rest-Harrow.

4 *Anonis, siue Spina lutea.*
Yellow Rest-Yarrow.

2 We haue in our London pastures, and likewise in other places, one of the Rest-Harrowes, not differing from the precedent in stalkes, leaues, or prickles: the onely difference is, that this plant bringeth forth white floures, and the others not so: whence we may call it *Anonis flore albo*, Cammocke with white floures.

3 Rest-Harrow without thornes hath a tough hoary rough stalke, diuided into other rough branches, whereon are set without order, long leaues sharpe pointed, sleightly cut about the edges, of an hoary colour, and somewhat hairy: from the bosome whereof commeth forth purple Pease-like floures of a reasonable good smell: the root is verie tough, long, and wooddy.

4 The yellow floured Cammock is a stranger in these parts, it is only found in the cold Easterne countries, for ought that I can learne; it differs not from the last described, sauing that the floures hereof are of a darke yellow colour, wherein it differeth from all the other of his kinde.

¶ *The Place.*

These grow in earable grounds in fertile pastures, and in the borders of fields, in a fat, fruitful, and long lasting soile: it is sooner found than desired of husbandmen, because the tough and wooddie roots are combersome vnto them, for that they stay the plough, and make the oxen stand.

¶ *The Time.*

They send forth new shoots in May: they be ful growne in Autumne, and then those that of nature are prickly be fullest of sharpe thornes: they floure in Iuly and August.

¶ *The Names.*

Cammocke is called in Greeke Ἄνωνις, or Ὄνωνις: and likewise in Latine *Anonis*, and *Ononis*: Of Herbarists commonly *Arresta Bouis*, and *Remora aratri*, because it maketh the Oxen whilest they be in plowing to rest or stand still: it is also called *Acutella*, of the stiffe and sharpe thorns which prick those that passe by: in French, *Areste beuf*, and *Boucrande*.

Crateuas nameth it *Ægipyrus*: in high-Dutch, **Stalkraut**: in low-Dutch, **Pzangwoztele**: in Italian, *Bonaga*: in Spanish, *Gattilhos*: in French, *Arreste beuf*, *Beuf & Bouerande*: in English, Cammocke, Rest-Harrow, Petty Whinne, and ground Furze.

¶ *The Temperature.*

The root of Cammocke is hot in the third degree, as *Galen* saith: it cutteth also and maketh thinne.

¶ *The Vertues.*

The barke of the root drunke with Wine prouoketh vrine, breaketh the stone, and driueth it forth. A

The root boyled in water and vineger allayeth the paine of the teeth, if the mouth be often washed therewith hot. B

Pliny reporteth, that being boyled in Oxymel (or the syrrup made with honey and vineger) till the one halfe be wasted, it is giuen to those that haue the falling sickenesse. *Matthiolus* reporteth, that he knew a man cured of a rupture, by taking of the pouder of this root for many moneths together. C

The tender sprigs or crops of this shrub before the thornes come forth, are preserued in pickle, and be very pleasant sauce to be eaten with meat as sallad, as *Dioscorides* teacheth. D

CHAP.

Chap. 22.

Of Gooſe-berrie, or Fea-berry Buſh.

¶ *The Kindes.*

THere be diuers ſorts of the Gooſe-berries; ſome greater, others leſſe: ſome round, others long, and ſome of a red colour: the figure of one ſhall ſerue for the reſt.

‡ I will not much inſiſt vpon diuerſities of fruits, becauſe my kinde friend M^r. *Iohn Parkinſon* hath ſufficiently in his late Worke diſcourſed vpon that ſubiect; onely becauſe I iudge many wil be deſirous to know their names, and where to get them, I will briefely name the chiefe varieties our Kingdome affords; and ſuch as are deſirous of them may finde them with M^r. *Iohn Millen* liuing in Old-ſtreet.

The ſorts of Gooſe-berries are theſe: the long greene, the great yellowiſh, the blew, the great round red, the long red, and the prickly Gooſe-berrie.

Vua Criſpa.
Gooſe-berries.

¶ *The Deſcription.*

THe Gooſe-berry buſh is a ſhrub of three or foure cubits high, ſet thicke with moſt ſharpe prickles: it is likewiſe full of branches, ſlender, wooddy, and prickly: whereon doe grow round leaues cut with deepe gaſhes into diuers parts like thoſe of the Vine, of a very greene colour: the floures be very ſmal, of a whitiſh greene, with ſome little purple daſhed here and there: the fruit is round, growing ſcatteringly vpon the branches, greene at the firſt, but waxing a little yellow through maturitie, full of a winie iuyce ſomewhat ſweet in taſte when they be ripe; in which is contained hard ſeed of a whitiſh colour: the root is woodie, and not without ſtrings anexed thereto.

There is another whoſe fruit is almoſt as big as a ſmall Chery, and very round in forme: as alſo another of the like bigneſſe, of an inch in length, in taſte and ſubſtance agreeing with the common ſort.

We haue alſo in our London gardens another ſort altogether without prickles: whoſe fruit is very ſmal, leſſer by much than the common kinde, but of a perfect red colour, wherein it differeth from the reſt of his kinde.

¶ *The Place.*

Theſe plants do grow in our London gardens and elſewhere in great aboundance.

¶ *The Time.*

The leaues come forth in the beginning of Aprill or ſooner: the fruit is ripe in Iune and Iuly.

¶ *The Names.*

This ſhrub had no name among the old Writers, who as we deeme knew it not, or elſe eſteemed it not: the later writers call it in Latine *Groſſularia*: and oftentimes of the berries, *Vua Criſpa*, *Vua ſpina*, *Vua ſpinella*, and *Vua Criſpina*: in high-Dutch, **Kruſelbeer**: in low-Dutch, **Stekelbeſien**: in Spaniſh, *Vua Criſpa*, or *Eſpina*: in Italian, *Vua ſpina*: in French, *Groiſelles*: in Engliſh, Gooſe-berry, Gooſe-berry buſh, and Fea-berry buſh in Cheſhire, my natiue countrey.

¶ *The Temperature.*

The berries of this buſh before they be ripe are cold and dry, and that in the later end of the ſecond degree, and alſo binding.

¶ *The Vertues.*

The fruit is vſed in diuers ſauces for meate, as thoſe that are skilfull in cookerie can better tel than my ſelfe.

They

They are vſed in broths in ſtead of Veriuice, which maketh the broth not onely pleaſant to the taſte, but is greatly profitable to ſuch as are troubled with a hot burning ague. B

They are diuerſly eaten, but howſoeuer they be eaten they alwaies ingender raw and cold bloud: they nouriſh nothing or very little: they alſo ſtay the belly, and ſtench bleedings. C

They ſtop the menſes, or monethly ſickenes, except they happen to be taken into a cold ſtomack, then do they not helpe, but rather clog or trouble the ſame by ſome manner of flix. D

The ripe berries, as they are ſweeter, ſo doe they alſo little or nothing binde, and are ſomething hot, and yeeld a little more nouriſhment than thoſe that be not ripe, and the ſame not crude or raw; but theſe are ſeldome eaten or vſed as ſauce. E

The iuice of the greene Gooſeberries cooleth all inflammations, *Eryſipelas*, and Saint Anthonies fire. F

They prouoke appetite, and coole the vehement heate of the ſtomacke and liuer. G

The young and tender leaues eaten raw in a ſallad, prouoke vrine, and driue forth the ſtone and grauell. H

Chap. 23. *Of Barberries.*

¶ *The Kindes:*

There de diuers ſorts of Barberries, ſome greater, others leſſer, and ſome without ſtones.

Spina acida, ſiue Oxyacantha.
The Barberry buſh.

¶ *The Deſcription.*

THe Barberry plant is an high ſhrub or buſh, hauing many young ſtraight ſhootes and branches, very full of white and prickly thornes, the rinde whereof is ſmooth and thin, the wood it ſelfe yellow: the leaues are long, very greene, ſlightly nicked about the edges, and of a ſowre taſte: the floures be yellow, ſtanding in cluſters vpon long ſtemmes: in their places come vp long berries, ſlender, red when they be ripe, with a little hard kernell or ſtone within; of a ſowre and ſharpe taſte: the root is yellow, diſperſeth it ſelfe farre abroad, and is of a wooddy ſubſtance.

Wee haue in our London gardens another ſort, whoſe fruite is like in forme and ſubſtance, but one berry is as big as three of the common kinde, wherein conſiſteth the difference.

We haue likewiſe another without any ſtone, the fruite is like the reſt of the Barberries, both in ſubſtance and taſte.

¶ *The Place.*

The Barberrie buſh groweth of it ſelfe in vntoiled places and deſart grounds, in woods, and the borders of fields, eſpecially about a Gentlemans houſe ealled Mr. *Monke*, dwelling in a village called Iuer, two miles from Colebrooke, where moſt of the hedges are nothing elſe but Barberry buſhes.

They are planted in gardens in moſt places of England.

¶ *The Time.*

The leaues ſpring forth in Aprill: the floures and fruite in September.

¶ *The Names.*

Galen calleth this thorne in Greeke, ὀξυάκανθος, who maketh it to differ from ἀβρόβατος, in his booke of the Faculties of ſimple medicines: but more plainely in his booke of the Faculties of Nouriſhments; where he reckoneth vp the tender ſprings of Barberries among the tender ſhoots that are

to be eaten, such as *Oxyacanthus* or the Hawthorne bringeth not forth, wherein he plainely made a difference, *Oxyacantha* the Barbery bush, and *Oxyacanthus* the Hawthorne tree.

Dioscorides hath not made mention of this Thorne; for that which he calleth *Oxyacantha* in the Fœminine gender, is *Galens Oxyacanthus* in the Masculine gender.

Auicen seemeth to containe both these shrubs vnder the name of *Amyrberis*, but we know they are neither of affinitie or neighbourhood, although they be both prickly.

The shrub it selfe is called in shops Barbaries, of the corrupted name *Amyrberis*, of the later writers *Crespinus*: in Italian, *Crespino*. in Spanish, *Espino de maiuelas*: in high Dutch, **Paisselbeer**: in low Dutch, **Sauseboom**: in French, *Espine vinette*: and thereupon by a Latine name, *Spinauineta*, *Spina acida*, and *Oxyacantha Galeni*. ‡ In English, a Barbery bush, or Piprige Tree, according to D. Turner. ‡

¶ *The Temperature.*

The leaues and berries of this thorne are cold and dry in the second degree: and as *Galen* also affirmeth, they are of thin parts, and haue a certaine cutting qualitie.

¶ *The Vertues.*

A The leaues are vsed of diuers to season meate with, and in stead of a sallad, as be those of Sorrell.

B The decoction thereof is good against hot burnings and cholericke agues: it allaieth the heate of the bloud, and tempereth the ouermuch heate of the liuer.

C The fruite or berries are good for the same things, and be also profitable for hot laskes, and for the bloudy flixe, and they stay all manner of superfluous bleedings.

D The greene leaues of the Barbery bush stamped, and made into sawce, as that made of Sorrell, called greene sauce, doth coole hot stomackes, and those that are vexed with hot burning agues, and procureth appetite.

E The conserue made of the fruite and sugar performeth all those things before remembred, but with better force and successe.

F The roots of the tree steeped for certaine daies together in strong lie, made with ashes of the ash-tree, and the haire often moistned therewith, maketh it yellow.

G ‡ The barke of the roots is also vsed in medicines for the iaundise, and that with good successe. ‡

Chap. 24. *Of the white Thorne, or Hawthorne Tree.*

¶ *The Kindes.*

There be two sorts of the white Thorn Trees described of the later writers, one very common in most parts of England: there is another very rare, and not found in Europe, except in some few rare gardens of Germanie; which differeth not from our common Hawthorne, sauing that the fruit here of is as yellow as Saffron: we haue in the West of England one growing at a place called Glastenburie, which bringeth forth his floures about Christmas, by the report of diuers of good credit, who haue seen the same; but my selfe haue not seen it; and therefore leaue it to be better examined.

¶ *The Description.*

1 The white Thorne is a great shrub growing oftentimes to the height of the Peare-tree the trunke or body is great: the boughes and branches hard and wooddy, set full of long sharpe thornes: the leaues be broad, cut with deepe gashes into diuers sections, smooth, and of a glistering greene colour: the floures grow vpon spokie rundles, of a pleasant sweet smell, sometimes white, and often dasht ouer with a light wash of purple; which hath moued some to thinke some difference in the plants: after which come the fruit, being round berries, green at the first, and red when they be ripe; wherein is found a soft sweet pulpe, and certaine whitish seed: the root groweth deepe in the ground, of a hard wooddy substance.

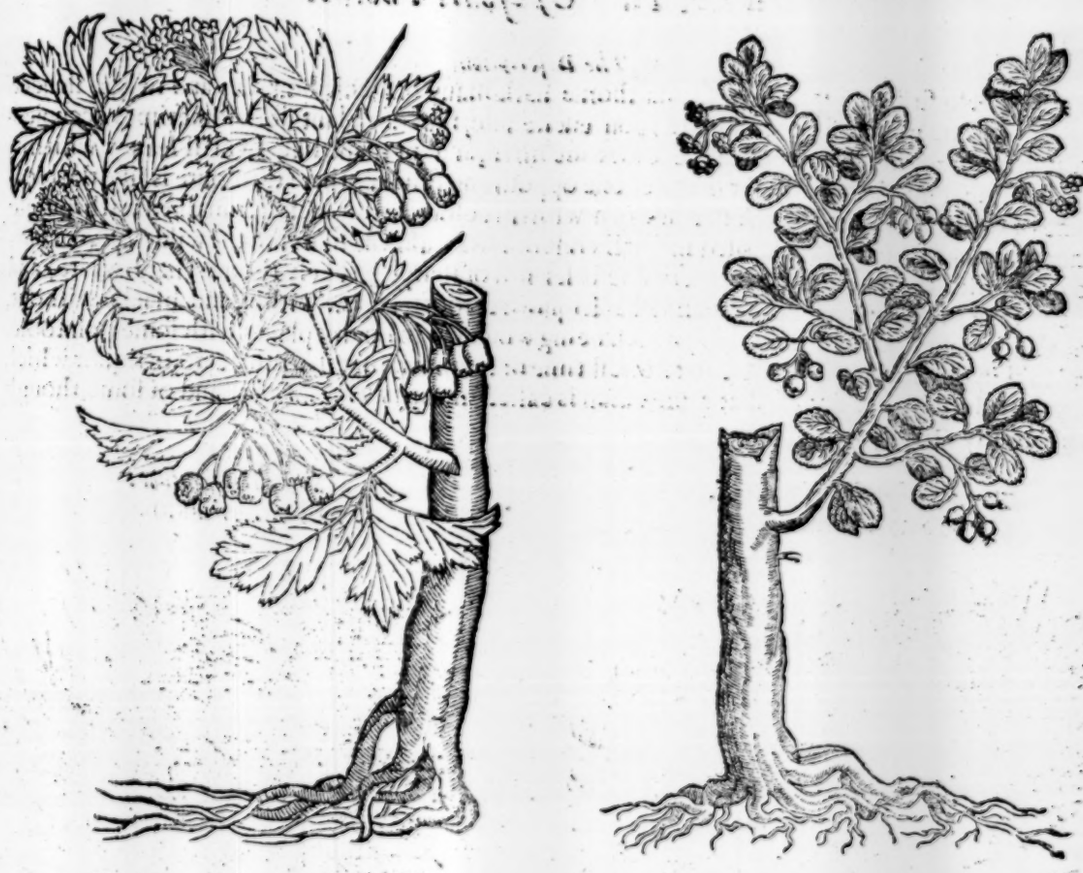
2 The second and third haue been touched in the first title, notwithstanding I haue thought it not vnfit to insert in this place a plant perticipating with the Hawthorne in floures and fruit, and with the Seruice tree in leaues, and not vnlike in fruit also.

Theophrastus hath set forth this tree vnder the name of *Aria*, which groweth vnto the forme of a small tree, delighting to grow in our shadowie woods of Cumberland and Westmerland, and many other places of the North country, where it is to be found in great quantitie: but seldome in Spaine,

Spaine, Italy, or any hot Region. This tree is garniſhed with many large branches beſet with leaues like the Peare tree, or rather like the Aller leafe, of a darke greene colour aboue, and of a white colour vnderneath: among theſe leaues come forth tufts of white floures, very like vnto the Hawthorne floures, but bigger: after which ſucceed ſmall red berries, like the berries of the Haw-thorne, and in taſte like the Neapolitan Medlar: the temperature and faculties whereof are not yet knowne.

1 *Oxyacanthus.*
The Haw-thorne tree.

2 *Aria Theophraſti.*
Cumberland Haw-thorne.



¶ *The Place.*

The Haw-thorne groweth in woods and in hedges neere vnto high-waies almoſt euery where. The ſecond is a ſtranger in England. The laſt groweth at Glaſtenbury Abbey, as it is credibly reported vnto me. ‡ The *Aria* groweth vpon Hamptſted heath, and in many places of the Weſt of England. ‡

¶ *The Time.*

The firſt and ſecond floure in May; whereupon many do call the tree it ſelfe the May-buſh, as a chiefe token of the comming in of May: the leaues come forth a little ſooner: the fruit is ripe in the beginning of September, and is a food for birds in Winter.

¶ *The Names.*

Dioſcorides deſcribeth this ſhrub, and nameth it ὀξυάκανθα, in the feminine gender: and *Galen* in his booke of the Faculties of ſimple medicines, ὀξυάκανθος, in the maſculine gender: *Oxyacanthus*, ſaith he, is a tree, and is like to the wilde Peare tree in forme, and the vertues not vnlike, &c. Of *Oxyacantha*, *Dioſcorides* writeth thus: It is a tree like to the wild Peare tree, very full of thorns, &c. *Serapio* calleth it *Amyrberis*: and ſome, ſaith *Dioſcorides*, would haue it called πυρίνη, but the name *Pyrina* ſeemeth to belong to the yellow Haw-thorne: it is called in high-Dutch, **Haegdozen**: in low-Dutch, **Hagedozen**: in Italian, *Bagaia*: in Spaniſh, *Pirlitero*: in French, *Aub-eſpine*: in Engliſh, White-thorne, Haw-thorne tree; and of ſome Londoners, May-buſh. ‡ This is not the *Oxyacantha* of the Greekes, but that which is called *Pyracantha*, as ſhall be ſhewed hereafter.

The ſecond is thought to be the *Aria* of *Theophraſtus*, and ſo *Lobel* and *Tabernamontanus* call it. Some, as *Bellonius*, *Geſner*, and *Cluſius*, refer it to the *Sorbus*, and that not vnfitly: in ſome places of this kingdome they call it a white Beame tree. ‡

¶ *The Temperature.*

The fruit of the Haw-thorne tree is very aſtringent.

¶ *The Vertues.*

A The Hawes or berries of the Haw-thorne tree, as *Dioſcorides* writeth, do both ſtay the laske, the menſes, and all other fluxes of bloud: ſome Authors write, that the ſtones beaten to pouder, and giuen to drinke are good againſt the ſtone.

Chap. 25. *Of Goats Thorne.*

¶ *The Deſcription.*

1 THe firſt *Tragagantha* or Goats-thorne hath many branchie boughes and twigs, ſlender and pliant, ſo ſpred abroad vpon euerie ſide, that one plant doth ſometimes occupie a great ſpace or roome in compaſſe: the leaues are ſmall, and in ſhape like Lentill leaues, whitiſh, and ſomewhat moſſie or hairy, ſet in rowes one oppoſite againſt another: the floure is like the bloſſome of the Lentill, but much leſſer, and of a whitiſh colour, and ſometimes marked with purple lines or ſtreaks: the ſeed is incloſed in ſmall cods or husks, almoſt like vnto the wilde *Lotus* or horned Trefoile: the whole plant on euery ſide is ſet full of ſharpe prickely thornes, hard, white, and ſtrong: the roots run vnder the ground like Liquorice roots, yellow within, and blacke without, tough, limmer, and hard to breake; which being wounded in ſundry places with ſome iron toole, and laid in the Sun at the higheſt and hotteſt time of Sommer, iſſueth forth a certain liquor, which being hardned by the Sun, is that gum which is called in ſhops *Tragacantha*: and of ſome, though barbarouſly *Dragagant*.

1 *Tragacantha, ſiue ſpina Hirci.*
Goats Thorne.

2 *Spina Hirci minor.*
Small Goats Thorne.

2 The ſecond kinde of *Tragacantha* is a low and thicke ſhrub, hauing many ſhoots growing from one turfe: of a white or grayiſh colour, about a cubit high, ſtiffe and wooddy: the leaues are like the former, and garded with moſt ſtiffe pricks not very ſafely to be touched: among the thornie leaues come forth many floures in ſmall tufts like *Geniſtella*, but that they are white: the cods

are

are many, ſtraight and thorny like *Geniſtella*, wherein are many ſmall white and three cornered ſeeds as big as muſtard ſeed. ‡ This differs from the former in that it is ſmaller, and loſeth the leaues euery Winter, when as the former keepes on the leaues vntill new ones come in the Spring. The middle rib of the winged leaues ends in a pricke, which by the falling of the leaues becommeth a long and naked thorne. I haue giuen you a more accurate figure hereof out of *Cluſius*, wherein the leaues, floures, cods, and ſeeds are all expreſſed apart. ‡

3 The Grecians haue called this plant Νοτιάδα, becauſe it is good for the ſinewes: it ſhould ſeeme it tooke the name *Poterion*, of *Potrix*, becauſe it loueth a watry or fenny ſoile: it hath ſmall branches, and leaues of *Tragacantha*, growing naturally in the tract of Piedmont in Italy: it ſpreadeth abroad like a ſhrub: the barke or rinde is blackiſh, and dry without great moiſture, very much writhed or wrinkled in and out as that of *Nepa* or *Corruda*: the ſharpe pricks ſtand not in order as *Tragacantha*, but confuſedly, and are finer and three times leſſer than thoſe of *Tragacantha*, growing much after the manner of *Aſtragalus*: but the particular leaues are greene aboue, and white below, ſhaped ſomewhat like Burnet: the ſeed is ſmall and red, like vnto Sumach, but leſſer.

‡ *Tragacanthæ minoris icon accuratior.*
A better figure of the Goats-thorne.

† 3 *Poterion Lob. ſiue Pimpinella ſpinoſa Camer.*
Burnet Goats-thorne.

¶ *The Place.*

Petrus Bellonius in his firſt booke of Singularities reports, that there is great plenty hereof growing in Candy vpon the tops of the mountaines. *Theophraſtus* ſaith that it was thought to grow no where but in Candy; but now it is certaine that it is found in Achaia, Peloponeſſus, and in Aſia: it doth alſo grow in Arcadia, which is thought not to be inferiour to that of Candy. It is thought by *Lobel* to grow in Languedock in France, whereof *Theophr.* hath written in his ninth booke, that the liquor or gum iſſueth out of it ſelfe, and that it is not needfull to haue the root broken or cut. The beſt is that, ſaith *Dioſcorides*, which is through-ſhining, thin, ſmooth, vnmixt, and ſweet of ſmel and taſte.

¶ *The Time.*

They floure and flouriſh in the Sommer moneth: I haue ſowne the ſeed of Poterion in Aprill, which I receiued from *Ioachimus Camerarius* of Noremberg, that grew in my garden two yeares together, and after periſhed by ſome miſchance.

¶ *The Names.*

Goats-thorne is called in Greeke τραγάκανθα: of moſt Herbariſts likewiſe *Tragacantha*: we may cal it in Latine *Spina Hirci*: in French, *Barbe Renard*: and in Engliſh for want of a better name, Goats-Thorne: the liquor or gum that iſſueth forth of the roots beareth the name alſo of *Tragacantha*: it is called in ſhops *Gummi Tragacanthæ*; and in a barbarous manner *Gummi Tragacanthi*: in Engliſh, Gum Dragagant.

¶ *The Temperature.*

This plant in each part thereof is of a drying facultie without biting. It doth conſolidate or glew together ſinewes that be cut: but the roots haue that facultie eſpecially, which are boyled in wine, and the decoction giuen vnto thoſe that haue any griefe or hurt in the ſinewes.

Gum Dragagant hath an emplaſticke qualitie, by reaſon whereof it dulleth or allayeth the ſharpneſſe of humors, and doth alſo ſomthing dry.

¶ *The Vertues.*

A The Gumme is ſingular good to be licked in with honey againſt the cough, roughneſſe of the throat, hoarſeneſſe, and all ſharpe and thin rheumes or diſtillations: being laid vnder the tongue it taketh away the roughneſſe thereof.

B Being drunke with Cute or the decoction of Liquorice it taketh away and allayeth the heat of the vrine: it is alſo vſed in medicines for the eyes.

C The greateſt part of thoſe artificiall beades, ſweet chaines, bracelets, and ſuch like pretty ſweet things of pleaſure are made hard and fit to be worne by mixing the gum hereof with other ſweets, being firſt ſteeped in Roſe water till it be ſoft.

† The figure which was in the third place was of the plant deſcribed in the ſecond which *Matthiolus* and *Tabern.* made their *Pentaphyllum*, but it agreed not with the deſcription which was taken out of the *Aduerſ.*

Chap. 26. *Of the Ægyptian Thorne.*

‡ 1 *Acacia Dioſcoridis.*
The Egyptian Thorne.

† 2 *Acacia altera trifolia.*
Thorny Trefoile.

¶ *The*

¶ *The Description.*

1 Dioſcorides maketh mention of *Acacia*, whereof the firſt is the true and right *Acacia*, which is a ſhrub or hedge tree, but not growing right or ſtraight vp as other ſmall ſmall trees do: his branches are wooddie, beſet with many hard and long Thorns; about which grow the leaues, compact of many ſmall leaues cluſtering about one ſide, as in the Lentill: the floures are whitiſh, the husks or cods be plaine and flat, yea very broad like vnto Lupines, eſpecially on that ſide where the ſeed growes, which is contained ſometimes in one part, and ſometimes in two parts of the husk, growing together in a narrow necke: the ſeed is ſmooth and gliſtering. There is a blacke iuice taken out of theſe huskes, if they be dried in the ſhadow when they be ripe; but if when they are not ripe, then it is ſomewhat red: ſome do wring out a iuice out of the leaues and fruit: there floweth alſo a gum out of this tree, which is the gum of Arabia, called Gum Arabicke.

2 *Dioſcorides* hauing deſcribed *Spina Acacia*, ſetteth downe a ſecond kinde thereof, calling it *Acacia altera*, which hath the three leaues of Rue or *Cytiſus*, and coddes like thoſe of *Geniſtella*, but ſomewhat more blunt at the end, and thicke at the backe like a Raſor, and ſtill groweth forward narrower and narrower, vntill it come to haue a ſharpe edge: in theſe cods are contained three or foure flat ſeeds like *Geniſtella*, which before they wax ripe are yellow, but afterwards blacke: the whole plant groweth to the height of *Geniſta ſpinoſa*, or Gorſſe, both in ſhape, height, and reſemblance, and not to the height of a tree, as *Matthiolus* would perſuade vs, but full of ſharpe Thornes like the former.

¶ *The Place.*

The true Acacia groweth in Egypt, Paleſtina, Lombardie, and Syria, as *Dioſcorides* writeth: among the ſhrubs and trees that remaine alwaies greene, Acacia is noted for one by *Petrus Belloniuus*, in his firſt booke of Singularities, chap. 44.

The other Acacia groweth in Cappadocia and Pontus, as *Dioſcorides* writeth: it is alſo found in Corſica, and on diuers mountaines of Italy, and likewiſe vpon all the coaſt of Liguria and Lombardie, and vpon the Narbone coaſt of the Mediterranean ſea.

¶ *The Time.*

Theſe floure in May, and their fruit is ripe in the end of Auguſt.

¶ *The Names.*

The tree Acacia is named of the Græcians ἀκακία, yea euen in our time, and likewiſe of the Latins *Acacia*: it is alſo called *Ægyptia ſpina*: this ſtrange thorne hath no Engliſh name that I can learn, and therefore it may keep ſtill the Latine name Acacia, yet I haue named it the Egyptian thorne: the iuice is called alſo Acacia after the name of the plant: the Apothecaries of Germanie do vſe in ſtead hereof, the iuice that is preſſed forth of ſloes or ſnags, which they therefore call *Acacia Germanica*: *Matthiolus* pictureth for Acacia the tree which the later Herbariſts do call *Arbor Iudæ*, to which he hath vntruly added Thorns, that he might belie Acacia, and yet he hath not made it agree with *Dioſcorides* his deſcription.

They call this τὴν ἑτέραν: in Latine *Acacia altera*, or the other Acacia, and *Pontica Acacia*, or Ponticke Acacia.

¶ *The Nature.*

The iuice of Acacia, as *Galen* ſaith, conſiſteth not of one only ſubſtance, but is of ſubſtance both cold and earthie, to which alſo is coupled a certaine waterie eſſence, and it likewiſe hath thin and hot parts diſperſed in it ſelfe: therefore it is dry in the third degree, and cold in the firſt if it be not waſhed; and in the ſecond, if it be waſhed: for by waſhing it loſeth his ſharpe and biting quality and the hot parts.

¶ *The Vertues.*

The iuice of Acacia ſtoppeth the laske, the inordinate courſe of womens termes, and mans inuoluntarie iſſue called *Gonorrhœa*, if it be drunke in red wine. A

It healeth the blaſtings and inflammations of the eies, and maketh the skin and palmes of the hands ſmooth after the healing of the *Serpigo*: it healeth the bliſters and extreme heat in the mouth, and maketh the haires blacke that are waſhed therewith. B

It is good, ſaith *Dioſcorides*, againſt S. Anthonies fire, the ſhingles, Chimetla, Pterygia, and whitlowes. C

The gum doth binde and ſomewhat coole: it hath alſo ioined vnto it an emplaiſtick quality, by which it dulleth or alayeth the ſharpneſſe of the medicines wherewith it is mixed. Being applied with the white and yolk of an egge, it ſuffereth not bliſters to riſe in burned or ſcalded parts. *Dioſc.* D

The iuice of the other, ſaith *Dioſcorides*, doth alſo binde, but it is not ſo effectuall nor ſo good in eie medicines. E

† Our Author gaue but formerly one figure, which was that in the ſecond place, and he would haue perſuaded vs, that it was of the right *Acacia*, yet in his deſcription he tells vs otherwaies.

CHAP.

Chap. 27. *Of box Thorne, and the iuice thereof called Lycium.*

¶ *The Deſcription.*

1 Box Thorne is a rare plant, in ſhape not vnlike the Box tree, whereof it hath beene reckoned for a wilde kinde, hauing many great branches ſet full of round and thicke leaues, very like that of the common Box tree: amongſt which grow forth moſt ſharpe pricking thornes: the floures grow among the leaues, which yeeld forth ſmall blacke berries of a bitter taſt, as big as a pepper corne: the iuice whereof is ſomewhat oilie, and of a reddiſh colour; which bitter iuice being ſet on fire, doth burne with a maruellous cracking and ſparkling; the aſhes thereof are of a red colour: it hath many wooddie roots growing aſlope.

1 *Lycium, ſive Pyxacantha.*
Box Thorne.

‡ 2 *Lycium Hiſpanicum.*
Spaniſh Box Thorne.

2 The other kinde of *Pyxacantha* or *Lycium*, groweth like vnto the common Priuet, hauing ſuch like leaues, but ſomewhat narrower: the tops of the ſlender ſprigs are furniſhed with prickles: the root is tough, and of a wooddie ſubſtance.

¶ *The Place.*

They grow in Cappadocia and Lycia, and in many other countries: it proſpereth in rough places, it hath likewiſe been found in Languedoc, and Prouence in France: *Bellonius* writeth that hee found it in Paleſtina.

Matthiolus pictureth for Box Thorne, a plant with box leaues, with very many boughes, and certaine thornes ſtanding among them: but the notable Herbariſt *Anguillara* and others, hold opinion, that it is not the right; with whom we alſo do agree.

There is drawne out of the leaues and branches of box Thorn, or as *Pliny* ſaith, out of the boughs and roots being throughly boiled, a iuice, which is named *Lycium*.

Dioſcorides ſaith, that the leaues and branches muſt be braied, and the infuſion made many daies

in

in the decoction thereof, after which the feces or wooddie ſtuffe muſt be caſt away, and that which remaineth boiled againe till it become as thicke as honie: *Pliny* ſaith, that the roots and branches are very bitter, and for three daies together they muſt be boiled in a copper veſſell, and the wood and ſticks often taken out till the decoction be boiled to the thickneſſe of honie.

¶ *The Time.*

They floure in Februarie and March, and their fruit is ripe in September.

¶ *The Names.*

It is named in Greeke ξυλόακανθος, which a man may call in Latine *Buxea ſpina*: and in Engliſh, Box Thorne: of ſome, Aſſes Box Tree, and prickley Boxe: it is alſo named *Lycium*, of the iuice which is boyled out of it: the iuice is properly called λύκιον, and retaineth in Latine the ſame name *Lycium*: it is termed in Engliſh Thorne box. But it ſeemeth to me, that the originall name *Lycium* is fitter, being a ſtrange thing, and knowne to very few: the Apothecaries know it not, who in ſtead thereof do vſe amiſſe the iuice of the fruit of Woodbinde, and that not without great errour, as we haue already written. ‡ It is vnknowne in our ſhops, neither is there any thing vſed for it, it being wholly out of vſe, wherefore our Author might here well haue ſpared *Dodonæus* his words. ‡

Dioſcorides teacheth to make a χύλισμα of Sumach which is good for thoſe things that *Lycium* is, and is vſed when *Lycium* is not to be had, and it is fit to be put in all medicines in ſtead thereof.

¶ *The Temperature.*

Lycium, or the iuice of Box Thorne, is as *Galen* teacheth, of a drying qualitie, and compounded of diuers kindes of ſubſtances, one of thinne parts digeſting and hot; another earthie and cold, by which it enioyeth his binding facultie: it is hot in a meane, and therefore it is vſed for ſeuerall purpoſes.

¶ *The Vertues.*

Lycium cleareth the ſight, ſaith *Dioſcorides*, it healeth the ſcruuie feſtred ſores of the eye lids, the A itch, and old fluxes, or diſtillations of humors; it is a remedie for the running of the eares; for vlcers in the gummes, and almonds of the throat, and againſt the chappes or gallings of the lips and fundament.

† The figure which was in the 2. place, was of the *Lycium Italicum* of *Matthiolus* and others; but the deſcription and title better fitted this *Lycium Hiſpanicum* or Lerd, which therefore I put thereto. The figure alſo of the *Lycium Italicum* of *Matthiolus* our Author gaue againe in the next chapter ſame two.

Chap. 28. *Of Ramme or Harts Thorne.*

¶ *The Kindes.*

After the opinion of *Dioſcorides* there be three ſorts of *Rhamnus*, one with long, flat & ſoft leaues: the other with white leaues; and the third with round leaues, which are ſomewhat blackiſh; *Theophraſtus* and *Pliny* affirme that there are but two, the one white, and the other black, both which do beare Thornes: but by the labour and induſtry of the new and late writers there are found ſundry ſorts moe, all which and euery one of them are plants of a wooddie ſubſtance, hauing alſo many ſtraight twiggie and pliant branches, ſet with moſt ſharpe pricking thornes.

¶ *The Deſcription.*

1 THis is a ſhrubbe growing in the hedges, and bringing forth ſtraight branches and hard thornes, like to thoſe of the Hawthorne, with little leaues, long, ſomething fat and ſoft: and this hath that notable learned man *Cluſius* deſcribed more diligently in theſe words: the Ram is a ſhrub fit to make hedges of, with ſtraight branches, parting it ſelfe into many twigs, white, and ſet with ſtiffe and ſtrong thornes, hauing leaues, which for the moſt part grow by foures or fiues at the root of euery Thorne, long, ſomething fat, like to thoſe of the Oliue tree, ſomewhat white, but tender and full of iuice; which in Autumne doe ſometimes fall off, leauing new growing in their places: the floures in Autumne are ſomething long, whitiſh, diuided at the brims into fiue parts: in their places is left a ſeed, in ſhew as in *Gelſemine*: notwithſtanding it was neuer my chance to ſee the fruit: the root is thicke and diuerſly parted.

‡ I obſerued another (ſaith the ſame Author) almoſt like to the former, but lower, and diuided into more branches, with leſſer leaues, more thick and ſalt of taſte, and whiter alſo than the former: the floures are like, in all things but their colour, thoſe of the former, which in this are purpie.

2 This hath more flexible ſtalks and branches, and theſe alſo ſet with thornes: the leaues are narrow, and not ſo thicke or fleſhie as thoſe of the former, yet remaine alwaies greene like as they do: the floures are ſmall and moſſie, of a greeniſh colour, growing thicke about the branches, and they are ſucceeded by a round fruit, yellowiſh when it is ripe, and remaining on the ſhrubbe all the

Winter,

‡ 1 *Rhamnus* 1. *Cluſij flo. albo.*
White floured Ram-thorne.

‡ *Rhamnus alter Cluſ. flore purpureo.*
Purple floured Ram-thorne.

‡ 2 *Rhamnus* 2. *Cluſij.*
Sallow-Thorne.

3 *Rhamnus tertius Cluſij.*
Ram or Harts-Thorne.

Winter: The whole ſhrubbe lookes as if it were ſprinckled ouer with duſt.

3 To theſe may be added another growing with many branches to the height of the Sloe-tree or blacke Thorne, and theſe are couered with a blackiſh barke, and armed with long prickles: the leaues, as in the firſt, grow forth of certaine knots many together, long, narrow, fleſhie, greene, and continuing all the yeare: their taſte is aſtringent, ſomewhat like that of Rhabarb: the floures ſhew themſelues at the beginning of the Spring, of a greeniſh colour, growing thicke together, and neere the ſetting on of the leaues; in Summer it carries a blacke fruit almoſt like a Sloe, round, and harſh of taſte.

¶ *The Place.*

The firſt of theſe growes in ſundry places of Spaine, Portugall, and Prouince: the other varietie thereof *Cluſius* ſaith he found but onely in one place, and that was neere the citie Horivela, called by the Antients *Orcellis*, by the riuer Segura, vpon the borders of the kingdome of Valentia: the ſecond growes in many maritime places of Flanders and Holland, and in ſome vallies by riuers ſides. The third growes in the vntilled places of the kingdome of Granado and Murcia. ‡

¶ *The Time.*

This Ram is euer greene together with his leaues: the fruit or berries remaine on the ſhrub, yea euen in Winter.

¶ *The Names.*

The Grecians call this thorne ῥάμνος: the Latines alſo *Rhamnus*: and of diuers it is alſo named σπῖνα λευκὴ, that is *Spina alba*, or white Thorne, *Spina Cerualis*, or Harts-thorne, as we finde written among the baſtard words. *Marcellus* nameth it *Spina ſalutaris*, and *Herba ſalutaris*; which hath, ſaith he, as it were a grape. It is called in Italian *Marruca* and *Rhamno*: in Spaniſh, *Scambrones*: in Engliſh, Ram, or Harts Thorne.

¶ *The Temperature.*

The Ram, ſaith *Galen*, doth drie and digeſt in the ſecond degree, it cooleth in the later end of the firſt degree, and in the beginning of the ſecond.

¶ *The Vertues.*

The leaues, ſaith *Dioſcorides*, are layed pultis wiſe vpon hot cholericke inflammations, and Saint Anthonies fire, but we muſt vſe them whileſt they be yet but tender, as *Galen* addeth. A

‡ The leaues and buds or young ſhoots of the firſt, are eaten as ſallads with oile, vineger, and ſalt, at Salamanca and other places of Caſtile, for they haue a certaine acrimonie and aciditie which are gratefull to the taſte. A decoction of the fruit of the third is good to foment relaxed and weake or paralyticke members, and to eaſe the paine of the gout, as the Inhabitants of Granado told *Cluſius*. ‡ B

† Our Author in this chapter gaue onely the figure of the third, and the deſcription of the firſt, in the place of the ſecond, with the names and faculties in generall.

Chap. 29. *Of Chriſts Thorne.*

¶ *The Deſcription.*

Chriſts Thorn or Ram of Lybia, is a very tough and hard ſhrubby buſh, growing vp ſometimes vnto the height of a little tree, hauing very long and ſharpe prickle branches: but the thornes that grow about the leaues are leſſer, and not ſo prickly as the former. The leaues are ſmall, broad, and almoſt round, ſomewhat ſharpe pointed, firſt of a darke greene colour, and then ſomwhat reddiſh. The floures grow in cluſters at the top of the ſtalks, of a yellow colour: the husks wherein the ſeeds be contained, are flat and broad, very like vnto ſmall bucklers as hard as wood, wherein are contained three or foure thin and flat ſeeds, like the ſeed of Line or Flax.

¶ *The Place.*

This Thorne groweth in Lybia; it is better eſteemed of in the countrey of Cyrene than is their Lote tree, as *Pliny* affirmeth. Of this ſhrub *Diphilus Siphnius* in *Athenæus* in his foureteenth booke maketh mention, ſaying, that hee did verie often eat of the ſame in Alexandria that beautifull Citie.

Petrus Bellonius who trauelled ouer the Holly Land, ſaith, that this ſhrubbie thorne *Paliurus* was the

Paliurus.
Chriſts Thorne.

the thorne wherewith they crowned our Sauiour Chriſt: his reaſon for the proofe hereof is this, that in Iudæa there was not any thorne ſo common, ſo pliant, or ſo fit for to make a crown or garland of, nor any ſo full of cruell ſharpe prickles. It groweth throughout the whole countrey in ſuch aboundance, that it is their common fuell to burne; yea ſo common with them there, as our Gorſſe, Brakes, and broome is here with vs. *Ioſephus* in his firſt booke of Antiquities, and 11. chap. ſaith, that this Thorne hath the moſt ſharpe prickles of any other, and therefore that Chriſt might be the more tormented, the Iewes rather tooke this than any other. Of which I haue a ſmall tree growing in my garden, that I haue brought forth by ſowing of the ſeed.

The Time.

The leaues fall away and continue not alwaies green, as do thoſe of the Rams: it budded forth in the Spring, as *Pliny* teſtifieth.

¶ *The Names.*

This Thornie ſhrubbe is called in Greeke παλιουρος: the Latines and Italians retaine the ſame name *Paliurus*: for want of an Engliſh name, it may be termed Ramme of Lybia, or Chriſts Thorne: *Pliny* reporteth, that the ſeed is called *Zura*.

¶ *The Temperature.*

The leaues and root of Chriſts Thorne doe euidently binde and cut.

¶ *The Vertues.*

A By vertue of this cutting quality the ſeed doth weare away the ſtone, and cauſe tough and ſlimy humors to remoue out of the cheſt and lungs, as *Galen* ſaith.

B The decoction of the leaues and root of Chriſts Thiſtle, as *Dioſcorides* writeth, ſtoppeth the belly, prouoketh vrine, and is a remedy againſt poiſons, and the bitings of ſerpents.

C The root doth waſte and conſume away *Phymata*, and *Oedemata* if it be ſtamped and applied.

D The ſeed is good for the cough, and weareth away the ſtone in the bladder.

Chap. 30. *Of Buck-Thorne, or laxatiue Rem.*

¶ *The Deſcription.*

1 BVck-thorne groweth in manner of a ſhrub or hedge tree; his trunke or body is often as big as a mans thigh; his wood or timber is yellow within, and his barke is of the colour of a Cheſtnut, almoſt like the bark of a Cherry tree. The branches are beſet with leaues that are ſomewhat round, and finely ſnipt about the edges like the leaues of the Crab or Wilding tree: among which come forth Thornes which are hard and prickly: the floures are white and ſmal, which being vaded there ſucceed little round berries, greene at the firſt, but afterwards black, whereof that excellent greene colour is made, which the Painters and Limners do call Sap-greene; but theſe berries before they be ripe do make a faire yellow colour, being ſteeped in vineger.

‡ 2 Beſides the common kinde, *Cluſius* mentions two other: the firſt of which hath branches ſome two cubits long, ſubdiuided into diuers others, couered with a ſmooth barke like that of the former, which, the vpper rinde being taken off, is of a yellowiſh greene colour, and bitteriſh taſte: the branches haue ſome few prickles vpon them, and commonly end in them: the leaues are almoſt like thoſe of the common kinde, but ſmaller, narrower, and ſomewhat reſembling thoſe of the blacke Thorn, hauing ſomewhat a drying taſte: the floure conſiſts of foure leaues of a yellowiſh greene

‡ 1 *Rhamnus ſolutivus.*
Buck-thorne.

‡ 2 *Rhamnus ſolutivus minor.*
Middle Buck-thorne.

† 3 *Rhamnus ſolutivus pumilus.*
Dwarfe Buck-thorne.

greene colour: the root is wooddie as in other ſhrubs: *Cluſius* found this growing in the mountanous places of Auſtria, and calls it *Spina infectoria pumila.*

3 This other hath branches ſome cubite long, and of the thickneſſe of ones little finger, or leſſer, couered with a blacke and ſhriuelled barke: and towards the top diuided into little boughs, which are couered with a thin & ſmoother barke, and commonly end in a ſharp thorn: the leaues much reſemble thoſe of the Slo-tree yet are they ſhorter and leſſer, greene alſo, and ſnipt about the edges; firſt of an aſtringent, and afterwards of ſomewhat a bitteriſh taſte; the floures which grow amongſt the leaues are of an herby colour, and conſiſt of foure leaues: the fruit is not much vnlike that of the former; but diſtinguiſhed with two, & ſomtimes with three creſts or dents, firſt green, and then black when it is ripe: the root is thicke, wooddie and hard. *Cluſius* found this on the hill aboue the Bathes of Baden, hee calls it *Spina infectoria pumila* 2. This *Matthiolus* and others call *Lycium Italicum*: and our Author formerly gaue the figure of *Matthiolus* and *Tabernamontanus*, by the name of *Lycium Hiſpanicum*, and here againe another for his *Rhamnus ſolutivus*, which made mee to keepe it in this chapter, and omit it in the former, it being deſcribed in neither. ‡

¶ *The Place.*

Buck-thorne groweth neere the borders of fields, in hedges, woods, and in other vntoiled places: it delighteth to grow in riuers and in water ditches: it groweth in Kent in ſundry places, as at Farningham vpon the cony burrowes belonging ſometime to M^r. *Sibil*, as alſo vpon cony burrowes in Southfleet, eſpecially in a ſmall and narrow lane leading from the houſe of M^r. *William Swan* vnto Longfield downes, alſo in the hedge vpon the right hand at Dartford townes end towards London, and in many places more vpon the chalkie bankes and hedges.

¶ *The Time.*

It floureth in May, the berries be ripe in the fall of the leafe.

¶ *The Names.*

The later Herbariſts call it in Latine *Rhamnus ſolutiuus*, becauſe it is ſet with thornes, like as the Ram, and beareth purging berries. *Matthiolus* namethit *Spina infectoria*; *Valerius Cordus*, *Spina Cerui*, and diuers call it *Burgiſpina*. It is termed in high Dutch, **Creukbeet weghdozn**: in Italian, *Spino Merlo*, *Spino Zerlino*, *Spino Ceruino*: in Engliſh, Laxatiue Ram, Way-thorne, and Buck-thorne: in low Dutch they call the fruit or berries **Rhijnbeſien**, that is, as though you ſhould ſay in Latine, *Baſca Rhenana*; in Engliſh, Rheinberries: in French, *Nerprun*.

¶ *The Temperature.*

The berries of this Thorne, as they be in taſte bitter and binding, ſo be they alſo hot and dry in the ſecond degree.

¶ *The Vertues.*

A The ſame do purge and void by the ſtoole thicke flegme, and alſo cholericke humors: they are giuen being beaten into pouder from one dram to a dram and a halfe: diuers do number the berries, who giue to ſtrong bodies from fifteene to twenty or moe; but it is better to breake them and boile them in fat fleſh broth without ſalt, and to giue the broth to drinke: for ſo they purge with leſſer trouble and fewer gripings.

B There is preſſed forth of the ripe berries a iuice, which being boyled with a little Allum is vſed of painters for a deep greene, which they do call Sap greene.

C The berries which be as yet vnripe, being dried and infuſed or ſteeped in water, do make a faire yellow colour; but if they be ripe they make a greene.

Chap. 31. *Of the Holme, Holly, or Huluer tree.*

Agrifolium.
The Holly tree.

¶ *The Deſcription.*

THe Holly is a ſhrubbie plant, notwithſtanding it oftentimes growes to a tree of a reaſonable bigneſſe: the boughes whereof are tough and flexible, couered with a ſmooth and green bark. The ſubſtance of the wood is hard and ſound, and blackiſh or yellowiſh within, which doth alſo ſinke in the water, as doth the Indian wood which is called *Guaiacum*: the leaues are of a beautifull green colour, ſmooth and glib, like almoſt the bay leaues, but leſſer, and cornered in the edges with ſharp prickles, which notwithſtanding they want or haue few when the tree is old: the floures be white, and ſweet of ſmell: the berries are round, of the bigneſſe of a little Peaſe, or not much greater, of colour red, of taſt vnpleaſant, with a white ſtone in the midſt, which do not eaſily fall away, but hang on the boughes a long time: the root is wooddie.

There is made of the ſmooth barke of this tree or ſhrub, Birdlime, which the birders and country men do vſe to take birds with: they pul off the barke, and make a ditch in the ground, ſpecially in moiſt, boggy, or foggy earth, wherinto they put this bark, couering the ditch with boughes of trees, letting it remaine there till it be rotten and putrified, which will be done in the

the ſpace of twelue daies or thereabout: which done, they take it forth, and beat in morters vntill it be come to the thickneſſe and clammineſſe of Lime: laſtly, that they may cleare it from pieces of barke and other filthineſſe, they do waſh it very often: after which they adde vnto it a little oyle of nuts, and after that do put it vp in earthen veſſells.

¶ *The Place.*

The Holly tree groweth plentifully in all countries. It groweth green both winter and ſommer, the berries are ripe in September, and they do hang vpon the tree a long time after.

¶ *The Names.*

This tree or ſhrub is called in Latine *Agrifolium*: in Italian, *Agrifoglio*, and *Aguifoglio*: in Spaniſh, *Azebo*: in high Dutch, **Walddiſtell**, and of diuers **Steepalmen**: in low Dutch, **Hulſt**: in French, *Hous* and *Houſſon*: in Engliſh, Holly, Huluer, and Holme.

¶ *The Temperature.*

The berries of Holly are hot and drie, and of thin parts, and waſte away winde.

¶ *The Vertues.*

They are good againſt the collicke: for ten or twelue being inwardly taken bring away by the ſtoole thicke flegmaticke humors, as we haue learned of them who oftentimes made triall thereof. A

The Birdlime which is made of the barke hereof is no leſſe hurtfull than that of Miſſeltoe, for it is maruellous clammie, it glueth vp all the intrails, it ſhutteth and draweth together the guts and paſſages of the excrements, and by this meanes it bringeth deſtruction to man, not by any qualitie, but by his glewing ſubſtance. B

Holly beaten to pouder and drunke, is an experimented medicine againſt all the fluxes of the belly, as the dyſenterie and ſuch like. C

Chap. 32. *Of the Oke.*

1 *Quercus vulgaris cum glande & muſco ſuo.*
The Oke Tree with his Acornes and Moſſe.

¶ *The Deſcription.*

1 The common Oke groweth to a great tree; the trunke or body whereof is couered ouer with a thicke rough barke full of chops or rifts: the armes or boughs are likewiſe great, diſperſing themſelues farre abroad: the leaues are bluntly indented about the edges, ſmooth, and of a ſhining greene colour, whereon is often found a moſt ſweet dew and ſomewhat clammie, and alſo a fungous excreſcence, which we call Oke Apples. The fruit is long, couered with a browne hard and tough pilling, ſet in a rough ſcaly cup or husk: there is often found vpon the body of the tree, and alſo vpon the branches, a certaine kind of long white moſſe hanging downe from the ſame: and ſometimes another wooddie plant, which we cal Miſſeltoe, being either an excreſcence or outgrowing from the tree it ſelfe, or of the doung (as it is reported) of a bird that hath eaten a certaine berrie. ‡ Beſides theſe there are about the roots of old Okes within the earth certaine other excreſcences, which *Bauhine* and others haue called *Vuæ quercinæ*, becauſe they commonly grow in cluſters together, after the manner of Grapes and about their bignes, being ſometimes round, & otherwhiles cornered, of a woody ſubſtance, hollow within; and ſomtimes of a purple, otherwhiles of a whitiſh colour on the outſide: their taſte is aſtringent, and vſe ſingular in all Dyſente-

ries and fluxes of bloud, as *Encelius* affirmes, *Cap.* 51. *de Lapid. & Gen.* ‡

3 *Carolus Cluſius* reporteth that hee found this baſe or low Oke not far from Lisbone, of the height of a cubite, which notwithſtanding did alſo beare an acorne like that of our Oke-tree, ſauing that the cup is ſmoother, and the Acorne much bitterer, wherein it differeth from the reſt of his kinde.

2 *Quercus vulgaris cum excrementis fungoſis:*
The common Oke with his Apple or greene Gall.

3 *Quercus humilis.*
The dwarfe Oke.

There is a wilde Oke which riſeth vp oftentimes to a maruellous height, and reacheth very far with his armes and boughes, the body wherof is now and then of a mighty thickneſſe, in compaſſe two or three fathoms: it ſendeth forth great ſpreading armes, diuided into a multitude of boughs. The leaues are ſmooth, ſomething, hard, broad, long, gaſhed in the edges, greene on the vpper ſide: the Acornes are long, but ſhorter than thoſe of the tamer Oke; euery one faſtened in his owne cup, which is rough without: they are couered with a thin rinde or ſhell: the ſubſtance or kernell within is diuided into two parts, as are Beans, Peaſe, and Almonds: the bark of the yong Okes is ſmooth, glib, and good to thicken skins and hides with, but that of the old Okes is rugged, thicke, hard, and full of chops: the inner ſubſtance or heart of the wood is ſomthing yellow, hard and ſound, and the older the harder: the white and outward part next to the barke doth eaſily rot, being ſubiect to the worme, eſpecially if the tree be not felled in due time: ſome of the roots grow deepe into the earth, and otherſome far abroad, by which it ſtiffely ſtandeth.

¶ *The Place.*

The Oke doth ſcarcely refuſe any ground; for it groweth in a drie and barren ſoile, yet doth it proſper better in a fruitfull ground: it groweth vpon hills and mountaines, and likewiſe in vallies: it commeth vp euery where in all parts of England, but is not ſo common in other of the South and hot regions.

¶ *The Time.*

The Oke doth caſt his leaues for the moſt part about the end of Autumne: ſome keepe their leaues on, but dry all winter long, vntill they be thruſt off by the new ſpring.

¶ *The Names.*

The Oke is called in Greeke δρῦς: in Latine, *Quercus*: of ſome, *Placida*, as *Gaza* tranſlateth it. It may be called *Satiua*, *Vrbana*, or *Culta*; ſome alſo, *Emeros mudion*, and *Robur*: the Macedonians ἐμπέλιμον,

as

as though you ſhould ſay *Veriquercus*, as *Gaza* expo undeth it, or *Vere Quercus*, the true Oke. We may name it in Engliſh, the tamer Oke-tree: in French, *Cheſne*: in Dutch, **Eycken boom.**

The fruit is named in Greeke βαλανος: in Latine, *Glans*: in high Dutch, **Eichel**: in low Dutch, **Eckel**: in Spaniſh, *Bellotus*: in Italian, *Chiande*: in Engliſh, Acorne and Maſt.

The cup wherein the Acorne ſtandeth is named in Greeke ὀμφακὶς, as *Paulus Ægineta* in his third booke, 42 chapter teſtifieth, ſaying, *Omphacis* is the hollow thing out of which the Acorne groweth: in Latine, *Calix glandis*: in ſhops, *Cupula glandis*: in Engliſh, the Acorne cup.

¶ *The Temperature and Vertues.*

The leaues, barke, Acorne cups, and the Acornes themſelues, doe mightily binde and drie in the third degree, being ſomewhat cold withall. A

The beſt of them, ſaith *Galen*, is the thin skin which is vnder the barke of the tree, and that next, which lieth neereſt to the pulpe, or inner ſubſtance of the Acorne: all theſe ſtay the whites, the reds, ſpitting of bloud and lasks: the decoction of theſe is giuen, or the pouder of them dried, for the purpoſes aforeſaid. B

Acornes if they be eaten are hardly concocted, they yeeld no nouriſhment to mans body, but that which is groſſe, raw, and cold. C

Swine are fatted herewith, and by feeding hereon haue their fleſh hard and ſound. D

The Acorns prouoke vrine, and are good againſt all venome and poiſon, but they are not of ſuch a ſtopping and binding facultie as the leaues and barke. E

The Oke apples are good againſt all fluxes of bloud and lasks, in what manner ſoeuer they be taken, but the beſt way is to boile them in red wine, and being ſo prepared, they are good alſo againſt the exceſſiue moiſture and ſwelling of the iawes and almonds or kernels of the throat. F

The decoction of Oke apples ſtaieth womens diſeaſes, and cauſeth the mother that is falne downe to returne againe to the naturall place, if they doe ſit ouer the ſaid decoction being very hot. G

The ſame ſteeped in ſtrong white wine vineger, with a little pouder of Brimſtone, and the root of *Ireos* mingled together, and ſet in the Sun by the ſpace of a moneth, maketh the haire blacke, conſumeth proud and ſuperfluous fleſh, taketh away ſun-burning, freckles, ſpots the morphew, with all deformities of the face, being waſhed therewith. H

The Oke Apples being broken in ſunder about the time of their withering, do foreſhew the ſequell of the yeare, as the expert Kentiſh husbandmen haue obſerued by the liuing things found in them: as if they finde an Ant, they foretell plenty of graine to inſue: if a white worme like a Gentill or Magot, then they prognoſticate murren of beaſts and cattell; if a ſpider, then (ſay they) wee ſhall haue a peſtilence or ſome ſuch like ſickneſſe to follow amongſt men: theſe things the learned alſo haue obſerued and noted; for *Matthiolus* writing vpon *Dioſcorides* ſaith, that before they haue an hole through them, they containe in them either a flie, a ſpider, or a worme; if a flie, then war inſueth, if a creeping worme, than ſcarcitie of victuals; if a running ſpider, then followeth great ſickneſſe or mortalitie. I

CHAP. 33. *Of the Scarlet Oke.*

¶ *The Kindes.*

ALthough *Theophraſtus* hath made mention but of one of theſe Holme or Holly Okes onely, yet hath the later age ſet downe two kindes thereof; one bearing the ſcarlet grain, and the other only the Acorn: which thing is not contrary to *Dioſcorides* his opinion, for he intreateth of that which beareth the Acorne, in his firſt booke, among δρυὸς or the Okes; and the other hee deſcribeth in his fourth booke, vnder the title κόκκος βαφικὸς or *Coccus Baphice.*

¶ *The Deſcription.*

THe Oke which beareth the ſcarlet graine is a ſmall tree, in manner of a hedge tree, of a meane bigneſſe, hauing many faire branches or boughes ſpread abroad: whereon are ſet leaues, greene aboue, white vnderneath, ſnipt about the edges, and at euery corner one ſharpe prickle, in manner of the ſmoother Holly: among which commeth ſometimes, but not often, ſmall Acornes, ſtanding in little cups or husks, armed with prickes as ſharpe as thornes, and of a bitter taſte. Beſides the Acornes, there is found cleauing vnto the wooddie branches, a certaine kinde of berries, or rather an excreſcence, of the ſubſtance of the Oke Apple, and of the bigneſſe of a Peaſe, at the firſt white, and of the colour of aſhes when they be ripe, in which are ingendred little Maggots, which ſeeme

Ilex Coccigera.
The Scarlet Oke.

to be without life vntill they feele th e heat of the ſun, and then they creep, and ſeeke to flie away. But the people of the countrey (which make a gaine of them) doe watch the time of their flying, euen as we doe Bees, which they then take and put into a linnen bag, wherein they ſhake and boult them vp and downe vntil they be dead, which they make vp into great lumpes oftentimes, and likewiſe ſell them to diers apart, euen as they were taken forth of the bag, whereof is made the moſt perfect Scarlet.

¶ *The Place.*

This Oke groweth in Languedocke, and in the countries thereabout, and alſo in Spain: but it beareth not the ſcarlet grain in all places, but in thoſe eſpecially, which lie towards the Midland ſea, and which be ſubiect to the ſcorching heat of the Sun, as *Carolus Cluſius* witneſſeth; & not there alwaies, for when the tree waxeth old it growes to be barren. Then do the people cut and lop it downe, that after the young ſhoots haue attained to two or three yeares growth, it may become fruitfull againe.

Petrus Bellonius in his books of Singularities ſheweth, that *Coccus Baphicus* or the Scarlet graine doth grow in the Holy land, and neere to the lake which is called the Sea of *Tiberias*, and that vpon little trees, whereby the inhabitants get great ſtore of wealth, who ſeperat the husks from the pulpe or Magots, and ſell this being made vp into balls or lumpes, much dearer than the emptie ſhels or husks.

Of this graine alſo *Pauſanias* hath made mention in his tenth booke, and ſheweth, that the tree which bringeth forth this graine is not great, and alſo groweth in Phocis, which is a countrey in Macedonia neere to the Boetians, not far from the mountain Parnaſſus.

Theophraſtus writeth, that πρῖνος or the Scarlet Oke, is a great tree, and riſeth vp to the height of the common Oke: amongſt which writers there are ſome contrarietie. *Petrus Bellonius* reporteth it is a little tree, and *Theophraſtus* a great one, which may chance according to the ſoyle and climate; for that vpon the ſtonie mountaines cannot grow to that greatneſſe as thoſe in the fertill grounds.

¶ *The Time.*

The little graines or berries which grow about the boughes begin to appeare eſpecially in the Spring, when the Southweſt windes do blow: the floures fall and are ripe in Iune, together with the Maggots growing in them, which receiuing life by the heat of the Sun, do forthwith flie away (in manner of a Moth or Butterflie) vnleſſe by the care and diligence of the keepers, they be killed by much and often ſhaking them together, as aforeſaid.

The tree or ſhrub hath his leaues alwaies greene: the Acornes be very late before they be ripe, ſeldome before new come vp in their place.

¶ *The Names.*

The Scarlet Oke is called in Greeke πρῖνος: in Latine *Ilex*: the later writers, *Ilex Coccigera*, or *Coccifera*; in Spaniſh, *Coſcoia*: for want of a fit Engliſh name, we haue thought good to call it by the name of Scarlet Oke, or Scarlet Holme Oke: for *Ilex* is named of ſome in Engliſh, Holme, which ſignifieth Holly or Huluer. But this *Ilex*, as well as thoſe that follow, might be called Holm Oke, Huluer Oke, or Holly Oke, for difference from the ſhrub or hedge tree *Agrifolium*, which is ſimply called Holme, Holly, and Huluer.

The graine or berrie that ſerueth to die with is properly called in Greeke κόκκος βαφικὸς: in Latine, *Coccus infectoria*, or *Coccum infectorium*: *Pliny* alſo nameth it *Cuſculium*: or as moſt men doe reade it, *Quiſquilium*: the ſame Author ſaith, that it is likewiſe named *Scolecion*, or Maggot berrie.

The Arabians and the Apothecaries doe know it by the name of *Cheſmes*, *Chermes*, and *Kermes*: They are deceiued who thinke that *Cheſmes* doth differ from *Infectorium Coccum*: it is called in Italian, *Grano de tinctori*: in Spaniſh, *Graña de tintoreros*: in high Dutch, **Scharlachbeer**: in French, *Vermillon*,

Vermillon, and *Graine d'eſcarlate*: in Engliſh, after the Dutch, Scarlet Berry, or Scarlet graine, and after the Apothecaries word, *Coccus Baphicus*: the maggot within is that which is named Cutchonele, as moſt do deeme.

Theophraſtus ſaith the Acorne or fruit hereof is called of diuers, Ἄκυλον, *Acylum*.

¶ *The Temperature and Vertues.*

This graine is aſtringent and ſomwhat bitter, and alſo dry without ſharpneſſe and biting, therefore, ſaith *Galen*, it is good for great wounds and ſinewes that be hurt, if it be layd thereon: ſome temper it with Vineger; others with Oxymel or ſyrrup of vineger. A

It is commended and giuen by the later Phyſitians to ſtay the Menſes: it is alſo counted among thoſe Simple which be cordials, and good to ſtrengthen the heart. Of this graine that noble and famous confection *Alkermes*, made by the Arabians, hath taken his name, which many doe highly commend againſt the infirmities of the heart: notwithſtanding it was chiefly deuiſed in the beginning for purging of melancholy; which thing is plainly perceiued by the great quantitie of *Lapis Lazulus* added thereto: and therefore ſeeing that this ſtone hath in it a venomous quality, and likewiſe a property to purge melancholy, it canot of it ſelfe be good for the heart, but the other things be good, which be therefore added, that they might defend the heart from the hurts of this ſtone, and correct the malice thereof. B

This compoſition is commended againſt the trembling and ſhaking of the heart, and for ſwounings and melancholy paſſions, and ſorrow proceeding of no euident cauſe: it is reported to recreate the minde, and to make a man merry and ioyfull. C

It is therefore good againſt melancholy diſeaſes, vaine imaginations, ſighings, griefe and ſorrow without manifeſt cauſe, for that it purgeth away melancholy humors: after this maner it may be comfortable for the heart, and delightfull to the minde, in taking away the materiall cauſe of ſorrow: neither can it otherwiſe ſtrengthen a weake and feeble heart, vnleſſe this ſtone called *Lapis Cyaneus* be quite left out. D

Therefore he that is purpoſed to vſe this compoſition againſt beatings and throbbings of the heart, and ſwounings, and that not as a purging medicine, ſhall do well and wiſely by leauing out the ſtone *Cyaneus*; for this being taken in a little weight or ſmall quantitie, cannot purge at all, but may in the meane ſeaſon trouble and torment the ſtomacke, and withall thorow his ſharpe and venomous qualitie (if it be oftentimes taken) be very offenſiue to the guts and intrailes, and by this meanes bring more harme than good. E

Moreouer, it is not neceſſarie, no nor expedient, that the briſtle died with Cochenele, called *Cheſmes*, as the Apothecaries terme it, ſhould be added to this compoſition, for this briſtle is not died without *Auripigmentum*, called alſo Orpiment, and other pernitious things ioyned therewith, whoſe poyſonſome qualities are added to the iuyces together with the colour, if either the briſtle or died ſilke be boyled in them. F

The berries of the Cochenele muſt be taken by themſelues, which alone are ſufficient to dy the iuices, and to impart vnto them their vertue: neither is it likewiſe needfull to boile the raw ſilke together with the graines, as moſt Phyſitians thinke: this may be left out, for it maketh nothing at all for the ſtrengthning of the heart. G

Chap. 34. *Of the great Skarlet Oke.*

¶ *The Deſcription.*

The great Skarlet Oke, or the great Holme Oke, groweth many times to the full height of a tree, ſometimes as big as the Peare tree, with boughes far ſpreading like the Acorne or common Maſt trees: the timber is firme and ſound: the leaues are ſet with prickles round about the edges, like thoſe of the former Skarlet Oke: the leaues when the tree waxeth old haue on them no prickles at all, but are ſomwhat bluntly cut or indented about the edges, greene on the vpper ſide, and gray vnderneath: the Acorne ſtandeth in a prickly cup like our common Oke Acorne, which when it is ripe becommeth of a browne colour, with a white kernel within of taſte not vnpleaſant. There is found vpon the branches of this tree a certaine kinde of long hairy moſſe of the colour of aſhes, not vnlike to that of our Engliſh Oke. ‡ This tree is euer greene, and at the tops of the branches about the end of May, here in England, carrieth diuers long catkins of moſſie yellow floures, which fall away, and are not ſucceeded by the acornes, for they grow out vpon other ſtalks. *Cluſius* in the yeare 1581 obſerued two trees; the one in a garden aboue the Bridge, and the other in the priuat garden at White-Hall, hauing leſſer leaues than the former. The later of theſe is yet ſtanding, and euery yeare beares ſmall Acornes, which I could neuer obſerue to come to any maturitie. ‡

¶ *The*

Ilex maior Glandifera.
The great Skarlet Oke.

‡ *Ilicis ramus floridus.*
The floures of the great Skarlet Oke.

¶ *The Place.*

In diuers places there are great woods of theſe trees, hills alſo and vallies are beautified therewith: they grow plentifully in many countries of Spaine, and in Languedocke and Prouence in great plenty. It is likewiſe found in Italy. It beareth an Acorne greater, and of a larger ſize than doth the tame Oke; in ſome countries leſſer and ſhorter: they are ſtrangers in England, notwithſtanding there is here and there a tree thereof, that hath been procured from beyond the ſeas: one groweth in her Maieſties Priuy Garden at White-Hall, neere to the gate that leadeth into the ſtreet, and in ſome other places here and there one.

¶ *The Time.*

It is greene at all times of the yeare: it is late before the Acornes be ripe. *Cluſius* reporteth, that he ſaw the floures growing in cluſters of a yellow colour in May.

¶ *The Names.*

This Oke is named in Greeke ἀρία: in Latine, *Ilex*: in Spaniſh, *Enzina*: in Italian, *Elize*: in French, *Cheſneuerd*: in Engliſh, Barren Skarlet Oke, or Holme Oke, and alſo of ſome, French or Spaniſh Oke.

The Spaniards call the fruit or Acorne *Bellota*, or *Abillota*. *Theophraſtus* ſeemeth to call this tree not *Prinos*, but *Smilax*; for he maketh mention but of one *Ilex* onely, and that is of Scarlet Oke; and he ſheweth that the Arcadians do not call the other *Ilex*, but *Smilax*: for the name *Smilax* is of many ſignifications: there is *Smilax* among the Pulſes, which is alſo called *Dolichus*, and *Phaſeolus*; and *Smilax aſpera*, and *Lænis*, amongſt the Binde-weeds: likewiſe *Smilax* is taken of *Dioſcorides* to be *Taxus*, the Yew tree. Of *Smilax*, *Theophraſtus* writeth thus in his third booke: the inhabitants of Arcadia do call a certaine tree *Smilax*, being like vnto the Skarlet Oke: the leaues thereof be not ſet with ſuch ſharpe prickles, but tenderer and ſofter.

Of this *Smilax Pliny* alſo writeth, in his ſixteenth booke, chap. 6. There be of *Ilex*, ſaith he, two kindes, *Ex ijs in Italia folio non multum ab oleis diſtant*, called of certain Grecians *Smilaces*, in the prouinces *Aquifolia*: in which words, in ſtead of Oliue trees may perchance be more truly placed *Suberis*, or the Corke tree; for this kinde of *Ilex* or *Smilax* is not reported of any of the old writers

to

to haue the leafe of the Oliue tree: but *Suber* in Greeke, called *Phellos*, or the Corke tree, hath a little leafe.

¶ *The Temperature and Vertues.*

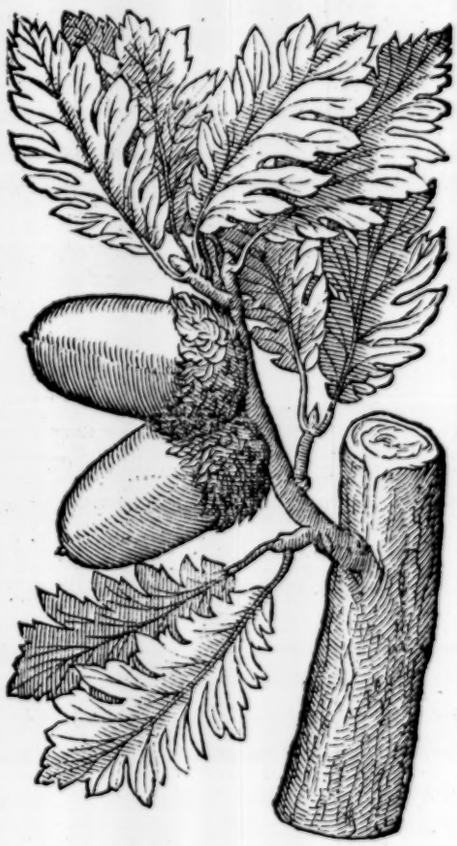
The leaues of this Oke haue force to coole and repell or keepe backe, as haue the leaues of the Acornes or Maſt trees: being ſtamped or beaten, and applied, they are good for ſoft ſwellings, and ſtrengthen weake members. A

The barke of the root boiled in water vntill it be diſſolued, and layd on all night, maketh the haire blacke, being firſt ſcoured with *Cimolia*, as *Dioſcorides* ſaith. B

Cluſius reporteth, that the Acorne is eſteemed of, eaten, and brought into the market to be ſold, in the city of Salamanca in Spaine, and in many other places of that countrey; and of this Acorne *Pliny* alſo hath peraduenture written, *lib. 16. cap. 5.* in theſe words: Moreouer, at this day in Spain the Acorne is ſerued for a ſecond courſe. C

Chap. 35. *Of the great Holme-Oke.*

1 *Cerris maiore Glande.*
The Holme Oke with great Acornes.



2 *Cerris minore Glande.*
The Holme Oke with leſſer Acorns.

¶ *The Deſcription.*

1 AMong the wilder Okes this is not the leaſt, for his comely proportion, although vnprofitable for timber, to make coles, carts, Wainſcot, houſes, or ſhips of: the fruit is not fit for any man or beaſt to eate, neither any propertie knowne for the vſe of phyſicke or ſurgerie: it groweth vp to the height of a faire tree, the trunke or body is great, and verie faire to looke vpon: the wood or timber ſoft and ſpongie, ſcarce good to be burned: from which ſhooteth forth very comely branches diſperſing themſelues farre abroad; whereon are ſet for the moſt part by couples very faire leaues, greene aboue, and of an ouerworne ruſſet colour vnderneath, cut or ſnipt about the edges very deepe: the Acorne groweth faſt vnto the boughes, without any foot-ſtalke at all, being very like vnto our common Acorne, ſet in a rough and prickly cup like an Hedge-hog or the Cheſnut huske, of a harſh taſte, and hollow within: this tree beareth or bringeth

‡ *Cerri minoris ramulus cum flore.*
A branch of the ſmaller Holme Oke with floures.

bringeth forth oft times a certain ſmooth kinde of Gall not altogether vnprofitable. This Oke likewiſe bringeth forth another kinde of excreſence, which the Grauer hath omitted in the figure, which is called in Greeke φαλλος: *Gaza* nameth it *Penis*. This *Penis* or pricke is hollow, moſſie, hanging downe halfe a yard long, like a long rag of linnen cloath.

2 The ſecond is altogether like the firſt, ſauing that this beareth ſmaller Acornes, and the whole tree is altogether leſſe, wherein conſiſteth the difference.

‡ Both this & the former cary floures cluſtering vpon long ſtalkes, like as in the common Oke; but the fruit doth not ſucceed them, but grow forth in other places. ‡

¶ *The Place.*

This Oke groweth in vntoiled places, it is ſeldome times found, and that but in Woods onely: it is for the moſt part vnknowne in Italy, as *Pliny* reporteth.

¶ *The Time.*

They bring forth their fruit or Acornes in the fall of the leafe.

¶ *The Names.*

This Oke is called in Greeke αιγιλωψ: in Latine, *Cerrus*: yet doth *Pliny* make mention both of *Ægilops*, and alſo of *Cerrus*: αιγιλωψ is likewiſe one of the diſeaſes of corne, called in Latine *Feſtuca*: in Engliſh, wilde Otes, and far differing from the tree *Ægilops*.

That which hangeth from the boughs, *Pliny, lib.* 16. *cap.* 8. calleth *Panus* onely: that acorne tree named *Ægilops* bringeth forth *Panos arentes*, withered prickes, couered with white moſſie iags hanging downe, not only in the barke, but alſo from the boughes, halfe a yard in bigneſſe, bearing a ſweet ſmell, as we haue ſaid, among ointments.

¶ *The Temperature and Vertues.*

We finde nothing written of the faculties of this tree among the old Writers, neither of our owne experience.

Chap. 36. *Of the Corke Oke.*

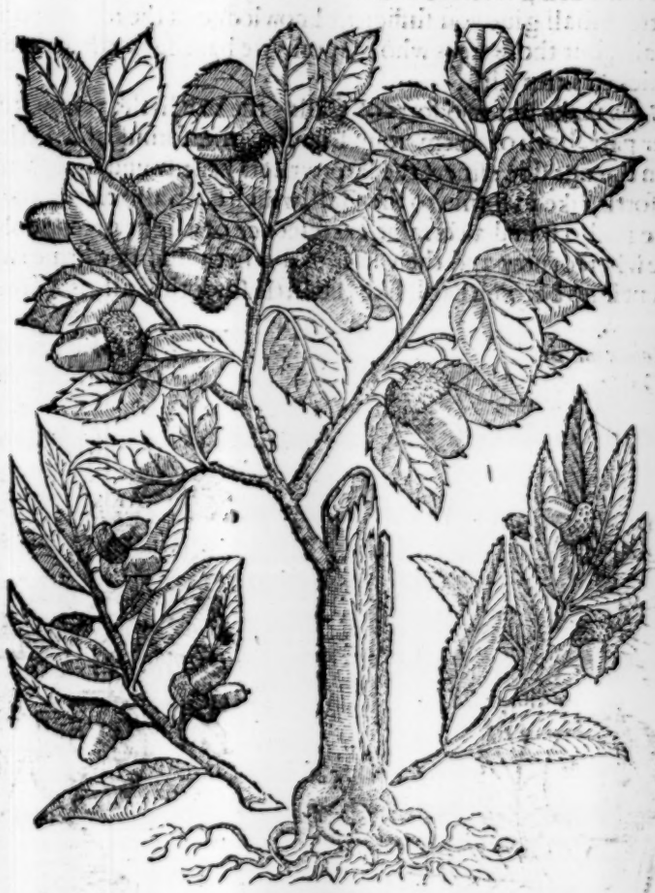
¶ *The Deſcription.*

1 THe Corke tree is of a middle bigneſſe like vnto *Ilex*, or the barren skarlet Oke, but with a thicker body, and fewer boughes: the leaues be for the moſt part greater, broader, rounder, and more nicked in the edges: the barke of the tree is thicke, very rugged, and full of chinkes or crannies that cleaueth and diuideth it ſelfe into pieces, which vnleſſe they be taken away in due time do giue place to another barke growing vnderneath, which when the old is remoued is maruellous red, as though it were painted with ſome colour: the Acorne ſtandeth in a cup, which is great, briſtled, rough, and full of prickles: this Acorne is alſo aſtringent or binding, more vnpleaſant than the Holme Acorne, greater in one place, and leſſe in another.

2 The Corke tree with narrow leaues groweth likewiſe to the height and bigneſſe of a great tree; the trunke or body whereof is couered with a rough and ſcabbed barke of an ouerworn blackiſh colour, which likewiſe cleaueth and caſteth his coat when the inner barke groweth ſomwhat thicke: the branches are long, tough, and flexible, eaſie to be bowed any way, like thoſe of the Oziar;

Oziar; whereupon do grow leaues like thoſe of the precedent, but longer, and little or nothing indented about the edges: the fruit groweth in ſmall cups as the Acornes doe: they are leſſer than thoſe of the other kinde, as is the reſt of the tree, wherein is the chiefeſt difference. ‡ This varies in the leafe, (as you may ſee in the figure) which in ſome is ſnipt about the edge, in other ſome not at all.

1. 2. *Suber latifolium & anguſtifolium.*
The Corke tree with broad and narrow leaues.



¶ *The Place.*

It groweth in the countrey of Aquitania, neere to the mountaines called Pyrenæi: it alſo groweth plentifully in the kingdomes of Spaine, differing ſomewhat from that of Aquitania, as *Cluſius* declareth: it is likewiſe found in Italy, and that in the territorie of Piſa, with a longer leafe, and ſharper pointed; and about Rome with a broader, and cut in the edges like a ſaw, and rougher, as *Matthiolus* teſtifieth.

¶ *The Time.*

The leaues of the firſt are alwaies greene in Spaine and Italy, about the Pyrenæan mountaines they fall away in Winter.

¶ *The Names.*

This tree is called in Greeke : in Latine *Suber*: in French, *Liege*: in Italian, *Sugaro*: the ſame names do alſo belong to the barke: the Spaniards call the tree *Alcornoque*: the Engliſhmen, Corke tree; and the barke, *Corcha de Alcornoque*; whereupon the Low-countrey men and Engliſh men alſo do call it Corke; and yet it is called in low-Dutch alſo **Ulothout.**

¶ *The Temperature and Vertues.*

This barke doth manifeſtly dry, with a binding facultie.

A Being beaten to pouder and taken in water it ſtancheth bleeding in any part of the body. The
B Corke which is taken out of wine veſſels, ſaith *Paulus*, being burnt, maketh aſhes which do mightily dry, and are mixed in compoſitions diuiſed againſt the bloudy flix.

C Corke is alſo profitable for many things: it is vſed (ſaith *Pliny*) about the anchors of ſhips, Fiſhers nets, and to ſtop veſſels with; and in Winter for womens ſhooes, which vſe remaines with vs euen to this day: fiſhermen hang this barke vpon the wings of their nets for feare of ſinking: and ſhoo-makers put it in ſhooes and pantofles for warmneſſe ſake.

CHAP.

Chap. 37. *Of the Gall tree.*

¶ *The Kindes.*

OF trees that bring forth Galls there be diuers ſorts, as may appeare by the diuers formes and ſorts of Galls ſet forth in this preſent chapter, which may ſerue for their ſeuerall diſtinctions, whereof ſome bring forth Acornes likewiſe, and ſome nothing but Galls: the figures of ſome few of the trees ſhall giue you ſufficient knowledge of the reſt: for all the Acorne or Maſt trees bring forth Galls, but thoſe trees whoſe figures we haue ſet forth do beare thoſe Galls fit for medicine, and to thicken skins with.

Dioſcorides and *Galen* make but two ſorts of Galls; the one little, yellow, full of holes, and more ſpongie in the inner part, both of them round, hauing the forme of a little ball, and the other ſmooth and euen on the out ſide: ſince, the later writers haue found moe, ſome hauing certain little knobs ſticking forth, like in forme to the Gall, which doth alſo cleaue and grow without ſtalke to the leafe. There is alſo found a certaine excreſcence of a light greene colour, ſpongie and waterie, in the middle whereof now and then is found a little flie or worme: which ſoft ball in hot countries doth oftentimes become hard, like the little ſmooth Gall, as *Theophraſtus* ſaith.

1 *Galla, ſiue Robur maius.*
The great Gall tree.

‡ 2 *Robur, ſiue Galla maior altera.*
Another great Gall tree.

¶ *The Deſcription.*

1 THe Gall tree growes vp to a ſufficient height, hauing a very faire trunk or body, whereon are placed long twiggy branches bringing forth very faire leaues, broad, and nicked in the edges like the teeth of a ſaw: among which come forth acornes, although the figure expreſſe not the ſame, like thoſe of the Oke, and likewiſe a wooddy excreſcence, which we name the Gall, hauing certaine ſmall eminences or bunches on the out ſide, growing for the moſt part vpon the ſlender branches without ſtalks, and ſomtimes they grow at the ends thereof; which by the heate of the Sun are harder, greater, and more ſollid in one countrey than another, according to the ſoile and clymat.

‡ 2 The

3 *Galla minor.*
The little Gall tree.

‡ 2 This growes to the height of a tall man, hauing leaues deepely diuided on the edges like the Oke, and they are green aboue, but hairy and hoary below: it carries a great Gall of the bigneſſe of a little Apple, and that in great plenty, & without any order. This groweth in diuers parts of old Caſtile in Spain, and in all the mountainous woods about Vienna in Auſtria.‡

3 The leſſer Gall tree differeth not from the former, ſauing that it is altogether leſſer: the fruit and Gall is likewiſe leſſer, wherein eſpecially conſiſteth the difference.

¶ *The Place.*

The Galls are found in Italy, Spaine, and Bohemia, and moſt of the hot regions.

¶ *The Time.*

The Gall, ſaith *Pliny*, appeareth or commeth forth when the Sun commeth out of the ſigne *Gemini*, and that generally in one night.

¶ *The Names.*

The Gall tree is called *Quercus*, *Robur*, and *Gallæ arbor*: the Gall is called in Greeke [illegible]: the Apothecaries and Italians keepe the name *Galla* for the fruit: in high-Dutch, **Galopffel**: in low-Dutch, **Galnoten**: in Spaniſh, *Agatha Galha*, and *Bugalha*: in French, *Noix de Galle*: in Engliſh, Gaules, and Galls.

¶ *The Temperature and Vertues.*

The Gall called *Omphacitis*, as *Galen* writeth, is dry in the third degree, and cold in the ſecond: it is a very harſh medicine, it faſtneth and draweth together faint and ſlacke parts, as the ouergrowings in the fleſh: it repelleth and keepeth backe rheumes and ſuch like fluxes, and doth effectually dry vp the ſame, eſpecially when they haue a deſcent into the gums, almonds of the throat, and other places of the mouth. A

The other Gall doth dry and alſo binde; but ſo much leſſer, by how much the harſh or choking qualitie is diminiſhed: being boyled, beaten, and alſo applied in manner of a plaiſter is laid with good ſucceſſe vpon the inflammations of the fundament, and falling downe thereof: it is boiled in water if there be need of a little aſtriction; and in wine, eſpecially in auſtere wine, if more need require. B

Galls are very profitable againſt the Dyſenterie and the Cœliacke paſſion, being drunk in wine, or the pouder thereof ſtrewed vpon meats. C

Galls are vſed in dying and colouring of ſundry things, and in making of inke. D

Laſt of all, burnt Galls doe receiue a further facultie, namely to ſtanch bloud, and are of thin parts, and of a greater vertue to dry than be thoſe that are not burnt: they muſt be layd vpon hot burning coles vntill they come to be thorow white, and then they are to be quenched in Vineger and wine. E

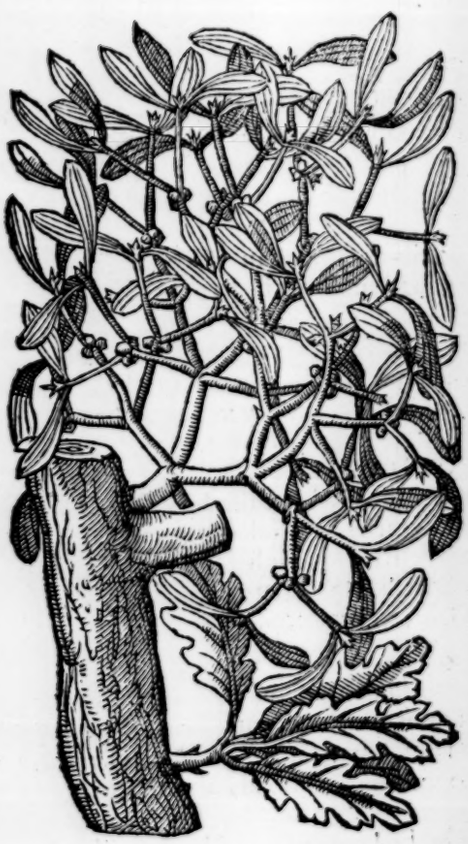
Moreouer, Galls are good for thoſe that are troubled with the bloudy flix and common laskes, being taken in wine or water, and alſo applied or vſed in meats: finally, theſe are to be vſed as oft as need requireth to dry and binde. F

Oke Apples are much of the nature of Galls, yet are they far inferiour to them, and of leſſer force. G

† Our Author out of *Tabernæmontanus* gaue the figures of fourteene varieties of Galls; ſome being large, others ſmall; ſome round, others longiſh, and others diuerſly cornered.

Chap. 38.
Of Miſſeltoe or Miſteltoe.

1 *Viſcum.*
Miſſeltoe.



¶ *The Deſcription.*

1 *Viſcum* or Miſſeltoe hath many ſlender branches ſpred ouerthwart one another, and wrapped and interlaced one within another: the bark whereof is of a light green or Popinjay colour: the leaues of this branching excreſcence be of a browne greene colour: the floures be ſmal and yellow: which being paſt, there appeare ſmall cluſters of white tranſlucent berries, which are ſo cleare that a man may ſee through them, and are full of clammy or viſcous moiſture, whereof the beſt Bird-lime is made, far exceeding that which is made of Holme or Holly barke: and within this berry is a ſmall blacke kernell or ſeed: this excreſence hath not any root, neither doth encreaſe himſelfe of his ſeed, as ſome haue ſuppoſed; but it rather commeth of a certaine moiſture and ſubſtance gathered together vpon the boughes and ioints of the trees, through the barke whereof this vaporous moiſture proceeding, bringeth forth the Miſſeltoe. Many haue diuerſly ſpoken hereof: ſome of the Learned haue ſet downe, that it comes of the dung of the bird called a Thruſh, who hauing fed of the ſeeds thereof, as eating his owne bane, hath voided and left his dung vpon the tree, whereof was ingendred this berry, a moſt fit matter to make lime of to intrap and catch birds withall.

2 Indian Miſſeltoe groweth likewiſe vpon the branches of trees, running along ſt the ſame in manner of Polypodie: the ſtrings of the roots are like thoſe of Couch-graſſe; from which riſe vp diuers ſtalks ſmooth and euen, ſet with ioints and knees at certain diſtances: toward the top comes forth one leafe ribbed like the Plantain leafe, whereon are marked certaine round eyes ſuch as are in the haft of a knife; from the boſome whereof commeth forth a chaffie branch, ſet with ſmall leaues which continue greene winter and Sommer.

2 *Viſcum Indicum Lobelij.*
Indian Miſſeltoe.

3 *Viſcum Peruvianum Lobelij.*
Miſſeltoe of Peru.

3 There is found alſo another plant growing vpon the boughes or branches of trees, in maner as our Miſſeltoe doth, and may very well be reckoned as a kinde thereof: the plant cleaueth vnto the branches, being ſet thereto as it were with the pillings of the ſea onion, of the bredth of a mans hand toward the bottome, and ſomewhat hollow: the tops whereof are very ſmall and ruſhy, hollow likewiſe, and of a purple colour: among which comes forth a branch like that of *Haſtula Regia*, or the Kings Speare, reſembling the buſh of Otes, couered with a white ſilke, ſuch as is to be found in *Aſclepias*, of a ſalt and nitrous taſte, and very vnpleaſant.

¶ *The Place.*

The firſt kinde of Miſſeltoe groweth vpon Okes and diuers other trees almoſt euery where; as for the other two they are ſtrangers in England.

¶ *The Time.*

Miſſeltoe is alwaies greene as well in Winter as in Sommer: the berries are ripe in Autumne; they remaine all Winter thorow, and are a food for diuers birds, as Thruſhes, Blacke-birds, and Ring-doues.

¶ *The Names.*

Miſſeltoe is called in Greeke ἰξὸς, and ἰξία: in Latine, *Viſcum*: in high-Dutch, **Miſtell**: in Low-Dutch, **Marentacken**: in Italian, *Viſchio*: in Spaniſh, *Liga*: in the Portugal language, *Viſgo*: in Engliſh, Miſſel, and Miſſeltoe.

The glue which is made of the berries of Miſſel is likewiſe called *Viſcum* and *Ixia*: in Engliſh, Bird-lime. *Ixia* is alſo called *Chamæleon albus*, by reaſon of the glue which is oftentimes found about the root thereof. This word is alſo aſcribed to *Chamæleon niger*, as we reade among the baſtard names. *Ixia* is likewiſe reckoned vp by *Dioſcorides*, *lib.* 6. and by *Paulus Ægineta*, *lib.* 5. among the poyſons: but what this poyſonſome and venomous *Ixia* is it is hard and doubtfull to declare: many would haue it to be *Chamæleon niger*: others, the glue or clammy ſubſtance which is made of the berries of Miſſel-toe; who do truly thinke that *Ixia* differeth from *Chamæleon niger*: for *Paulus Ægineta*, *lib.* 5. *cap.* 30. in reckoning vp of ſimple poyſons hath firſt made mention of *Chamæleon niger*, then a little after of *Ixia*: and whileſt he doth particularly diſcourſe of euery one, he intreateth of *Chamæleon niger*, *cap.* 32. and of *Ixia* (which hee alſo nameth *Vlophonon*) *cap.* 47. and telleth of the dangerous and far differing accidents of them both. And *Dioſcorides* himſelfe, *lib.* 6. where he ſetteth downe his iudgement of ſimple poyſons, intreateth firſt of *Chamæleon niger*, and then a little after of *Ixia*. Theſe things declare that *Chamæleon niger* doth differ from *Ixia*, which is reckoned among the poyſons. Moreouer, it can no where be read that *Chamæleon niger* beareth Bird-lime, or hath ſo glutinous and clammy a ſubſtance as that it ought to be called *Ixia*: therfore *Ixia*, as it is one of the poyſons, is the glue that is made of the berries of Miſſeltoe, which becauſe it is ſharpe and biting, inflameth and ſetteth the tongue on fire, and with his ſlimie and clammy ſubſtance doth ſo draw together, ſhut, and glue vp the guts, as that there is no paſſage for the excrements, which things are mentioned among the miſchiefes that *Ixia* bringeth.

‡ I can by no meanes approue of, or yeeld to this opinion here deliuered out of *Dodonæus* by our Author; which is, That the Bird-lime made of the berries of Miſſeltoe is poyſon; or that *Ixia* ſet forth by *Dioſcorides* and *Nicander* for a poyſon is meant of this: for this is manifeſtly treated of in *Dioſcorides*, *lib.* 3. *cap.* 103. by the name of ἰξὸς: when as the other is mentioned, *lib.* 6. *cap.* 21. by the name of ἰξία. Alſo dayly experience ſhewes this plant to haue no maligne nor poiſonous, but rather a contrarie facultie, being frequently vſed in medicines againſt the Epilepſie. Such as would ſee more concerning *Ixia* or *Ixias*, let them haue recourſe to the firſt chapter of the firſt part of *Fabius Columna*, *de Stirpib. min. cognitis & rarioribus*, where they ſhall finde it largely treated of. ‡

¶ *The Temperature and Vertues.*

The leaues and berries of Miſſeltoe are hot and dry, and of ſubtill parts: the Bird-lime is hot and biting, and conſiſts of an airy and waterie ſubſtance, with ſome earthy qualitie; for according to the iudgement of *Galen*, his acrimony ouercommeth his bitterneſſe; for if it be vſed in outward applications it draweth humors from the deepeſt or moſt ſecret parts of the body, ſpreading and diſperſing them abroad, and digeſting them. A

It ripeneth ſwellings in the groine, hard ſwellings behinde the eares, and other impoſtumes, being tempered with roſin and a little quantitie of wax. B

With Frankincenſe it mollifieth old vlcers and malicious impoſtumes, being boyled with vnſlaked lime, or with *Gagate lapide*, or *Aſio*, and applied, it waſteth away the hardnes of the ſpleene. C

With Orpment or *Sandaraca* it taketh away foule ill fauoured nailes, being mixed with vnſlaked lime and wine lees it receiueth greater force. D

It hath been moſt credibly reported vnto me, that a few of the berries of Miſſeltoe bruiſed and ſtrained into Oyle, and drunken, hath preſently and forthwith rid a grieuous and ſore ſtitch. E

Chap. 39. *Of the Cedar tree.*

¶ *The Kindes.*

THere be two Cedars, one great bearing Cones, the other ſmall bearing berries like thoſe of Iuniper.

Cedrus Libani.

The great Cedar tree of Libanus.

¶ *The Deſcription.*

THe great Cedar is a very big and high tree, not onely exceeding all other reſinous trees, and thoſe which beare fruit like vnto it, but in his tallneſſe and largeneſſe farre ſurmounting all other trees: the body or trunke thereof is commonly of a mighty bigneſſe, inſomuch as foure men are not able to fathome it, as *Theophraſtus* writeth: the barke of the lower part, which proceedeth out of the earth, to the firſt yong branches or ſhoots, is rough and harſh; the reſt which is among the boughes is ſmooth and glib: the boughes grow forth almoſt from the bottome, and not farre from the ground, euen to the very top, waxing by degrees leſſer and ſhorter ſtill as they grow higher, the tree bearing the forme or ſhape of a Pyramide or ſharpe pointed ſteeple: theſe compaſſe the body round about in maner of a circle, and are ſo orderly placed by degrees, as that a man may clymbe vp by them to the very top as by a ladder: the leaues be ſmall and round like thoſe of the Pine tree, but ſhorter, and not ſo ſharp pointed; all the cones or clogs are far ſhorter and thicker than thoſe of the Firre tree, compact of ſoft, not hard ſcales, which hang not downewards, but ſtand vpright vpon the boughes, whereunto alſo they are ſo ſtrongly faſtned, as they can hardly be plucked off without breaking of ſome part of the branches, as *Bellonius* writeth: the timber is extreme hard, and rotteth not, nor waxeth old: there is no wormes nor rottenneſſe can hurt or take the hard matter or heart of this wood, which is very odoriferous, and ſomewhat red: *Solomon* King of the Iewes did therefore build Gods Temple in Ieruſalem of Cedar wood: the Gentiles were wont to make their Diuels or Images of this kinde of wood, that they might laſt the longer.

¶ *The Place.*

The Cedar trees grow vpon the ſnowie mountaines, as in Syria vpon mount Libanus, on which there remaine ſome euen to this day, ſaith *Bellonius*, planted as is thought by *Solomon* himſelfe: they are likewiſe found on the mountaines Taurus and Amanus, in cold and ſtony places: the merchants of the factorie at Tripolis told me, that the Cedar tree groweth vpon the declining of the mountaine Libanus, neere vnto the Hermitage by the city Tripolis in Syria: they that dwel in Syria vſe to make boats thereof for want of the Pine tree.

¶ *The Time.*

The Cedar tree remaineth alwaies greene, as other trees which beare ſuch manner of fruit: the timber of the Cedar tree, and the images and other workes made thereof, ſeeme to ſweat and ſend forth moiſture in moiſt and rainy weather, as do likewiſe all that haue an oylie iuyce, as *Theophraſtus* witneſſeth.

¶ *The Names.*

This huge and mighty tree is called in Greeke κέδρος: in Latine likewiſe *Cedrus*: in Engliſh, Cedar, and Cedar tree. *Pliny, lib. 24. cap. 5.* nameth it *Cedrelate*, as though he ſhould ſay, *Cedrus abies*, or *Cedrina abies*, Cedar Firre; both that it may differ from the little Cedar, and alſo becauſe it is very like to the Firre tree.

The

The Rosin hath no proper name, but it may be syrnamed *Cedrina*, or Cedar Rosin.

The pitch which is drawne out of this is properly called κέδρια: yet *Pliny* writeth, that also the liquor of the Torch Pine is named *Cedrium*. The best, saith *Dioscorides*, is fat, thorow shining, and of a strong smell; which being poured out in drops vniteth it selfe together, and doth not remaine seuered.

¶ *The Temperature and Vertues.*

Cedar is of temperature hot and dry, with such an exquisite tenuitie and subtiltie of parts, that it seemeth to be hot and dry in the fourth degree, especially the Pitch or Rosin thereof. A

There issueth out of this tree a Rosin like vnto that which issueth out of the Fir tree, very sweet in smell, of a clammy or cleauing substance, the which if you chew in your teeth it will hardly be gotten forth againe, it cleaueth so fast: at the first it is liquid and white, but being dried in the sun it waxeth hard: if it be boiled in the fire an excellent pitch is made thereof, called Cedar Pitch. B

The Ægyptians were wont to coffin and embalme their dead in Cedar, and with Cedar pitch, although they vsed also other meanes, as *Herodotus* recordeth. C

The condited or embalmed body they call in shops *Mumia*, but very vnfitly; for *Mumia* among the Arabians is that which the Grecians call *Pissasphalton*, as appeareth by *Auicen, cap.* 474. and out of *Serapio, cap.* 393. D

He that interpreted and translated *Serapio* was the cause of this error, who translated and interpreted *Mumia* according to his owne fancie, and not after the sence and meaning of his Author *Serapio*, saying that this *Mumia* is a compsition made of Aloes and Myrrh mingled together with the moisture of mans body. E

The gum of Cedar is good to be put in medicines for the eyes, for being anointed therewith it cleareth the sight, and clenseth them from the Haw and from stripes. F

Cedar infused in vineger and put into the eares killeth the wormes therein, and being mingled with the decoction of Hyssop, appeaseth the sounding, ringing, and hissing of the eares. G

If it be washed or infused in vineger, and applied vnto the teeth, it easeth the tooth-ache. H

If it be put into the hollownesse of the teeth it breaketh them, and appeaseth the extreme griefe thereof. I

It preuaileth against *Angina's*, and the inflammation of the Tonsils, if a Gargarisme be made thereof. K

It is good to kill nits and lice and such like vermine: it cureth the biting of the serpent *Ceraſtes*, being layd on with salt. L

It is a remedie against the poyson of the sea Hare, if it be drunke with sweet wine. M

It is good also for Lepers: being put vp vnderneath it killeth all manner of worms, and draweth forth the birth, as *Dioscorides* writeth. N

Chap. 40. *Of the Pitch tree.*

¶ *The Description.*

1 *Picea*, the tree that droppeth Pitch, called Pitch tree, groweth vp to be a tall, faire, and big tree, remaining alwaies greene like the Pine tree: the timber of it is more red than that of the Pine or Firre: it is set full of boughes not onely about the top, but much lower, and also beneath the middle part of the body, which many times hang downe, bending toward the ground: the leaues be narrow, not like those of the Pine tree, but shorter and narrower, and sharpe pointed like them, yet are they blacker, and withall couer the yong and tender twigs in manner of a circle, like those of the Firre tree; but being many, and thicke set, grow forth on all sides, and not onely one right against another, as in the Yew tree: the fruit is scaly, and like vnto the Pine apple, but smaller: the barke of the tree is somewhat blacke, tough and flexible, not brittle, as is the bark of the Firre tree: vnder which next to the wood is gathered a Rosin, which many times issueth forth, and is like to that of the Larch tree.

‡ 2 Of this sort (saith *Clusius*) there is found another that neuer growes high, but remaineth dwarfish, and it carries certaine little nugaments or catkins of the bignesse of a small nut, composed of scales lying one vpon another, but ending in a prickly leafe, which in time opening shew certaine emptie cauities or cels: from the tops of these sometimes grow forth branches set with many short and pricking little leaues: all the shrub hath shorter and paler coloured leaues than the former: I obserued neither fruit nor floure on this, neither know I whether it carry any. *Dalechampius* seemes to haue knowne this, and to haue called it *Pinus Tubulus* or *Tibulus*. ‡

1 *Picea maior.*
The Pitch tree.

‡ 2 *Picea pumila.*
The dwarfe Pitch tree.

¶ *The Place.*

The Pitch tree groweth in Greece, Italy, France, Germanie, and all the cold regions euen vnto Ruſſia.

¶ *The Time.*

The fruit of the Pitch tree is ripe in the end of September.

¶ *The Names.*

The Grecians call this Cone tree πίτυς: the Latines, *Picea*, and not *Pinus*; for *Pinus* or the Pine tree, is the Grecians πεύκη, as ſhall be declared: that πίτυς is named in Latine *Picea*, *Scribonius Largus* teſtifieth, in his 201 Compoſition, writing after this manner; *Reſinæ Petuinæ, id eſt, ex Piceæ arbore*, which ſignifies in Engliſh, of the Roſin of the tree *Pitys*, that is to ſay, of the Pitch tree. With him doth *Pliny* agree, *lib. 16. cap. 10.* where he tranſlating *Theophraſtus* his words concerning *Peuce* and *Pitys*, doth tranſlate *Pitys*, *Picea*, although for *Peuce* he hath written *Larix*, as ſhall be declared. *Pliny* writeth thus; *Larix vſtis radicibus non repullulat*: and the Larch tree doth not ſpring vp againe when the roots are burnt: the Pitch tree ſpringeth vp againe, as it hapned in Lesbos, when the wood *Pyrthæus* was ſet on fire. Moreouer, the wormes *Pityocampæ* are ſcarce found in any tree but onely in the Pitch tree, as *Bellonius* teſtifieth: ſo that they are not raſhly called *Pityocampæ*, or the wormes of the Pitch tree, although moſt Tranſlators name them *Pinorum erucæ*, or the the wormes of the Pine trees: and therefore *Pitys* is ſirnamed by *Theophraſtus*, φθειρόπιτυς, becauſe wormes and magots are bred in it. But forſomuch as the name *Pitys* is common both to the tame Pine, and alſo to the Pitch tree, diuers of the late writers do for this cauſe ſuppoſe, that the Pitch tree is named by *Theophraſtus*, πίτυς ἄγρια, or the wilde Pine tree. This *Picea* is named in high-Dutch, **Schwartz Tannebaum**, and **Rot Tannebaum**, and oftentimes alſo **Jozenholtz**; which name notwithſtanding doth alſo agree with other plants: in Engliſh, Pitch tree: in low-Dutch, **Peck boom.**

¶ *The Temperature and Vertues.*

The leaues, barke, and fruit of the Pitch tree, are all of one nature, vertue, and operation, and of the ſame facultie with the Pine trees.

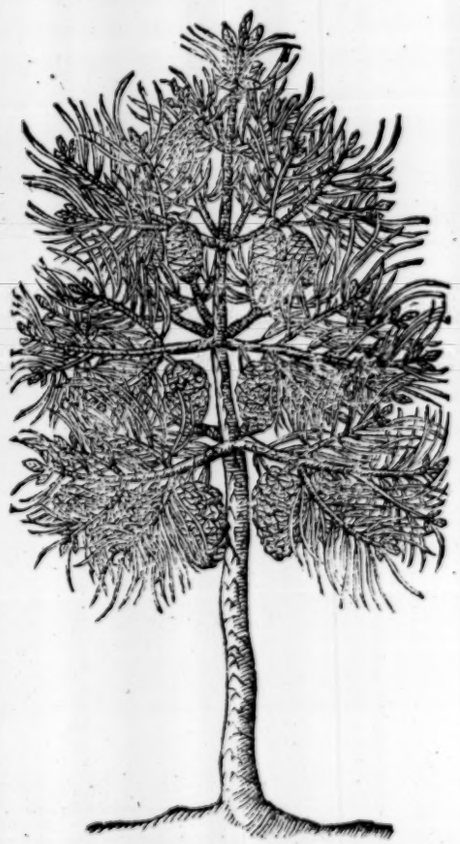
CHAP.

CHAP. 41. *Of the Pine Tree.*

¶ *The Kindes.*

THe Pine Tree is of two ſorts, according to *Theophraſtus*; the one ἥμερος, that is to ſay, tame, or of the garden; the other ἄγριος, or wilde: he ſaith that the Macedonians do adde a third, which is στέριφος or barren, or without fruit, that vnto vs is vnknowne: the later writers haue found moe as ſhall be declared.

Pinus ſativa, ſive domeſtica.
The tame or manured Pine tree.



¶ *The Deſcription.*

THe Pine tree groweth high, and great in the trunk or bodie, which below is naked, but aboue it is clad with a multitude of boughes, which diuide themſelues into diuers branches, whereon are ſet ſmall leaues, verie ſtraight, narrow, ſomwhat hard and ſharp pointed: the wood or timber is hard, heauy, about the heart or middle ful of an oileous liquor, & of a reddiſh colour: the fruit or clogs are hard, great, and conſiſt of many ſound woody ſcales, vnder which are included certaine knobs, without ſhape, couered with a woodden ſhell, like ſmall nuts, wherein are white kernels, long, very ſweet, and couered with a thin skin or membrane, that eaſily is rubbed off with the fingers; which kernell is vſed in medicine.

¶ *The Place.*

This tree groweth of it ſelfe in many places of Italie, and eſpecially in the territorie of Rauenna, and in Languedock, about Marſiles, in Spain, & in other regions, as in the Eaſt countries: it is alſo cheriſhed in the gardens of pleaſure, as well in the Low-countries as England.

¶ *The Time.*

The Pine tree groweth greene both winter and Sommer: the fruit it commonly two yeres before it be ripe: wherfore it is not to be found without ripe fruit, and alſo others as yet verie ſmall, and not come to ripeneſſe.

¶ *The Names.*

It is called in Latine, *Pinus*, and *Pinus ſatiua, Vrbana*, or rather *Manſueta*: in Engliſh, tame and garden Pine: of the Macedonians and other Græcians, πίτυς ἥμερος: but the Arcadians name it πίτυς for that which the Macedonians call πίτυς ἥμερος: the Arcadians name πίτυς, as *Theophraſtus* ſaith, and ſo doth the tame Pine in Arcadia, and about Elia change her name: and by this alteration of them it happens that the fruit or Nuts of the Pine tree found in the Cones or Apples, be named in Greeke by *Dioſcorides, Galen, Paulus*, and others, πιτύδες, as though they ſhould terme it *Pityos fructus*, or the fruit of the Pine tree.

There is alſo another πίτυς in Latine *Picea*, or the Pitch tree, which differeth much from the Pine tree: but *Pytis* of Arcadia differeth nothing from the Pine tree, as we haue ſaid.

The fruit or apples of theſe be called in Greeke κῶνοι, and in Latine *Coni*: notwithſtanding *Conos* is a common name to all the fruits of theſe kind of trees: they alſo be named in Latine, *Nuces pineæ*: by *Mneſitheus* in Greeke ὀστρακίτης, by *Diocles Caryſtius*, πίτυος καρύα, which be notwithſtanding the fruit or clogges of the tree that *Theophraſtus* nameth πίτυς, or the wilde Pine tree, as *Athenæus* ſaith. It is thought that the whole fruit is called by *Galen* in his 4. Commentarie vpon *Hipocrates* Bookes of Diet in ſharpe diſeaſes, *Strobilos*: yet in his 2. booke of the Faculties of Nouriſhments hee doth not call *Conos* or the apple by the name of *Strobilos*, but the nuts contained in it. And in like manner in his ſeuenth book of the Faculties of Simple medicines; the Pine Apple fruit, ſaith he, which they

they call *Coccalus*, and *Strobilus*, as we haue ſaid before, that theſe are named in Greeke κωνάριον. This apple is called in high Dutch, Zyzbel: in low Dutch, Pijn appel: in Engliſh, Pine apple, Clogge, and Cone.

¶ *The Temperature and Vertues.*

A The kernels of theſe nuts do concoct and moderately heate, being in a meane betweene cold and hot: it maketh the rough parts ſmooth; it is a remedy againſt an old cough, and long infirmities of the cheſt, being taken by it ſelfe or with hony, or elſe with ſome other licking thing.

B It cureth the Ptiſicke, and thoſe that pine and conſume away through the rottenneſſe of their lungs: it recouereth ſtrength; it nouriſheth and is reſtoratiue to the bodie.

It yeeldeth a thicke and good iuice, and nouriſheth much, yet is it not altogether eaſie of digeſtion, and therefore it is mixed with preſerues, or boyled with ſugar.

C The ſame is good for the ſtone in the Kidneies, and againſt frettings of the bladder, and ſcalding of the vrine, for it alayeth the ſharpneſſe, mitigateth paine, and gently prouoketh vrine: moreouer, it increaſeth milke and ſeed, and therefore it alſo prouoketh fleſhly luſt.

D The whole Cone or Apple being boyled with freſh Horehound, ſaith *Galen*, and afterwards boiled againe with a little hony til the decoction be come to the thickneſſe of hony, maketh an excellent medicine for the clenſing of the cheſt and lungs.

E The like thing hath *Dioſcorides*; the whole Cones, ſaith hee, which are newly gathered from the trees, broken and boiled in ſweet wine are good for an old cough, and conſumption of the lungs, if a good draught of that liquour be drunke euery day.

F The ſcales of the Pine apple, with the barke of the tree, do ſtoppe the laske and the bloudy flixe, they prouoke vrine; and the decoction of the ſame hath the like propertie.

Chap. 42. *Of the Wilde Pine tree.*

1 *Pinus ſylueſtris.*
The wilde Pine tree.

2 *Pinus ſylueſtris mugo.*
The low wilde Pine tree.

¶ *The*

¶ *The Deſcription.*

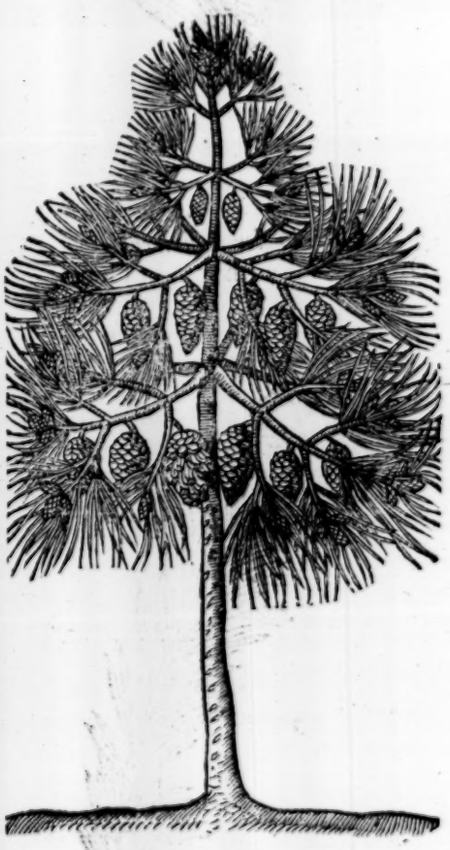
1 THe firſt kinde of wilde Pine tree groweth very great, but not ſo high as the former, being the tame or manured Pine tree; the barke thereof is glib: the branches are ſpread abroad, beſet with long ſharpe pointed leaues: the fruit is ſomewhat like the tame Pine tree, with ſome Roſine therein, and ſweet of ſmell, which doth eaſily open it ſelfe, and quickely falleth from the tree.

2 The ſecond kinde of wilde Pine tree groweth not ſo high as the former, neither is the ſtem growing ſtraight vp, but yet it bringeth forth many branches, long, ſlender, and ſo eaſie to be bent or bowed, that hereof they make Hoops for wine Hogs-heads and Tuns: the fruit of this pine is greater than the fruit of any of the other wilde Pines.

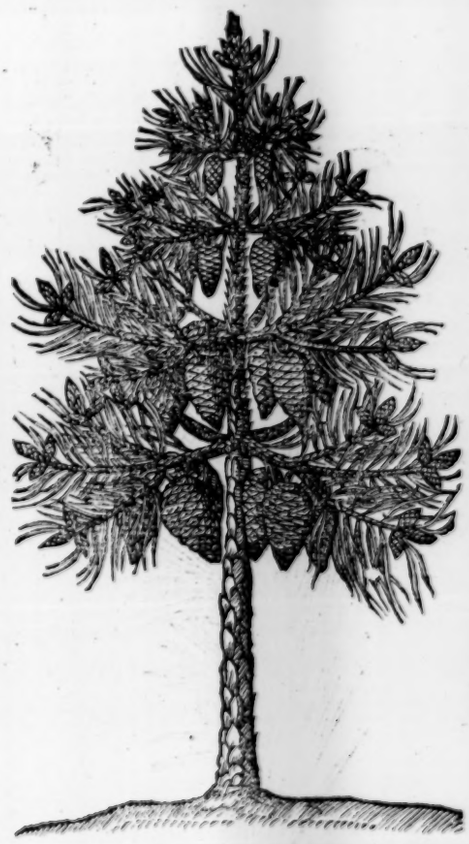
3 The third kinde of wilde Pine tree groweth ſtraight vpright, and waxeth great and high, yet not ſo high as the other wilde kindes: the branches do grow like the pitch tree: the fruit is long and big, almoſt like the fruit of the ſaid Pitch tree; wherein are contained ſmal triangled nuts, like the nuts of the Pine Apple tree, but ſmaller, & more brittle; in which is contained a kernell of a good taſte, like the kernell of the tame Pine apple: the wood is beautiful, and ſweet of ſmell, good to make tables and other workes of.

4 There is another wilde Pine of the mountaine, not differing from the precedent but in ſtature, growing for the moſt part like a hedge tree, wherein is the difference.

3 *Pinus ſylueſtris montana.*
The mountaine wilde Pine tree.



4 *Pinus montana minor.*
The ſmaller wilde Pine tree.



5 This kinde of Pine, called the ſea Pine tree, groweth not aboue the height of two men, hauing leaues like the tame Pine tree, but ſhorter: the fruit is of the ſame forme, but longer ſomewhat faſhioned like a Turnep: this tree yeeldeth very much Roſine. ‡ *Bauhine* iudges this all one with the third. ‡

6 The ſixt kinde of wilde Pine being one of the Sea Pines, groweth like an hedge tree or ſhrub ſeldome exceeding the height of a man; with little leaues like thoſe of the Larch tree, but alwaies continuing with a very little cone, and fine ſmall kernell.

7 The baſtard wilde Pine tree groweth vp to a meane height; the trunke or bodie, as alſo the branches

5 *Pinus maritima maior.*
The great Sea Pine tree.

6 *Pinus ſylueſtris minor.*
The little Sea Pine Tree.

7 *Tæda ſive pſeudopinus.*
The baſtard wilde Pine.

‡ 8 *Pinaſter Auſtriacus.*
Dwarfe Pine with vpright Cones.

‡ 9 *Pinaſter maritimus minor:*
Dwarfe Sea Pine.

ches & leaues are like vnto thoſe of the manured Pine tree: the onely difference is, that ſome yeares it reſembleth the Pine it ſelfe; and the other yeares as a wilde hedge tree, varying often, as nature liſteth to play and ſport her ſelfe amongſt her delights, with other plants of leſſe moment: the timber is ſoft, and not fit for building, but is of the ſubſtance of our Birch tree: the fruit is like thoſe of the other wilde Pines, whereof this is a kinde.

‡ 8 This dwarfe Auſtrian Pine exceeds not the height of a man, but immediately from the root is diuided and ſpread abroad into tough, bending, pretty thicke branches, couered ouer with a rough barke: the leaues, as in the former, come two out of one hoſe, thicker, ſhorter, blunter pointed, and more greene than the former: the cones or clogs are but ſmall, yet round, and compact, and hang not dowewards, but ſtand vpright: the root is tough and wooddie like other plants of this kinde: It growes on the Auſtrian and Styrian Alpes. *Cluſius* ſets it forth by the name of *Pinaſter* 4. *Auſtriacus*.

9 This other Dwarfe is of the ſame height with the former, with ſuch tough and bending branches, which are neither ſo thick nor clad with ſo rough a barke, nor ſo much ſpread. The leaues alſo are ſmaller, and not vnlike thoſe of the Larix tree, but not ſo ſoft, nor falling euery yeare as they do. The cones are little and ſlender, the kernell ſmall, blackiſh, and winged as the reſt. *Cluſius* found this onely in ſome few places of the kingdome of Murcia in Spaine, wherefore he calls it, *Pinaſter* 3. *Hiſpanicus*. *Dodonæus* calls it *Pinus maritima minor*. ‡

¶ *The Place.*

Theſe wilde Pines doe grow vpon the cold mountaines of Liuonia, Polonia, Noruegia, and Ruſſia, eſpecially vpon the Iſland called Holland within the Sownd, beyond Denmarke, and in the woods by Narua, vpon the Liefeland ſhore, and all the tract of the way, being a thouſand Werſts, (each Werſt containing three quarters of an Engliſh mile) from Narua vnto Moſcouia, where I haue ſeene them grow in infinite numbers.

¶ *The Time.*

The fruit of theſe Pine trees is ripe in the end of September: out of all theſe iſſueth forth a white and ſweet ſmelling Roſine: they are alſo changed into *Teda*, and out of theſe is boiled through the force of the fire, a blacke Pitch: the Pitch tree and the Larch tree be alſo ſometimes changed into *Teda*; yet very ſeldome, for *Teda* is a proper and peculiar infirmitie of the wilde Pine tree. A tree is ſaid to be changed into *Teda*, when not onely the heart of it, but alſo the reſt of the ſubſtance is turned into fatneſſe.

¶ *The Names.*

All theſe are called in Greeke πίτυς ἡμερος: and in Latine *Syluęſtres Pini*: of *Pliny*, *Pinaſtri*: *Pinaſter*, ſaith he in his 16. booke. 10 chapter, is nothing elſe but *Pinus ſylueſtris*, or the wild Pine tree, of a leſſer height, and ful of boughes from the middle, as the tame Pine tree in the top, (moſt of the copies haue falſely) of a maruellous height: they are far deceiued who thinke that the Pine tree is called in Greeke πίτυς, beſides the tame Pine which notwithſtanding is ſo called not of all men, but onely of the Arcadians (as we haue ſaid before) πίτυς, all men do name the wilde πεύκη; and therefore *Teda*, or the Torch Pine, hereof is ſaid to be in Latine not *Picea*, but *Pinea*, that is, not the Pitch-tree, but the Pine tree, as *Ouid* doth planly teſtifie in his Heroicall Epiſtles;

Vt vidi, vt perij, nec notis ignibus arſi,
Ardet vt ad magnos Pinea Teda deos.

Alſo in *Faſtorum* 4.

Illic accendit geminas pro lampade Pinus:
Hinc Cereris ſacris nunc quoque Teda datur.

The ſame doth *Virgill* alſo ſignifie in the ſeuenth of his Æneid.

Ipſa inter medias, flagrantem feruida Pinum
Suſtinet. ——————

Where in ſtead of *Flagrantem Pinum*, *Seruius* admoniſheth vs to vnderſtand *Teda Pinea*. *Catullus* alſo conſenteth with them in the marriage ſong of *Iulia* and *Mallius*.

—— *Manu*
Pineam quate tedam.

And *Prudentius* in *Hymno Cerei Paſchalis*.

Seu Pinus piceam fert alimoniam.

Moreouer, the herbe *Peucedanos*, or Horeſtrong, ſo named of the likeneſſe of πεύκη, is called alſo in Latine *Pinaſtellum*, of *Pinus* the Pine tree: all which things do euidently declare that πεύκη is called in Latine not *Picea*, but *Pinus*.

The firſt of theſe wilde kindes may be *Idæa Theophraſti*, or *Theophraſtus* his Pine tree, growing on mount Ida, if the apple which is ſhorter were longer: for he nameth two kindes of wilde Pines, the one of mount Ida, and the other the Sea Pine with the round fruit: but we hold the contrarie, for the fruit or apple of the wilde mountaine Pine is ſhorter, and that of the Sea Pine longer. This may more truly be *Macedonum mas*, or the Macedonians male Pine, for they make two ſorts of wilde Pines, the male and the female, and the male more writhed and harder to be wrought vpon, and the female more eaſie; but the wood of this is more writhed, and not ſo much in requeſt for workes, as the other, and therefore it ſeemeth to be the male. This wilde Pine tree is called in high Dutch, **Hartzbaum**, and **Wilder Hartzbaum**: in Gallia Celtica, *Elvo Aleuo*: and in Spaniſh, *Pino Carax*.

The ſecond wild Pine tree is named commonly of the Italians *Tridentinis*, and *Ananienſibus*, *Cembro*, and *Cirmolo*; it ſeemeth to differ nothing at all from the Macedonians wilde female Pine, for the wood is eaſie to be wrought on, and ſerueth for diuers and ſundry workes.

The third they call *Mugo*: this may be named not without cauſe χαμαίπιτυς, that is to ſay, *Humilis Pinus*, or Dwarfe Pine: yet doth it differ from *Chamæpeuce* the Herbe called in Engliſh, Ground Pine.

The fourth wilde Pine is named in Greeke πιτυοκάμπη: in Latine, *Maritima*, and *Marina Pinus*: in Engliſh, Sea Pine.

That which the Latines call *Teda*, is named in Greeke πεύκη, and πεύκινον: in high Dutch, **Kynholtz**: it may be termed in Engliſh, Torch-pine.

Pliny is deceiued, in that he ſuppoſeth the Torch Pine to bee a tree by it ſelfe, and maketh it the ſixth kinde of Cone-tree; as likewiſe he erreth in taking *Larix*, the Larch tree, for πίτυς, the Pine Tree. And as *Dioſcorides* maketh ſo little difference as ſcarſe any, betweene πίτυς and πεύκη, and ſuppoſeth them to be both of one kinde, ſo likewiſe he ſetteth downe faculties common to them both.

¶ *The Temperature and Vertues.*

A The barke of them both, ſaith he, doth binde; being beaten and applied it cureth Merigals, and alſo ſhallow vlcers and burnings if it be layed on with Litharge and fine Frankincenſe.

B With the Cerote of Myrtles it healeth vlcers in tender bodies: being beaten with Copperas it ſtaieth tetters, and creeping vlcers: it draweth away the birth and after birth, if it be taken vnder in a fume: being drunke it ſtoppeth the belly, and prouoketh vrine.

C *Galen* hath almoſt the ſame things, but he ſaith, that the barke of the Pine tree is more temperate than that of the Pitch tree; the leaues ſtamped take away hot ſwellings and ſores that come thereof.

D Being ſtamped and boyled in vineger, they aſſwage the paine of the teeth, if they be waſhed with this decoction hot: the ſame be alſo good for thoſe that haue bad liuers, being drunke with water or mead.

E Of the ſame operation is likewiſe the barke of the pine nuts; but *Galen* affirmeth that the Core

or

or apple, although it ſeeme to be like theſe is notwithſtanding of leſſer force, inſomuch as it cannot effectually performe any of the aforeſaid vertues, but hath in it a certaine biting qualitie, which hurteth.

The Torch Pine cut into ſmall pieces and boiled in vineger, is a remedy likewiſe againſt the tooth-ache if the teeth be waſhed with the decoction. F

Of this there is made a profitable ſpather or ſlice to be vſed in making of compound plaiſters and peſſaries that eaſe paine. G

Of the ſmoke of this is made a blacke which ſerueth to make inke of, and for eating ſores in the corners of eies, and againſt the falling away of the haire of the eie lids, and for watering and bleere eies, as *Dioſcorides* teacheth. H

Of Roſins.

¶ *The Kindes.*

1 OVt of the Pine trees, eſpecially of the wilde kinds, there iſſueth forth a liquid, whitiſh, and ſweet ſmelling Roſin, and that many times by it ſelfe; but more plentifully either out of the cut and broken boughes, or forth of the body when the tree commeth to be a Torch Pine.

2 there iſſueth alſo forth of the crackes and chinkes of the barke, or out of the cut boughes, a certaine dry Roſin, and that forth of the Pine Tree or Firre Tree.

There is likewiſe found a certaine congealed Roſin vpon the cones or apples.

It is called in Latine, *Reſina*: in Greeke, ῥητίνη: in high Dutch, Hartz: in low Dutch, Herſt: in Italian, *Ragia*: in Spaniſh, *Reſina*: in Engliſh, Roſin.

The firſt is named in Latine, *Liquida Reſina*: in Greeke, ῥητίνη ὑγρά, and of diuers, ἀνθίνη, that it to ſay, iſſueth out of it ſelfe: of the Lacedemonians, πρωτόγονος, or *Primiflua*, the firſt flowing Roſin: and in Cicilia, καπαία, as *Galen* writeth in his third booke of medicines according to the kindes: in ſhops *Reſina Pini*, or Roſin of the Pine tree, and common Roſin. It hapneth oftentimes through the negligent and careleſſe gathering thereof, that certaine ſmall pieces of wood, and little ſtones be found mixed with it: this kinde of Roſin *Galen* ſurnameth σύγχυτον, as though he ſhould ſay, confuſed, which being melted and clenſed from the droſſe becommeth hard and brittle.

The like hapneth alſo to another liquid Roſin, which after it is melted, boiled, and cooled againe, is hard and brittle, and may likewiſe be beaten, ground, and ſearced; and this Roſin is named in Greeke ψιμυθία: in Latine, *Fricta*, and many times *Colophonia*, in Greeke, κολοφωνία: which name is vſed among the Apothecaries, and may ſtand for an Engliſh name; for *Galen* in his third booke of Medicines according to their kindes ſaith, that it is called *Fricta*, and of ſome *Colophonia*: that, ſaith he, is the drieſt Roſin of all, which ſome call *Fricta*, others *Colophonia*: becauſe in times paſt, as *Dioſcorides* writeth, it was fetched from *Colophon*, this being yellow or blacke in compariſon of the reſt, is white when it is beaten: *Pliny* in his 14. booke, 20. chapter.

The ſecond Roſin is named in Greeke ῥητίνη ξηρά, ſpecially that of the Pitch tree without fatneſſe, and that ſoone waxeth dry, which *Galen* in his 6. booke of Medicines according to the kindes, calleth properly φύσικη πιτύινη: that which in Aſia is made of the Pitch tree being very white, is called *Spagas*, as *Pliny* teſtifieth.

The third is called in Greeke ῥητίνη τερμινθίνη: the ſame is alſo named φύσικη τερμινθίνη: this is vnknowne in ſhops. Yet there is to be ſould a certaine dry Roſin, but the ſame is compounded of the Roſins of the Pine tree, of the cones or clogs, and of the Firre tree mixed altogether, which they call *Garipot*: this is vſed in perfumes in ſtead of Frankincenſe, from which notwithſtanding it farre differeth.

¶ *The Temperature and Vertues.*

All the Roſins are hot and dry, but not all after one manner: for there is a difference among them: they which be ſharper and more biting, are hotter, as that which commeth of the cones, being of Roſins the hotteſt, becauſe it is alſo the ſharpeſt: the Roſin of the Pitch Tree is not ſo much biting, and therefore not ſo hot: the Roſin of the Firre tree is in a meane between them both; the liquid Roſin of the Pine is moiſter, comming neere to the qualitie and facultie of the Larch Roſin. A

The Roſins which are burnt or dried, as *Dioſcorides* teſtifieth, are profitable in plaiſters, and compoſitions that eaſe wearieſomeneſſe; for they do not onely ſupple or mollifie, but alſo by reaſon of the thinneſſe of their parts and dryneſſe, they digeſt: therefore they both mollifie and waſt away ſwellings, and through the ſame facultie they cure weariſomneſſe, being vſed in compound medicines for that purpoſe. B

The liquid Roſins are very fitly mixed in ointments, commended for the healing vp of greene wounds, for they both bring to ſuppuration, and do alſo glue and vnite them together. C

D Moreouer, there is gathered out from the Roſins as from Frankincenſe, a congealed ſmoke, called in Latine *Fuligo*; in Greeke καπνος: and in Engliſh, Blacke, which ſerueth for medicines that beautifie the eie lids, and cure the fretting ſores of the corners of the eies, and alſo watering eies, for it drieth without biting.

E There is made hereof ſaith *Dioſcorides*, writing inke, but in our age not that which we write withall, but the ſame which ſerueth for Printers to print their bookes with, that is to ſay, of this blacke, or congealed ſmoke, and other things added.

Of Pitch and Tar.

The manner of drawing forth of Pitch.

Out of the fatteſt wood of the Pine tree changed into the Torch Pine, is drawne Pitch by force of fire. A place muſt be paued with ſtone, or ſome other hard matter, a little higher in the middle, about which there muſt alſo be made gutters, into which the liquor ſhall fall; then out from them other gutters are to be drawne, by which it may be receiued; being receiued, it is put into barrels. The place being thus prepared, the clouen wood of the Torch Pine muſt be ſet vpright; then muſt it be couered with a great number of Fir and Pitch boughes, and on euery part all about with much lome and earth: and great heed muſt be taken, leaſt there be any cleft or chinke remaining, onely a whole left in the top of the furnace, thorow which the fire may be put in, and the flame and ſmoke may paſſe out: when the fire burneth the Pitch runneth forth, firſt the thin, and then the thicker.

This liquor is called in Greeke πισσα: in Latine, *Pix*: in Engliſh, Pitch, and the moiſture, euen the ſame that firſt runneth is named of *Plinie* in his 16. booke, 11. chapter, *Cedria*: There is boyled in Europe, ſaith he, from the Torch Pine a liquid Pitch vſed about ſhips, and ſeruing for many other purpoſes; the wood being clouen is burned with fire, and ſet round about the furnaces on euery ſide, after the manner of making Charcoles: the firſt liquor runneth thorow the gutter like water: (this in Syria is called *Cedrium*, which is of ſo great vertue, as in Ægypt the bodies of dead men are preſerued, being all couered ouer with it) the liquor following being now thicker, is made Pitch. But *Dioſcorides* writeth, that *Cedria* is gathered of the great Cedar tree, and nameth the liquor drawne out of the Torch tree by force of fire, πισσα ὑγρα: this is, that which the Latines call *Pix liquida*: the Italians, *Pece liquida*: in high Dutch, **Weich bach**: in low Durch, **Teer**: in French, *Poix foudire*: in Spaniſh, *Pex liquida*: certaine Apothecaries, *Kitran*: and we in Engliſh, Tar.

And of this when it is boiled is made a harder Pitch: this is named in Greeke ξηρα πισσα: in Latine, *Arida*, or *ſicca Pix*: of diuers, πολιτρωτος: as though they ſhould ſay, *Iterata Pix*, or Pitch iterated: becauſe it is boiled the ſecond time. A certaine kinde hereof being made clammie or glewing is named βουνιτις: in ſhops, *Pix naualis*, or Ship Pitch: in high Dutch, **Bach**: in low Dutch, **Steenpech**: in Italian, *Pece ſecca*: in French, *Poix ſeche*: in Spaniſh, *Pez ſeca*: in Engliſh, Stone Pitch.

¶ *The Temperature and Vertues.*

A Pitch is hot and dry, Tarre is hotter, and ſtone pitch more drying, as *Galen* writeth. Tar is good againſt inflammations of the almonds of the throte, and the uvula, and likewiſe the Squincie, being outwardly applied.

B It is a remedie for mattering eares with oile of Roſes: it healeth the bitings of Serpents, if it be beaten with ſalt and applied.

C With an equall portion of wax it taketh away foule ilfauoured nailes, it waſteth away ſwellings of the kernels, and hard ſwellings of the mother and fundament.

D With barly meale and a boies vrine it conſumeth χιρσους, or the Kings euill: it ſtaieth eating vlcers, if it be laid vnto them with brimſtone, and the barke of the Pitch Tree, or with branne.

E If it be mixed with fine Frankincenſe, and a cerote made thereof, it healeth chops of the fundament and feet.

F Stone Pitch doth mollifie and ſoften hard ſwellings: it ripens and maketh matter, and waſteth away hard ſwellings and inflammations of kernels: it filleth vp hollow vlcers, and is fitly mixed with wound medicines.

G What vertue Tarre hath when it is inwardly taken we may reade in *Dioſcorides* and *Galen*, but we ſet downe nothing thereof, for that no man in our age will eaſily vouchſafe the taking.

H There is alſo made of Pitch a congealed ſmoke or blacke, which ſerueth for the ſame purpoſes, as that of the Roſins doth.

CHAP.

Chap. 43. *Of the Firre or Deale Tree.*

¶ *The Deſcription.*

1 THe Firre tree groweth very high and great, hauing his leaues euer greene, his trunke or body ſmooth, euen and ſtraight, without ioints or knots, vntill it hath gotten branches; which are many and very faire, beſet with leaues, not much vnlike the leaues of the Ewe tree, but ſmaller: among which come forth floures vpon the taller trees, growing at the bottomes of the leaues like little catkins, as you may ſee them expreſt in a branch apart by themſelues: the fruit is like vnto the Pine Apple, but ſmaller and narrower, hanging downe as the Pine Apple: the timber hereof excelleth all other timber for the maſting of ſhips, poſts, rails, deale boords, and ſundry other purpoſes.

1 *Abies.*
The Firre tree.

‡ 2 *Abies mas.*
The male Firre tree.

2 There is another kinde of Firre tree, which is likewiſe a very high and tall tree, and higher than the Pine: the body of it is ſtraight without knots below, waxing ſmaller and ſmaller euen to the very top: about which it ſendeth forth boughes, foure together out of one and the ſelfe ſame part of the body, placed one againſt another, in manner of a croſſe, growing forth of the foure ſides of the body, and obſeruing the ſame order euen to the very top: out of theſe boughes grow others alſo, but by two and two, one placed right againſt another, out of the ſides, which bend downwards when the other beare vpwards: the leaues compaſſe the boughes round about, and the branches thereof: they be long, round, and blunt pointed, narrower, and much whiter than thoſe of the Pitch tree, that is to ſay, of a light greene, and in a manner of a white colour: the cones or clogs be long, and longer than any others of the cone trees, they conſiſt of a multitude of ſoft ſcales, they hang downe from the end of the twigs, and doe not eaſily fall downe, but remaine on the tree a very long time: the kernels in theſe are ſmall, not greater than the kernels of the Cherrie ſtone, with a thinne skin growing on the one ſide, very like almoſt to the wings of Bees, or great Flies: the timber or ſubſtance of the wood is white, and clad with many coats, like the head of an Onion.

‡ *Abietis ramus cum julis.*
A branch with Catkins or floures.

¶ *The Place.*

The Firre trees grow vpon high mountains, in many woods of Germany and Bohemia, in which it continueth alwaies greene; it is found alſo on hils in Italy, France, & other countries; it commeth downe oftentimes into the vallies: they are found likewiſe in Pruſe, Pomerania, Liefeland, Ruſſia, & eſpecially in Norway, where I haue ſeene the goodlieſt trees in the world of this kinde, growing vpon the rockie and craggie mountaines, almoſt without any earth about them, or any other thing, ſauing a little moſſe about the roots, which thruſt themſelues here and there into the chinkes and cranies of the rockes, and therefore are eaſily caſt downe with any extreme gale of winde. I haue ſeen theſe trees growing in Cheſhire, Staffordſhire, and Lancaſhire, where they grew in great plenty, as is reported, before *Noahs* floud: but then being ouerturned and ouerwhelmed haue lien ſince in the moſſes and waterie mooriſh grounds very freſh and ſound vntill this day, & ſo full of a reſinous ſubſtance, that they burne like a Torch or Linke, and the inhabitants of thoſe countries do call it Fir-wood, and Firewood vnto this day: out of this tree iſſueth the roſin called *Thus*, in Engliſh, Frankinſence: but from the young Fir trees proceedeth an excellent cleare and liquid Roſin, in taſte like to the peelings or outward rinde of the Pomecitron.

¶ *The Time.*

The time of the Fir tree agreeth with the Pine trees.

¶ *The Names.*

The tree is called in Latine *Abies*: in Greeke, ἄκτη: amongſt the Græcians of our time the ſame name remaineth whole and vncorrupt: it is called in high Dutch, **Weiſz Thannen**, and **Weiſz Thannen baum**: in Low Dutch, **Witte Dennen boom**, or **Abel-boom**, and **Maſt-boom**: in Italian, *Abete*: in Spaniſh, *Abeto*: in Engliſh, Firre-tree, Maſt-tree, and Deale-tree. The firſt is called in Trench, *du Sap*, or *Sapin*: the other is *Suiſſe*.

The liquid roſin which is taken forth of the barke of the young Firre-trees, is called in Greeke ὑγρὸν τῆς ἐλάτης: in Latine, *Lachryma abietis*, and *Lachryma abiegna*: in the ſhops of Germany, as alſo of England, *Terebinthina Veneta*, or Venice Turpentine: in Italian, *Lagrimo*: diuers do thinke that *Dioſcorides* calleth it ἀκανθίνη ὑγρὰ, *Oleaſa Reſina*, or oile Roſin; but oile Roſin is the ſame that *Pix liquida*, or Tar is.

Arida Abietum Reſina, or drie Roſin of the Fir trees, is rightly called in Greeke ξηρὰ ἄκτη, and in Latine, *Abiegna Reſina*: it hath a ſweet ſmell, and is oftentimes vſed among other perfumes in ſtead of Frankincenſe.

¶ *The Temperature.*

The barke, fruit, and gums of the Fir tree, are of the nature of the Pitch tree and his gums.

¶ *The Vertues.*

A The liquid Roſin of the Fir tree called Turpentine, looſeth the belly, driueth forth hot cholerick humours, clenſeth and mundifieth the kidnies, prouoketh vrine, and driueth forth the ſtone and grauell.

B The ſame taken with Sugar and the pouder of Nutmegs, cureth the ſtrangurie, ſtaieth the Gonorrhœa or the inuoluntary iſſue of mans nature, called the running of the rains, and the white flux in women.

C It is very profitable for all green and freſh wounds, eſpecially the wounds of the head: for it healeth and clenſeth mightily, eſpecially if it be waſhed in Plantaine water, and afterward in Roſe water, the yolke of an egge put thereto, with the pouders of *Olibanum* and Maſticke finely ſearced, adding thereto a little Saffron.

CHAP.

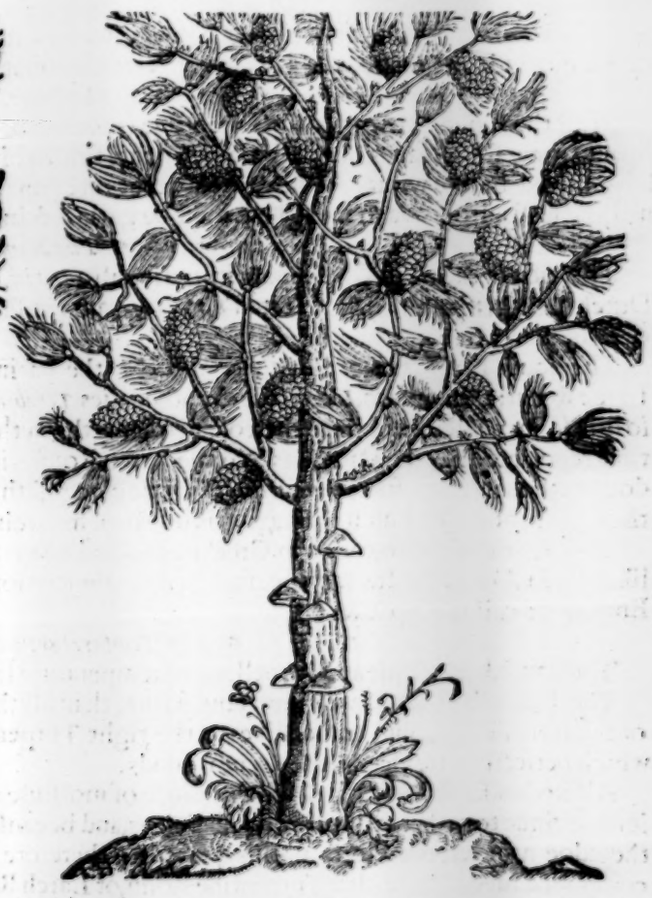
Chap. 44. *Of the Larch Tree.*

¶ *The Deſcription.*

1 THe Larch is a tree of no ſmall height, with a body growing ſtraight vp: the bark wherof in the nether part beneath the boughes is thicke, rugged, and full of chinks; which being cut in ſunder is red within, and in the other part aboue ſmooth, ſlipperie, ſomething white without: it bringeth forth many boughes diuided into other leſſer branches, which be tough and pliable. The leaues are ſmall, and cut into many iags, growing in cluſters thicke together like taſſels, which fall away at the approch of Winter: the floures or rather the firſt ſhewes of the cones or fruit be round, and grow out of the tendereſt boughes, being at the length of a braue red purple colour: the cones be ſmall, and like almoſt in bigneſſe to thoſe of the Cypreſſe tree, but longer, and made vp of a multitude of thin ſcales like leaues: vnder which lie ſmall ſeeds, hauing a thin velme growing on them very like to the wings of Bees and waſps: the ſubſtance of the wood is very hard, of colour, eſpecially that in the midſt, ſomewhat red, and very profitable for workes of long continuance.

1 *Laricis ramulus.*
A branch of the Larch tree.

2 *Larix cum Agarico ſuo.*
The Larch tree with his Agarick.



It is not true that the wood of the Larch tree tree cannot be ſet on fire, as *Vitruvius* reporteth of the caſtle made of Larch wood, which *Cæſar* beſieged, for it burneth in chimneies, and is turned into coles, which are very profitable for Smithes, as *Matthiolus* writeth.

There is alſo gathered of the Larch tree a liquid Roſin, very like in colour and ſubſtance to the whiter hony, as that of Athens or of Spaine, which notwithſtanding iſſueth not forth of it ſelfe, but runneth out of the ſtocke of the tree, when it hath been bored euen to the heart with a great and long auger and wimble.

Galen writeth, that there be after a ſort two kindes hereof, in his 4. booke of Medicines, according to the kinds, one like vnto Turpentine, the other more ſharper than this, hotter, more liquid

of a ſtronger ſmell, and in taſte bitterer and hotter: but the later is thought not to be the Roſine of the Larch, but of the Fir-tree, which *Galen* becauſe it is after a ſort like in ſubſtance, might haue taken for that of the Larch tree.

There groweth alſo vpon the Larch tree a kinde of Muſhrum or excreſcence, not ſuch as is vpon other trees, but whiter, ſofter, more looſe and ſpungie than any other of the Muſhrums, and good for medicine, which beareth the name of *Agaricus*, or Agaricke: I find that *Pliny* ſuppoſeth all the Maſticke trees, and thoſe that beare Galls, do bring forth this *Agaricum*: wherein he was ſomewhat deceiued, and eſpecially in that he took *Glandifera* for *Conifera*, that is, thoſe trees which beare maſt or Acornes, for the Pine apple trees: but among all the trees that beare *Agaricus*, the Larch is the chiefe, and bringeth moſt plenty of Agarick.

¶ *The Place.*

The Larch tree groweth not in Greece, or in Macedon, but chiefely vpon the Alpes of Italy, not far from Trent, hard by the riuers *Benacus* and *Padus*; and alſo in other places of the ſame mountaines: it is likewiſe found on hils in Morauia, which in times paſt was called the countrey of the Marcomans: *Fuchſius* writeth, that it groweth alſo in Sileſia: others, in Luſatia, in the borders of Poland: it alſo groweth plentifully in the woods of Gallia Ceſalpina.

Pliny hath ſaid ſomewhat hereof, contradicting the writings of others, in his 16 book, 8 chapter, where he ſaith, that ſpecially the Acorne trees of France do beare Agaricke, and not only the acorn trees, but the Cone trees alſo; among which, ſaith he, the Larch tree is the chiefe that bringeth forth Agaricke, and that not onely in Gallia, which now is called France, but rather in Lumbardy and Piemont in Italy, where there be whole woods of Larch trees, although they be found in ſome ſmal quantitie in other countries.

The beſt Agarick is that which is whiteſt, very looſe and ſpungie, which may eaſily be broken, and is light, and in the firſt taſte ſweet, hard, and well compact: that which is heauy, blackiſh, and containing in it little threds as it were of ſinewes, is counted pernicious and deadly.

¶ *The Time.*

Of all the Cone trees onely the Larch tree is found to be without leaues in the Winter: in the Spring grow freſh leaues out of the ſame knobs, from which the former did fall. The cones are to be gathered before winter, ſo ſoone as the leaues are gone: but after the ſcales are looſed and opened, the ſeeds drop away: the Roſine muſt be gathered in the Sommer moneths.

¶ *The Names.*

This tree is called in Greeke λάριξ: in Latine alſo *Larix*, in Italian and Spaniſh, *Larice*: in high Dutch, **Lerchenbaum**: in low Dutch **Lorkenboom**: in French, *Meleſe*: in Engliſh, Larch tree, and of ſome Larix tree.

The liquid Roſin is named by *Galen* alſo λάριξ: the Latines call it *Reſina Larigna*, or *Reſina Laricea*, Larch Roſin: the Italians, *Larga*: the Apothecaries, *Terebinthina*, or Turpentine, and it is ſold and alſo mixed in medicines in ſtead thereof: neither is that a thing newly done; for *Galen* likewiſe in his time reporteth, that the Druggers ſold the Larch Roſine in ſtead of Turpentine: and this may bee done without errour; for *Galen* himſelfe in one place vſeth Larch Roſin for Turpentine; and in another, Turpentine for Larch Roſine, in his booke of medicines according to the kindes.

The Agaricke is alſo called in Greeke ἀγάρικον and ἀγαρικὸς: in Latine, *Agaricum* and *Agaricus*, and ſo likewiſe in ſhops: the Italians, Spaniards, and other nations do imitate the Greeke word; and in Engliſh we call it Agaricke.

¶ *The Temperature and Vertues.*

A The leaues, barke, fruit and kernell, are of temperature like vnto the Pine, but not ſo ſtrong.

B The Larch Roſin is of a moiſter temperature than all the reſt of the Roſines, and is withall without ſharpneſſe or biting, much like to the right Turpentine, and is fitly mixed with medicines which perfectly cure vlcers and greene wounds.

C All Roſins, ſaith *Galen*, that haue this kinde of moiſture and clammineſſe ioined with them, do as it were binde together and vnite dry medicines, and becauſe they haue no euident biting qualitie, they doe moiſten the vlcers nothing at all: therefore diuers haue very well mixed with ſuch compound medicines either Turpentine Roſin, or Larch Roſin: thus far *Galen*. Moreouer, Larch Roſin performeth all ſuch things that the Turpentine Roſin doth, vnto which, as we haue ſaid, it is much like in temperature, which thing likewiſe *Galen* himſelfe affirmeth.

D Agaricke is hot in the firſt degree and dry in the ſecond, according to the old writers. It cutteth, maketh thin, clenſeth, taketh away obſtructions or ſtoppings of the intrailes, and purgeth alſo by ſtoole.

E Agaricke cureth the yellow iaundice proceeding of obſtructions, and is a ſure remedie for cold ſhakings, which are cauſed of thicke and cold humors.

F The ſame being inwardly taken and outwardly applied, is good for thoſe that are bit of venomous beaſts which hurt with their cold poiſon.

It

It prouoketh vrine, and bringeth downe the menſes: it maketh the body well co loured, driueth forth wormes, cureth agues, eſpecially quotidians and wandring feuers, and others that are of long continuance, if it be mixed with fit things that ſerue for the diſeaſe: and theſe things it performes by drawing forth and purging away groſſe, cold, and flegmaticke humors, which cauſe the diſeaſes. G

From a dram weight, or a dram and a halfe, to two, it is giuen at once in ſubſtance or in pouder: the weight of it in an infuſion or decoction is from two drams to fiue. H

But it purgeth ſlowly, and doth ſomewhat trouble the ſtomacke; and therefore it is appointed that Ginger ſhould be mixed with it, or wilde Carrot ſeed, or Louage ſeed, or Sal gem, in Latine, *Sal foſſilis*. I

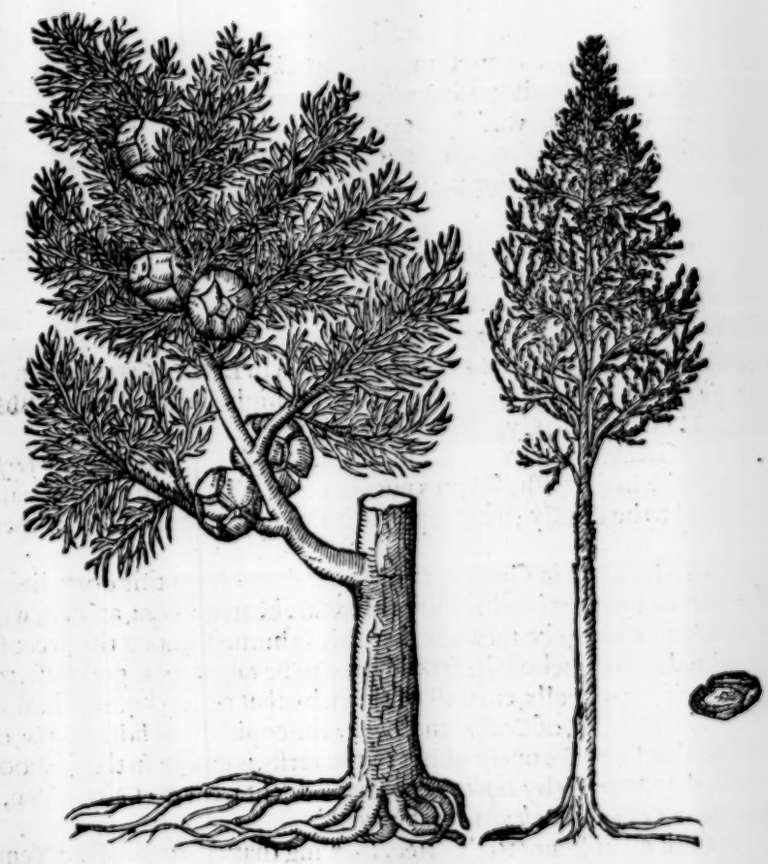
Galen, as *Meſue* reporteth, gaue it with wine wherein Ginger was infuſed: ſome vſe to giue it with Oxymel, otherwiſe called ſyrrup of vineger, which is the ſafeſt way of all. K

Agaricke is good againſt the paines and ſwimming in the head, or the falling Euill, being taken with ſyrrup of vineger. L

It is good againſt the ſhortneſſe of breath, called *Aſthma*, the inueterate cough of the lungs, the ptyſicke, conſumption, and thoſe that ſpet bloud: it comforteth the weake and feeble ſtomacke, cauſeth good digeſtion, and is good againſt wormes. M

Chap. 45. *Of the Cypreſſe tree.*

Cupreſſus ſatiua & ſylueſtris.
The Garden and wild Cypreſſe tree.



¶ *The Deſcription.*

THe tame or manured Cypreſſe tree hath a long thicke and ſtraight body; whereupon many ſlender branches do grow, which do not ſpred abroad like the branches of other trees, but grow vp alongſt the body, yet not touching the top: they grow after the faſhion of a ſteeple, broad below, and narrow toward the top: the ſubſtance of the wood is hard, ſound, well compact, ſweet of ſmell, and ſomewhat yellow, almoſt like the yellow Saunders, but not altogether ſo yellow, neither

ther doth it rot nor wax old, nor cleaueth or choppeth it ſelf. The leaues are long, round like thoſe of Tamariske, but fuller of ſubſtance. The fruit or nuts do hang vpon the boughes, being in manner like to thoſe of the Larch tree, but yet thicker and more cloſely compact: which being ripe do of themſelues part in ſunder, and then falleth the ſeed, which is ſhaken out with the winde: the ſame is ſmall, flat, very thin, of a ſwart ill fauoured colour, which is pleaſant to Ants or Piſmires, and ſerueth them for food.

Of this diuers make two kindes, the female and the male; the female barren, and the male fruitfull. *Theophraſtus* reporteth, that diuers affirme the male to come of the female. The Cypreſſe yeelds forth a certaine liquid Roſin, like in ſubſtance to that of the Larch tree, but in taſte maruellous ſharpe and biting.

The wilde Cypreſſe, as *Theophraſtus* writeth, is an high tree, and alwaies greene, ſo like to the other Cypreſſe, as it ſeemeth to be the ſame both in boughes, body, leaues, and fruit, rather than a certaine wilde Cypreſſe: the matter or ſubſtance of the wood is ſound, of a ſweet ſmell, like that of the Cedar tree, which rotteth not: there is nothing ſo criſped as the root, and therefore they vſe to make precious and coſtly workes thereof.

‡ I know no difference betweene the wilde and tame Cypreſſe of our Author, but in the handſomneſſe of their growth, which is helped ſomewhat by art. ‡

¶ *The Place.*

The tame and manured Cypreſſe groweth in hot countries, as in Candy, Lycia, Rhodes, and alſo in the territorie of Cyrene: it is reported to be likewiſe found on the hills belonging to Mount Ida, and on the hills called *Leuci*, that is to ſay white, the tops whereof be alwaies couered with ſnow. *Bellonius* denieth it to be found vpon the tops of theſe hills, but in the bottoms on the rough parts and ridges of the hills: it groweth likewiſe in diuers places of England where it hath beene planted, as at Sion a place neere London, ſometime a houſe of Nunnes: it groweth alſo at Greenwich, and at other places, and likewiſe at Hampſted in the garden of M^r. *Wade*, one of the Clerkes of her Maieſties priuy Councell.

The wilde kinde of Cypreſſe tree groweth hard by *Ammons* Temple, and in other parts of the countrey of Cyrene vpon the tops of mountaines, and in extreme cold countries. *Bellonius* affirmeth, that there is found a certaine wilde Cypreſſe alſo in Candy, which is not ſo high as other Cypreſſe trees, nor groweth ſharpe toward the top, but is lower, and hath his boughes ſpred flat, round about in compaſſe: he ſaith the body thereof is alſo thicke: but whether this be *Thya*, of which *Theophraſtus* and *Pliny* make mention, we leaue it to conſideration.

¶ *The Time.*

The tame Cypres tree is alwaies greene; the fruit may be gathered thrice a yeare, in Ianuarie, May, and September, and therefore it is ſyrnamed *Trifera*.

The wilde Cypres tree is late, and very long before it budded.

¶ *The Names.*

The tame Cypres is called in Greeke, Κυπάρισσος, or Κυπάριττος: in Latine, *Cupreſſus*: in ſhops, *Cypreſſus*: in Italian, *Cypreſſo*: in French and Spaniſh, *Cipres*: in high-Dutch, **Cipreſſenbaum**: in low-Dutch, **Cypreſſe boom**: in Engliſh, Cypres, and Cypres tree.

The fruit is named in Greeke, Στρόβιλοι κυπαρίσσου: in Latine, *Pilulæ Cupreſſi*, *Nuces Cupreſſi*, and *Galbuli*: in ſhops, *Nuces Cypreſſi*: in Engliſh, Cypres nuts or clogs. This tree in times paſt was dedicated to *Pluto*, and was ſaid to be deadly; whereupon it is thought that the ſhadow thereof is vnfortunate.

The wilde Cypres tree is called in Greeke, θύα or θύον, and θύη: from this doth differ θύος, being a name not of a plant, but of a mortar in which dry things are beaten: *Thya*, as *Pliny* writeth, *lib.* 13. *cap.* 16. was well knowne to *Homer*: he ſheweth that this is burned among the ſweet ſmells, which *Circe* was much delighted withall, whom he would haue to be taken for a goddeſſe, to their blame that call ſweet and odoriferous ſmells, euen all of them, by that name; becauſe he doth eſpecially make mention withall in one verſe, of *Cedrus* and *Thya*: the copies haue falſly *Larix*, or Larch tree, in which it is manifeſt that he ſpake onely of trees: the verſe is extant in the fift booke of *Odyſſes*, where he mentioneth, that *Mercurie* by *Iupiters* commandement went to *Calypſus* den, and that he did ſmell the burnt trees *Thya* and *Cedrus* a great way off.

Theophraſtus attributeth great honor to this tree, ſhewing that the roofs of old Temples became famous by reaſon of that wood, and that the timber thereof, of which the rafters are made is euerlaſting, and it is not hurt there by rotting, cobweb, nor any other infirmitie or corruption.

¶ *The Temperature.*

The fruit and leaues of the Cypres are dry in the third degree, and aſtringent.

¶ *The Vertues.*

A The Cypres nuts being ſtamped and drunken in wine, as *Dioſcorides* writeth, ſtoppeth the laske and bloudy flix, it is good againſt the ſpitting of bloud and all other iſſues of bloud.

They

They glue and heale vp great vlcers in hard bodies: they ſafely and without harme ſoke vp and B
conſume the hid and ſecret moiſture lying deepe and in the bottome of weake and moiſt infir-
mities.

The leaues and nuts are good to cure the rupture, to take away the *Polypus*, being an excreſcence C
growing in the noſe.

Some do vſe the ſame againſt carbuncles and eating ſores, mixing them with parched Barley D
meale.

The leaues of Cypres boyled in ſweet wine or Mede, helpes the ſtrangurie and difficulty of ma- E
king water.

It is reported, that the ſmoke of the leaues doth driue away gnats, and that the clogs do ſo like- F
wiſe.

The ſhauings of the wood laid among garments preſerueth them from the moths: the roſin kil- G
leth Moths, little wormes, and magots.

† Our Author in this chapter hath put together two chapters of *Dodonæus*; the one of Cypreſſe, the other of *Thya*, out of *Theophraſtus* and others. *Vid. Pemp. 6. lib. 3. cap. 7 & 8.*

Chap. 46. *Of the Tree of Life.*

Arbor Vitæ.
The Tree of Life.

¶ *The Deſcription.*

THe tree Tree of Life groweth to the height of a ſmall tree, the barke being of a darke reddiſh colour: the timber very hard, the branches ſpreading themſelues abroad, hanging down toward the ground by reaſon of the weakeneſſe of the twiggie branches ſurcharged with very oileous and ponderous leaues, caſting, and ſpreading themſelues like the feathers of a wing, reſembling thoſe of the Sauine tree, but thicker, broader, and more ful of gummie or oileous ſubſtance: which being rubbed in the hands do yeeld an aromatick, ſpicie, or gummie ſauor, very pleaſant and comfortable: amongſt the leaues come forth ſmall yellowiſh floures, which in my garden fall away without any fruit: but as it hath beene reported by thoſe that haue ſeene the ſame, there followeth a fruit in hot regions, much like vnto the fruit of the Cypres tree, but ſmaller, compact of little and thinne ſcales cloſely pact one vpon another, which my ſelfe haue not yet ſeene. The branches of this tree laid downe in the earth wil very eaſily take root, euen like the Woodbinde or ſome ſuch plant; which I haue often proued, and thereby haue greatly multiplied theſe trees.

¶ *The Place.*

This tree groweth not wilde in England, but it groweth in my garden very plentifully.

¶ *The Time.*

It endureth the cold of our Northerne clymat, yet doth it loſe his gallant greenes in the winter moneths: it floureth in my garden about May.

¶ *The Names.*

Theophraſtus and *Pliny*, as ſome thinke, haue called this ſweet and aromatical tree *Thuia*, or *Thya*: ſome call it *Cedrus Lycia*: the new writers do terme it *Arbor vitæ*: in Engliſh, the tree of life, I doe not meane that whereof mention is made, *Gen.* 3. 22.

¶ *The Temperature.*

Both the leaues and boughes be hot and dry.

¶ *The Vertues.*

Among the plants of the New-found land, this Tree, which *Theophraſtus* calls *Thuia*, or *Thua*,

is the moſt principal, and beſt agreeing vnto the nature of man, as an excellent cordial, and of a very pleaſant ſmell.

Chap. 47. *Of the Yew tree.*

Taxus.
The Yew tree.

¶ *The Deſcription.*

‡ IN ſtead of the deſcription and place mentioned by our Author (which were not amiſſe) giue me leaue to preſent you with one much more accurate, ſent me by Mr. *Iohn Goodyer.*

Taxus glandifera bacciferaque.
The Yew bearing Acornes and berries.

THe Yew tree that beareth Acornes and berries is a great high tree remaining alwaies greene, and hath vſually an huge trunke or body as big as the Oke, couered ouer with a ſcabbed or ſcaly barke, often pilling or falling off, and a yong ſmooth barke appearing vnderneath; the timber hereof is ſomewhat red, neere as hard as Box, vniuerſally couered next the barke with a thicke white ſap like that of the Oke, and hath many big limmes diuided into many ſmal ſpreading branches: the leaues be about an inch long, narrow like the leaues of Roſemary, but ſmooth, and of a darker greene colour, growing all alongſt the little twigs or branches cloſe together, ſeldome one oppoſite againſt another, often hauing at the ends of the twigs little branches compoſed of many leaues like the former, but ſhorter and broader, cloſely compact or ioyned together: amongſt the leaues are to be ſeene at all times of the yeare, ſmall ſlender buds ſomewhat long, but neuer any floures; which at the very beginning of the Spring grow bigger and bigger, till they are of the faſhion of little Acornes, with a white kernell within: after they are of this forme, then groweth vp from the bottomes of the Acornes a reddiſh matter, making beautiful reddiſh berries more long than round, ſmooth on the out ſide, very clammie within, and of a ſweet taſte, couering all the Acorne, onely leauing a little hole at the top, where the top of the Acorne is to be ſeene: theſe fallen, or deuoured by birds, leaue behinde them a little whitiſh huske made of a few ſcales, appearing like a little floure, which peraduenture may deceiue ſome, taking it to be ſo indeed: it ſeemes this tree, if it were not hindred by cold weather, would alwaies haue Acornes and berries on him, for he hath alwaies little buds, which ſo ſooneas the Spring yeelds but a reaſonable heate, they grow iuto the forme of Acornes: about the beginning of Auguſt, ſeldome before, you ſhall finde them turned into ripe berries, and from that time till Chriſtmaſſe, or a little after, you may ſee on him both Acornes and red berries.

Taxus tantum florens.
The Yew which only floures.

The Yew which onely beareth floures and no berries, is like the other in trunke, timber, barke, and leaues; but at the beginning of Nouember, or before, this tree doth beginne to be very thicke ſet or fraught on the lower ſide or part of the twigs or little branches, with ſmall round buds, verie neere as big, and of the colour of Radiſh ſeed, and do ſo continue all the Winter, till about the beginning or middle of Februarie, when they open at the top, ſending forth one ſmall ſharpe pointall, little longer than the huske, diuided into many parts, or garniſhed towards the top with many ſmall

ſmall duſty things like floures, of the colour of the husks; and if you ſhall beate or throw ſtones into this tree about the end of Februarie, or a good ſpace after, there will proceed and fly from theſe floures an aboundance of duſtie ſmoke. Theſe duſty floures continue on the trees till about harueſt, and then ſome and ſome fall away, and ſhortly after the round buds come vp as aforeſaid.

¶ *The Place.*

Theſe trees are both very common in England: in Hampſhire there is good plentie of them growing wilde on the chalkie hills, and in Church-yards where they haue been planted.

¶ *The Time.*

The time is expreſſed in their deſcriptions. Dec. 19. 1621. *Iohn Goodyer.* ‡

¶ *The Names.*

This tree is named by *Dioſcorides*, Σμίλαξ: by *Theophraſtus*, Μίλος: but *Nicander* in his book of Counterpoyſons, Σμίλαξ: *Galen* doth alſo call it Κάλαμος: it is named in Latine *Taxus*: in high-Dutch, **Eybenbaum**: in low-Dutch, **Ibenboom**: in Italian, *Taſſo*: in Spaniſh, *Toxo*, and *Taxo*: in French, *If*: in Engliſh, Ewe, or Yew tree: in the vnlearned ſhops of Germany, if any of them remaine, it is called *Tamariſcus*; where in times paſt they were wont not without great error, to mix the bark hereof in compound medicines, in ſtead of the Tamariske barke.

¶ *The Temperature.*

The Yew tree, as *Galen* reporteth, is of a venomous qualitie, and againſt mans nature. *Dioſcorides* writeth, and generally all that heretofore haue dealt in the facultie of Herbariſme, that the Yew tree is very venomous to be taken inwardly, and that if any doe ſleepe vnder the ſhadow thereof it cauſeth ſickneſſe and oftentimes death. Moreouer, they ſay that the fruit thereof being eaten is not onely dangerous and deadly vnto man, but if birds do eat thereof, it cauſeth them to caſt their feathers, and many times to die. All which I dare boldly affirme is altogether vntrue: for when I was yong and went to ſchoole, diuers of my ſchoole-fellowes and likewiſe my ſelfe did eat our fils of the berries of this tree, and haue not only ſlept vnder the ſhadow thereof, but among the branches alſo, without any hurt at all, and that not one time, but many times. *Theophraſtus* ſaith, That Νέμεα, *animalia*, *Gaza* tranſlates them *Iumenta*, or labouring beaſts, do die, if they do eat of the leaues; but ſuch cattell as chew their cud receiue no hurt at all thereby.

Nicander in his book of Counterpoiſons doth reckon the Yew tree among the venomous plants, ſetting downe alſo a remedie, and that in theſe words, as *Gorræus* hath tranſlated them.

Parce venenata Taxo, quæ ſurgit in Oeta
Abietibus ſimilis, lethoque abſumit acerbo
Ni præter morem pleno cratere meraca
Fundere vina pares, cum primum ſentiet æger
Arctari obſtructas fauces animæque canalem.

‡ Shun th' poys'nous Yew, the which on Oeta growes,
Like to the Firre, it cauſes bitter death;
Vnleſſe beſides thy vſe pure wine that flowes
From empty'd cups, thou drinke, when as thy breath
Begins to faile, and paſſage of thy life
Growes ſtrait. ——

Pena and *Lobel* alſo obſerued that which our Author here affirmes, and dayly experience ſhewes it to be true, that the Yew tree in England is not poyſonous: yet diuers affirme, that in Prouince in France, and in moſt hot countries, it hath ſuch a maligne qualitie, that it is not ſafe to ſleepe or long to reſt vnder the ſhadow thereof. ‡

Chap. 48. *Of the Funiper tree.*

¶ *The Kindes.*

AMong the Iuniper trees one is leſſer, another greater, being a ſtrange and forreine tree: one of theſe bringeth forth a floure and no fruit; the other fruit and no floures.

¶ *The Deſcription.*

1 THe common Iuniper tree groweth in ſome parts of Kent vnto the ſtature and bignes of a faire great tree, but moſt commonly it growes very low like vnto ground Furres: this tree

1 *Iuniperus.*
The Iuniper tree.

2 *Iuniperus maxima.*
The great Iuniper tree.

‡ 3 *Iuniperus Alpina minor.*
Small Iuniper of the Alps.

tree hath a thin bark or rinde, which in hot regions will chop and rend it ſelf into many cranies or pieces: out of which rifts iſſueth a certaine gum or liquour much like vnto Frankincenſe: the leaues are very ſmall, narrow, and hard, and ſomwhat prickly, growing euer green along the branches, thicke together: amongſt which come forth round and ſmall berries, greene at the firſt, but afterward blacke declining to blewneſſe, of a good ſauor, and ſweet in taſte, which do wax ſomwhat bitter after they be dry and withered.

2 The great Iuniper tree comes now and then to the height of the Cypres tree, with a greater and harder leaſe, and alſo with a fruit as big as Oliue berries, as *Bellonius* writeth, of an exceeding faire blew colour, and of an excellent ſweet ſauor.

‡ 3 This exceeds not the height of a cubit, but growes low, and as it were creeps vpon the ground, and conſiſts of ſundry thicker and ſhorter branches than the common kind, tough alſo, writhen, and hard to breake; 3 leaues alwaies growing at equall diſtances, as in the common, but yet broader, ſhorter, and thicker, neither leſſe pricking than they, of a whitiſh greene colour on the inſide, and green without, incompaſſe the tender branches. *Cluſius*, who giues vs this figure and hiſtorie, obſerued not the floure, but the fruit is like that of the ordi-

narie,

nary, but yet ſomewhat longer; It growes vpon the Auſtrian Alpes, and ripens the fruite in Auguſt and September. ‡

¶ *The Place.*

The common Iuniper tree is found in very many places, eſpecially in the South parts of England. *Bellonius* reporteth, that the greater groweth vpon mount Taurus: *Aloiſius Anguillara* writeth, that it is found on the ſea ſhores of the *Ligurian* and *Adriaticke* ſea and in *Illyricum*, bringing forth great berries: and others ſay that it growes in Prouence of France: it commeth vp for the moſt part in rough places and neere to the ſea, as *Dioſcorides* noteth.

¶ *The Time.*

The Iuniper tree floureth in May; the floure whereof is nothing elſe but as it were a little yellowiſh duſt or powder ſtrowed vpon the boughes. The fruit is ripe in September, and is ſeldome found either winter or Sommer without ripe and vnripe berries, and all at one time.

¶ *The Names.*

The Iuniper tree is called in Greeke ἄρκευθος: the Apothecaries keepe the Latine name *Iuniperus*: the Arabians call it *Archonas* and *Archencas*: the Italians, *Ginepro*: in high Dutch, **Wechholter**: in Spaniſh, *Enebro*, *Ginebro*, and *Zimbro*: the French men and baſe Almaines *Geneue*: in Engliſh, Iuniper tree.

The leſſer is named in Greeke ὀξύκεδρος: in Latine, *Iuniperus*. The great Iuniper Tree is called as ſome thinke in Greeke μεγίστη ὀξύκεδρος: in Latine (by *Lobel*) *Iuniperus maximus Illyricus carulea bacca*, by reaſon of the colour of the berries, and may be called in Engliſh, blew Iuniper.

The berries are called *Grana Iuniperi*: in Greeke, ἄρκευθος, although the Tree it ſelfe alſo is oftentimes called by the ſame name ἄρκευθος: it is termed in high Dutch, **Krametbeer, Weckholierbeer**: in low Dutch, **Genebrebeſſen**: in Spaniſh, *Neurinas*: in Engliſh, Iuniper berries.

The gum of the Iuniper tree is vſually called of the Apothecaries *Vernix*: in Latine, *Lachryma Iuniperi*: *Serapio* nameth it *Sandarax* and *Sandaracha*; but there is another *Sandaracha* among the Grecians, being a kinde of Orpment, which growes in the ſame minerals wherein Orpment doth, and this doth farre differ from *Vernix*, or the Iuniper gum. *Pliny* in his 11. booke, 7. chapter maketh mention alſo of another *Sandaracha*, which is called *Erithrce* and *Cerinthus*: this is the meate of Bees whileſt they be about their worke.

¶ *The Temperature.*

Iuniper is hot and dry, and that in the third degree, as *Galen* teacheth; the berries are alſo hot, but not altogether ſo drie: the gum is hot and dry in the firſt degree, as the Arabians write.

¶ *The Vertues.*

The fruite of the Iuniper tree doth clenſe the liuer and kidnies, as *Galen* teſtifieth: it alſo maketh thin clammie and groſſe humors: it is vſed in counterpoyſons and other wholeſome medicines: being ouer largely taken it cauſeth gripings and gnawings in the ſtomacke, and maketh the head hot: it neither bindeth nor looſeth the belly: it prouoketh vrine. A

Dioſcorides reporteth, that this being drunke is a remedy againſt the infirmitie of the cheſt, coughes, windines, gripings and poiſons, and that the ſame is good for thoſe that be troubled with cramps, burſtings, and with the diſeaſe called the mother. B

It is moſt certaine that the decoction of theſe berries is ſingular good againſt an old cough, and againſt that with which children are now and then extremely troubled, called the Chin cough, in which they vſe to riſe vp raw, tough and clammy humors, that haue many times bloud mixed with them. C

Diuers in Bohemia do take in ſtead of other drinke, the water wherein thoſe berries haue been ſteeped, who liue in wonderfull good health. D

This is alſo drunke againſt poiſons and peſtilent feuers, and it is not vnpleaſant in the drinking: when the firſt water is almoſt ſpent, the veſſell is againe filled vp with freſh. E

The ſmoke of the leaues and wood driueth away ſerpents, and all infection and corruption of the aire, which bring the plague, or ſuch like contagious diſeaſes: the iuice of the leaues is laid on with wine, and alſo drunke againſt the bitings of the viper. F

The aſhes of the burned barke, being applied with water, take away ſcurffe and filth of the skinne. G

The powder of the wood being inwardly taken, is pernicious and deadly, as *Dioſcorides* vulgar copies do affirme; but the true copies vtterly deny it, neither do any of the old writers affirme it. H

The fume and ſmoke of the gum doth ſtay flegmaticke humors that diſtill out of the head, and ſtoppeth the rheume: the gum doth ſtay raw and flegmaticke humors that ſticke in the ſtomacke and guts, if it be inwardly taken, and alſo drunke. I

It killeth all maner of wormes in the belly, it ſtaieth the menſes, and hemorrhodes: it is commended alſo againſt ſpitting of bloud; it dryeth hollow vlcers, and filleth them with fleſh, if it be caſt thereon: being mixed with oile of Roſes, it healeth chops in the hands and feet. K

L There is made of this and of oile of Lineſeed, mixed together, a liquor called Verniſh, which is vſed to beautifie pictures and painted tables with, and to make iron gliſter, and to defend it from the ruſt.

Chap. 49. *Of the prickly Cedar, or Cedar Iuniper.*

¶ *The Kindes:*

THe prickly Cedar tree is like to Iuniper, and is called the ſmall or little Cedar, for difference from the great and tall Cedar, which bringeth Cones; and of this there are two kindes, as *Theophraſtus* and *Pliny* do teſtifie, that is to ſay, one of Lycia, and another crimſon.

¶ *The Deſcription.*

1 THe Crimſon or prickly Cedar ſeemeth to be very like to the Iuniper tree in body and boughes, which are writhed, knotty, and parted into very many wings: the ſubſtance of the wood is red, and ſweet of ſmell like that of the Cypreſſe; the tree is couered ouer with a rugged barke: the leaues be narrow and ſharpe pointed, harder than thoſe of Iuniper, ſharper and more pricking, and ſtanding thinner vpon the branches: the fruite or berry is ſometimes as big as a haſell nut, or, as *Theophraſtus* ſaith, of the bigneſſe of Myrtle berries, and being ripe it is of a reddiſh yellow, or crimſon colour, ſweet of ſmell, and ſo pleaſant in taſte, as euen the countrey-men now and than do eate of the ſame with bread.

1 *Oxycedrus Phœnicia.*
Crimſon prickly Cedar.

3 *Oxycedrus Lycia.*
Rough Lycian Cedar.

2 The other low Cedar which growes in Lycia is not ſo high as the former, hauing likewiſe a writhed body as big as a mans arme, full of boughes; the barke is rough, yellowiſh without, and red within: the leaues ſtand thicker, like at the firſt to thoſe of Iuniper, but yet ſomewhat ſhorter, and in the third or fourth yeere thicker, long and round withall, comming neere to the leaues of

‡ 3 *Cedrus Lycia altera.*
The other Lycian Cedar.

of the Cypres tree, or of the second Sauine, that is, blunt, and not pricking at all, which being bruised betweene the fingers, do yeeld a very pleasant smel: so doth one and the selfe same plant bring forth below sharpe and prickly leaues, and aboue thick and blunt ones, as that notable learned Herbarist *Clusius* hath most diligently obserued: the fruit or berry is round like that of Iuniper, of colour yellow when it is ripe, inclining to a red, in taste somwhat bitter, but sweet of smell.

‡ 3 This also hath Cypresse-like leaues, not vnlike those of the last described, yet somwhat thicker and broader: the fruit is also much larger, being as big as Hasell nuts, and of a red or skarlet colour; whence *Lobel* calleth it *Cedrus Phœnicia altera.* ‡

¶ *The Place.*

The prickely Cedar with the crimson colour commeth vp higher and greater in certaine places of Italy, Spaine, and Asia, and in other Countries; for that which grows on mount Garganus in Apulia is much higher and broader than those that grow elsewhere, and bringeth forth greater berries, of the bignesse of an hasell nut, and sweeter, as that most diligent writer *Bellonius* reporteth. *Carolus Clusius* sheweth, that the prickely Cedar and the Iuniper tree be of so great a growth in diuers places of Spaine, as he hath obserued, as that the body of them is as thicke as a man.

The Lycian Cedar is found in Prouence of France, not far from Massilia, and groweth in a great part of Greece, in Illyricum and Epirum.

¶ *The Time.*

Both of them are alwaies greene, and in Winter also full of fruit, by reason that they continually bring forth berries, as when the old do fall new come in their places: in the spring grow vp new buds and beginnings of berries: in Autumne they wax ripe the second yeare, as doe the berries of Iuniper.

¶ *The Names.*

They are called in Latine, *Minores*, and *Humiles Cedri*, little and low Cedars, for difference from the tall and great Cedar which beareth Cones.

The former is named in Greeke, ὀξύκεδρος, and κέδρος φοινικὴ: in Latine, *Oxycedrus*, and *Cedrus Punica*: in English, Prickly Cedar, and Crimson Cedar: *Pliny* surnameth it *Phœnicea*, of the crimson colour of the fruit: the Spaniards call this also *Enebro*, as *Clusius* testifieth, euen by the same name which they giue to the Iuniper: wherein likewise they are thought to imitate diuers of the old Writers, who haue not by names distinguished the Iuniper from the Cedar, but haue, as *Theophrastus* noteth, called them *Cedros*, Cedar trees; yet with an addition, ὀξύκεδρος, or prickly Cedar.

The other with the blunt leafe is named by *Theophrastus*, λευκὴ κέδρος: of *Pliny* also, *Lycia Cedrus*: in Prouince of France, *Morucinc*: diuers name this *Sabina*, and vse it in stead of Sauine, which they want; as the Apothecaries of *Epidaurus*, and in diuers cities of Greece, and also in Illyricum and Epirum, as *Bellonius* testifieth. Some would haue it to be θύα, *Thya*; but *Thya*, according to *Theophrastus*, is like, not onely in body, leaues, and boughes, but in fruit also, to the Cypresse tree, but the fruit of this is nothing like to the Cypresse Cones.

The fruit of this Cedar is named by *Theophrastus*, κέδρις, *Cedris*: notwithstanding *Cedrus*, as hee himselfe doth also testifie (*Gaza* nameth it *Credula*) is a certaine little shrub which neuer groweth to a tree.

The gum or liquor which issueth forth of the prickly Cedar is also called *Vernix*, and is sold in stead thereof.

¶ *The Temperature and Vertues.*

The little Cedar, as *Galen* writeth, is hot and dry in a manner in the third degree: the matter or substance thereof is sweet of smell, like that of Iuniper, and is vsed for perfumes and odoriferous smells together with the leaues. A

B The berries or fruit of the low Cedar haue the faculties not ſo ſtrong, as the ſame Author teſtifieth, inſomuch as that they may alſo be eaten, yet if they be taken too plentifully, they cauſe head-ache, and breed heate and gnawings in the ſtomacke. Yet there is a difference betweene theſe two Cedar berries; for the crimſon ones are not ſo hot and dry, by reaſon they are ſweeter and pleaſanter to the taſte, and therefore they are better to be eaten, and do alſo yeeld vnto the body a kind of nouriſhment: but the berries of that of *Lycia* are biting, hotter and drier alſo than thoſe of Iuniper, from which they differ eſpecially in the biting qualitie, they bring no nouriſhment at all, and though a man eate neuer ſo few of them he ſhall feele gnawings in his ſtomacke, and paine in his head.

C The Peaſants do feed thereon rather to ſatisfie their huuger, than for any delight they haue in the taſte, or the phyſicall vertues thereof; albeit they be good againſt the ſtrangurie, and prouoke vrine.

Chap. 50. *Of Sauin.*

¶ *The Kindes.*

THere be two kindes of Sauin; one like in leafe to Tamariske, the other to the Cypreſſe tree; whereof the one beareth berries, the other is barren.

1 *Sabina ſterilis.*
Barren Sauin.

2 *Sabina baccifera.*
Sauin bearing berries.

¶ *The Deſcription.*

1 THe firſt Sauin, which is the common kind, and beſt of all knowne in this country, groweth in manner of a low ſhrub or tree: the ſtem or trunke whereof is ſomtimes as big as a mans arme, diuiding it ſelfe into many branches ſet full of ſmall leaues like vnto Cypres, or Tamariske, but thicker, and more ſharpe or prickely, remaining greene Winter and Sommer, in ſmell ranke or very ſtrong, barren both of floures and fruit.

2 The

‡ 3 *Sabina baccata altera.*
The leſſer berry-bearing Sauin.

2 The other Sauin is an high tree, as *Bellonius* ſaith, as tall as the Almond tree, and much like to the tame Cypreſſe tree: the bodie is writhed, thicke, and ſometimes of ſo great a compaſſe as that it cannot be fathomed; the ſubſtance of the wood is red within, as is that of the Iuniper, and of the prickely Cedar: the barke is not very thicke, and it is of a yellowiſh red: the leaues are of a maruellous gallant greene colour, like to thoſe of the Cypres tree, yet thicker or more in number; in taſte bitter, of a ſpicie ſmell, and like Roſin: the boughes are broader, and thicke ſet as it were with wings, like thoſe of the Pitch tree and of the Yew tree: on which grow a great number of berries, very round like thoſe of the little Cedars, which at the firſt are green, but when they be ripe they are of a blackiſh blew. Out of the root hereof iſſueth oftentimes a roſin, which being hard is like to that of the Iuniper tree, and doth alſo crumble in the chewing.

‡ 3 There is another, which differs from the laſt deſcribed onely in that the leaues are ſmaller and leſſe pricking than thoſe of the former, as alſo the branches leſſer: *Lobel* calls this *Sauina baccata altera.* ‡

¶ *The Place.*

Both of them grow vpon hills in woods, and in other like vntoiled places, as in Candy, Myſia, and elſewhere. *P. Bellonius* reporteth that he found them both vpon the tops of the mountaines Taurus, Amanus, and Olympus.

The firſt is planted in our Engliſh gardens almoſt euery where: the ſecond is planted both by the ſeed and by the ſlip: the ſlips muſt be ſet in a ground that is meanly moiſt and ſhadowie, till they haue taken root: the ſhrubs which grow of theſe decline toward the one ſide, retaining ſtill the nature of the bough: but that Sauin which is planted by the ſeed groweth more vpright; this in continuance of time bringeth forth ſeeds, and the other for the moſt part remaines barren: both theſe grow in my garden.

¶ *The Time.*

They both continue alwaies greene: the one is found to be loden with ripe fruit commonly in Winter, but it hath fruit at all times; for before the old berries fall, new are come vp.

¶ *The Names.*

Sauine is called in Greeke Βρᾶθυς, or Βρᾶθυ: in Latine, *Sabina.*

The firſt is commonly called in the Apothecaries ſhops by the name *Sauina:* of diuers, *Sauimera:* the Italians and Spaniards keepe the Latine name: it is called in high-Dutch, **Siben baum:** in low-Dutch, **Sauel boom:** in French, *Sauenier:* in Engliſh, common Sauine, or garden Sauine.

Some name the other *Cupreſſus Cretica,* or Cypres of Candy, as *Pliny* ſaith, *lib.* 12. *cap.* 17. making mention of a tree called *Bruta:* ſome there are that take this to be *altera Sabina,* or the ſecond Sauin, and to be read *Bruta* for Βρᾶθυ, *Brathu,* by altering of the vowels. For it is deſcribed by *Plin. li.* 12. *cap.* 17. to be like the Cypreſſe tree, in theſe words; They ſeeke in the mountaine Elimæi the tree *Bruta,* being like to the broad Cypres tree, hauing white boughes, yeelding a ſweet ſmell when it is ſet on fire; whereof mention is made with a miracle, in the ſtories of *Claudius Cæſar.* It is reported that the Parthians do vſe the leaues in drinks; that the ſmell is very like to that of the Cypres tree, and that the ſmoke thereof is a remedie againſt other woods. It groweth beyond Paſitigris, neere vnto the towne Sittaca, on mount Zagrus. Thus far *Pliny.*

The mountaines Elimæi are deſcribed by *Strabo* in the countrey of the Aſſyrians, next after the mountaine Sagrus aboue the Babylonians; by *Ptolomæus* not far from the Perſian gulfe: therefore it is hard to ſay that *Bruta* is *Sabina altera,* or the ſecond Sauine, ſeeing that ſo great a diſtance of the place may vndoubtedly cauſe a difference, and that it is not largely but briefely deſcribed. It ſeemeth that *Thya* mentioned by *Theophraſtus* is more like vnto Sauine: but yet foraſmuch as *Thya* is like in fruit to the Cypres tree, and not to the fruit or berries of the little Cedars, it is alſo verie

manifeſt, that the ſecond Sauine is not *Thya*, neither *Vitæ arbor*, ſo called of the later Herbariſts: it is likewiſe named by *Lobel*, *Sabina genuina baccifera, atrocærulea*, that is, the true Sauine that beareth berries of a blackiſh blew colour.

¶ *The Temperature.*

The leaues of Sauine, which are moſt vſed in medicine, are hot and dry in the third degree, and of ſubtill parts, as *Galen* ſaith.

¶ *The Vertues.*

A The leaues of Sauin boyled in Wine and drunke prouoke vrine, bring downe the menſes with force, draw away the after-birth, expell the dead childe, and kill the quicke: it hath the like vertue receiued vnder in a perfume.

B The leaues ſtamped with honey and applied, cure vlcers, ſtay ſpreading and creeping vlcers, ſcoure and take away all ſpots and freckles from the face or body of man or woman.

C The leaues boyled in oyle Oliue, and kept therein, kill the wormes in children, if you anoint their bellies therewith: and the leaues poudered and giuen in milke or Muſcadell do the ſame.

D The leaues dried and beate into fine pouder, and ſtrewed vpon thoſe kindes of excreſcences *ſub præputio*, called Caroles, and ſuch like, gotten by dealing with vncleane women, take them away perfectly, curing and healing them: but if they be inueterate and old, and haue been much tampered withall, it ſhall be neceſſarie to adde vnto the ſame a ſmall quantitie of *Auripigmentum* in fine pouder, and vſe it with diſcretion, becauſe the force of the medicine is greatly increaſed thereby and made more corroſiue.

Chap. 51. *Of Tamariske.*

1 *Tamariſcus Narbonenſis.*
French Tamariske.

2 *Tamariſcus Germanica.*
Germane Tamariske.

¶ *The*

¶ *The Deſcription.*

1 THe firſt kinde of Tamariske groweth like a ſmall hedge tree, couered with a reddiſh barke, hauing many branches ſet and bedeckt with leaues, much like vnto Heath: among which come forth ſmall moſſie white floures declining to purple, which turne into a pappous or downie ſeed, that flieth away with the winde, as that of Willow doth: the root is wooddie as the roots of other ſhrubs be, and groweth diuers waies.

2 The Germane Tamariske hath many wooddie branches or ſhoots riſing from the root, with a white bark, hauing his leaues thicker and groſſer than the former, and not ſo finely iagged or cut: The floures are reddiſh, and larger than the former, growing not vpon foot-ſtalkes, many thick cluſtering together, as thoſe of the former, but each a pretty diſtance from another on the tops of the branches ſpike faſhion, and begin to floure below: which do turne into ſeed, that is likewiſe carried away with the winde.

¶ *The Place.*

Tamariske groweth by running ſtreames, and many times by riuers that breake forth, and not ſeldome about fenny grounds, commonly in a grauelly ſoile, for it beſt proſpereth in moiſt and ſtony places: it is found in Germany, Vindelicia, Italy, Spaine, and alſo in Greece.

The Tamarisks do alſo grow in Egypt and Syria, as *Dioſcorides* writeth, and likewiſe in Tylus an Iſland in Arabia, as *Theophraſtus* noteth: the wood wherof, ſaith he, is not weak as with vs in Greece, but ſtrong like ἔρινον, or timber, or any other ſtrong thing: this Tamariske *Dioſcorides* doth call ἡμέρα, that is to ſay, tame, or planted; and ſaith that it bringeth forth fruit very like to Galls, in taſte rough and binding.

Petrus Bellonius in his ſecond booke of ſingularities reporteth, that hee ſaw in Egypt very high Tamarisks and great like other trees, and that ſometimes in moiſt places by riuers ſides, and many times alſo in dry and grauelly grounds where no other trees did grow, which now and then did beare hanging on the boughes ſuch a multitude of Galls, that the inhabitants call *Chermaſel*, as being ouer loden, they were ready to breake. Both theſe grow and proſper well in gardens with vs here in England.

¶ *The Time.*

Theſe trees or ſhrubs floure in May, and in the later end of Auguſt, their ſeed is carried away with the wind.

¶ *The Names.*

They are called in Greeke μυρίκη and in Latine alſo *Myrica*, and *Tamarix*: in ſhops, *Tamariſcus*: of *Octauius Horatianus*, *Murica*: *Dioſcorides* maketh that which groweth in Greece and Italy to be ἄγριος, or wilde Tamariske: it is named in high Dutch **Tamariſchen holtz**, and **Poſt**: in low Dutch, **Ibenboom, Tamariſchboome**: in Italian, *Tamarigio*: in Spaniſh, *Tamarguira*, and *Tamariz*: in French, *Tamaris*: in Engliſh, Tamariske.

¶ *The Temperature and Vertues.*

Tamariske hath a clenſing and cutting facultie with a manifeſt drying; it is alſo ſomewhat aſtringent or binding, and by reaſon of theſe qualities it is very good for an hard ſpleen, being boyled with vineger or wine, either the root or leaues, or tender branches, as *Galen* writeth. A

Moreouer *Dioſcorides* teacheth, that the decoction of the leaues made with wine, doth waſte the ſpleene, and that the ſame is good againſt the tooth-ache, if the mouth be waſhed therewith: that it bringeth downe the Menſes, if the patient ſit therein; that it killeth lice and nits, if the parts be bathed therewith. B

The aſhes of burnt Tamariske hath a drying facultie, and greatly ſcouring withall, and a little binding. C

The floures and downie ſeed of the greater Tamariske doth greatly binde, inſomuch as it commeth very neere to the Gall named *Galla Omphacitis*, but that the roughneſſe of taſte is more euident in the Gall; the which floures are of an vnequall temperature, for there is ioined to the nature thereof a great thinneſſe of parts, and clenſing facultie, which the Gall hath not, as *Galen* writeth. D

Theſe floures we fitly vſe (ſaith *Dioſcor.*) in ſtead of Gall, in medicines for the eies and mouth: E

It is good to ſtanch bloud, and to ſtay the laske and womens whites, it helpeth the yellow iaundice, and alſo cureth thoſe that are bit of the venomous ſpider called *Phalangium*; the barke ſerueth for the ſame purpoſes. F

The leaues and wood of Tamariske haue great power and vertue againſt the hardneſſe and ſtopping of the ſpleene, eſpecially the leaues being boiled in water, and the decoction drunke, or elſe infuſed in a ſmall veſſell of Ale or Beere, and continually drunke: and if it bee drunke forth of a cup or diſh made of the wood or timber of Tamariske, is of greater efficacie. G

CHAP.

Chap. 52. *Of Heath, Hather, or Linge.*

¶ *The Kindes.*

THere be diuers ſorts of Heath, ſome greater, ſome leſſer; ſome with broad leaues, and ſome narrower: ſome bringing forth berries, and others nothing but floures.

¶ *The Deſcription.*

1 THe common Heath is a low plant, but yet wooddie and ſhrubby, ſcarce a cubit high: it bringeth forth many branches, whereupon do grow ſundry little leaues ſomewhat hard and rough, very like to thoſe of Tamariske, or the Cypreſſe tree: the floures are orderly placed alongſt the branches, ſmall, ſoft, and of a light red colour tending to purple: the root is alſo wooddie, and creepeth vnder the vpper cruſt of the earth: and this is the Heath which the Antients tooke to be the right and true Heath.

1 *Erica vulgaris, ſive Pumila.*
Common or dwarfe Heath.

‡ *Erica vulgaris hirſuta.*
Rough leaued Heath.

There is another Heath which differeth not from the precedent, ſauing that this plant bringeth forth floures as white as ſnow, wherein conſiſteth the difference: wherefore we may call it *Erica pumila alba*, Dwarfe Heath with white floures.

2 The great Heath, (which *Carolus Cluſius* at his being in England found in the barren grounds about Windſor, which in his Spaniſh trauels he maketh the firſt kinde): groweth to the height of two cubits, ſeldome higher, full of branches, couered with a blackiſh barke: whereon are ſet in very good order by couples, ſmall, rough, ſquare leaues finer than thoſe of Tamariske or Cypreſſe. The floures incloſe the little twiggie branches round about at certaine diſtances, from the lower part to the top faſhioned like little bottles, conſiſting of foure parts, of a ſhining purple colour, very beautifull to behold, and the rather to be eſteemed becauſe it floureth twiſe in the yeare: the root is likewiſe wooddie.

‡ 3 This

† 3 *Erica maior flore albo Cluſij.*
The great Heath with white floures.

4 *Erica maior flore purpureo.*
Great Heath with purple floures.

† 5 *Erica cruciata.*
Croſſed Heath.

6 *Erica Pyramidalis.*
Steeple Heath.

‡ 3 This, ſaith *Cluſius*, which is the largeſt that I haue ſeene, ſometimes excceeds the height of a man, very ſhrubby, hauing a hard and blackiſh red wood: the leaues are ſmall and ſhort, growing about the branches by foures, of a very aſtringent taſte: it hath plentiful ſtore of floures growing all alongſt the branches, ſo that ſomtimes the larger branches haue floures for a foot in length: this floure is hollow and longiſh, well ſmelling, white and beautifull. It growes betweene Lisbone and the Vniuerſity of Conimbrica in Portugal where it floures in November, December, and Ianuarie. ‡

† 4 Of this kind there is another ſort with whitiſh purple floures, more frequently found than the other ſort, which floures are ſomwhat greater than the former, but in forme like, and flouring at the ſame time. ‡ The leaues alſo are hairy, and grow commonly by foures: the hollow floures grow cluſtering together at the very tops of the branches, and are to be found in Iuly and Auguſt; it growes on diuers heathy places of this kingdome. ‡

5 Croſſed Heath groweth to the height of a cubit and a halfe, full of branches, commonly lying along vpon the ground, of a ſwart darke colour: whereon do grow ſmall leaues, ſet at certaine ſpaces by two vpon one ſide, and two on the other, oppoſite, one anſwering another, euen as doe the leaues of Croſſe-wort. The floures in like manner ſtand alongſt the branches Croſſe faſhion, of a darke ouerworne greeniſh colour. The root is likewiſe wooddy, as is all the reſt of the plant.

6 This Steeple Heath hath likewiſe many wooddy braunches, garniſhed with ſmall leaues which eaſily fall off from the dryed ſtalks; among which come forth diuers little moſſie greeniſh floures of ſmall moment. The whole buſh for the moſt part groweth round together like a little cocke of hay, broad at the lower part, and ſharp aboue like a Pyramide or ſteeple, whereof it tooke his name.

7 *Erica tenuifolia.*
Small leafed Heath.

8 *Erica tenuifolia caliculata.*
Challice Heath.

7 This ſmall or thinne leafed Heath is alſo a low and baſe ſhrub, hauing many ſmall and ſlender ſhoots comming from the root, of a reddiſh browne colour; whereupon doe grow verie manie ſmall leaues, not vnlike to them of common Time, but much ſmaller and tenderer: the floures grow in tufts at certaine ſpaces, of a purple colour. The root is long and of a wooddie ſubſtance. ‡ The branches of this are commonly whitiſh, the leaues very green: the floures are ſmalleſt at both ends and biggeſt in the middeſt, hollow, and of a faire purple colour, which doth not eaſily decay: it floures

floures moſt part of Summer, and growes in many Heathie grounds. ‡

8 Challice Heath hath alſo many wooddy branches growing from the roots, ſlender, of a reddiſh browne colour, a foot and a halfe high, garniſhed with very little leaues, leſſer than thoſe of Time: the floures grow on the tops and vpper parts of the branches, and be in number, fiue, ſix or moe, hanging downewards, in faſhion long, hollow within like a little tunnell or open cup or challice, of a light purpliſh colour: the root creepeth and putteth forth in diuers places new ſprings or ſhoots.

9 The Heath that bringeth forth berries hath many weake and ſlender branches of a reddiſh colour, which trailing vpon the ground do take hold thereof in ſundry places, whereby it mightily increaſeth: the leaues are ſomewhat broad, of a thicke and fleſhie ſubſtance, in taſte ſomthing drying at the firſt, but afterwards ſomewhat ſharpe and biting the tongue: among which come forth ſmall floures of an herbie colour: which being vaded there ſucceed ſmall round berries, that at the firſt are greene, and afterward blacke, being as big as thoſe of Iuniper; wherein is contained purple iuice like that of the Mulberry: within thoſe berries are contained alſo ſmall three cornered grains: the root is hard, and of a wooddy ſubſtance. ‡ I found this growing in great plenty in Yorkſhire on the tops of the hills by Gisbrough, between it and Roſemary-topin (a round hill ſo called) and ſome of the people thereabouts told me they called the fruit Crake berries. This is the ſame that *Mathiolus* calls *Erica Baccifera:* and it is the *Erica Coris folio* 11. of *Cluſius*.‡.

‡ 9 *Erica baccifera procumbens.*
Heath bearing Berries.

10 *Erica baccifera tenuifolia.*
Small leafed Heath with Berries.

‡ 10 This which our Authour figured as you ſeee in the tenth place (putting the deſcription of the former thereto) hath brittle branches growing ſome cubit high, couered with a barke blacker than the reſt: the leaues are like thoſe of the former, but blacker and ſmaller, growing about the ſtalks by threes, of a hottiſh taſte with ſome aſtriction. In September and October it carries a fruit on the tops of the branches different from the reſt, for it is very beautifull, white, tranſparent, reſembling dusky and vneuen pearles in forme and colour, ſucculent alſo, and of an acide taſte, commonly containing three little ſeeds in each berry: in Nouember this fruit becomes dry, and falls away of it ſelfe. *Cluſius* onely obſerued this in Portugall, and at the firſt ſight a far off tooke the white berries to haue been graines of Manna. He calls it *Erica Coris folio.* 10.

11 I remember (ſaith *Dodonæus*) that I obſerued another Heath which grew low; yet ſent forth many

‡ 11 *Erica pumila*, 3. *Dod.*
Dodonæus his Dwarfe Heath.

‡ 12 *Erica ternis per intervalla ramis.*
Heath with three branches at a ioint.

‡ 13 *Erica peregrina Lobelij.*
Lobels ſtrange Heath.

‡ 14 *Erica Coris folio* 7. *Cluſij:*
Creeping Dutch Heath.

‡ 15 *Erica Coris folio. 9. Cluſij.*
Small Auſtrian Heath.

many wooddy and twiggy branches, hauing vpon them little narrow and longiſh leaues; on theſe ſtalkes ſpike faſhion to the tops of them, yet but on one ſide, grow elegant redde floures, pointed with blacke. This growes in that tract of Germany which leads from Bohemia to Noremberg on dry and vntilled places, and neere woods. It floures in Aprill.

12 This ſhrubby Heath is commonly ſome cubit high, hauing ſlender branches which come out of the maine ſtemmes commonly three together; and the leaues alſo grow in the ſame order; the tops of the branches are adorned with many floures of a darke purple colour, hollow, round, biggeſt below, and ſtanding vpon long footſtalks. *Cluſius* found this growing in the vntilled places of Portingale aboue Lisbone, where it floured in December; he calls it *Erica Coris folio*, 5.

13 Beſides all theſe (ſaith *Lobel*, hauing firſt treated of diuers plants of this kinde) there is a certaine rarer ſpecies growing like the reſt after the manner of a ſhrub in pots, in the Garden of M^r. *Iohn Brancion*: the leafe is long, and the purple floures, which as far as I remember conſiſted of foure little leaues apiece, grow on the tops of the branches. I know not whence it was brought, and therfore for the rarity I call it *Erica peregrina*, that is, Strange, or Forreine Heath.

14 This hath many round blackiſh purple branches ſome foot or cubit high, lying oft times along vpon the ground: theſe are beſet with many narrow little leaues, almoſt like thoſe of the third deſcribed, yet ſomewhat longer, commonly growing foure, yet ſometimes fiue together, of an aſtringent taſte; the little floures grow on the top of the branches, longiſh, hollow, and of a light purple colour, comming out of foure little leaues almoſt of the ſame colour; when theſe are ripe and dryed they containe a blackiſh and ſmall ſeed; the root is hard, wooddy, and runnes diuers waies; the weake branches alſo that lie vpon the ground now and then take root againe. *Cluſius* found this growing plentifully in diuers mountanous places of Germany where it floured in Iune, and Iuly.

15 The weake ſtalkes of this are ſome foot high, which are ſet with many ſmall greene leaues growing commonly together by threes; the tops of the branches are deckt with little hollow and longiſh floures diuided at their ends into foure parts, of a fleſh colour, together wi h the foure little leaues out of which they grow, hauing eight blackiſh little threds in them, with a purpliſh pointall in the middle. The ſeed is blacke and ſmall; the root wooddy as in other plants of this kinde. *Cluſius* found this in ſome mountanous woods of Auſtria, where it floured in Aprill and May. ‡

¶ *The Place.*

Heath groweth vpon dry mountaines which are hungry and barren, as vpon Hampſteed Heath neere London, where all the ſorts do grow, except that with the white floures, and that which beareth berries. ‡ There are not aboue three or foure ſorts that I could euer obſerue to grow there. ‡

Heath with the white floures groweth vpon the downes neere vnto Grauesend.

Heath which beareth berries groweth in the North parts of England, namely, at a place called Crosby Rauenſwaith, and in Crag cloſe alſo in the ſame countrey: from whence I haue receiued the red berries by the gift of a learned Gentleman called M^r. *Iames Thwaites*.

¶ *The Time.*

Theſe kindes or ſorts of Heath do for the moſt part floure all the Sommer, euen vntill the laſt of September.

¶ *The Names.*

Heath is called in Greeke, ἐρείκη: in Latine alſo *Erica*: diuers do falſly name it *Myrica*: in high and low Dutch, **Heiden**: in Italian, *Erica*: in Spaniſh, *Breſo Quirro*: in French, *Bruyre*: in Engliſh, Heath, Hather, and Linge.

¶ *The Temperature.*

Heath hath, as *Galen* ſaith, a digeſting facultie, conſuming by vapors: the floures and leaues are to be vſed.

¶ *The Vertues.*

A The tender tops and floures, ſaith *Dioſcorides*, are good to be laid vpon the bitings and ſtingings of any venomous beaſt: of theſe floures the Bees do gather bad hony.

B The barke and leaues of Heath may be vſed for, and in the ſame cauſes that Tamariske is vſed.

† The figure which our Author gaue in the ninth place by the name of *Erica baccifera latifolia* I take to be the *Vitis Idæa*, 2. of *Clusius* (which you ſhall finde in his due place) and in ſtead thereof I haue giuen you our ordinary berry-bearing Heath.

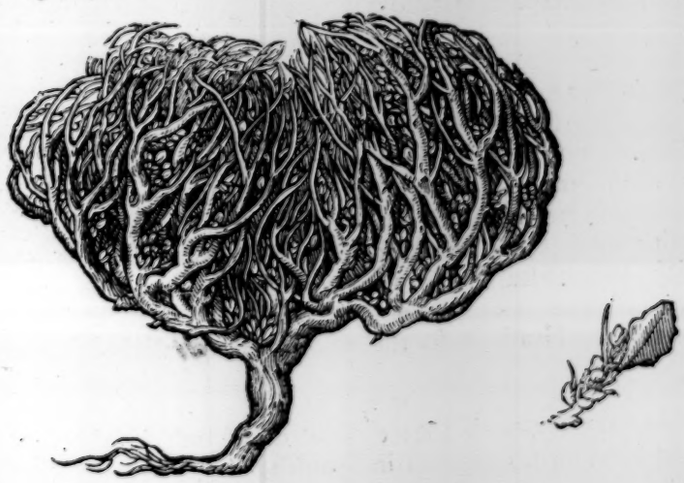
Chap. 53. *Of Heath of Ierico.*

1 *Roſa Hiericontea maior.*
The Heath Roſe of Ierico.

¶ *The Deſcription.*

1 THis kinde of Heath which of the later writers hath been called by the name *Roſa Hiericontea*; the coiner ſpoiled the name in the mint, for of all plants that haue bin written of, there is not any more vnlike vnto the Roſe, or any kinde thereof than this plant: what moued them thereto I know not: but thus much of my owne knowledge, it hath neither ſhape, nature, nor facultie agreeing with any Roſe; the which doubtleſſe is a kinde of Heath, as the barren ſoile, and that among Heath, doth euidently ſhew, as alſo the Heathie matter wherewith the whole plant is poſſeſſed, agreeing with the kindes of Heath in very notable points. It riſeth vp out of the ground, of the height of four inches, or an hand breadth, compact or made of ſundry hard ſtickes, (which are the ſtalkes) claſping or ſhutting it ſelfe together into a round forme, intricately weauing it ſelfe one ſticke ouerthwart another, like a little net: vpon which wooddy ſtickes do grow leaus not vnlike to thoſe of the Oliue tree, which maketh the whole plant of a round forme, and hollow within; among the leaues on the inſide grow ſmall moſſie floures, of a whitiſh herbie colour, which

2 *Roſa Hiericontea ſiccata.* The Heath Roſe of Ierico dried.



turne

turn into little ſeed, like the ſeed of Rocket, but leſſer: the whole plant is of the ſubſtance of heath, and wooddie.

2 The ſecond figure ſetteth forth the dried plant, as it is brought vnto vs from beyond the ſeas; which being ſet into a diſh of warme water, for halfe an houre, openeth it ſelfe in forme, as when it did grow, and taken forth vntill it be drie, returneth ſhut vp againe as before.

¶ *The Place.*

It groweth in the barren grounds of France, and other hot regions, among the Heath and ſuch like plants: it is a ſtranger in England, yet dried we haue them in great plenty. ‡ I haue not read nor heard that this grows wilde in France; but *Bellonius* ſaith it growes in Arabia *deſerta*: *Bauhine* ſaith it eaſily grew and flouriſhed many yeares in his garden at Baſill. ‡

¶ *The Time.*

The ſeed being ſowne in our cold climate, is ſowne in Aprill; it periſheth when it is ſprung vp, and bringeth neither floures nor ſeed.

¶ *The Names.*

This kinde of Heath is called *Roſa Hiericontea*, or *de Hiericho*, the Roſe of Ierico: of ſome, the Roſe of Ieruſalem, and alſo *Roſa Mariæ*: in Engliſh, the Heath Roſe.

¶ *The Temperature and Vertues.*

There is not any of the antient nor later writers that haue ſet downe any certaintie of this plant as touching the temperature and faculties, but onely a bare picture with a ſlender deſcription. A

Chap. 54. *Of the Chaſte Tree.*

1 *Vitex, ſive Agnus Caſtus.*
The Chaſte tree.

‡ 2 *Vitex latiore ſerrato folio.*
Chaſte tree with cut leaues.

¶ *The Deſcription.*

1 *Vitex*, or the Chaſte tree, groweth after the manner of a buſhie ſhrub or hedge tree, hauing many twiggie branches, very pliant and eaſie to be bent without breaking, like to the willow: the leaues are for the moſt part diuided into fiue or ſeuen ſections or diuiſions, much like the leaues of Hemp, whereof each part is long and narrow, very like vnto the willow leafe, but ſmaller: the floures do grow at the vppermoſt parts of the branches, like vnto ſpikie eares, cluſtering together about the branches, of a light purple or blew colour, and very ſweet ſmel: the fruit is ſmall and round, like vnto the graines or cornes of pepper.

‡ 2 *Lobel* mentions another varietie hereof that differs from the former onely in that it hath broader leaues, and theſe alſo ſnipt about the edges. ‡

¶ *The Place.*

Vitex groweth naturally in Italy, and other hot regions, by water courſes and running ſtreames: I haue it growing in my garden.

¶ *The Time.*

Vitex beginneth to recouer his laſt leaues in May, and the floures come forth in Auguſt.

¶ *The Names.*

† The Grecians call this ſhrub ἄγνος and ἁγνὸς *Agnos* (i.) *Caſtus*, Chaſte: becauſe, ſaith *Pliny* in his 24. booke, 9. Chapter, the Athenian Matrons in their feaſt called *Theſmophoria* dedicated to the honour of *Ceres*, deſirous to keepe themſelues chaſte, doe lay the leaues in their beds vnder them: the Latines name it *Vitex*, and of diuers it is termed, as wee finde among the baſtard and counterfeit names, ἄγνος in Latine, *Salix marina*, or *Salix Amerina*, and *Piper Agreſte*: in high Dutch, **Schaffmulle, Keuſchbaum**: in low Dutch, and alſo of the Apothecaries, *Agnus Caſtus*: the Italians, *Vitice*, *Agno Caſto*: in Spaniſh, *Gattile caſto*: in Engliſh, Chaſte tree, Hempe tree, and of diuers *Agnus caſtus*. ‡ The name *Agnus Caſtus* comes by confounding the Greeke name *Agnos* with *Caſtus*, the Latine interpretation thereof. ‡

¶ *The Temperature.*

The leaues and fruit of *Agnus caſtus* are hot and drie in the third degree: they are of very thin parts, and waſte or conſume winde.

The Vertues.

A *Agnus Caſtus* is a ſingular medicine and remedie for ſuch as would willingly liue chaſte, for it withſtandeth all vncleanneſſe, or deſire to the fleſh, conſuming and drying vp the ſeed of generation, in what ſort ſoeuer it be taken, whether in pouder onely, or the decoction drunke, or whether the leaues be carried about the body; for which cauſe it was called *Caſtus*; that is to ſay, chaſte, cleane, and pure.

B The ſeed of *Agnus Caſtus* drunken, driueth away, and diſſolueth all windineſſe of the ſtomacke, openeth and cureth the ſtoppings of the liuer and ſpleen; and in the beginning of dropſies, it is good to be drunke in wine in the quantitie of a dram.

C The leaues ſtamped with butter, diſſolue and aſſwage the ſwellings of the genitories and cods, being applied thereto.

D The decoction of the herbe and ſeed is good againſt pain and inflammations about the matrix, if women be cauſed to ſit and bathe their priuy parts therein: the ſeed being drunke with Penny-roiall bringeth downe the menſes, as it doth alſo both in a fume and in a peſſary: in a Pultis it cureth the head-ache, the Phrenticke, and thoſe that haue the Lethargie are woont to be bathed herewith, oile and vineger being added thereto.

E The leaues vſed in a fume, and alſo ſtrowed, driue away ſerpents; and beeing layed on doe cure their bitings.

F The ſeed laied on with water doth heale the clifts or rifts of the fundament; with the leaues, it is a remedie for lims out of ioint, and for wounds.

G It is reported that if ſuch as iourney or trauell do carry with them a branch or rod of *Agnus Caſtus* in their hand, it will keep them from Merry-galls, and wearineſſe: *Dioſc.*

Chap. 55. *Of the Willow Tree.*

¶ *The Deſcription.*

1 The common Willow is an high tree, with a body of a meane thickneſſe, and riſeth vp as high as other trees doe if it be not topped in the beginning, ſoone after it is planted; the barke

barke thereof is ſmooth, tough, and flexible: the wood is white, tough, and hard to be broken: the leaues are long, leſſer and narrower than thoſe of the Peach tree, ſomewhat greene on the vpper ſide and ſlipperie, and on the nether ſide ſofter and whiter: the boughes be couered either with a purple, or elſe with a white barke: the catkins which grow on the toppes of the branches come firſt of all forth, being long and moſſie, and quickly turne into white and ſoft downe, that is carried away with the winde.

1 *Salix.*
The common Willow.

2 *Salix aquatica.*
The Oziar or water Willow.

2 The leſſer bringeth forth of the head, which ſtandeth ſomewhat out, ſlender wands or twigs, with a reddiſh or greene barke, good to make baskets and ſuch like workes of: it is planted by the twigs or rods being thruſt into the earth, the vpper part whereof when they are growne vp, is cut off, ſo that which is called the head increaſeth vnder them, from whence the ſlender twigs doe grow, which being oftentimes cut, the head waxeth greater: many times alſo the long rods or wands of the higher Withy trees be lopped off and thruſt into the ground for plants, but deeper, and aboue mans height: of which do grow great rods, profitable for many things, and commonly for bands, wherewith tubs and casks are bound.

3 The Sallow tree or Goats Willow, groweth to a tree of a meane bigneſſe: the trunke or body is ſoft and hollow timber, couered with a whitiſh rough barke: the branches are ſet with leaues ſomewhat rough, greene aboue, and hoarie vnderneath: among which come forth round catkins, or aglets that turne into downe, which is carried away with the winde.

4 This other Sallow tree differeth not from the precedent, but in this one point, that is to ſay, the leaues are greater and longer, and euery part of the tree larger, wherein is the difference. ‡ Both thoſe laſt deſcribed haue little roundiſh leaues like little eares growing at the bottoms of the foot-ſtalkes of the bigger leaues, whereby they may bee diſtinguiſhed from all other Plants of this kinde. ‡

5 The Roſe Willow groweth vp likewiſe to the height and bigneſſe of a ſhrubby tree; the body whereof is couered with a ſcabbed rough barke: the branches are many, whereupon do grow very many twigs of a reddiſh colour, garniſhed with ſmall long leaues, ſomewhat whitiſh: amongſt which come forth little floures, or rather a multiplication of leaues, ioined together in forme of a

¶ *The Deſcription.*

1 *Vitex*, or the Châſte tree, groweth after the manner of a buſhie ſhrub or hedge tree, hauing many twiggie branches, very pliant and eaſie to be bent without breaking, like to the willow: the leaues are for the moſt part diuided into fiue or ſeuen ſections or diuiſions, much like the leaues of Hemp, whereof each part is long and narrow, very like vnto the willow leafe, but ſmaller: the floures do grow at the vppermoſt parts of the branches, like vnto ſpikie eares, cluſtering together about the branches, of a light purple or blew colour, and very ſweet ſmel: the fruit is ſmall and round, like vnto the graines or cornes of pepper.

Chap. 55. *Of the Willow Tree.*

¶ *The Deſcription.*

1 The common Willow is an high tree, with a body of a meane thickneſſe, and riſeth vp as high as other trees doe if it be not topped in the beginning, ſoone after it is planted; the barke

barke thereof is ſmooth, tough, and flexible: the wood is white, tough, and hard to be broken: the leaues are long, leſſer and narrower than thoſe of the Peach tree, ſomewhat greene on the vpper ſide and ſlipperie, and on the nether ſide ſofter and whiter: the boughes be couered either with a purple, or elſe with a white barke: the catkins which grow on the toppes of the branches come firſt of all forth, being long and moſſie, and quickly turne into white and ſoft downe, that is carried away with the winde.

1 *Salix.*
The common Willow.

2 *Salix aquatica.*
The Oziar or water Willow.

2 The leſſer bringeth forth of the head, which ſtandeth ſomewhat out, ſlender wands or twigs, with a reddiſh or greene barke, good to make baskets and ſuch like workes of: it is planted by the twigs or rods being thruſt into the earth, the vpper part whereof when they are growne vp, is cut off, ſo that which is called the head increaſeth vnder them, from whence the ſlender twigs doe grow, which being oftentimes cut, the head waxeth greater: many times alſo the long rods or wands of the higher Withy trees be lopped off and thruſt into the ground for plants, but deeper, and aboue mans height: of which do grow great rods, profitable for many things, and commonly for bands, wherewith tubs and casks are bound.

3 The Sallow tree or Goats Willow, groweth to a tree of a meane bigneſſe: the trunke or body is ſoft and hollow timber, couered with a whitiſh rough barke: the branches are ſet with leaues ſomewhat rough, greene aboue, and hoarie vnderneath: among which come forth round catkins, or aglets that turne into downe, which is carried away with the winde.

4 This other Sallow tree differeth not from the precedent, but in this one point, that is to ſay, the leaues are greater and longer, and euery part of the tree larger, wherein is the difference. ‡ Both thoſe laſt deſcribed haue little roundiſh leaues like little eares growing at the bottoms of the foot-ſtalkes of the bigger leaues, whereby they may bee diſtinguiſhed from all other Plants of this kinde. ‡

5 The Roſe Willow groweth vp likewiſe to the height and bigneſſe of a ſhrubby tree; the body whereof is couered with a ſcabbed rough barke: the branches are many, whereupon do grow very many twigs of a reddiſh colour, garniſhed with ſmall long leaues, ſomewhat whitiſh: amongſt which come forth little floures, or rather a multiplication of leaues, ioined together in forme of a

3 *Salix Caprea rotundi folia.*
The Goat round leafed Willow.

4 *Salix Caprea latifolia.*
The Goat broad leafed Sallow.

5 *Salix Roſea Anglica.*
The Engliſh Roſe Willow.

Roſe, of a greeniſh white colour, which doe not only make a gallant ſhew, but alſo yeeld a moſt cooling aire in the heat of Sommer, being ſet vp in houſes, for the decking of the ſame.

6 The low or baſe Willow groweth but low, & leaneth weakly vpon the ground, hauing many ſmall and narrow leaues, ſet vpon limber and pliant branches, of a darke or blackiſh greene colour: amongſt which come forth long ſlender ſtems full of moſſie floures, which turne into a light downie ſubſtance that flieth away with the winde.

7 The dwarfe Willow hath very ſmall and ſlender branches, ſeldome times aboue a foot, but neuer a cubit high, couered with a duskiſh barke, with very little and narrow leaues, of a greene colour aboue, and on the vpper ſide, but vnderneath of a hory or ouerworne greeniſh colour, in bigneſſe and faſhion of the leaues of garden Flax: among which come forth little duskiſh floures, which doe turne into downe that is carried away with the winde: the root is ſmall and threddy, of the bigneſſe of a finger, and of a blackiſh colour.

8 There is another kinde of willow like to the former, and differeth from it in that, the leaues of this kinde are ſmaller and narrower, as big as the leaues of Myrtle, hauing ſmall knobbie floures of a duskiſh colour,

6 Salix humilis.
The low Willow.

7 Chamæitea, ſiue Salix pumila.
Thedwarfe Willow.

‡ 8 *Salix humilis repens.*
Creeping dwarfe Willow.

colour, which turne into downe that flyeth away with the winde: the root is ſmall and limber, not growing deep, but running along vpon the vpper cruſt of the earth.

¶ *The Place.*

Theſe Willowes grow in diuers places of England: the Roſe-Willow groweth plentifully in Cambridge ſhire, by the riuers and ditches there in Cambridge towne they grow aboundantly about the places called Paradiſe and Hell-mouth, in the way from Cambridge to Grandcheſter: I found the dwarfe Willowes growing neere to a bog or mariſh ground at the further end of Hampſted heath vpon the declining of the hill, in the ditch that incloſeth a ſmall Cottage there, not halfe a furlong from the ſaid houſe or cottage.

¶ *The Time.*

The willowes do floure at the beginning of the Spring.

¶ *The Names.*

The Willow tree is called in Greeke ἰτέα: in Latine, *Salix*: in high-Dutch, **Weyden**: in low-Durch, **Wilgen**: in Italian, *Salice, Salcio*: in French, *Saux*: in Spaniſh, *Salgueiro, Salzer*, and *Sauz*: in Engliſh, Sallow, Withie, and Willow.

The

The greater is called in Latine *Salix perticalis*, common Withy, Willow, and Sallow, eſpecially that which being often lopped ſendeth out from one head many boughs: the kinde hereof with the red barke is called of *Theophraſtus*, blacke Withy; and the other, white: *Pliny* calleth the black *Græca*, or Greeke Withie (the red, being the Greeke Withy, ſaith he, is eaſie to be cleft) and the whiter, *Amerina*.

Theophraſtus writeth, that the Arcadians do call the leſſer Ἰτέαν, not Ἰτέαν: *Pliny* alſo nameth this *Helice*: both of them do make this to be *Salicis tertia ſpecies*, the third kinde of Sallow: the ſame is likewiſe called in Latine, *Salix pumila*, *Salix viminalis*, *Gallica Salix*; and by *Columella*, *Sabina*, which he ſaith that many do terme *Amerina*: in high-Dutch, **Kleyn Weyden**: in low-Dutch, **Wissmen**: in Engliſh, Oſier, ſmall Withy, Twig Withy: *Petrus Creſcentius* nameth it *Vincus*.

¶ *The Temperature.*

The leaues, floures, ſeed, and barke of Willowes are cold and dry in the ſecond degree, and aſtringent.

¶ *The Vertues.*

A The leaues and barke of Withy or Willowes do ſtay the ſpitting of bloud, and all other fluxes of bloud what ſoeuer in man or woman, if the ſaid leaues and barke be boiled in wine and drunke.

B The greene boughes with the leaues may very well be brought into chambers and ſet about the beds of thoſe that be ſicke of feuers, for they do mightily coole the heate of the aire, which thing is a wonderfull refreſhing to the ſicke Patients.

C The barke hath like vertues: *Dioſcorides* writeth, that this being burnt to aſhes, and ſteeped in vineger, takes away cornes and other like riſings in the feet and toes: diuers, ſaith *Galen*, doe ſlit the barke whileſt the Withy is in flouring, and gather a certain iuice, with which they vſe to take away things that hinder the ſight, and this is when they are conſtrained to vſe a clenſing medicine of thin and ſubtill parts.

Chap. 56. *Of the Oliue Tree.*

1 *Olea ſativa.*
The manured Oliue tree.

2 *Olea ſylueſtris.*
The wilde Oliue tree.

¶ *The*

¶ *The Deſcription.*

1 THe tame or manured Oliue tree groweth high and great with many branches, full of long narrow leaues not much vnlike the leaues of Willowes, but narrower and ſmaller: the floures be white and very ſmall, growing vpon cluſters or bunches: the fruit is long and round, wherein is an hard ſtone: from which fruit is preſſed that liquor which we call oyle Oliue.

2 The wilde Oliue is like vnto the tame or garden Oliue tree, ſauing that the leaues are ſomething ſmaller: among which ſometimes do grow many prickely thornes: the fruit hereof is leſſer than of the former, and moe in number, which do ſeldome come to maturitie or ripenes in ſomuch that the oile which is made of thoſe berries continueth euer green, and is called Oile Omphacine, or oile of vnripe Oliues.

¶ *The Place.*

Both the tame and the wilde Oliue trees grow in very many places of Italy, France, and Spaine, and alſo in the Iſlands adioyning: they are reported to loue the ſea coaſts; for moſt do thinke, as *Columella* writeth, that aboue ſixty miles from the ſea they either dy, or elſe bring forth no fruit: but the beſt, and they that do yeeld the moſt pleaſant Oyle are thoſe that grow in the Iſland called Candy.

¶ *The Time.*

All the Oliue trees floure in the moneth of Iune: the fruit is gathered in Nouember or December: when they be a little dried and begin to wrinckle they are put into the preſſe, and out of them is ſqeezed oile, with water added in the preſſing: the Oliues which are to be preſerued in ſalt and pickle muſt be gathered before they be ripe, and whileſt they are greene.

¶ *The Names.*

The tame or garden Oliue tree is called in Greeke Ἐλαία, and Ἐλαία ἥμερος: in Latine, *Olea ſatiua*, and *Vrbana*: in high-Dutch, **Oelbaum**: in low-Dutch, **Olijfboome**: in Italian, *Oliuo domeſtico*: in French, *Oliuier*: in Spaniſh, *Oliuo*, and *Oliuera*: in Engliſh, Oliue tree.

The berry is called *Oliua*: in Greeke alſo Ἐλαία: in Spaniſh, *Aczeytuna*: in French, Dutch, and Engliſh, Oliue.

Oliues preſerued in brine or pickle are called *Colymbades*.

The wilde Oliue tree is named in Greeke, Ἀγριελαία: in Latine, *Olea ſylueſtris*, *Oleaſter*, *Cotinus*, *Olea Æthiopica*: in Dutch, **Woald Oelbaum**: in Italian, *Oliuo ſaluatico*: in Spaniſh, *Azebuche*, *Azambulheyro*: in French, *Oliuier ſauuage*: in Engliſh, wilde Oliue tree.

¶ *The Temperature and Vertues.*

A The Oliues which be ſo ripe as that either they fall off themſelues, or be ready to fall, which are named in Greeke, Δρυπεπεῖς, be moderatly hot and moiſt, yet being eaten they yeeld to the body little nouriſhment.

B The vnripe oliues are dry and binding.

C Thoſe that are preſerued in pickle, called *Colymbades*, do dry vp the ouermuch moiſture of the ſtomacke, they remoue the loathing of meate, ſtirre vp an appetite; but there is no nouriſhment at all that is to be looked for in them, much leſſe good nouriſhment.

D The branches, leaues, and tender buds of the Oliue tree do coole, dry, and binde, and eſpecially of the wilde Oliue; for they be of greater force than thoſe of the tame: therefore by reaſon they be milder they are better for eye medicines, which haue need of binding things to be mixed with them.

E The ſame do ſtay S. Anthonies fire, the ſhingles, epiny ſtides, night wheales, carbuncles, and eating vlcers: being laid on with honey they take away eſchares, cleanſe foule and filthy vlcers, and quench the heate of hot ſwellings, and be good for kernels in the flanke: they heale & skin wounds in the head, and being chewed they are a remedie for vlcers in the mouth.

F The iuyce and decoction alſo are of the ſame effect: moreouer, the iuice doth ſtay all maner of bleedings, and alſo the whites.

G The iuice is preſſed forth of the ſtamped leaues, with wine added thereto (which is better) or with water, and being dried in the Sun it is made vp into little cakes like perfumes.

H The ſweat or oyle which iſſueth forth of the wood whileſt it is in burning healeth tetters, ſcurfs and ſcabs, if they be anointed therewith.

I The ſame which is preſſed forth of the vnripe Oliues is as cold as it is binding.

K The old oile which is made of ſweet and ripe Oliues, being kept long, doth withall become hotter, and is of greater force to digeſt or waſte away; and that oile which was made of the vnripe Oliue, being old, doth as yet retaine ſome part of his former aſtriction, and is of a mixt faculty, that is to ſay, partly binding, and partly digeſting; for it hath got this digeſting or conſuming faculty by age, and the other propertie of binding of his owne nature.

The

L The oile of ripe Oliues mollifieth and aſſwageth paine, diſſolueth tumors or ſwellings, is good for the ſtiffeneſſe of the ioints, and againſt cramps, eſpecially being mingled according to art, with good and wholeſome herbes appropriate vnto thoſe diſeaſes and griefes, as *Hypericon*, Cammomill, M Dill, Lillies, Roſes, and many others, which do fortifie and increaſe his vertues.

The oile of vnripe Oliues, called *Omphacinum Oleum*, doth ſtay, repreſſe, and driue away the beginning of tumors and inflammations, cooling the heate of burning vlcers and exulcerations.

Chap. 57. *Of Priuet or Prim Print.*

Liguſtrum.
Priuet, or Prim Print.

¶ *The Deſcription.*

PRiuet is a ſhrub growing like a hedge tree, the branches and twigs wherof be ſtraight, and couered with ſoft gliſtring leaues of a deepe green colour, like thoſe of Peruincle, but yet longer, greater alſo than the leaues of the Oliue tree: the floures be white, ſweet of ſmell, very little, growing in cluſters; which being vaded there ſucceed cluſters of berries, at the firſt greene, and when they be ripe blacke like a little cluſter of grapes, which yeeld a purple iuice: the root groweth euery way aſlope.

¶ *The Place.*

The common Priuet groweth naturally in enery wood, and in the hedge rowes of our London gardens: it is not found in the countrey of Polonia and other parts adiacent.

¶ *The Time.*

It floureth in the end of May, or in Iune: the berries are ripe in Autumne or about Winter, which now and then continue all the Winter long; but in the meane time the leaues fall away, and in the Spring new come vp in their places.

¶ *The Names.*

It is called in Latine, *Liguſtrum*: in Italian at this day, *Guiſtrico*, by a corrupt word drawne from *Liguſtrum*: it is the Grecians ἀκόμιτος, and in no wiſe κύπρος: for Cyprus is a ſhrub that groweth naturally in the Eaſt, and Priuet in the Weſt. They be very like one vnto another, as the deſcriptions doe declare; but yet in this they differ, as witneſſeth *Bellonius*, becauſe the leaues of Priuet do fall away in winter, and the leaues of Cyprus are alwaies greene: moreouer, the leaues of Cyprus do make the haire red, as *Dioſcorides* ſaith, and (as *Bellonius* reporteth) do giue a yellow colour: but the leaues of Priuet haue no vſe at all in dying. And therefore *Pliny*, *lib.* 24. *cap.* 10. was deceiued, in that he iudged Priuet to be the ſelfe ſame tree which Cyprus is in the Eaſt: which thing notwithſtanding he did not write as hee himſelfe thought, but as other men ſuppoſe; for, *lib.* 12. *cap.* 14. he writeth thus: Some (ſaith he) affirme this, *viz.* Cyprus, to be that tree which is called in Italy, *Liguſtrum*; and that *Liguſtrum* or Priuet is that plant which the Grecians call ἀκόμιτος, the deſcription doth declare.

Phillyria, ſaith *Dioſcorides*, is a tree like in bigneſſe to Cyprus, with leaues blacker and broader than thoſe of the Oliue tree: it hath fruit like to that of the Maſtick tree, blacke, ſomething ſweet, ſtanding in cluſters, and ſuch a tree for all the world is Priuet, as we haue before declared.

Serapio the Arabian, *cap.* 44. doth call Priuet *Mahaleb*. There is alſo another *Mahaleb*, which is a graine or ſeed of which *Auicen* maketh mention, *cap.* 478. that it doth by his warme and comfortable heate diſſolue and aſſwage paine. *Serapio* ſeemeth to intreat of them both, and to containe diuers of the *Mahaleb* vnder the title of one chapter: it is named in high-Dutch, **Beinholtzlein, Wundtholtz, Rhein oder Schulweiden**: in low-Dutch, **Keelcrupt, Monthout**: in French, *Troeſne*: in Engliſh, Priuet, Primprint, and Print.

Some

Some there be that would haue the berries to be called *Vaccinia*, and *Vaccinium* to be that of which *Vitruvius* hath made mention in his ſeuenth booke of Architecture or the art of building, chap. 14. of purple colours: after the ſame manner, ſaith he, they temper *Vaccinium*, and putting milke vnto it do make a gallant purple: in ſuch breuitie of the old writers what can be certainely determined.

¶ *The Temperature.*

The leaues and fruit of Priuet are cold, dry, and aſtringent.

¶ *The Vertues.*

The leaues of Priuet do cure the ſwellings, apoſtumations, and vlcers of the mouth or throat, being gargariſed with the iuyce or decoction thereof, and therefore they be excellent good to be put into lotions, to waſh the ſecret parts, and the ſcaldings with women, cankers and ſores in childrens mouthes. A

CHAP. 58. *Of Mocke-Priuet.*

1 *Phillyrea anguſtifolia.*
Narrow leaued Mock-Priuet.

2 *Phillyrea latiore folio.*
The broader leaued Mock-Priuet.

¶ *The Deſcription.*

1 CYprus is a kinde of Priuet, and is called *Phillyrea*, which name all the ſorts or kindes thereof do retaine, though for diſtinctions ſake they paſſe vnder ſundry titles. This plant groweth like an hedge tree, ſometimes as big as a Pomegranat tree, beſet with ſlender twiggy boughes which are garniſhed with leaues growing by couples, very like the leaues of the Oliue tree, but broader, ſofter, and of a greene colour: from the boſomes of theſe leaues come forth great bunches of ſmall white floures, of a pleaſant ſweet ſmell: which being vaded, there ſucceed cluſters of blacke berries very like the berries of the Alder tree.

2 The ſecond Cyprus, called alſo *Phillyrea latifolia*, is very like the former in body, branches, leaues,

3 *Phillyrea ſerrata 2. Cluſij.*
The ſecond toothed Priuet of *Cluſius.*

leaues, floures, and fruit; and the difference is this, that the leaues of this plant are broader, but in facultie they are like.

3 This kinde of Priuet riſeth vp like an hedge buſh, of the height of fiue or ſix cubits: the branches are long, fragile or brittle, couered with a whitiſh barke; whereon are ſet leaues ſomwhat broad, iagged on the edges like the teeth of a ſaw, and of a deep green colour: among which come forth the floures, which neither my Author nor my ſelfe haue ſeene: the berries grow vpon ſmall foot-ſtalks, for the moſt part three together, being round, and of the bigneſſe of pepper graines, or Myrtle berries, of a blacke colour when they be ripe.

¶ *The Place.*

Theſe plants do grow in Syria neere the city Aſcalon, and were found by our induſtrious *Pena* in the mountaines neere Narbone and Montpelier in France: the which I planted in the garden at Barn-Elmes neere London, belonging to the right Honourable the Earle of Eſſex: I haue them growing in my garden likewiſe.

¶ *The Time.*

The leaues ſhoot forth in the firſt of the Spring: the floures ſhew themſelues in May and Iune: the fruit is ripe in September.

¶ *The Names.*

This Priuet is called in Greeke, κύπρος, and in Latine alſo *Cyprus*; and may be named in Engliſh, Eaſterlin Priuet, and Mocke-Priuet, for the reaſon following: they are deceiued who taking *Pliny* for their Author, do thinke that it is *Liguſtrum*, or our Weſterne Priuet, as wee haue ſhewed in the former chap. it is the Arabians *Alcanna*, or *Henne*: and it is alſo called of the Turks *Henne* euen at this preſent time.

¶ *The Temperature.*

The leaues of theſe kindes of Priuet haue a binding qualitie, as *Dioſcorides* writeth.

¶ *The Vertues.*

A Being chewed in the mouth they heale the vlcers thereof, and are a remedie againſt inflammations or hot ſwellings.

B The decoction thereof is good againſt burnings and ſcaldings.

C The ſame being ſtamped and ſteeped in the iuice of Mullen and laid on, do make the haire red, as *Dioſcorides* noteth. *Bellonius* writeth, that not only the haire, but alſo the nether parts of mans body and nailes likewiſe are coloured and died herewith, which is counted an ornament among the Turks.

D The floures being moiſtned in vineger and applied to the temples aſſwageth head-ache.

E There is alſo made of theſe an oile called *Oleum Cyprinum*, ſweet of ſmell, and good to heate and ſupple the ſinewes.

Chap. 59. *Of baſtard Priuet.*

¶ *The Deſcription.*

1 THis ſhrubby tree, called *Macaleb*, or *Mahaleb*, is alſo one of the Priuets: it riſeth vp like vnto a ſmall hedge tree, not vnlike vnto the Damſon or Bulleſle tree, hauing many vpright ſtalks and ſpreading branches: whereon do grow leaues not vnlike thoſe of the *Phillyrea* of *Cluſius* deſcription: amongſt which come forth moſſie floures of a white colour, and of a perfect ſweet

ſweet ſmell, growing in cluſters, many hanging vpon one ſtem, which the Grauer hath omitted: after which come the berries, greene at the firſt, and blacke when they be ripe, with a little hard ſtone within, in which lieth a kernell.

2 *Geſner* and *Matthiolus* haue ſet forth another *Macaleb*, being alſo another baſtard Priuet. It groweth to a ſmall hedge tree, hauing many greene branches ſet with round leaues like thoſe of the Elme tree, ſomwhat ſnipt about the edges: the floures are like thoſe of the precedent: The fruit, or rather the kernell thereof, is as hard as a beade of Corall, ſomewhat round, and of a ſhining blacke colour; which the cunning French Perfumers do bore thorow, making thereof braceletes, chaines, and ſuch like trifling toyes, which they ſend into England, ſmeared ouer with ſome odde ſweet compound or other, and they are here ſold vnto our curious Ladies and Gentlewomen for rare and ſtrange Pomanders, for great ſummes of money.

1 *Phillyrea arbor, verior Macaleb.*
Baſtard Priuet.

2 *Macaleb Geſneri.*
Corall Priuet.

¶ *The Place.*

Theſe trees grow in diuers places of France, as about Tholouſe, and ſundry other places: they are ſtrangers in England.

¶ *The Time.*

The floures bud forth in the Spring: the fruit is ripe in Nouember and December.

¶ *The Names.*

This baſtard Priuet is that tree which diuers ſuſpect to be that *Mahaleb* or *Macaleb* of which *Auicen* writeth, *cap.* 478. and which alſo *Serapio* ſpeaketh of out of *Meſue*: but it is an hard thing to affirme any certaintie thereby, ſeeing that *Auicen* hath deſcribed it without markes: notwithſtanding this is taken to be the ſame of moſt writers, and thoſe of the beſt: we may call it in Engliſh, baſtard Priuet, or Corall, or Pomander Priuet, being without doubt a kinde thereof.

¶ *The Temperature and Vertues.*

Concerning this baſtard Priuet we haue learned as yet no vſe thereof in Phyſicke. The kernels which are found in the ſtones or fruit, as they be like in taſte to thoſe of Cherries, ſo be they alſo anſwerable to them in temperature; for they are of a temperat heate, and do gently prouoke vrine, and be therefore good for the ſtone: more we haue not to write than hath beene ſpoken in the deſcription. A

Chap. 60. *Of the fruitleſſe Priuet.*

¶ *The Deſcription.*

1 THis ſhrubby buſh, called of *Pliny* and *Carolus Cluſius*, *Alaternus*, groweth vp to a ſmall hedge tree, in forme like vnto a baſtard Priuet; but the leaues are more like thoſe of *Ilex*, or the French Oke, yet ſtiffer and rounder than thoſe of *Macaleb*: amongſt which come forth tufts of greeniſh yellow floures like thoſe of the Lentiske tree: vnder and among the leaues come forth the berries, like thoſe of *Laurus Tinus*, in which are contained two kernels like to the Acines or ſtones of the Grape.

1 *Alaternus Plinij.*
Fruitleſſe Priuet.

2 *Alaternus humilior.*
The lower fruitleſſe Priuet.

2 The ſecond kinde of *Alaternus* is likewiſe a fruitleſſe kinde of Priuet, hauing narrow leaues ſomewhat ſnipt about the edges: from the boſomes whereof come forth ſmall herby coloured floures; which being vaded, there ſucceedeth the fruit, whereof *Auicen* ſpeaketh, calling it by the name *Fagaras*, being a fruit in bigneſſe and forme like thoſe in ſhops called *Cocculus-indi*, and may be the ſame for any thing that hath been written to the contrarie. This fruit hangeth as it were in a darke aſh-coloured skin or huske, which incloſeth a ſlender ſtiffe ſhell like the ſhell of a nut, couered with a thin or blacke filme, whether it be the fruit of this plant it is not cenſured; notwithſtanding you ſhall finde the figure hereof among the Indian fruits, by the name *Fagaras*.

‡ This hath ſhorter branches and rounder leaues than the former: the floures are larger and greener; to which ſucceed fruit cluſtering together, firſt greene, then red, and afterwards blacke, and conſiſting of three kernells: it floures in Februarie and the beginning of March, and growes in ſundry places of Spaine. The fruit of this is not the *Fagaras*, neither doth the *Fagaras* mentioned by our Author any way agree with the *Cocculus Indi* of the ſhops, as ſhall be ſhewed hereafter in their fitplces. ‡

¶ *The Place.*

Theſe plants do grow in the ſhadowie woods of France, and are ſtrangers in England.

¶ *The*

¶ *The Time.*

The time anſwereth the reſt of the Priuets.

¶ *The Names.*

Alaternus of *Pliny* is the ſame *Phillyrea* which *Theophraſtus* hath written of by the name *Philyca*, and *Bellonius* alſo, *lib.* 1. *cap.* 42. of his Singularities, and the people of Candy call it *Elæprinon*: the Portugals, *Caſca*: in French, *Dalader*, and *Sangin blanc*: in Engliſh, barren or fruitleſſe Priuet: notwithſtanding ſome haue thought it to beare fruit, which at this day is called *Fagaras*: with vs, *Coculus-Indi*, as we haue ſaid. ‡ I can by no meanes approue of the Engliſh name here giuen by our Author; but iudge the name of Euer-greene Priuet, (giuen it by M^r. *Parkinſon*) to be much more fitting to the thing. ‡

¶ *The Temperature and Vertues.*

Whether the plant be vſed in medicine I cannot as yet learne: the fiſhermen of Portugall do A
vſe to ſeethe the barke thereof in water, with the which decoction they colour their nets of a reddiſh colour, being very fit for that purpoſe: the wood alſo is vſed by Dyers to dye a darke blacke withall.

Chap. 61. *Of the white and blew Pipe-Priuet.*

1 *Syringa alba.*
White Pipe.

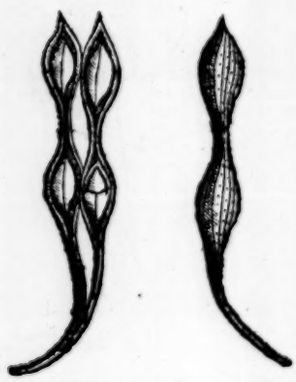
2 *Syringa cærulea.*
Blew Pipe.

¶ *The Deſcription.*

1 THe white Pipe groweth like an hedge tree, or buſhy ſhrub: from the root wherof ariſe many ſhoots, which in ſhort time grow to be equall with the old ſtocke, whereby in little time it increaſeth to infinite numbers, like the common Engliſh Prim or Priuet, whereof doubtleſſe it is a kinde, if we conſider euery circumſtance: the branches are couered with a rugged gray barke: the timber is white, with ſome pith or ſpongie matter in the middle like Elder, but leſſer in quantitie. Theſe little branches are garniſhed with ſmall crumpled leaues of the ſhape and bigneſſe of Peare tree leaues, and very like in forme: among which come forth

‡ 3 *Syringa Arabica.*
Arabian Pipe.

4 *Balanus Myrepſica, ſiue Glans vnguentaria.*
The Oylie Acorne.



the floures, growing in tufts, compact of foure ſmall leaues of a white colour, and of a pleaſant ſweet ſmell; but in my iudgement they are too ſweet, troubling and moleſting the head in very ſtrange manner. I once gathered the floures and laid them in my Chamber window, which ſmelled more ſtrongly after they had lien together a few houres, with ſuch an vnacquainted ſauor, that they awaked me out of my ſleepe, ſo that I could not take any reſt till I had caſt them out of my chamber. When the floures be vaded then followeth the fruit, which is ſmall, curled, and as it were compact of many little folds, broad towards the vpper part, and narrow towards the ſtalk, and black when it is ripe, wherin is contained a ſlender and long ſeed. The root hereof ſpreadeth it ſelfe abroad in the ground, after the manner of the roots of ſuch ſhrubbie trees.

2 The blew Pipe groweth likewiſe in maner of a ſmal hedge tree, with many ſhoots riſing from the root like the former, as our common Priuet doth, whereof it is a kinde: The branches haue ſome ſmall quantitie of pith in the middle of the wood, and are couered with a darke blacke greeniſh barke or rinde. The leaues are exceeding greene, and crumpled or turned vp like the brimmes of an hat, in ſhape very like vnto the leaues of the Poplar tree: among which come the floures, of an exceeding faire blew colour, compact of many ſmall floures in the forme of a bunch of grapes: each floure is in ſhew like thoſe of *Valeriana rubra Dodonæi*, conſiſting of foure parts like a little ſtar, of an exceeding ſweet ſauor or ſmel, but not ſo ſtrong as the former. When theſe floures be gone, there ſucceed flat cods, and ſomewhat long, which being ripe are of a light colour, with a thinne membrane or filme in the midſt, wherein are ſeeds almoſt foure ſquare, narrow and ruddy.

‡ 3 This (which *Cluſius* ſetteth forth by the name of *Iaſminum Arabicum*, or *Syringa Arabica*) groweth ſome two or three cubits high, diuided into many ſlender branches, whereon by couples at each ioint ſtand leaues like thoſe of the firſt deſcribed, but thinner, and not ſnipt about the edges: on the tops of the branches grow the floures, wholly white, conſiſting of nine, ten, or twelue leaues ſet in two rankes: theſe floures are very ſweet, hauing a ſent as it were compounded of the Spaniſh Iaſmine, and Orange floures. It is a tender plant, and may be graffed vpon the common Iaſmine, whereon it thriues well, and floures moſt part of the Sommer. It groweth plentifully in Egypt; and *Proſper Alpinus* is thought to mention this by the name of *Sambac Arabum, ſiue Gelſeminum Arabicum.* ‡

4 *Glans vnguentaria*, or the oylie Acorne, is the fruit of a tree like Tamariske, of the bigneſſe of an Haſell Nut, out of the kernell whereof, no otherwiſe than out of bitter Almonds, is preſſed an oylie iuyce which is vſed in pretious Oyntments, as *Dioſcorides* affirmeth: neither is it in our time wholly reiected; for the oyle of this fruit mixed with ſweet odours ſerueth to perfume gloues

gloues and diuers other things; and is vulgarly knowne by the name of Oyle of Ben.

¶ *The Place.*

1. 2. These trees grow not wilde in England, but I haue them growing in my garden in very great plenty.

¶ *The Time.*

They floure in Aprill and May, but as yet they haue not borne any fruit in my garden, though in Italy and Spaine their fruit is ripe in September.

¶ *The Names.*

The later Physitians call the first *Syringa*, or rather σύριγξ: that is to say, a Pipe, because the stalks and branches thereof, when the pith is taken out, are hollow like a pipe: it is also many times syrnamed *Candida*, or white, or *Syringa candido flore*, or Pipe with a white floure, because it should differ from *Lillach*, which is sometimes named *Syringa cærulea*, or blew Pipe: in English, White Pipe.

Blew Pipe the later Physitians, as we haue said, do name *Lillach*, or *Lilac*: of some, *Syringa cærulea*, or blew Pipe: most do expound the word *Lillach*, and call it *Ben*: *Serapio's* and the Arabians *Ben* is *Glans vnguentaria*, which the Grecians name βάλανος μυρεψικὴ, from which *Lillach* doth very much differ: among other differences it is very apparant, that *Lillach* bringeth forth no Nut, howsoeuer *Matthiolus* doth falsly picture it with one; for it hath only a little cod, the seed whereof hath in it no oile at all. The figure of the *Balanus Myrepsica* we haue thought good to insert in this chapter, for want of a more conuenient roome.

¶ *The Temperature and Vertues.*

Concerning the vse and faculties of these shrubs neither we our selues haue found out any thing A
nor learned ought of others.

‡ The *Balanus Myrepsica* taken in the quantitie of a dram, causeth vomit; drunk with *Hydromel* B
it purges by stoole, but is hurtfull to the stomacke.

The oile pressed out of this fruit, which is vsually termed oyle of Ben, as it hath no good or plea- C
sing smell, so hath it no ill sent, neither doth it become rancide by age, which is the reason that it is much vsed by perfumers.

The oile smoothes the skin, softens and dissolues hardnesse, and conduces to the cure of all cold D
affects of the sinewes; and it is good for the paine and noise in the eares, being mixed with Goose-grease, and so dropped in warme in a small quantitie. ‡

Chap. 62. *Of Widow-Waile, or Spurge Oliue.*

¶ *The Description.*

Widow-waile is a small shrub about two cubits high. The stalke is of a wooddy substance, branched with many small twigs, full of little leaues like Priuet, but smaller and blacker, on the ends whereof grow small pale yellow floures: which being past, there succeedeth a three cornered berrie like the Tithymales, for which cause it was called *Tricoccos*, that is, three berried *Chamelæa*: these berries are greene at the first, red afterward, and browne when they be withered, and containe in them an oylie fatnesse like that of the Oliue, being of an hot and biting taste, and that doe burne the mouth, as do both the leaues and rinde. The root is hard and wooddy.

¶ *The Place.*

It is found in most vntilled grounds of Italy and Languedoc in France, in rough and desart places. I haue it growing in my garden.

¶ *The Time.*

It is alwaies greene: the seed is ripe in Autumne.

¶ *The Names.*

The Grecians call it χαμέλαια, as though they should say, low or short Oliue tree: the Latines, *Oleago*, and *Oleastellus*, and likewise *Citocacium*: it is also named of diuers, *Oliuella*, as *Matthiolus Sylvaticus* saith: it is called in English, Widow-Waile, *quia facit viduas*.

The fruit is named of diuers, κόκκος κνίδιος: in Latine, *Coccus cnidicus*: but he is deceiued, saith *Dioscorides*, that nameth the fruit of Spurge-Oliue, *Coccus Cnidicus*: *Auicen* and *Serapio* call *Chamelæa*, or Spurge Oliue, *Mezereon*: vnder which name notwithstanding they haue also contained both the Chamæleons or Carlines; and so haue they confounded *Chamelæa* or Spurge Oliue with the Carlines, and likewise *Thymelæa*, or Spurge flax.

Chamelæa Arabum Tricoccos.
Widow-Waile.

Chamelæa Germanica, ſiue Mezereon.
Spurge Flax, or the dwarfe Bay.

¶ *The Temperature.*

Both the leaues and fruit of Spurge-Oliue, as we haue ſaid, are of a burning and extreme hot temperature. c

¶ *The Vertues.*

The leaues, ſaith *Dioſcorides*, purge both flegme and choler, eſpecially taken in pills, ſo that two parts of Wormewood be mixed with one of Spurge Oliue, and made vp into pils with Mede or honied water. They melt not in the belly, but as many as be taken are voided whole.

Meſue likewiſe hath a deſcription of pills of the leaues of *Mezereon*, that is, *Chamelæa*, or Spurge-Oliue (yet *Syluius* expoundeth it *Thymelæa*, or Spurge-Flax) but in ſtead of Wormwood he taketh the outward ſubſtance of the yellow Mirobalans and Cepula Mirobalans, and maketh them vp with Tereniabin, that is to ſay, with Manna and foure Dates, which they call Tamarinds, diſſolued in Endiue water; and appointeth the ſame leaues to be firſt tempered with very ſtrong vineger, and to be dried.

Theſe pills are commended againſt the Dropſie, for they draw forth watery humours, but are violent to nature; therfore we muſt vſe them as little as may be. Moreouer, *Dioſcorides* addeth, that the leaues of Spurge Oliue beaten with hony do cleanſe filthy or cruſted vlcers.

CHAP. 63.

Of Germane Oliue Spurge.

¶ *The Deſcription.*

THe dwarfe Bay tree, called of Dutchmen *Mezereon*, is a ſmal ſhrub two cubits high: the branches be tough, limber, & eaſie to bend, very ſoft to be cut; whereon grow long leaues like thoſe of Priuet, but thicker and fatter. The floures appeare before the leaues, oft times in Ianuarie, cluſtring together about the ſtalks at certain diſtances, of a whitiſh colour tending to purple, and of a moſt fragrant and pleaſant ſweet ſmel: after come the ſmall berries, green at the firſt, but being ripe, of a ſhining red colour, and afterward wax of a dark black colour, of a very hot and burning taſte, inflaming the mouth and throat, being taſted, with danger of choking. The root is wooddy.

¶ *The Place and Time.*

This plant grows naturally in the moiſt and ſhadowy woods of moſt of the Eaſt countries, eſpecially about Meluin in Poland, from whence I haue had great plenty thereof for my garden, where they floure in the firſt of the Spring, and ripen their fruit in Auguſt.

¶ *The Names.*

It is vſually called in high-Dutch. Zeilang, Zeidelbaſt, Lenſzkraut, and Kellerhals: the Apothecaries

Apothecaries of our countrey name it *Mezereon*, but we had rather call it *Chamelæa Germanica:* in Engliſh, Dutch Mezereon, or it may be called Germane Oliue Spurge. We haue heard, that diuers Italians do name the fruit thereof *Piper Montanum*, Mountaine Pepper. Some ſay that *Laureola* or Spurge Laurell is this plant, but there is another *Laureola*, of which we will hereafter treat: but by what name it is called of the old writers, and whether they knew it or no, it is hard to tell. It is thought to be *Cneoron album Theophraſti*, but by reaſon of his breuitie, we can affirme no certainty.

There is, ſaith he, two kindes of *Cneoron*, the white and the blacke, the white hath a leafe, long, like in forme to Spurge Oliue: the black is ful of ſubſtance like Mirtle; the low one is more white, the ſame is with ſmell, and the blacke without ſmell. The root of both which groweth deepe, is great: the branches be many, thicke, wooddie, immediatly growing out of the earth, or little aboue the earth, tough: wherefore they vſe theſe to binde with, as with Oziars. They bud and floure when the Autumne Equinoctiall is paſt, and a long time after. Thus much *Theophraſtus*.

The Germane Spurge Oliue is not much vnlike to the Oliue tree in leafe: the floure is ſweet of ſmell: the buds whereof, as we haue written, come forth after Autumne: the branches are wooddy and pliable: the root long, growing deepe: all which ſhew that it hath great likeneſſe and affinity with *Cneoron*, if it be not the very ſame.

¶ *The Temperature.*

This plant is likewiſe in all parts extreme hot: the fruit, the leaues, and the rinde are very ſharpe and biting: they bite the tongue, and ſet the throte on fire.

¶ *The Vertues.*

The leaues of Mezereon do purge downeward, flegme, choler, and wateriſh humours with great violence. A

Alſo if a drunkard do eat one graine or berry of this plant, hee cannot be allured to drinke any drinke at that time; ſuch will be the heat of his mouth and choking in the throat. B

This plant is very dangerous to be taken into the body, & in nature like to the Sea Tithymale, leauing (if it be chewed) ſuch an heat and burning in the throat, that it is hard to be quenched. C

The ſhops of Germany and of the Low-countries do when need require vſe the leaues hereof in ſtead of Spurge Oliue, which may be done without errour; for this Germane Spurge Oliue is like in vertue and operation to the other, therefore it may be vſed in ſtead therof, and prepared after the like and ſelfe-ſame manner. D

Chap. 64. *Of Spurge Flax.*

1 *Thymelæa.*

Spurge Flax, or mountaine Widow waile.

¶ *The Deſcription.*

Spurge Flax bringeth forth many ſlender branched ſprigs aboue a cubite high, couered round with long and narrow leaues like thoſe of flax, narrower & leſſer than the leaues of Spurge Oliue. The floures are white, ſmall, ſtanding on the vpper parts of the ſprigs: the fruit is round, greene at the firſt, but red when it is ripe, like almoſt to the round berries of the Hawthorne, in which is a white kernel couered with a blacke skinne, very hot and burning the mouth like Mezereon: the root is hard and wooddie.

¶ *The Place.*

It groweth in rough mountains, and in vntoiled places in hot regions. It groweth in my garden.

¶ *The Time.*

It is greene at any time of the yeare, but the fruit is perfected in Autumne.

¶ *The Names.*

The Grecians call it Θυμέλαια the Syrians, as *Dioſcorides* witneſſeth, *Apolinon:* diuers alſo *Chamelæa*, but not properly: but as *Dioſcorides* ſaith, the leafe is properly called *Cneoron*, & the fruit *Coccos Cnidios*; notwithſtanding thoſe which *Theophraſtus* calleth *Cneora* ſeem to differ from *Thymelæa*, or Spurge Flax, vnleſſe *Nigrum Cneoron* be *Thymelæa* for *Theophraſtus* ſaith

that

that there be two kindes of *Cneoron*; the one white, the other blacke: this may be called in Engliſh, Spurge Flax, or mountaine Widow Wayle: the ſeed of *Thymelæa* is called in ſhops, *Granum Gnidium*.

¶ *The Temperature.*

Spurge Flax is naturally both in leaues and fruit extreme hot, biting, and of a burning qualitie.

¶ *The Vertues.*

A The graines or berries, as *Dioſcorides* ſaith, purge by ſiege choler, flegme and water, if twenty graines of the inner part be drunke, but it burneth the mouth and throat, wherefore it is to be giuen with fine floure or Barly meale, or in Raiſons, or couered with clarified hony, that it may be ſwallowed.

B The ſame being ſtamped with Niter and vineger, ſerueth to annoint thoſe with, which can hardly ſweat.

C The leaues muſt be gathered about harueſt, and being dried in the ſhade, they are to be layed vp and reſerued.

D They that would giue them muſt beat them, and take forth the ſtrings: the quantity of two ounces and two drams put into wine tempered with water, purgeth and draweth forth watery humors: but they purge more gently if they be boiled with Lentils, and mixed with pot-herbes chopped.

E The ſame leaues beaten to pouder and made vp into trochiſces or flat cakes, with the iuice of ſower grapes are reſerued for vſe.

F The herbe is an enemy to the ſtomacke, which alſo deſtroyeth the birth if it be applied.

† Our Author formerly following *Tabernamontanus* gaue two figures and deſcriptions in this Chapter, but being both of one thing I omitted the worſer figure and deſcription.

Chap. 65. *Of Spurge Laurell.*

Laureola florens.
Laurell, or Spurge Laurell flouring.

Laureola cum fructu.
Laurell with his fruit.

¶ The

¶ *The Deſcription.*

SPurge Laurell is a ſhrub of a cubit high, oftentimes alſo of two, and ſpreadeth with many little boughes, which are tough and lithy, and couered with a thicke rinde. The leaues be long, broad, groſſe, ſmooth, blackiſh greene, ſhining, like the leaues of Laurell, but leſſer, thicker, and without ſmell, very many at the top, cluſtering together. The floures be long, hollow, of a whitiſh greene, hanging beneath and among the leaues: the berries when they be ripe are blacke, with a hard kernell within, which is a little longer than the ſeed of Hempe: the pulpe or inner ſubſtance is white: the root wooddie, tough, long, and diuerſly parted, growing deepe: the leaues, fruit and barke, as wel of the root as of the little boughes, doe with their ſharpneſſe and burning qualitie bite and ſet on fire the tongue and throat.

¶ *The Place.*

It is found on mountaines, in vntilled, rough, ſhadowie, and wooddie places, as by the lake of Lozanna or Geneua, and in many places neere the riuer of Rhene and of the Maze. ‡ It growes abundantly alſo in the woods in the moſt parts of England. ‡

¶ *The Time.*

The floures bud very ſoon, a little after the Autume Equinoctiall: they are full blown in Winter, or in the firſt Spring: the fruit is ripe in May and Iune: the plant is alwaies greene, and indureth the cold ſtormes of winter.

¶ *The Names.*

It is called in Greeke [illegible], of the likeneſſe it hath with the leaues of the Laurell or Bay tree: in Latine likewiſe *Daphnoides*: the later Latiniſts for the ſame cauſe name it *Laureola*, as though they ſhould ſay *Minor Laurus*, or little Laurell. it is called [illegible], and [illegible], notwithſtanding there is another *Chamædaphne*, and another *Peplion*. This ſhrub is commonly called in Engliſh, Spurge Laurell; of diuers, Laurell or Lowry.

Some ſay that the Italians name the berries hereof *Piper montanum*, or Mountaine Pepper, as alſo the berries of Dutch Mezereon: others affirme them to bee called in High Dutch alſo, **Zeilant.**

It may be *Theophraſtus* his *Cneoron*: for it is much like to a Mirtle in leafe, it is alſo a branched plant, tough and pliable, hauing a deep root, without ſmell, with a blacke fruit.

¶ *The Temperature.*

It is like in temperature and facultie to the Germane Spurge Oliue, throughout the whole ſubſtance biting and extreme hot.

¶ *The Vertues.*

The drie or greene leaues of Spurge Laurell, ſaith *Dioſcorides*, purgeth by ſiege flegmaticke humors; it procureth vomite and bringeth downe the menſes, and being chewed it draweth water out of the head. A

It likewiſe cauſeth neezing; moreouer, fifteene graines of the ſeed thereof drunke, are a purgation. B

Chap. 66. *Of Roſe Bay, or Oleander.*

¶ *The Deſcription.*

1 ROſe Bay is a ſmall ſhrub of a gallant ſhew like the Bay tree, bearing leaues, thicker, greater, longer and rougher than the leaues of the Almond tree: the floures be of a faire red colour, diuided into fiue leaues, not much vnlike a little Roſe: the cod or fruit is long, like *Aſclepias*, or *Vincetoxicum*, and full of ſuch white downe, among which the ſeed lieth hidden: the root is long, ſmooth, and wooddie.

2 The ſecond kinde of Roſe bay, is like the firſt, & differeth in that, that this plant hath white floures; but in other reſpects it is very like.

The

1 *Nerium, ſive Oleander.*
The Roſe Bay.

2 *Nerium flore albo.*
The Roſe Bay with white floures

¶ *The Place.*

Theſe grow in Italy and other hot regions, by riuers and the Sea ſide: I haue them growing in my garden.

¶ *The Time.*

In my garden they floure in Iuly and Auguſt: the cods be ripe afterwards.

¶ *The Names.*

This plant is named in Greeke Νήριον, by *Nicander*, Νήριος: in Latine likewiſe *Nerion*, and alſo *Rhododendron*, and *Rhododaphne*, that is to ſay, *Roſea arbor*, and *Roſea Laurus*: in ſhops, *Oleander*: in Italian, *Oleandro*: in Spaniſh, *Adelfa*, *Eloendro*, and *Alendro*: in French, *Roſagine*: in Engliſh, Roſe tree, Roſe Bay, Roſe Bay tree and Oleander.

¶ *The Temperature and Vertues.*

A This tree being outwardly applied, as *Galen* ſaith, hath a digeſting facultie: but if it be inwardly taken it is deadly and poiſonſome, not only to men, but alſo to moſt kindes of beaſts.

B The floures and leaues kill dogs, aſſes, mules, and very many of other foure footed beaſts: but if men drinke them in wine they are a remedy againſt the bitings of Serpents, and the rather if Rue be added.

C The weaker ſort of cattell, as ſheep and goats, if they drinke the water wherein the leaues haue been ſteeped, are ſure to die.

Chap. 67. *Of dwarfe Roſe Bay.*

¶ *The Deſcription.*

Dwarfe *Nerium*, or Roſe Bay, hath leaues which for the moſt part are alwaies green, rough, and ſmall, of a pale yellow colour like Box, far leſſer than Oleander: the whole plant is of a ſhrubbie ſtature, leaning this way and that way, as not able to ſtand vpright without helpe; his branches are couered and ſet full of ſmall floures, of a ſhining ſcarlet or crimſon colour; growing vpon the

1 *Chamærhododendros Alpigena.*
Dwarfe Roſe Bay.

Laurus.
The Bay tree.

the hils as ye go from Trent to Verona, which in Iune and Iuly are as it were couered with a ſcarlet coloured carpet, of an odoriferous ſauor, and delectable aſpect, which being fallen there commeth ſeed and faire berries like *Aſparagus*.

¶ *The Place.*

The place and time are expreſſed in the deſcription.

¶ *The Names.*

This may be called in Engliſh, Dwarfe Roſe Bay of the Alps. I find not any thing extant of the vertues, ſo that I am conſtrained to leaue the reſt vnto your owne diſcretion.

† The other plant our Author formerly deſcribed in this chapter in the 2. place by the name of *Chamærhododendros montana*, I haue here omitted, becauſe he ſet it forth before by the name of *Ciſtus Ledon Sileſiacum*, giuing figures and one deſcription, in the 11. and 12. places of the 8 chap. of this 3. Booke.

Chap. 68. *Of the Bay or Laurell tree.*

¶ *The Deſcription.*

1 THe Bay or Laurell tree commeth oftentimes to the height of a tree of a mean bigneſſe; it is full of boughes, couered with a greene barke: the leaues thereof are long, broad, hard, of colour greene, ſweetly ſmelling, and in taſte ſomwhat bitter: the floures alongſt the boughes and leaues are of a greene colour: the berries are more long than round, and be couered with a black rind or pill: the kernell within is clouen into two parts, like that of the Peach and Almond, and other ſuch, of a browne yellowiſh colour, ſweet of ſmell, in taſte ſomewhat bitter, with a little ſharpe or biting qualitie.

2 There is alſo a certaine other kinde hereof more like to a ſhrub, ſending forth out of the roots many offſprings, which notwithſtanding groweth not ſo high as the former, and the barkes of the boughes be ſomewhat red: the leaues be alſo tenderer, and not ſo hard: in other things not vnlike.

Theſe two Bay trees *Dioſcorides* was not ignorant of; for he ſaith, that the one is narrow leafed, and the other broader leafed, or rather harder leafed which is more like.

¶ *The Place.*

The Laurell or bay tree groweth naturally in

ly in Spaine and ſuch hot regions; we plant and ſet it in gardens, defending it from cold at the beginning of March eſpecially.

I haue not ſeene any one tree thereof growing in Denmarke, Sweuia, Poland, Liuonia, or Ruſſia, or in any of thoſe cold countries where I haue trauelled.

¶ *The Time.*

The Bay tree groweth greene winter and Sommer: it floureth in the Spring, and the black fruit is ripe in October.

¶ *The Names.*

This tree is called in Greeke δάφνη: in Latine, *Laurus*: in Italian, *Lauro*: in high Dutch, **Looerbeerbaum**: in low Dutch, **Laurus boome**: in French, *Laurier*: in Spaniſh, *Laurel*, *Lorel*, and *Loureiro*: in Engliſh, Laurell, or Bay tree.

The fruit is named in Greeke δαφνίδες: in Latine, *Lauri baccæ*: in high Dutch, **Looerbeeren**: in low Dutch, **Bakeleer**: in Spaniſh, *Vayas*: in Engliſh, Bay berries.

The Poets faine that it tooke his name of *Daphne*, *Ladoes* daughter, with whom *Apollo* fell in loue.

¶ *The Temperature and Vertues.*

A The Berries and leaues of the Bay tree, ſaith *Galen*, are hot and very drie, and yet the berries more than the leaues.

B The barke is not biting and hot, but more bitter, and it hath alſo a certaine aſtrictiue or binding qualitie.

C Bay Berries with Hony or Cute, are good in a licking medicine, ſaith *Dioſcorides*, againſt the phthicke or Conſumption of the lungs, difficulty of breathing, and all kinde of fluxes or rheumes about the cheſt.

D Bay Berries taken in wine, are good againſt the bitings and ſtingings of any venomous beaſt, and againſt all venome and poiſon: they cleanſe away the morphew: the iuice preſſed out hereof is a remedy for paine of the eares, and deafeneſſe, if it be dropped in with old wine and oile of Roſes: this is alſo mixed with ointments that are good againſt wearieſomneſſe, and that heate and diſcuſſe or waſte away humors.

E Bay berries are put into Mithridate, Treacle, and ſuch like medicines that are made to refreſh ſuch people as are growne ſluggiſh and dull by meanes of taking opiate medicines, or ſuch as haue any venomous or poiſoned quality in them.

F They are good alſo againſt cramps and drawing together of ſinewes.

G We in our time do not vſe the berries for the infirmities of the lungs, or cheſt, but miniſter them againſt the diſeaſes of the ſtomacke, liuer, ſpleene, and bladder: they warme a cold ſtomacke, cauſe concoction of raw humours, ſtirre vp a decaied appetite, take away the loathing of meat, open the ſtopping of the liuer and ſpleene, prouoke vrine, bring down the menſes, and driue forth the ſecondine.

H The oile preſſed out of theſe, or drawne forth by decoction, doth in ſhort time take away ſcabs and ſuch like filth of the skin.

I It cureth them that are beaten blacke and blew, and that be bruiſed by ſquats and falls, it remoueth blacke and blew ſpots and congealed bloud, and digeſteth and waſteth away the humors gathered about the grieued part.

K *Dioſcorides* ſaith, that the leaues are good for the diſeaſes of the mother and bladder, if a bath be made thereof to bathe and ſit in: that the greene leaues do gently binde, that being applied, they are good againſt the ſtingings of waſpes and Bees; that with Barly meale parched and bread, they aſſwage all kinde of inflammations, and that being taken in drinke they mitigate the paine of the ſtomacke, but procure vomite.

L The Berries of the Bay tree ſtamped with a little Scammonie and Saffron, and laboured in a mortar with vineger and oile of Roſes to the forme of a liniment, and applied to the temples and forepart of the head, do greatly ceaſe the paine of the Megrim.

M It is reported that common drunkards were accuſtomed to eat in the morning faſting two leaues thereof againſt drunkenneſſe.

N The later Phyſitions doe oftentimes vſe to boyle the leaues of Laurell with diuers meats, eſpecially fiſhes, and by ſo doing there happeneth no deſire of vomiting: but the meat ſeaſoned herewith becommeth more ſauory and better for the ſtomacke.

O The barke of the root of the Bay tree, as *Galen* writeth, drunken in wine prouoketh vrine, breakes the ſtone, and drieth forth grauell: it openeth the ſtoppings of the liuer, the ſpleene, and all other ſtoppings of the inward parts: which thing alſo *Dioſcorides* affirmeth, who likewiſe addeth that it killeth the childe in the mothers wombe.

It

It helpeth the dropſie and the iaundiſe, and procureth vnto women their deſired ſickneſſe. N

Our Author here alſo gaue the two figures of *Tabernæmontanus*; the firſt by the name of *Laurus mas*, or the male Bay tree, and the other by the name of *Laurus fœmina*, the female Bay: the difference in the figures was little or none, wherefore I haue made one ſerue.

Chap. 69. *Of the Wilde Bay tree.*

¶ *The Deſcription.*

1 *Laurus Tinus*, or the wilde Bay tree, groweth like a ſhrub or hedge buſh, hauing many tough and pliant branches, ſet full of leaues very like to the Bay leaues, but ſmaller and more crumpled, of a deepe and ſhining greene colour: among which come forth tufts of whitiſh floures, turning at the edges into a light purple: after which follow ſmall berries of a blew colour, containing a few graines or ſeeds like the ſtones or ſeeds of grapes: the leaues and all the parts of the plant are altogether without ſmell or ſauour.

1 *Laurus Tinus.*
The wilde Bay tree.

2 *Laurus Tinus Luſitanica.*
The Portingale wilde Bay tree.

2 *Tinus Luſitanica* groweth verie like to *Cornus Fœmina*, or the Dog-berry tree, but the branches be thicker, and more ſtiffe, couered with a reddiſh barke mixed with greene: the leaues are like the former, but larger, hauing many ſinewes or vaines running through the ſame like as in the leaues of Sage: the floures hereof grow in tufts like the precedent, but they are of colour more declining to purple: the ſmall branches are likewiſe of a purple colour: the leaues haue no ſmell at all, either good or bad: the berries are ſmaller than the former, of a blew colour declining to blackneſſe.

¶ *The Place.*

The wilde Bay groweth plentifully in euery field of Italy, Spain, and other regions, which differ according to the nature and ſcituation of thoſe countries: they grow in my garden and proſper very well.

¶ *The Time.*

The wilde Laurell is euer greene, and may oftentimes be ſeene moſt part of the winter, and the beginning of the ſpring, with the floures and ripe berries growing both at one ſeaſon.

¶ *The Names.*

It is called in Latine *Tinus*, and *Laurus ſylueſtris*: in Greeke, δάφνη ἀγρία: *Cato* nameth it *Laurus ſyluatica*: in Italian, *Lauro ſyluatico*: in Spaniſh, *Vna de Perro*, otherwiſe *Follado*; and of diuers, *Durillo*: in Engliſh wilde Bay.

¶ *The Temperature and Vertues.*

Pliny nor any other of the Antients haue touched the faculties of this wilde Bay, neither haue we any vnderſtanding thereof by the later writers, or by our owne experience.

Chap. 70. *Of the Box Tree.*

Buxus.
The Box tree.

¶ *The Deſcription.*

The great Box is a faire tree, bearing a great body or trunke: the wood or timber is yellow and very hard, and fit for ſundry workes, hauing many boughes and hard branches, beſet with ſundry ſmall hard green leaues, both winter and Sommer like the Bay tree: the floures are very little, growing among the leaues, of a greene colour: which being vaded there ſucceed ſmall blacke ſhining berries, of the bignes of the ſeeds of Corianders, which are incloſed in round greeniſh huskes, hauing three feet or legs like a braſſe or boiling pot: the root is likewiſe yellow, and harder than the timber, but of greater beauty, and more fit for dagger haftes, boxes, and ſuch like vſes, whereto the trunke or body ſerueth, than to make medicines; though fooliſh empericks and women leaches, do miniſter it againſt the Apoplexie and ſuch diſeaſes: Turners and Cutlers, if I miſtake not the matter, do call this wood Dudgeon, wherwith they make Dudgeon hafted daggers.

There is alſo a certaine other kinde hereof, growing low, and not aboue halfe a yard high, but it ſpreadeth all abroad: the branches hereof are many and very ſlender: the leaues bee round, and of a light greene.

¶ *The Place.*

Buxus, or the Box tree groweth vpon ſundry waſte and barren hils in England, and in diuers gardens.

¶ *The Time.*

The Box tree groweth greene winter and Sommer: it floureth in Februarie and March, and the ſeed is ripe in September.

¶ *The Names.*

The Grecians call it πύξος, in Latine, *Buxus*: in high Dutch, **Buchſzbaum**: in low Dutch, **Burboom**: in Italian, *Boſſo*: in Engliſh, Box tree.

The leſſer may be called χαμαίπυξος: and in Latine, *Humi Buxus*, or *Humilis Buxus*: in Engliſh, dwarf Box, or ground Box, and it is commonly called Dutch Box.

¶ *The Temperature and Vertues.*

A The leaues of the Box tree are hot, drie, and aſtringent, of an euill and lothſome ſmell, not vſed in medicine, but onely as I ſaid before in the deſcription.

CHAP.

Chap. 71. *Of the Myrtle Tree.*

¶ *The Deſcription.*

1 THe firſt and greateſt *Myrtus* is a ſmall tree, growing to the height of a man, hauing many faire and pliant branches, couered with a browne barke, and ſet full of leaues much like vnto the Laurell or Bay leafe, but thinner and ſmaller, ſomewhat reſembling the leaues of Perwincle, which being bruiſed do yeeld forth a moſt fragrant ſmell, not much inferiour vnto the ſmell of Cloues, as all the reſt of the kindes do: among theſe leaues come forth ſmall white floures, in ſhape like the floures of the Cherry tree, but much ſmaller, and of a pleaſant ſauour, which do turn into ſmall berries, greene at the firſt, and afterwards blacke.

1 *Myrtus Laurea maxima.*
The Myrtle tree.

‡ 2 *Myrtus Batica latifolia.*
Great Spaniſh Myrtle.

2 There is alſo another kind of *Myrtus* called *Myrtus Batica latifolia*, according to *Cluſius Myrtus Laurea*, that hath leaues alſo like Bay leaues, growing by couples vpon his pleaſant greene branches, in a double row on both ſides of the ſtalkes, of a light greene colour, and ſomewhat thicker than the former, in ſent and ſmell ſweet: the floures and fruit are not much differing from the firſt kinde.

3 There is likewiſe another kinde of *Myrtus* called *Exotica*, that is ſtrange and not common: it groweth vpright vnto the height of a man like vnto the laſt before mentioned, but that it is repleniſhed with greater plenty of leaues, which do fold in themſelues hollow and almoſt double, broader pointed, and keeping no order in their growing, but one thruſting within another, and as it were croſſing one another confuſedly; in all other points agreeing with the precedent.

4 There is another ſort like vnto the former in floures and branches, but the leaues are ſmooth, flat and plaine, and not crumpled or folded at all, they are alſo much ſmaller than any of the former. The fruit is in ſhape like the other, but that it is of a white colour, whereas the fruit of the other is blacke.

5 There is alſo another kinde of Myrtle, called *Myrtus minor*, or noble Myrtle, as being the

‡ 3 *Myrtus exotica.*
Strange Myrtle.

‡ 4 *Myrtus fructu albo.*
Myrtle with white berries.

‡ 5 *Myrtus minor.*
The little Myrtle.

‡ 6 *Myrtus Batica ſylueſtris.*
Wilde Spaniſh Myrtle.

chiefe of all the reſt (although moſt common and beſt knowne) and it groweth like a little ſhrub or hedge buſh, very like vnto the former, but much ſmaller: the leaues are ſmal and narrow, very much in ſhape reſembling the leaues of Maſticke Time called *Marum*, but of a freſher greene colour: the floures be white, nothing differing from the former ſauing in greatneſſe, and that ſometimes they are more double.

‡ 6 This growes not very high, neither is it ſo ſhrubby as the former: the branches are ſmall and brittle: the leaues are of a middle bigneſſe, ſharpe pointed, ſtanding by couples in two rowes, ſeldome in foure as the former, they are blackiſh alſo and wel ſmelling. the floure is like that of the reſt: the fruit is round, growing vpon long ſtalks out of the boſomes of the leaues, firſt greene, then whitiſh, laſtly blacke, of a winy and pleaſant taſte with ſome aſtriction. This growes wilde in diuers places of Portugall, where *Cluſius* found it flouring in October: he calls it *Myrtus Bætica ſylueſtris*. ‡

¶ *The Place.*

Theſe kindes of Myrtles grow naturally vpon the wooddy hills and fertill fields of Italy and Spain. ‡ The two laſt are nouriſhed in the garden of Miſtreſſe *Tuggy* in Weſtminſter, and in ſome other gardens. ‡

¶ *The Time.*

Where they ioy to grow of themſelues they floure when the Roſes do: the fruit is ripe in Autumne: in England they neuer beare any fruit.

¶ *The Names.*

It is called in Greeke μύρτος: in Latine, *Myrtus*: in the Arabicke tongue, *Alas*: in Italian, *Myrto*: in Spaniſh, *Arrayhan*: in the Portingale language, *Murta*, and *Murtella*: other Nations doe almoſt keepe the Latine name, as in Engliſh it is called Myrtle, or Myrtle tree.

Among the Myrtles that which hath the fine little leafe is ſurnamed of *Pliny*, *Tarentina*; & that which is ſo thicke and full of leaues is *Exotica*, ſtrange or forreine. *Nigra Myrtus* is that which hath the blacke berries: *Candida*, which hath the white berries, and the leaues of this alſo are of a lighter greene: *Satiua*, or the tame planted one is cheriſhed in gardens and orchards: *Sylueſtris*, or the wild Myrtle is that which groweth of it ſelfe; the berries of this are oftentimes leſſer, and of the other, greater. *Pliny* doth alſo ſet downe other kindes; as *Patritia*, *Plebeia*, and *Coniugalis*: but what manner of ones they are he doth not declare: he alſo placeth among the Myrtles, *Oxymyrſine*, or Kneeholm, which notwithſtanding is none of the Myrtles, but a thornie ſhrub.

Pliny in his 14. book, 16. chap. ſaith, that the wine which is made of the wilde Myrtle tree is called *Myrtidanum*, if the copie be true. For *Dioſcorides* and likewiſe *Sotion* in his Geoponikes report, that wine is made of Myrtle berries when they be thorow ripe, but this is called *Vinum Myrteum*, or *Myrtites*, Myrtle wine.

Moreouer, there is alſo a wine made of the berries and leaues of Myrtle ſtamped and ſteeped in Muſt, or wine new preſſed from the grape, which is called, as *Dioſcorides* ſaith, *Myrſinite vinum*, or wine of Myrtles.

The Myrtle tree was in times paſt conſecrated to *Venus*. *Pliny* in his 15. booke, 29. chapter, ſaith thus, There was an old Alter belonging to *Venus*, which they now call *Murtia*.

¶ *The Temperature and Vertues.*

The Myrtle conſiſteth of contrary ſubſtances, a cold earthineſſe bearing the preheminence; it hath alſo a certaine ſubtill heat, therefore, as *Galen* ſaith, it drieth notably. A

The leaues, fruit, buds, and iuice do binde, both outwardly applied and inwardly taken: they ſtay the ſpitting of bloud, and all other iſſues thereof: they ſtop both the whites and reds in women, if they ſit in a bath made therewith: after which manner and by fomenting alſo they ſtay the ſuperfluous courſe of the hemorrhoides. B

They are a remedy for laskes, and for the bloudy flix, they quench the fiery heat of the eies, if they be laid on with parched Barly meale. C

They be alſo with good ſucceſſe outwardly applied to all inflammations newly beginning, and alſo to new paine vpon ſome fall, ſtroke or ſtraine. D

They are wholſome for a moiſt and watery ſtomacke: the fruit and leaues dried prouoke vrine: for the greene leaues containe in them a certaine ſuperfluous and hurtfull moiſture. E

It is good with the decoction herof made with wine, to bathe lims that are out of ioint, and burſtings that are hard to be cured, and vlcers alſo of the outward parts: it helpeth ſpreading tetters, ſcoureth away the dandraſe and ſores of the head, maketh the haires blacke, and keepeth them F

from ſhedding; withſtandeth drunkenneſſe, if it be taken faſting, and preuaileth againſt poiſon, and the bitings of any venomous beaſt.

G There is drawne out of the green berries thereof a iuice, which is dried and reſerued for the foreſaid vſes.

H There is likewiſe preſſed out of the leaues a iuice, by adding vnto them either old wine or raine water, which muſt be vſed when it is new made, for being once drie it putrifieth, and as *Dioſcorides* ſaith, loſeth his vertues.

Chap. 72. *Of ſweet Willow or Gaule.*

Myrtus Brabantica, ſive Elæagnus Cordi.
Gaule, ſweet willow, or Dutch Myrtle tree.

¶ *The Deſcription.*

Gaule is a low and little ſhrub or wooddy plant hauing many brown & hard branches: whereupon doe grow leaues ſomewhat long, hard, thicke, and oileous, of an hot ſauour or ſmell ſomewhat like *Myrtus*: among the branches come forth other little ones, wherupon do grow many ſpokie eares or tufts, full of ſmall floures, and after them ſucceed great ſtore of ſquare ſeeds cluſtering together, of a ſtrong and bitter taſte. The root is hard, and of a wooddie ſubſtance.

¶ *The Place.*

This Gaule groweth plentifully in ſundry places of England, as in the Ile of Ely, & in the Fennie countries thereabouts, wherof there is ſuch ſtore in that countrey, that they make fagots of it and ſheaues, which they call Gaule ſheaues, to burne and heat their ouens. It groweth alſo by Colebrooke, and in ſundry other places.

¶ *The Time.*

The Gaule floureth in May and Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

This tree is called of diuers in Latine, *Myrtus Brabantica*, and *Pſeudomyrſine*; and *Cordus* calleth it *Elæagnus*, *Chamæleagnus*, and *Myrtus Brabantica*. *Elæagnus* is deſcribed by *Theophraſtus* to be a ſhrubbie plant like vnto the Chaſte tree, with a ſoft and downie leafe, and with the floure of the Poplar tree; and that which we haue deſcribed is no ſuch plant. It hath no name among the old writers for ought we know, vnleſſe it be *Rhus ſylueſtris Plinij*, or *Pliny* his wilde Sumach, of which hee hath written in his 24. book, 11 chap. [There is, ſaith he, a wilde herbe with ſhort ſtalkes, which is an enemy to poiſon, and a killer of mothes.] It is called in low Dutch, **Gagel**: in Engliſh, Gaule.

¶ *The Temperature.*

Gaule or the wilde Myrtle, eſpecially the ſeed, is hot and drie in the third degree: the leaues be hot and drie, but not ſo much.

¶ *The Vertues.*

A The fruit is troubleſome to the brain; being put into beere or aile whileſt it is in boiling (which many vſe to do) it maketh the ſame heady, fit to make a man quickly drunke.

B The whole ſhrub, fruit and all, being laied among clothes, keepeth them from moths and worms.

Chap. 73. *Of Worts or Wortle berries.*

¶ *The Kindes.*

Vaccinia, or Worts, of which we treat in this place, differ from Violets, neither are they eſteemed for their floures but berries: of theſe Worts there be diuers ſorts found out by the later Writers.

1 *Vaccinia nigra.*
Blacke Worts or Wortle berries.

2 *Vaccinia rubra.*
Red Worts or Wortle berries.

¶ *The Deſcription.*

1 *Vaccinia nigra*, the blacke Wortle or Hurtle, is a baſe and low ſhrub or wooddy plant, bringing forth many branches of a cubit high, ſet full of ſmall leaues of a dark greene colour, not much vnlike the leaues of Box or the Myrtle tree: amongſt which come forth little hollow floures turning into ſmall berries, greene at the firſt, afterward red, and at the laſt of a blacke colour, and full of a pleaſant and ſweet iuyce: in which doe lie diuers little thinne whitiſh ſeeds: theſe berries do colour the mouth and lips of thoſe that eate them, with a black colour: the root is wooddy, ſlender, and now and then creeping.

2 *Vaccinia rubra*, or red Wortle, is like the former in the manner of growing, but that the leaues are greater and harder, almoſt like the leaues of the Box tree, abiding greene all the Winter long: among which come forth ſmall carnation floures, long and round, growing in cluſters at the top of the branches: after which ſucceed ſmall berries, in ſhew and bigneſſe like the former, but that they are of an excellent red colour, and full of iuyce, of ſo orient and beautifull a purple to limne withall, that Indian *Lacca* is not to be compared thereunto, eſpecially when this iuyce is prepared and dreſſed with Allom according to art, as my ſelfe haue proued by experience: the taſt is rough and aſtringent: the root is of a wooddy ſubſtance.

3 *Vaccinia alba*, or the white Wortle, is like vnto the former, both in ſtalks and leaues, but the berries are of a white colour, wherein conſiſteth the difference.

‡ The figure which our Author here giues in the third place hath need of a better deſcription, for

3 *Vaccinia alba.*
The white Worts or Wortle berries.

4 *Vaccinia Pannonica, ſiue Vitis Idæa.*
Hungarie Wortle berries.

5 *Vaccinia Vrſi, ſiue Vua Vrſi apud Cluſium.*
Beare Wortle berries.

† 6 *Vitis Idæa foliis ſubrotundis maior.*
Great round leaued Wortle berries.

for the difference is not onely in the colour of the berries. This differs from the former in forme and bigneſſe, for it ſends forth many ſtalkes from the root, and theſe three, foure, or fiue cubits high, thicke, and diuided into ſundry branches, couered for the moſt part with a blackiſh barke: at the beginning of the Spring from the buds at the ſides of the branches it ſends forth leaues all horie and hairy vnderneath, and greene aboue: from the midſt of theſe, vpon little foot-ſtalkes ſtand cluſtering together many little floures, conſiſting of fiue white leaues apiece without ſmell; and then the leaues by little and little vnfold themſelues and caſt off their downineſſe, and become ſnipt about the edges. The fruit that ſucceeds the floures is round, blacke, ſomewhat like, but bigger than a Haw, full of iuyce of a very ſweet taſte; wherein lies ten or more longiſh ſmooth blackiſh ſeeds. It growes vpon the Auſtrian and Stirian Alps, where the fruit is ripe in Auguſt. *Cluſius* calls it *Vitis Idæa* 3. *Pena* and *Lobel*, *Amelancher*: *Geſner* by diuers names, as *Myrtomalus*, *Petromelis*, *Pyrus ceruinus*, *&c.* ‡

4 *Carolus Cluſius* in his Pannonicke Obſeruations hath ſet downe another of the Wortle berries, vnder the name of *Vitis Idæa*, which differeth from the other Wortle berries, not onely in ſtature, but in leaues and fruit alſo. ‡ The leaues are long, narrow, ſharpe pointed, full of veines, a little hairy, and lightly ſnipt about the edges, greener aboue than below: the fruit growes from the tops of the branches of the former yeare, hanging vpon long foot-ſtalkes, and being as big as little Cherries, firſt greene, then red, and laſtly blacke, full of iuyce, and that of no vnpleaſant taſte, containing no kernels, but flat white ſeeds commonly fiue in number: the ſtalkes are weake, and commonly lie vpon the ground: *Cluſius* found it vpon the Auſtrian mountaine Snealben, with the fruit partly ripe, and partly vnripe, in Auguſt. It is his *Vitis Idæa* 1. ‡

5 The ſame Author alſo ſetteth forth another of the Wortle berries, vnder the title of *Vua Vrſi*, which is likewiſe a ſhrubby plant, hauing many feeble branches, whereon grow long leaues blunt at the points, and of an ouerworn green colour: among which, at the tops of the ſtalks come forth cluſters of bottle-like floures of an herby colour: the fruit followeth, growing likewiſe in cluſters, green at the firſt, and blacke when they be ripe: the root is of a wooddy ſubſtance. ‡ This is alwaies greene, and the floures are of a whitiſh purple colour. ‡

6 ‡ This differs from the ſecond, in that the leaues are thinner, more full of veines, and whiter vnderneath: the floure is like the common kind, whitiſh purple, hollow, and diuided into fiue parts: the fruit alſo is blacke, and like that of the firſt deſcribed. This growes on diuers mountainous places of Germany, where *Cluſius* obſerued it, who made it his *Vitis Idæa* 2. ‡

¶ *The Place.*

Theſe plants proſper beſt in a lean barren ſoile, and in vntoiled wooddy places: they are now and then found on high hils ſubiect to the winde, and vpon mountaines: they grow plentifully in both the Germanies, Bohemia, and in diuers places of France and England; namely in Middleſex on Hampſted heath, and in the woods thereto adioyning, and alſo vpon the hills in Cheſhire called Broxen hills, neere Beeſton caſtle, ſeuen miles from the Nantwich; and in the wood by Highgate called Finchley wood, and in diuers other places.

The red Wortle berry groweth in Weſtmerland at a place called Crosby Rauenſwaith, where alſo doth grow the Wortle with the white berry, and in Lancaſhire alſo vpon Pendle hills.

‡ I haue ſeene none of theſe but only the firſt deſcribed, growing vpon Hampſted heath. The white formerly mentioned in the third deſcription, and here againe in the place, ſeems only a varietie of the ſecond hauing white berries, as far as I can gather by our Author; for it is moſt certaine, that it is not that which he figured, and I haue deſcribed in the third place. ‡

¶ *The Time.*

The Wortle berries do floure in May, and their fruit is ripe in Iune.

¶ *The Names.*

VVortle berries is called in high-Dutch, **Heydelbeeren**: in low-Dutch, **Crakebeſien**, becauſe they make a certaine cracke whileſt they be broken betweene the teeth: of diuers, **Hauerbeſien**: the French men, *Airelle*, or *Aurelle*, as *Iohannes de Choul* writeth: and we in England, VVorts, VVhortle berries, Blacke-berries, Bill-berries, and Bull-berries, and in ſome places, VVin-berries.

Moſt of the ſhops of Germany do call them *Myrtilli*, but properly *Myrtilli* are the fruit of the Myrtle tree, as the Apothecaries name them at this day. This plant hath no name for ought wee can learne, either among the Greekes or antient Latines; for whereas moſt doe take it to be *Vitis Idæa*, or the Corinth tree, which *Pliny* ſurnameth *Alexandrina*, it is vntrue; for *Vitis Idæa* is not only like to the common Vine, but is alſo a kinde of Vine: and *Theophraſtus*, who hath made mention hereof doth call it, without an Epethete, ἄμπελος ſimply, as a little after we wil declare; which without doubt he would not haue done if he had found it to differ from the common Vine: For what things ſoeuer receiue a name of ſome plant, the ſame are expreſſed with ſome Epethit added to be known to differ from others: as *Laurus Alexandrina*, *Vitis alba*, *Vitis nigra*, *Vitis ſylueſtris*, and ſuch like.

Moreouer, thoſe things which haue borrowed a name from ſome plant are like thereunto, if not wholly,

wholly, yet either in leafe or fruit, or in ſome other thing. *Vitis alba & nigra*, that is, the white and blacke Bryonies, haue leaues and claſping tendrels as hath the common Vine; and clyme alſo after the ſame manner: *Vitis ſylueſtris*, or the wilde Vine, hath ſuch like ſtalks as the Vine hath, and bringeth forth fruit like to the little Grapes. *Laurus Alexandrina*, and *Chamedaphne*, and alſo *Daphnoides*, are like in leaues to the Laurell tree: *Sycomorus* is like in fruit to the Fig tree, and in leaues to the Mulberry tree: *Chamædrys* hath the leafe of an Oke; *Peucedanus* of the Pine tree: ſo of others which haue taken their names from ſome other: but this low ſhrub is not like the Vine either in any part, or in any other thing.

This *Vitis Idæa* groweth not on the vppermoſt and ſnowie parts of mount Ida (as ſome would haue it, but about Ida, euen the hill Ida, not of Candy, but of Troas in the leſſer Aſia, which *Ptolomie* in his fifth booke of Geographie, chap. 3. doth call *Alexandri Troas*, or *Alexandri* his Troy: whereupon it is alſo aduiſedly named of *Pliny*, *lib.* 14. *cap.* 3. *Vitis Alexandrina*, no otherwiſe than *Alexandrina Laurus* is ſaid of *Theophraſtus* to grow there: *Laurus*, ſyrnamed *Alexandrina*, and *Ficus quædam*, or a certaine Fig tree, and Ἄμπελος, that is to ſay the Vine, are reported, ſaith he, to grow properly about Ida. Like vnto this Vine are thoſe which *Philoſtratus* in the life of *Apollonius* reporteth to grow in Mæonia, and Lydia, ſcituated not far from Troy, comparing them to thoſe vines which grow in India beyond Caucaſus: The Vines there, ſaith he, be very ſmall, like as be thoſe that do grow in Mæonia and Lydia, yet is the wine which is preſſed out of them of a maruellous pleaſant taſte.

This Vine which growes neere to mount Ida is reported to be like a ſhrub, with little twigs and branches of the length of a cubit, about which are grapes growing aſlope, blacke, of the bignes of a beane, ſweet, hauing within a certaine winie ſubſtance, ſoft: the leafe of this is round, vncut, and little.

This is deſcribed by *Pliny*, *lib.* 14, *cap.* 3. almoſt in the ſelfe ſame words: It is called, ſaith he, *Alexandrina vitis*, and groweth neere vnto Phalacra: it is ſhort, with branches a cubit long, with a blacke grape of the bignes of the Latines Beane, with a ſoft pulpe and very little, with very ſweet cluſters growing aſlope, and a little round leafe without cuts.

And with this deſcription the little ſhrub which the Apothecaries of Germany do call *Myrtillus* doth nothing at all agree, as it is very manifeſt; for it is low, ſcarce a cubit high, with a few ſhort branches not growing to a cubit in length: it doth not bring forth cluſters or bunches, nor yet fruit like vnto grapes, but berries like thoſe of the Yew tree, not ſweet, but ſomewhat ſoure and aſtringent; in which alſo there are many little white flat ſeeds: the leafe is not round, but more long than round, not like to that of the Vine, but of the Box tree. Moreouer, it is thought that this is not found in Italy, Greece, or in the leſſer Aſia, for that *Matthiolus* affirmeth the ſame to grow no where but in Germanie and Bohemia; ſo far is it from being called or accounted to be *Vitis Idæa* or *Alexandrina*.

The fruit of this may be thought not without cauſe to be named *Vaccinia*, ſith they are berries; for they may be termed of *Bacca*, berries, *Vaccinia*, as though they ſhould be called *Baccinia*. Yet this letteth not that there may be alſo other *Vaccinia's*: for *Vaccinia* is πολύσημον *dictio*, or a word of diuers ſignifications. *Virgil* in the firſt booke of his Bucolicks, *Eclog.* 10. affirmeth, that the written Hyacinth is named of the Latines, *Vaccinium*, tranſlating into Latine *Theocritus* his verſe which is taken out of his tenth Eidyl.

Καὶ τὸ ἴον μέλαν ἐστὶ καὶ ἄγχουσα δύναται

Virgil:

Et nigræ Violæ, ſunt & Vaccinia nigra.

Vitruvius, *lib.* 7. of his Architecture doth alſo diſtinguiſh *Vaccinium* from the Violet, and ſheweth, that of it is made a gallant purple; which ſeeing that the written Hyacinth cannot do, it muſt needs be that this *Vaccinium* is another thing than the Hyacinth is, becauſe it ſerues to giue a purple dye.

Pliny alſo, *lib.* 16. *cap.* 18. hath made mention of *Vaccinia*, which are vſed to dye bond-ſlaues garments with, and to giue them a purple colour.

But whether theſe be our *Vaccinia* or Whortle berries it is hard to affirme, eſpecially ſeeing that *Pliny* reckoneth vp *Vaccinia* amongſt thoſe plants which grow in waterie places; but ours grow on high places vpon mountaines ſubiect to windes, neither is it certainly knowne to grow in Italy. How ſoeuer it is, theſe our Whortles may be called *Vaccinia*, and do agree with *Plinies* and *Vitruvius* his *Vaccinia*, becauſe garments and linnen cloath may take from theſe a purple die.

The red Whortle berries haue their name from the blacke Whortles, to which they be in form very like, and are called in Latine, *Vaccinia rubra*: in high-Dutch, **Rooter Heidelbeere**: in low-Dutch, **Roode Crakebeſſen**: the French men, *Aurelles Rouges*: they be named in Engliſh Red,

Red Worts, or red Wortle berries. *Conradus Geſnerus* hath called this plant *Vitis Idæa rubris acinis:* but the growing of the berries doth ſhew, that this doth farre leſſe agree with *Vitis Idæa*, than the blacke; for they do not hang vpon the ſides of the branches as do the black (which deceiued them that thought it to be *Vitis Idæa*) but from the tops of the ſprigs in cluſters.

As concerning the names of the other they are touched in their ſeuerall deſcriptions.

¶ *The Temperature.*

Theſe *Vaccinia* or Wortle berries are cold euen in the later end of the ſecond degree, and dry alſo, with a manifeſt aſtriction or binding qualitie.

Red Wortle berries are cold and dry, and alſo binding.

¶ *The Vertues.*

The iuyce of the blacke Wortle berries is boyled till it become thicke, and is prepared or kept by adding hony and ſugar vnto it: the Apothecaries call it *Rob*, which is preferred in all things before the raw berries themſelues; for many times whileſt they be eaten or taken raw they are offenſiue to a weake and cold ſtomacke, and ſo far are they from binding the belly, or ſtaying the laske, as that they alſo trouble the ſame through their cold and raw qualitie, which thing the boiled iuyce called *Rob* doth not any whit at all. A

They be good for an hot ſtomacke, they quench thirſt, they mitigate and allay the heate of hot burning agues, they ſtop the belly, ſtay vomiting, cure the bloudy flix proceeding of choler, and helpe the felonie, or the purging of choler vpwards and downwards. B

The people of Cheſhire do eate the blacke wortles in creame and milke, as in theſe South parts we eate Strawberries, which ſtop and binde the belly, putting away alſo the deſire to vomit. C

The red Wortle is not of ſuch a pleaſant taſte as the blacke, and therefore not ſo much vſed to be eaten; but (as I ſaid before) they make the faireſt carnation colour in the world. D

Chap. 74.

Of the Mariſh Worts or Fenne-Berries.

Vaccinia paluſtria.
Mariſh Worts.

¶ *The Deſcription.*

THe Mariſh Wortle berries grow vpon the bogs in mariſh or mooriſh grounds, creeping thereupon like vnto wilde Time, hauing many ſmall limmer and tender ſtalkes layd almoſt flat vpon the ground, beſet with ſmal narrow leaues faſhioned almoſt like the leaues of Thyme, but leſſer: among which come forth little berries like vnto the common blacke Wortle berrie in ſhape, but ſomewhat longer, ſometimes all red, and ſometimes ſpotted or ſpecked with red ſpots of a deeper colour: in taſte rough and aſtringent.

¶ *The Place.*

The Mariſh Wortle growes vpon bogs and ſuch like wateriſh and fenny places, eſpecially in Cheſhire and Staffordſhire, where I haue found it in great plenty.

¶ *The Time.*

The Berries are ripe about the end of Iuly, and in Auguſt.

¶ *The Names.*

They are called in high-Dutch, **Moſzbeeren, Veenbeſien:** that is to ſay, Fen-Grapes, or Fen-Berries, and Mariſh-worts, or Mariſh-Berries. *Valerius Cordus* nameth them *Oxycoccon*. wee haue called them *Vaccinia paluſtria*, or Mariſh Wortle berries, of the likeneſſe they haue to the other berries: ſome alſo call them Moſſe-Berries, or Moore-berries.

¶ *The Temperature.*

Theſe Wortle berries are cold and dry, hauing withall a certain thinneſſe of parts and ſubſtance, with a certaine binding qualitie adioyned.

¶ *The*

¶ *The Vertues.*

A They take away the heate of burning agues, and alſo the drought, they quench the furious heate of choler, they ſtay vomiting, reſtore an appetite to meate which was loſt by reaſon of cholericke and corrupt humors, and are good againſt the peſtilent diſeaſes.

B The iuice of theſe alſo is boyled till it be thicke, with ſugar added that it may be kept, which is good for all things that the berries are, yea and far better.

† I haue brought this Chapter and the next following from the place they formerly held, and ſeated them here amongſt the reſt of their kindred.

Chap. 75. *Of Cloud-berry.*

Vaccinia Nubis.
Cloud-berries.

¶ *The Deſcription.*

THe Cloud-berrie hath many ſmall threddy roots, creeping farre abroad vnder the vpper cruſt of the earth, and alſo the moſſe, like vnto Couch-graſſe, of an ouerworn reddiſh colour, ſet here and there with ſmal tufts of hairy ſtrings: from which riſe vp two ſmall ſtalks, hard, tough, and of a wooddy ſubſtance (neuer more nor leſſe) on which doe ſtand the leaues like thoſe of the wilde Mallow, and of the ſame colour, full of ſmall nerues or ſinewes running in each part of the ſame: between the leaues commeth vp a ſtalke likewiſe of a wooddy ſubſtance, whereon doth grow a ſmall floure conſiſting of fiue leaues, of an herby or yellowiſh green colour like thoſe of the wilde Auens. After commeth the fruit, greene at the firſt, after yellow, and the ſides next the Sun red when they be ripe; in forme almoſt like vnto a little heart, made as it were of two, but is no more but one, open aboue, and cloſed together in the bottom, of a harſh or ſharpe taſte, wherein is contained three or foure little white ſeeds.

¶ *The Place.*

This plant groweth naturally vpon the tops of two high mountaines (among the moſſie places) one in Yorkſhire called Ingleborough, the other in Lancaſhire called Pendle, two of the higheſt mountaines in all England, where the clouds are lower than the tops of the ſame all Winter long, whereupon the people of the countrey haue called them Cloud-berries, found there by a curious gentleman in the knowledge of plants, called M^r. *Hesketh*, often remembred.

¶ *The Time.*

The leaues ſpring vp in May, at which time it floureth: the fruit is ripe in Iuly.

¶ *The Temperature.*

The fruit is cold and dry, and very aſtringent.

¶ *The Vertues.*

A The fruit quencheth thirſt, cooleth the ſtomacke, and allayeth inflammations, being eaten as Worts are, or the decoction made and drunke.

† My friend M. *Pimble* of Maribone receiued a plant hereof out of Lancaſhire: and by the ſhape of the leafe I could not iudge it to differ from the *Chamæmorus* formerly deſcribed, pag. 1273. neither doe the deſcriptions much differ in any materiall point: the figures differ more; but I iudge this a very imperfect one.

Chap. 76. *Of ſhrub Heart-Wort of Æthiopia.*

¶ *The Deſcription.*

THis kind of Seſely, being the Æthiopian Seſely, hath blackiſh ſtalks of a wooddy ſubſtance: this plant diuideth it ſelfe into ſundry other armes or branches, which are beſet with thicke fat and oileous leaues, faſhioned ſomewhat like the Wood-binde leaues, but thicker, and more

Seſeli Æthiopicum frutex.
Shrub Seſely, or Hart-woort of Ethiopia.

more gummie, approching very neere vnto the leaues of Oleander both in ſhape and ſubſtance, being of a deepe or darke green colour, and of a very good ſauour and ſmell, and continueth greene in my garden both winter and Sommer, like the Bay or Laurell. The floures do grow at the tops of the branches in yellow rundles like the floures of Dill; which being paſt, there ſucceedeth a darke or duskie ſeed reſembling the ſeed of Fennell, and of a bitter taſte. The root is thicke and of a wooddy ſubſtance.

¶ *The Place.*

It is found both in ſtony places, and on the ſea coaſts not farre from Marſilles, and likewiſe in other places of Languedocke: it alſo groweth in Ethiopia, in the darke and deſart woods: it groweth in my garden.

¶ *The Time.*

It flouriſheth, floureth and ſeedeth in Iuly and Auguſt.

¶ *The Names.*

The Grecians call it Αἰθιοπικὸν σέσελι: the Latines likewiſe *Æthiopicum Seſeli*: the Ægyptians, κύνος ὄφθαλμος: that is, Dogs horrour: in Engliſh, Seſely of Ethiopia, or Ethiopian Hart-woort.

¶ *The Temperature and Vertues.*

Seſely of Ethiopia is thought to haue the ſame faculties that the Seſely of Marſilles hath, whereunto I refer it. A

CHAP. 77. *Of the Elder tree.*

¶ *The Kindes.*

THere be diuers ſorts of Elders, ſome of the land, and ſome of the water or mariſh grounds; ſome with very jagged leaues, and others with double floures, as ſhall be declared.

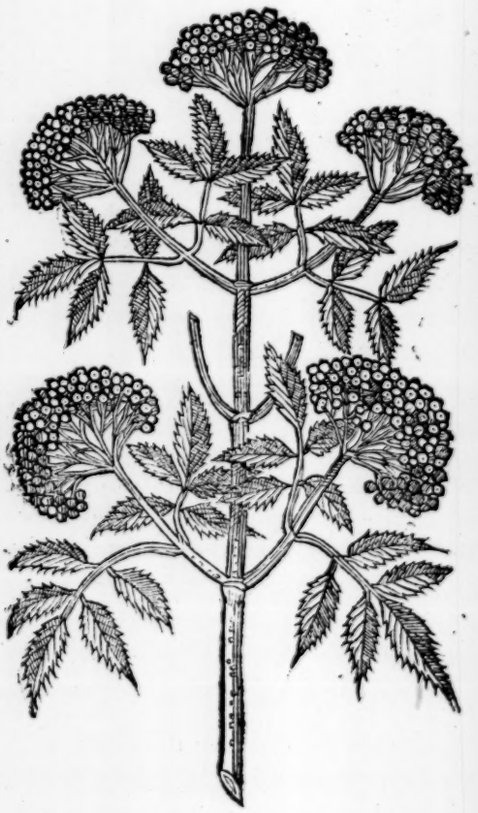
¶ *The Deſcription.*

1 THe common Elder groweth vp now and then to the bigneſſe of a meane tree, caſting his boughes all about, and oftentimes remaineth a ſhrub: the body is almoſt all wooddie, hauing very little pith within; but the boughes and eſpecially the young ones which be iointed, are full of pith within, and haue but little wood without: the barke of the body and great armes is rugged and full of chinks, and of an ill fauoured wan colour like aſhes: that of the boughes is not very ſmooth, but in colour almoſt like; and that is the outward barke, for there is another vnder it neerer to the wood, of colour greene: the ſubſtance of the wood is ſound, ſomewhat yellow, and that may be eaſily cleft: the leaues conſiſt of fiue or ſix particular ones faſtened to one rib, like thoſe of the Walnut tree, but euery particular one is leſſer, nicked in the edges, and of a ranke and ſtinking ſmell. The floures grow on ſpokie rundles, which be thin and ſcattered, of a white colour and ſweet ſmell: after them grow vp little berries, greene at the firſt, afterwards blacke, whereout is preſſed a purple juice, which being boiled with Allom and ſuch like things, doth ſerue very well for the Painters vſe, as alſo to colour vineger: the ſeeds in theſe are a little flat, and ſomewhat long. There groweth oftentimes vpon the bodies of thoſe old trees or ſhrubs a certaine excreſcence called *Auricula Iudæ*, or Iewes eare, which is ſoft, blackiſh, couered with a skin, ſomewhat like now and then to a mans eare, which being plucked off and dryed,

ſhrinketh together and becommeth hard. This Elder groweth euery where, and is the common Elder.

2 There is another alſo which is rare and ſtrange, for the berries of it are not blacke, but white: this is like in leaues to the former.

1 *Sambucus.*
The common Elder tree.



‡ 2 *Sambucus fructu albo.*
Elder with white berries.

3 The jagged Elder tree groweth like the common Elder in body, branches, ſhootes, pith, floures, fruit, and ſtinking ſmell, and differeth onely in the faſhion of the leaues, which doth ſo much diſguiſe the tree, and put it out of knowledge, that no man would take it for a kinde of Elder, vntill he hath ſmelt thereunto, which will quickely ſhew from whence he is deſcended: for theſe ſtrange Elder leaues are very much jagged, rent or cut euen vnto the middle rib. From the trunke of this tree as from others of the ſame kinde, proceedeth a certaine fleſhie excreſcence like vnto the eare of a man, eſpecially from thoſe trees that are very old.

4 This kinde of Elder hath floures which are white, but the berries redde, and both are not contained in ſpokie rundles, but in cluſters, and grow after the manner of a cluſter of grapes: in leaues and other things it reſembleth the common Elder, ſaue that now and then it groweth higher.

¶ *The Place.*

The common Elder groweth euery where: it is planted about conie-burrowes for the ſhadow of the Conies; but that with the white berries is rare: the other kindes grow in like places; but that with the cluſtered fruit groweth vpon mountaines; that with the jagged leaues groweth in my garden.

¶ *The Time.*

Theſe kindes of Elders do floure in Aprill and May, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke, ἀκτὴ: in Latine and of the Apothecaries, *Sambucus*: of *Guillielmus Salicetus*, *Beza*: in high Dutch, **Holunder, Holder**: in low Dutch, **Ulier**: in Italian, *Sambuco*: in French, *Hus* and *Suin*: in Spaniſh, *Sauco*, *Sauch*, *Sambugueyro*: in Engliſh, Elder, and Elder tree: that with the white berries diuers would haue to be called *Sambucus ſylueſtris*, or wilde Elder, but *Matthiolus* calleth it *Montana*, or mountaine Elder.

¶ *The*

3 *Sambucus laciniatis folijs.*
The iagged Elder tree.

4 *Sambucus racemoſa, vel Ceruina.*
Harts Elder, or Cluſter Elder.

¶ *The Temperature and Vertues.*

Galen attributeth the like facultie to Elder that he doth to Danewoort, and ſaith that it is of a drying qualitie, gluing, and moderatly digeſting: and it hath not only theſe faculties, but others alſo; for the barke, leaues, firſt buds, floures, and fruit of Elder, do not only dry, but alſo heate, and haue withall a purging qualitie, but not without trouble and hurt to the ſtomacke. A

The leaues and tender crops of common Elder taken in ſome broth or pottage open the belly, purging both ſlimie flegme and cholericke humors: the middle barke is of the ſame nature, but ſtronger, and purgeth the ſaid humors more violently. B

The ſeeds contained within the berries dried are good for ſuch as haue the dropſie, and ſuch as are too fat, and would faine be leaner, if they be taken in a morning to the quantity of a dram with wine for a certaine ſpace. C

The leaues of Elder boiled in water vntill they be very ſoft, and when they are almoſt boiled enough a little oile of ſweet Almonds added thereto, or a little Lineſeed oile; then taken forth and laid vpon a red cloath, or a piece of ſcarlet, and applied to the hemorrhoides or Piles as hot as can be ſuffered, and ſo let to remaine vpon the part affected, vntill it be ſomewhat cold, hauing the like in a readineſſe, applying one after another vpon the diſeaſed part, by the ſpace of an houre or more, and in the end ſome bound to the place, and the patient put warme a bed; it hath not as yet failed at the firſt dreſſing to cure the ſaid diſeaſe; but if the Patient be dreſſed twice it muſt needs doe good if the firſt faile. D

The greene leaues pounded with Deeres ſuet or Bulls tallow are good to be laid to hot ſwellings and tumors, and doth aſſwage the paine of the gout. E

The inner and greene barke doth more forcibly purge: it draweth forth choler and waterie humors; for which cauſe it is good for thoſe that haue the dropſie, being ſtamped, and the liquor preſſed out and drunke with wine or whay. F

Of like operation are alſo the freſh floures mixed with ſome kinde of meat, as fried with egges, they likewiſe trouble the belly and moue to the ſtoole: being dried they loſe as well their purging qualitie as their moiſture, and retaine the digeſting and attenuating qualitie. G

H The vinegar in which the dried floures are ſteeped are wholſome for the ſtomacke: being vſed with meate it ſtirreth vp an appetite, it cutteth and attenuateth or maketh thin groſſe and raw humors.

I The facultie of the ſeed is ſomewhat gentler than that of the other parts: it alſo moueth the belly, and draweth forth waterie humors, being beaten to pouder, and giuen to a dram weight: being new gathered, ſteeped in vineger, and afterwards dried, it is taken, and that effectually, in the like weight of the dried lees of wine, and with a few Aniſe ſeeds, for ſo it worketh without any maner of trouble, and helpeth thoſe that haue the dropſie. But it muſt be giuen for certaine daies together in a little wine, to thoſe that haue need thereof.

K The gelly of the Elder, otherwiſe called Iewes eare, hath a binding and drying qualitie: the infuſion thereof, in which it hath bin ſteeped a few houres, taketh away inflammations of the mouth, and almonds of the throat in the beginning, if the mouth and throat be waſhed therewith, and doth in like manner helpe the uvula.

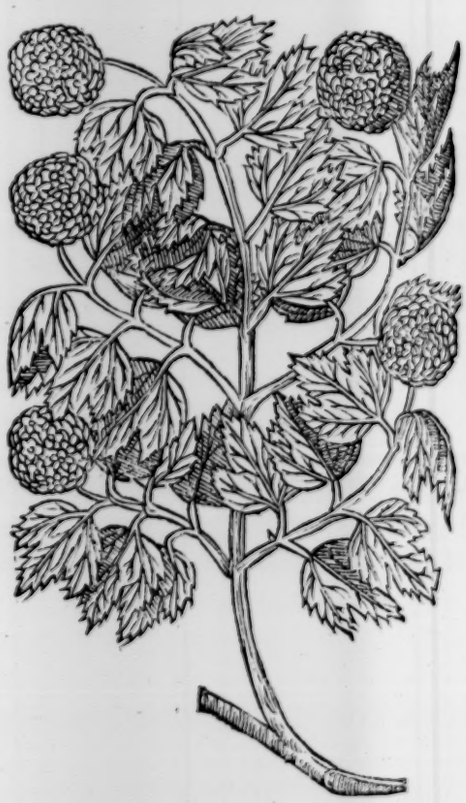
L *Dioſcorides* ſaith, that the tender and greene leaues of the Elder tree, with barley meale parched, do remoue hot ſwellings, and are good for thoſe that are burnt or ſcalded, and for ſuch as be bitten with a mad dog, and that they glew and heale vp hollow vlcers.

M The pith of the young boughes is without qualitie: This being dried, and ſomewhat preſſed or quaſhed together, is good to lay vpon the narrow orifices or holes of fiſtula's and iſſues, if it be put therein.

Chap. 78. *Of Mariſh or Water Elder.*

1 *Sambucus aquatilis, ſiue paluſtris.*
Mariſh or water Elder.

2 *Sambucus Roſea.*
The Roſe Elder.



¶ *The Deſcription.*

1 MAriſh Elder is not like to the common Elder in leaues, but in boughes: it groweth after the manner of a little tree: the boughes are couered with a barke of an ill fauoured Aſh colour, as be thoſe of the common Elder: they are ſet with ioints by certaine

certaine diſtances, and haue in them great plenty of white pith, therefore they haue leſſe wood, which is white and brittle: the leaues be broad, cornered, like almoſt to Vine leaues, but leſſer and ſofter: among which come forth ſpoked rundles which bring forth little floures, the vttermoſt whereof alongſt the borders be greater, of a gallant white colour, euery little one conſiſting of fiue leaues: the other in the midſt and within the borders be ſmaller, and it floures by degrees, and the whole tuft is of a moſt ſweet ſmell: after which come the fruit or berries, that are round like thoſe of the common Elder, but greater, and of a ſhining red colour, and blacke when they be withered.

2 *Sambucus Roſea*, or the Elder Roſe groweth like an hedge tree, hauing many knotty branches or ſhoots comming from the root, full of pith like the common Elder: the leaues are like the vine leaues; among which come forth goodly floures of a white colour, ſprinkled and daſhed here and there with a light and thin Carnation colour, and do grow thicke and cloſely compact together, in quantitie and bulke of a mans hand, or rather bigger, of great beauty, and ſauoring like the floures of the Haw-thorne: but in my garden there groweth not any fruit vpon this tree, nor in any other place, for ought that I can vnderſtand.

3 This kinde is likewiſe an hedge tree, very like vnto the former in ſtalks and branches, which are iointed and knotted by diſtances, and it is full of white pith: the leaues be likewiſe cornered: the floures hereof grow not out of ſpoky rundles, but ſtand in a round thicke and globed tuft, in bigneſſe alſo and faſhion like to the former, ſauing that they tend to a deeper purple colour, wherin only the difference conſiſts.

¶ *The Place.*

Sambucus paluſtris, the water Elder, growes by running ſtreames and water courſes, and in hedges by moiſt ditch ſides.

The Roſe Elder groweth in Gardens, and the floures are there doubled by Art, as it is ſuppoſed.

¶ *The Time.*

Theſe kindes of Elders do floure in Aprill and May, and the fruit of the water Elder is ripe in September.

¶ *The Names.*

The water Elder is called in Latine, *Sambucus aquatica*, and *Sambucus paluſtris*: it is called *Opulus*, and *Platanus*, and alſo *Chamaplatanus*, or the dwarfe Plane tree, but not properly: *Valerius Cordus* maketh it to be *Lycoſtaphylos*: the Saxons, ſaith *Geſner*, do call it *Vua Lupina*; from whence *Cordus* inuented the name Λυκοσταφυλος; it is named in high-Dutch, **Walt holder**, and **Hirſch holder**: in low Dutch, **Swelcken**, and **Swelckenhout**: of certaine French men, *Obiere*: in Engliſh, Mariſh Elder, and Whitten tree, Ople tree, and dwarfe Plane tree.

The Roſe Elder is called in Latine, *Sambucus Roſea*, and *Sambucus aquatica*, being doubtles a kind of the former water Elder, the floures being doubled by art, as we haue ſaid: it is called in Dutch, **Gheldersche Roose**: in Engliſh, Gelders Roſe, and Roſe Elder.

¶ *The Temperature and Vertues.*

Concerning the faculties of theſe Elders, and the berries of the Water Elder, there is nothing found in any writer, neither can we ſet downe any thing hereof of our owne knowledge.

Chap. 79.

Of Dane-Wort, Wall-Wort, or Dwarfe Elder.

¶ *The Deſcription.*

Dane-wort, as it is not a ſhrub, neither is it altogether an herby plant, but as it were a Plant participating of both, being doubtles one of the Elders, as may appeare both by the leaues, floures, and fruit, as alſo by the ſmell and taſte.

Wall-wort is very like vnto Elder in leaues, ſpoky tufts, and fruit, but it hath not a wooddie ſtalke; it bringeth forth only greene ſtalks, which wither away in Winter: theſe are edged, and full of ioynts, like to the yong branches and ſhoots of Elder: the leaues grow by couples, with diſtances, wide, and conſiſt of many ſmall leaues which ſtand vpon a thicke ribbed ſtalke, of which euery one is long, broad, and cut in the edges like a ſaw, wider and greater than the leaues of the common Elder tree: at the top of the ſtalkes there grow tufts of white floures tipt with red, with fiue little chiues in them pointed with blacke, which turne into blacke berries like the Elder, in the which be little long ſeed: the root is tough, and of a good and reaſonable length, better for Phyſicks vſe than the leaues of Elder.

Ebulus, ſiue Sambucus humilis.
Dane-wort, or dwarfe Elder.

A

¶ *The Place.*

Dane-wort growes in vntoiled places neere common waies, and in the borders of fields: it groweth plentifully in the lane at Kilburne Abbey by London: alſo in a field by S. Ioans neere Dartford in Kent: and alſo in the high-way at old Branford townes end next London, and in many other places.

¶ *The Time.*

The floures are perfected in Sommer, and the berries in Autumne.

¶ *The Names.*

It is named in Greeke, χαμαίακτη, that is, *humilis Sambucus*, or low Elder: it is called in Latine, *Ebulus*, and *Ebulum*: in high-Dutch, **Attich**: in low-Dutch, **Hadtich**: in Italian, *Ebulo*: in French, *Hieble*: in Spaniſh, *Yezgos*: in Engliſh, Wall-wort, Dane-wort, and dwarfe Elder.

¶ *The Temperature.*

Wall-wort is of temperature hot and drie in the third degree, and of a ſingular qualitie, which *Galen* doth attribute vnto it, to waſt and conſume; and alſo it hath a ſtrange and ſpeciall facultie to purge by the ſtoole: the roots be of greateſt force, the leaues haue the chiefeſt ſtrength to digeſt and conſume.

¶ *The Vertues.*

The roots of Wall-wort boiled in wine and drunken are good againſt the dropſie, for they purge downwards watery humors.

B The leaues do conſume and waſte away hard ſwellings if they be applied pultiſ-wiſe, or in a fomentation or bath.

C *Dioſcorides* ſaith, that the roots of Wall-wort doe ſoften and open the matrix, and alſo correct the infirmities thereof, if they be boiled for a bath to ſit in; and diſſolue the ſwellings and paines of the belly.

D The iuice of the root of Dane-wort doth make the haire blacke.

E The yong and tender leafe quencheth hot inflammations, being applied with Barly meale: it is with good ſucceſſe laid vpon burnings, ſcaldings, and vpon the bitings of mad dogs; and with Bulls tallow or Goats ſuet it is a remedie for the gout.

F The ſeed of Wall-wort drunke in the quantitie of a dram is the moſt excellent purger of waterie humors in the world, and therefore moſt ſingular againſt the dropſie.

G If one ſcruple of the ſeed be bruiſed and taken with ſyrrup of Roſes and a little Secke, it cureth the dropſie, and eaſeth the gout, mightily purging downwards wateriſh humors, being once taken in the weeke.

Chap. 80. *Of Beane Trefoile.*

¶ *The Deſcription.*

1 THe firſt kinde of *Anagyris* or *Laburnum* groweth like vnto a ſmall tree, garniſhed with many ſmall branches like the ſhoots of Oziars, ſet full of pale greene leaues, alwaies three together, like the *Lotus* or medow Trefoile, or rather like the leaues of *Vitex*, or the *Cytiſus* buſh: among which come forth many tufts of floures of a yellow colour, not much vnlike the floures of Broome: when theſe floures be gone there ſucceed ſmall flat cods, wherein are contained ſeeds like Galega or the Cytiſus buſh: the whole plant hath little or no ſauour at all: the root is ſoft and gentle, yet of a wooddy ſubſtance.

2 Stinking

2 Stinking Trefoile is a ſhrub like to a little tree, riſing vp to the height of ſix or eight cubits, or ſometimes higher: it ſendeth forth of the ſtalks very many ſlender branches; the barke whereof is of a deep greene colour: the leaues ſtand alwaies three together, like thoſe of *Lotus* or medow Trefoile, yet of a lighter greene on the vpper ſide: the floures be long, as yellow as gold, very like to thoſe of Broome, two or three alſo ioined together: after them come vp broad cods, wherein do lie hard fruit like Kidney Beanes, but leſſer; at the firſt white, afterwards tending to a purple, and laſt of all of a blackiſh blew: the leaues and floures hereof haue a filthy ſmell, like thoſe of the ſtinking Gladdon, and ſo ranke withall, as euen the paſſers by are annoied therewith.

1 *Anagyris.*
Beane Trefoile.

2 *Anagyris fœtida.*
Stinking Beane Trefoile.

‡ Of *Anagyris* there are foure kindes, two with ſtinking leaues; the one with longiſh leaues, the other with rounder.

Two other whoſe leaues do not ſtinke; the one of theſe hath ſometimes foure or fiue leaues on one ſtalke, and the leaues are long and large. The other hath them leſſer and narrower. ‡

¶ *The Place.*

Theſe grow of themſelues in moſt places of Languedocke and Spaine, and in other countries alſo by high waies ſides, as in the Iſle of Candy, as *Bellonius* writeth: the firſt I haue in my garden; the other is a ſtranger in England. ‡ Maſter *Tradeſcant* hath two ſorts hereof in his garden. ‡

¶ *The Time.*

They floure in Iune, and the ſeed is ripe in September.

¶ *The Names.*

The Beane Trefoile is called in Greeke ἀναγύρις, which name remaineth vncorrupt in Candy euen to this day: in Latine alſo *Anagyris*, and *Laburnum*: of the people of Anagni in Italy named *Eghelo*, which is referred vnto *Laburnum*, of which *Pliny* writeth in his 16. booke, 18. chapter. In Engliſh, Beane Trefoile, or the Peaſcod tree.

¶ *The Temperature.*

Beane Trefoile, as *Galen* writeth, hath a hot and digeſting faculty.

¶ *The*

¶ *The Vertues.*

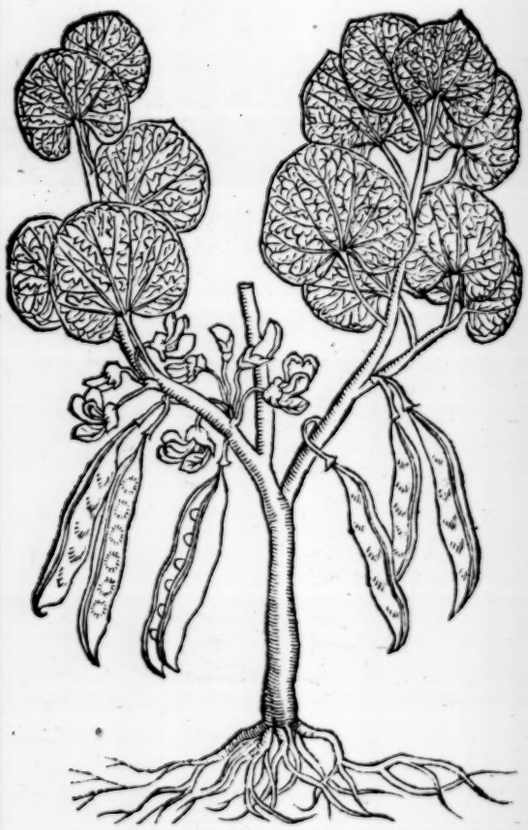
A The tender leaues, ſaith *Dioſcorides*, being ſtamped and layed vpon cold ſwellings, do waſte away the ſame.

B They are drunke with Cute in the weight of a dram againſt the ſtuffing of the lungs, and doe bring downe the menſes, the birth, and the afterbirth.

C They cure the head-ache being drunke with wine; the iuice of the root digeſteth and ripeneth, if the ſeed be eaten it procureth vomite, which thing, as *Matthiolus* writeth, the ſeed not onely of ſtinking Beane Treſoile doth effect, but that alſo of the other likewiſe.

Chap. 81. *Of Iudas Tree.*

Arbor Iudæ.
Iudas Tree.



¶ *The Deſcription.*

IVdas tree is likewiſe one of the hedge plants: it groweth vp vnto a tree of a reaſonable bigneſſe, couered with a dark coloured barke, whereon doe grow many twiggie tough branches of a brown colour, garniſhed with round leaues, like thoſe of round Birthwoort, or Sowbread, but harder, and of a deeper greene colour: among which come forth ſmall floures like thoſe of Peaſon, of a purple colour, mixed with red, which turn into long flat cods, preſſed hard together, of a tawny or wan colour, wherein is contained ſmall flat ſeeds, like the Lentill, or rather like the ſeed of Medica, faſhioned like a little kidney: the root is great and wooddie.

¶ *The Place.*

This ſhrub is found in diuers prouinces of Spaine, in hedges, and among briers & brambles: the mountaines of Italy, and the fields of Languedocke are not without this ſhrub: it groweth in my garden.

¶ *The Time.*

The floures come forth in the Spring, and before the leaues: the fruit or cods be ripe in Sommer.

¶ *The Names.*

It is commonly named in Latine *Arbor Iudæ*: ſome haue called it *Sycomorus*, or Sycomore tree, and that becauſe the floures and cods hang downe from the bigger branches: but the right Sycomore tree is like the Fig-tree in fruit, & in leaues to the Mulberrie tree, wherupon it is ſo named. Others take it to be συρις: of which *Theophraſtus* writeth thus, *Cercis* bringeth forth fruit in a cod; which words are all ſo few, as that of this no certaintie can be gathered, for there be more ſhrubs that bring forth fruit in cods. The French men call it *Guainier*, as though they ſhould ſay, *Vaginula*: or a little ſheath: moſt of the Spaniards do name it *Algorouo loco*, that is, *Siliqua ſyluęſtris* or *fatua*, wilde or fooliſh cod: others, *Arbol d' amor*, for the braueneſſe ſake: it may be called in Engliſh, *Iudas* tree, for that it is thought to be that whereon *Iudas* did hang himſelfe, and not vpon the Elder tree, as it is vulgarly ſaid.

¶ *The Temperature and Vertues.*

The temperature and vertues of this ſhrub are vnknowne, and not found out: for whereas *Matthiolus* maketh this to be *Acacia*, by adding falſely thornes vnto it, it is but a ſurmiſe.

Chap.

Chap. 82. *Of the Carob tree, or Saint Iohns Bread.*

¶ *The Deſcription.*

THe Carob tree is alſo one of thoſe that beare cods; it is a tree of a middle bigneſſe, very full of boughes: the leaues long, and conſiſt of many ſet together vpon one middle rib, like thoſe of the Aſh, but euery particular one of them is broader, harder and rounder: the fruit or long cods in ſome places are a foot in length, in other places ſhorter by halfe, an inch broad, ſmooth, & thick; in which do lie flat and broad ſeeds: the cods themſelues are of a ſweet taſte, and are eaten of diuers, but not before they be gathered and dried; for being as yet green, though ripe, they are vnpleaſant to be eaten by reaſon of their ill fauoured taſte.

Ceratia ſiliqua, ſiue Ceratonia.
The Carob tree.

¶ *The Place.*

This groweth in Apulia, a Prouince of the kingdome of Naples, and alſo in diuers vntoiled places in Spaine: it is likewiſe found in India and other countries Eaſtward, where the cods are ſo full of ſweet iuice as that it is vſed to preſerue Ginger and other fruites, as *Matthiolus* ſheweth. *Strabo lib.* 15. ſaith, that *Ariſtobulus* reporteth how there is a tree in India of no great bignes, which hath great cods, ten inches long, full of hony; *Quas qui ederent non facile ſeruari*; which thing peraduenture is onely to be vnderſtood of the greene cods, & thoſe that are not yet dry: it is very wel known in the coaſts of Nicea and Liguria in Italy, as alſo in all the tracts and coaſts of the Weſt Indies, and Virginia. It groweth alſo in ſundry places of Paleſtine, where there is ſuch plenty of it, that it is left vnto ſwine and other wilde beaſts to feed vpon, as our Acornes and Beech maſt. Moreouer, both young and old feed thereon for pleaſure, and ſome haue eaten thereof to ſupply and help the neceſſary nouriſhment of their bodies. This of ſome is called Saint *Iohns* bread, and thought to be that which is tranſlated Locuſts, whereon S. *Iohn* did feed when he was in the wilderneſſe, beſides the wilde hony whereof he did alſo eat; but there is ſmall certainty of this: but moſt certaine that the people of that countrey doe feed vpon theſe cods, in Greeke called κερατια, in Latine, *Siliquæ*: but Saint *Iohns* food is called in Greeke ἀκρίδες: which word is often vſed in the Reuelation written by Saint *Iohn*, and tranſlated Locuſts. Now wee muſt alſo remember that this Greeke word hath two ſeuerall interpretations or ſignifications, for taken in the good part, it ſignifieth a kinde of creeping creature, or flie, which hoppeth or skippeth vp and down, as doth the graſſhopper; of which kinde of creatures it was lawfull to eat, *Leuit.* 11. 22. and *Mat.* 3. 4. It ſignifieth alſo thoſe Locuſts which came out of the ſmoke of the bottomles pit, mentioned *Apoc.* 9. *v.* 3. 4. &c. which were like vnto horſes prepared for battell. The Hebrew word which the Engliſh tranſlators haue turned Graſſhoppers, *Tremelius* daresnot giue the name *Locuſt* vnto it, but calleth it by the Hebrew name *Arbis*, after the letters and Hebrew name, ſaying thus in the note vpon the 22. verſe of the 11. chapter of *Leuit.* Theſe kindes of creeping things neither the Hebrews nor the Hiſtoriographers, nor our ſelues do know what they meane: wherefore we ſtill retaine the Hebrew words, for all the foure kindes thereof: but it is certaine that the Eaſt countrey Graſſhoppers and Locuſts were ſometimes vſed in meat, as *Math.* 3. 4. and *Marc.* 1. 6. *Plin lib.* 11. *Natur. Hiſtor. cap* 26. and 29.

Thus

Thus far *Tremelius* and *Iunius*. By that which hath been ſaid it appeareth what S. *Iohn* the Baptiſt fed of, vnder the title Locuſts: and that it is nothing like vnto this fruit *Ceratia ſiliqua*: I rather take the husks or ſhells of the fruit of this tree to be the cods or husks whereof the prodigall childe would haue fed, but none gaue them vnto him, though the ſwine had their fill thereof. Theſe cods being drie are very like beane cods, as I haue often ſeen. I haue ſowne the ſeeds in my garden, where they haue proſpered exceeding well.

‡ There is no doubt but the Κεράτια or *Siliquæ* mentioned in Saint *Lukes* Goſpel, Chap. 15. *v.* 16. were the cods or fruit of this tree. I cannot beleeue that either the fruit of this or the Locuſts, were the Ἀκρίδες mentioned in the third chapter of Saint *Mat.* *v.* 4. But I am of the opinion of the Greeke Father *Iſodore Peluſiota*, who, *lib.* 1. *Epiſt.* 132. hath theſe words, Ἀκρίδες, ἃς Ἰωάννης ἐβόρατο, οὐ ζῶά τινα ἔμψυχα ἦν, καθάπερ τινὲς ὑπέλαβον, μὴ γένοιτο, ἀλλ' ἀκρέμονες βοτανῶν ἁπαλοὶ φυτῶν· ἔστι γὰρ πέφυκε τις ἐξ ἀρχῆς μέλι ἄγριον, ἀλλὰ μέλι ὄρειον τοῦτο· μελίσσαι γὰρ ἐν ὄρεσι γεννῶνται, &c. That is: The *Acrides* which *Iohn* fed vpon are not liuing creatures like to Beetles, as ſome vnlearnedly ſuppoſe, farre be it from vs ſo to thinke; but they are the tender buds of herbes and plants or trees; neither on the other ſide is the *Meli agrion* any herbe ſo called, but mountaine hony gathered by wilde Bees, &c. ‡

¶ *The Time.*

The Carob tree bringeth forth fruit in the beginning of the Spring, which is not ripe till Autumne.

¶ *The Names.*

The Carob tree is called κερατέα: in Latine likewiſe, *Ceratonia*: in Spaniſh, *Garouo*: in Engliſh, Carob tree; and of ſome, Beane tree, and Saint *Iohns* Bread: the fruit or cod is named κέρατον: in Latine *Siliqua*, or *Siliqua dulcis*: in diuers ſhops, *Xylocaracta*: in other ſhops in Italy, *Carobe*, or *Carobole*: of the Apothecaries of Apulia, *Salequa*: it is called in Spaniſh, *Alfarobas*, or *Algarouas*: and without an article *Garouas*: in high Dutch, **S. Johans brot**: that is to ſay, *Sancti Iohan. panis*, or S. *Iohns* Bread, neither is it knowne by any other name in the Low-countries: Some call it in Engliſh, Carob.

¶ *The Temperature.*

The Carob tree is drie and aſtringent, as is alſo the fruit, and containeth in it a certaine ſweetnes as *Galen* ſaith.

¶ *The Vertues.*

A The fruit of the Carob Tree, beeing eat when it is greene, doth gently looſe the belly; but beeing dry it is hard of digeſtion, and ſtoppeth the belly, it prouoketh vrine, it is good for the ſtomacke, and nouriſheth well, and much better than when it is greene and freſh.

Chap. 83. *Of* Caſsia Fiſtula, *or Pudding Pipe.*

¶ *The Deſcription.*

Caſſia purgatrix, or *Caſſia fiſtula*, groweth vp to be a faire tree, with a tough barke like leather, of the colour of Box, whereupon ſome haue ſuppoſed it to take the Greeke name κέρατα, in Latine, *Coriaceus*: the armes and branches of this are ſmall and limber, beſet with many goodly leaues, like thoſe of the Wall-nut tree: among which come forth ſmall floures of a yellow colour, compact or conſiſting of ſix little leaues, like the floures of *Chelidonium minus*, or Pile-woort: after theſe be vaded, there ſucceed goodly blacke round, long cods, whereof ſome are two foot long, and of a wooddy ſubſtance: in theſe coddes are contained a blacke pulpe, very ſweet and ſoft, of a pleaſant taſte, and ſeruing to many vſes in Phyſicke, in which pulpe lieth the ſeed couched in little cels or partitions: this ſeed is flat and browniſh, not vnlike the ſeed of *Ceratia Siliqua*, and in other reſpects very like vnto it alſo.

¶ *The Place.*

This tree groweth much in Egypt, eſpecially about Memphis and Alexandria, and moſt parts of Barbarie, and is a ſtranger in theſe parts of Europe.

¶ *The Time.*

The Caſſia tree groweth green winter and ſommer: it ſheddeth his old leaues when new are come, by meanes whereof it is neuer void of leaues: it floureth early in the ſpring, and the fruit is ripe in Autumne.

¶ *The*

Caſſia fiſtula.
Pudding Pipe tree.

¶ *The Names.*

This tree was vnknowne to the old writers, or ſo little accounted of, as that they haue made no mention of it at all: the Arabians were the firſt that eſteemed of it, by reaſon they knew the vſe of the pulpe which is found in the Pipes: and after them the later Grecians, as *Actuarius* & other of his time, by whom it was named κασία μελαινα that is to ſay in Latine, *Caſia nigra*. The fruit thereof, ſaith *Actuarius* in his fift booke, is like a long pipe, hauing within it a thicke humour or moiſture, which is not congealed all alike thorow the pipe, but is ſeparated and diuided with many partitions, being thin wooddy skins. The Apothecaries call it *Caſia fiſtula*, and with a double ſſ *Caſſia fiſtula*: it is called in Engliſh after the Apothecaries word, Caſſia fiſtula, and may alſo be Engliſhed, Pudding Pipe, becauſe the cod or Pipe is like a pudding: but the old Caſſia fiſtula, or κασσία in Greeke, is that ſweet and odoriferous barke that is rolled together, after the manner of a long and round pipe, now named of the Apothecaries *Caſſia lignea*, which is a kinde of Cinamon.

¶ *The Temperature.*

The pulpe of this pipe which is chiefely in requeſt, is moiſt in the later end of the firſt degree, and little more than temperatly hot.

The Vertues.

The pulpe of *Caſia fiſtula* extracted with violet water, is a moſt ſweet and pleaſant medicine, and may be giuen without danger to all weak people of what age and ſex ſoeuer they be, yea it may be miniſtred to women with childe, for it gently purgeth cholericke humours and ſlimie flegme, if it be taken in the weight of an ounce. A

Caſia is good for ſuch as be vexed with hot agues, pleuriſies, iaundice, or any other inflammation of the liuer, being taken as afore is ſhewed. B

Caſſia is good for the reines and kidneies, driueth forth grauell and the ſtone, eſpecially if it bee mingled with the decoction of Parſley, and Fennell roots, and drunke. C

It purgeth and purifieth the bloud, making it more cleane than before, breaking therewith the actimonie and ſharpneſſe of the mixture of bloud and choler together. D

It diſſolueth all phlegmons and inflammations of the breſt, lungs, and the rough artery called *Trachea arteria*, eaſing thoſe parts exceeding well. E

Caſſia abateth the vehemencie of thirſt in agues, or any hot diſeaſe whatſoeuer, eſpecially if it be taken with the iuice of *Intybum*, *Cichoreum*, or *Solanum*, depured according to Art: it abateth alſo the intemperate heat of the reines, if it be receiued with diureticke ſimples, or with the decoction of Licorice onely, and will not ſuffer the ſtone to grow in ſuch perſons as do receiue and vſe this medicine. F

The beſt *Caſſia* for your vſe is to be taken out of the moſt ful, moſt heauy, & faireſt cods, or canes, and thoſe which do ſhine without, and are full of ſoft pulpe within; that pulpe which is newly taken forth is better than that which is kept in boxes, by what Art ſoeuer. G

Caſia being outwardly applied, taketh away the roughneſſe of the skin, and being laid vpon hot ſwellings, it bringeth them to ſuppuration. H

Many ſingular compounded medicines are made with this *Caſſia*, which here to recite belongs not to my purpoſe or hiſtory. I

Chap. 84. *Of the Lentiske, or Maſticke tree.*

¶ *The Deſcription.*

Lentiſcus.
The Maſticke tree.

¶ *The Deſcription.*

THe Maſtick tree groweth commonly like a ſhrub without any great body, riſing vp with many ſprings and ſhoots like the Haſell; and oftentimes it is of the height and bigneſſe of a meane tree: the boughes thereof are tough, and flexible; the barke is of a yellowiſh red colour, pliable likewiſe, and hard to be broken: there ſtand vpon one rib for the moſt part 8 leaues, ſet vpon a middle rib, much like to the leaues of Licorice, but harder, of a deepe greene colour, and oftentimes ſomewhat red in the brims, as alſo hauing diuers vains running along of a red colour, and ſomthing ſtrong of ſmel: the floures be moſſie, and grow in cluſters vpon long ſtems: after them come vp the berries, of the bigneſſe of Vetches, greene at the firſt, afterwards of a purple colour, and laſt of all, black, fat, and oily, with a hard black ſtone within; the kernel whereof is white, of which alſo is made oile, as *Dioſcorides* witneſſeth: it bringeth forth likewiſe cods beſides the fruit (which may be rather termed an excreſcence, than a cod) writhed like a horn; in which lieth at the firſt a liquour, and afterwards when this waxeth ſtale, little liuing things like vnto gnats, as in the Turpentine hornes, and in the folded leaues of the Elm tree. There commeth forth of the Maſtick tree a Roſin, but dry, called Maſticke.

¶ *The Place.*

The Maſticke tree groweth in many regions, as in Syria, Candy, Italy, Languedocke, and in moſt Prouinces of Spaine: but the chiefeſt is in Chios an Iſland in Greece, in which it is diligently and ſpecially looked vnto, and that for the Maſticke ſake, which is there gathered from the husbanded Maſticke trees by the inhabitants euery yeare moſt carefully, and is ſent from thence into all parts of the world.

¶ *The Time.*

The floures be in their pride in the ſpring time, and the berries in Autumne: the Maſtick muſt be gathered about the time when the Grapes be.

¶ *The Names.*

This tree is named in Greeke σχῖνος: in Latine, *Lentiſcus*: in Italian, *Lentiſque*: in Spaniſh, *Mata*, and *Arcoyra*: in Engliſh, Maſticke tree; and of ſome, Lentiske tree.

The Roſin is called in Greeke ἡ σχῖνου σάκχαρ, and μαστίχη: in Latine, *Lentiſcina Reſina*, and likewiſe *Maſtiche*: in ſhops, *Maſtix*: in Italian, *Maſtice*: in high and low Dutch and French alſo, *Maſtic*: in Spaniſh, *Almaſtiga*, *Maſtech*, and *Almecega*: in Engliſh, Maſticke.

Cluſius writeth, that the Spaniards call the oile that is preſſed out of the berries, *Azeyte de Mata.*

¶ *The Temperature.*

The leaues, barke, and gum of the Maſticke tree are of a meane and temperate heate, and are drie in the ſecond degree, and ſomewhat aſtringent.

¶ *The Vertues.*

A The leaues and barke of the Maſticke tree ſtoppe the laske, the bloudy flixe, the ſpitting of blood,

bloud, the piſſing of bloud, and all other fluxes of bloud: they are alſo good againſt the falling ſickeneſſe, the falling downe of the mother, and comming forth of the fundament.

The gum Maſticke hath the ſame vertue, if it be relented in wine and giuen to be drunke.

Maſticke chewed in the mouth is good for the ſtomacke, ſtaieth vomiting, increaſeth appetite, B
comforteth the braines, ſtaieth the falling downe of the rheumes and watery humors, and maketh C
a ſweet breath.

The ſame infuſed in Roſe water is excellent to waſh the mouth withall, to faſten looſe teeth, D
and to comfort the iawes.

The ſame ſpred vpon a piece of leather or veluet, and laid plaiſterwiſe vpon the temples, ſtaieth E
the rheume from falling into the iawes and teeth, and eaſeth the paines thereof.

It preuaileth much againſt vlcers and wounds, being put into digeſtiues and healing Vn- F
guents.

It draweth flegme forth of the head gently and without trouble. G

It is alſo vſed in waters which ſerue to clenſe and make faire the face with. H

The decoction of this filleth vp hollow vlcers with fleſh if they be bathed therewith. I

It knitteth broken bones, ſtaieth eating vlcers, and prouoketh vrine. K

Chap. 85. *Of the Turpentine Tree:*

1 *Terebinthus.*
The Turpentine tree.

2 *Terebinthus latifolia.*
The broad leafed Turpentine tree.

¶ *The Deſcription.*

1 THe firſt Turpentine Tree groweth to the height of a tall and faire tree, hauing many long boughes or branches, diſperſed abroad, beſet with long leaues, conſiſting of ſundry other ſmall leaues, each whereof reſembleth the Bay leafe, growing one againſt another vpon a little ſtem or middle rib, like vnto the leaues of the Aſh tree: the floures be ſmall & reddiſh, growing vpon cluſters or bunches that turne into round berries, which at their beginning are greene, afterwards reddiſh; but being ripe wax blacke, or of a darke blew colour, clammie, full of fat

and oilous in ſubſtance, and of a pleaſant ſauour: this plant beareth an empty cod, or crooked horne ſomewhat reddiſh, wherein are found ſmall flies, wormes or gnats, bred and ingendred of a certaine humorous matter, which cleaueth to the inner ſides of the ſaid cods or hornes, which wormes haue no phyſicall vſe at all. The right Turpentine iſſueth out of the branches of theſe trees, if you do cut or wound them, the which is faire and cleere, and better than that which is gathered from the barke of the Firre tree.

2 The ſecond kinde of Turpentine tree is very like vnto the former, but that it groweth not ſo great: yet the leaues are greater and broader, and of the ſame faſhion, but very like to the leaues of the Piſtacia tree. The berries are firſt of a ſcarlet colour, and when they be ripe of a skie colour. The great horned cods are ſharpe pointed, and ſomewhat corne'ed, conſiſting as it were of the ſubſtance of griſtles. And out of thoſe bladders being broken, do creepe and come ſmall flies or gnats, bred of a fuliginous excrement, and ingendred in thoſe bladders. The tree doth alſo yeeld his Turpentine by dropping like the former.

¶ *The Place.*

Theſe trees grow, as *Dioſcorides* ſaith, in Iurie, Syria, Cyprus, Africke, and in the Iſlands called *Cyclades*. *Bellonius* reporteth that there are found great ſtore of them in Syria, and Cilicia, and are brought from thence to Damaſcus to be ſold. *Cluſius* ſaith, that ir growes of it ſelfe in Languedocke, and in very many places of Portingale and Spaine, but for the moſt part like a ſhrub, and without bearing Turpentiue.

Theophraſtus writeth, that it groweth about the hill Ida, and in Macedonia, ſhort, in manner of a ſhrub, and writhed; and in Damaſcus and Syria great, in manner of a ſmall tree: he alſo ſetteth downe a certaine male Turpentine-tree, and a female: the male, ſaith he, is barren, and the female fruitfull. And of theſe he maketh the one with a berry red at the firſt, of the bigneſſe of a Lentill, which cannot come to ripenes; and the other with the fruit greene at the firſt, afterwards ſomewhat of a yellowiſh red, and in the end blacke, waxing ripe in the ſpring, of the bigneſſe of the Grecians Beane, and roſenny.

He alſo writeth of a certaine Indian Turpentine tree, that is to ſay, a tree like in boughes and leaues to the right Turpentine tree, but differing in fruit, which is like vnto Almonds.

¶ *The Time.*

The floures of the Turpentine tree come forth in the ſpring together with the new buds: the berries are ripe in September and October, in the time of Grape gathering. The hornes appeare about the ſame time.

¶ *The Names.*

This tree is called in Greeke πιστακη, and alſo many times πιστηκη: in Latine, *Terebinthus*: in Italian, *Terebintho*: in Spaniſh, *Cornicabra*: in French, *Terebinte*: in Engliſh, Turpentine tree: the Arabians call it *Botin*, and with an article *Albotin*.

The Roſin is ſurnamed πιστακη: in Latine, *Terebinthina*: in high Dutch, **Termintijn**: in Engliſh, Turpentine, and right Turpentine: in the Arabian language *Albotin*, who name the fruit *Granum viride*, or greene berries.

¶ *The Temperature and Vertues.*

A The barke, leaues, and fruit of the Turpentine tree do ſomewhat binde, they are hot in the ſecond degree, and being greene they dry moderately; but when they are dryed they dry in the ſecond degeee; and the fruit approacheth more neere to thoſe that be dry in the third degree, and alſo hotter. This is fit to be eaten, as *Dioſcorides* ſaith, but it hurteth the ſtomacke.

B It prouoketh vrine, helpeth thoſe that haue bad ſpleenes, and is drunke in wine againſt the bitings of the poyſonſome ſpiders called *Phalangia*.

C The Roſin of the Turpentine tree excelleth all other Roſins, according to *Dioſcorides* his opinion: but *Galen* writeth, that the Roſin of the maſticke tree beareth the preheminence, and then the Turpentine.

D This Roſin hath alſo an aſtringent or binding facultie, and yet not ſo much as maſticke; but it hath withall a certaine bitterneſſe ioyned, by reaſon whereof it digeſteth more than that of the Maſticke tree: thorow the ſame qualitie there is likewiſe in it ſo great a clenſing, as alſo it healeth ſcabs, in his 8. booke of the faculties of ſimple medicines; but in his booke of medicines according to the kindes, he maketh that of the Turpentine tree to be much like the Roſins of the Larch tree, which he affirmeth to be moiſter than all the reſt, and to be without both ſharpneſſe and biting.

E The fruit of Turpentine prouoketh vrine and ſtirreth vp fleſhly luſt.

F The Roſine of this tree, which is the right Turpentine, looſeth the belly, openeth the ſtoppings of the liuer and ſpleene, prouoketh vrine, and driueth forth grauell, being taken the quantitie of two or three Beanes.

The

The like quantitie waſhed in water diuers times vntill it be white, then muſt be put thereto the like quantity of the yolk of an egge, and laboured together adding thereto by little and little (continually ſtirring it) a ſmall draught of poſſit drinke made of white wine, and giuen to drink in the morning faſting, it helpeth moſt ſpeedily the Gonorrhæa, or running of the reines, commonly at the firſt time, but the medicine neuer faileth at the ſecond time of the taking of it, which giues ſtooles from foure to eight, according to the age and ſtrength of the patient. G

Chap. 86. *Of the Frankincenſe tree.*

¶ *The Deſcription.*

THe tree from which Frankincenſe floweth is but low, and hath leaues like the Maſtick tree, yet ſome are of opinion that the leafe is like the leafe of a Peare tree, and of a graſſie colour: the rinde is like that of the Bay tree, whereof there are two kindes: the one groweth in mountains and rockie places, the other in the plaine: but thoſe in the plaines are much worſe than thoſe of the mountaines: the gum hereof is alſo blacker, fitter to mingle with Pitch, and ſuch other ſtuffe to trim ſhips, than for other vſes.

Arbor Thurifera.
The Frankincenſe tree.

Thuris Limpidifolium Lobelij.
The ſuppoſed leafe of the Frankincenſe tree.

Theuet in his Coſmographie ſaith, that the Frankincenſe tree doth reſemble a gummie or roſiny Pine tree, which yeeldeth a iuice that in time groweth hard, and is called *Thus*, Frankincenſe, in whom is found ſometime certaine ſmall graines like vnto grauell, which they call the Manna of Frankincenſe.

Of this there is in Arabia two other ſorts, the one, the gum wherof is gathered in the Dog daies when the Sun is in Leo, which is white, pure, cleare, and ſhining. *Pena* writeth that he hath ſeene the cleare Frankincenſe called *Limpidum*, and yeelding a very ſweet ſmell when it is burnt, but the leafe hath been ſeldome ſeene; which the Phyſition *Launanus* gaue to *Pena* and *Lobel*, together with ſome pieces of the Roſine, which he had of certaine mariners, but he could affirme nothing of certaintie whether it were the leafe of the Frankincenſe, or of ſome other Pine tree, yeelding the like iuice or gum. It is, ſaith he (which doth ſeldom happen in other leaues) from the lower part or foot of the leafe, to the vpper end, as it were doubled, conſiſting of two thin rindes or coats, with a ſheath a ſpan and a halfe long, at the top gaping open like a hood or fooles coxcombe, and as it were couered with a helmet, which is a thing ſeldome ſeene in a leafe, but is proper to the floures of *Napellus*,

or *Lonchitis*, as writers affirme; the other is gathered in the ſpring, which is reddiſh, worſer than the other in price or value, becauſe it is not ſo well concocted in the heat of the Sunne. The Arabians wound this tree with a knife, that the liquour may flow out more abundantly, whereof ſome trees yeeld threeſcore pounds of Frankinſence.

¶ *The Place.*

Dioſcorides ſaith it groweth in Arabia, and eſpecially in that quarter which is called Thurifera, the beſt in that countrey is called *Stagonias*, and is round, and if it be broken, is fat within, and when it is burned doth quickly yeeld a ſmel: next to it in goodnes is that which groweth in Smilo, leſſer than the other, and more yellow.

¶ *The Time.*

The time is already declared in the deſcription.

¶ *The Names.*

It is called in Greeke λιβανος: in Latine, *Thus*: in Italian, *Incenſo*: in Dutch, **Wieirauch**: in Spaniſh, *Encenſo*: in French, *Enceus*: in Engliſh, Frankincenſe, and Incenſe: in the Arabian tongue, *Louan*, and of ſome few, *Cond.r*. ‡ The Roſin carries the ſame name; but in ſhops it is called *Olibanum*, of the Greeke name and article put before it. ‡

¶ *The Temperature and Vertues.*

A It hath, as *Dioſcorides* ſaith, a power to heate and binde.

B It driueth away the dimneſſe of the eye-ſight, filleth vp hollow vlcers, it cloſes raw wounds, ſtaieth all corruptions of bloud, although it fall from the head.

C *Galen* writeth thus of it; *Thus* doth heate in the ſecond degree, and drie in the firſt, and hath ſome ſmall aſtriction, but in the white there is a manifeſt aſtriction; the rinde doth manifeſtly binde and dry exceedingly, and that moſt certainly in the ſecond degree, for it is of more groſſer parts than Frankincenſe, and not ſo ſharpe, by reaſon whereof it is much vſed in ſpitting of bloud, ſwellings in the mouth, the collicke paſſion, the flux in the belly riſing from the ſtomacke, and bloudy flixes.

D The fume or ſmoke of it hath a more drier and hotter quality than the Frankincenſe it ſelfe, being dry in the third degree.

E It doth alſo clenſe and fill vp the vlcers in the eies, like vnto Myrrhe: thus far *Galen*.

F *Dioſcorides* ſaith, that if it be drunk by a man in health, it driueth him into a frenſie: but there are few Greekes of his minde.

G *Auicen* reporteth that it doth helpe and ſtrengthen the wit and vnderſtanding, but the often taking of it will breed the head-ache, and if too much of it be drunke with wine it killeth.

Chap. 87. *Of Fiſticke Nuts.*

Piſtacia. The Fiſticke Nut.

¶ *The Deſcription.*

THe tree which beareth Fiſticke Nuts is like to the Turpentine tree: the leaues hereof be greater than thoſe of the Maſticke tree, but ſet after the ſame maner, and in like order that they are, being of a faint yellow colour out of a green; the fruit or Nuts do hang by their ſtalks in cluſters, being greater than the Nuts of Pine Apples, and much leſſer than Almonds: the husks without is of a grayiſh colour ſometimes reddiſh, the ſhell brickle and white; the ſubſtance of the kernell greene; the taſte ſweet, pleaſant to be eaten, and ſomething ſweet of ſmell.

¶ *The Place.*

Fiſticke Nuts grow in Perſia, Arabia, Syria, and in India; now they are made free Denizons in Italy, as in Naples and in other Prouinces there.

¶ *The Time.*

This tree doth floure in May, and the fruit is ripe in September.

¶ *The Names.*

This Nut is called in Greeke πιστακιον in *Athenæus*: *Nicander Colophonius* in his booke of Treacles nameth it πιστακιον: *Poſſidonius* nameth it πιστακιον: others, πιστακιον: the Latines obſeruing the ſame termes, haue named it *Piſtacion*, *Biſtacion*, or *Phiſtacion*:

ſtacion: the Apothecaries, *Fiſtici*: the Spaniards, *Alhocigos*, and *Fiſticos*: in Italian, *Piſtacchi*: in Engliſh, Fiſticke Nut.

¶ *The Temperature and Vertues.*

The kernels of the Fiſticke Nuts are oftentimes eaten as be thoſe of the Pine Apples; they be of temperature hot and moiſt; they are not ſo eaſily concocted, but much eaſier than common nuts: the iuice is good, yet ſomewhat thicke; they yeeld to the body no ſmall nouriſhment, they nourish bodies that are conſumed: they recouer ſtrength.

They are good for thoſe that haue the phthiſicke, or rotting away of the lungs.

They concoct, ripen, and cleanſe forth raw humours that cleaue to the lights and cheſt.

They open the ſtoppings of the liuer, and be good for the infirmities of the kidneies; they alſo remoue out of the kidneies ſand and grauell; and aſſwage their paine: they are alſo good for vlcers.

The kernels of Fiſticke nuts condited, or made into comfits, with ſugar, and eaten, doe procure bodily luſt, vnſtop the lungs and the breſt, are good againſt the ſhortneſſe of breath, and are an excellent preſeruatiue medicine being miniſtred in wine againſt the bitings of all manner of wilde beaſts.

CHAP. 88. *Of the Bladder Nut.*

Nux veſicaria.
The Bladder Nut.

¶ *The Deſcription.*

THis is a low tree, hauing diuers young ſprings growing forth of the root: the ſubſtance of the wood is white, very hard & ſound; the barke is of a light greene: the leaues conſiſt of fiue little ones, which be nicked in the edges like thoſe of the Elder, but leſſer, not ſo greene nor ranke of ſmell. It hath the pleaſant whitiſh floures of Bryonie or *Labruſca*, both in ſmell and ſhape, which turne into ſmal cornered bladders of winter Cherries, called Alkakengie, but of an ouerworne greeniſh colour: in theſe bladders are contained two little nuts, and ſometimes no more but one, leſſer than the Haſell nut, but greater than the Ram Cich, with a wooddie ſhel and ſomewhat red: the kernell within is ſomething green, in taſte at the firſt ſweet, but afterwards lothſome, and ready to prouoke vomit.

¶ *The Place.*

It groweth in Italy, Germany and France; it groweth likewiſe at the houſe of ſir *Walter Culpepper* neere Flimmewell in the Weild of Kent, as alſo in the Frier-yard without Saint Paules gate in Stamford, and about Spalding Abbey, and in the garden of the right honourable the Lord Treaſurer my very good Lord and Maſter, and by his houſe in the Strand. It groweth alſo in my garden, and in the garden hedges of ſir *Francis Carew* neere Croydon, ſeuen miles from London.

¶ *The Time.*

This tree floureth in May, the Nuts be ripe in Auguſt and September.

¶ *The Names.*

It is commonly called in high Dutch, **Pimpernuſz**, which ſignifieth in low Dutch **Pimpernoten**: diuers call it in Latine *Piſtacium Germanicum*: we thinke it beſt to call it *Nux veſicaria*. *Matthiolus* in his Epiſtles doth iudge the Turks *Coulcoul* and *Hebulben* to agree with this: *Gulielmus Quacelbenus* affirmeth, Coulcoul to be vſed of diuers in Conſtantinople for a daintie, eſpecially when they be new brought out of Egypt. This plant hath no old name, vnleſſe it be *Staphylodendron Plinij*:

for which it is taken of the later writers: and *Pliny* hath written of it in his 16. book, 16. chap. There is also (saith he) beyond the Alpes a tree, the timber whereof is very like to that of white Maple, and is called *Staphylodendron*, it beareth cods, and in those kernels, hauing the taste of the Hasel nut. It is called in English, S. Anthonies nuts, wilde Pistacia, or Bladder nuts: the Italians call it *Pistachio Saluaticke*: the French men call it *Baguenaudes a patre nostres*, for that the Friers do vse to make beads of the nuts.

¶ *The Temperature and Vertues.*

A These nuts are moist and ful of superfluous raw humours, and therefore they easily procure a readinesse to vomite, and trouble the stomacke, by reason that withall they be somewhat binding, and therefore they be not to be eaten.

B They haue as yet no vse in medicine, yet notwithstanding some haue attributed vnto them some vertues in prouoking of Venerie.

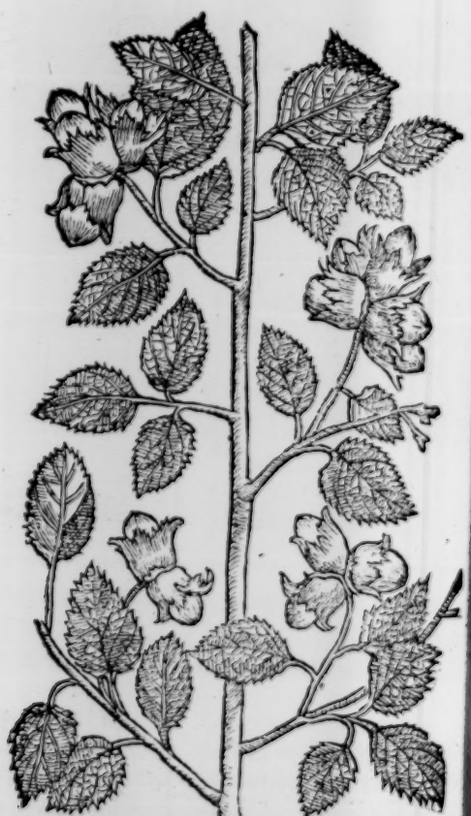
Chap. 89. *Of the Hasell tree.*

¶ *The Description.*

1 THe Hasell tree groweth like a shrub or small tree, parted into boughes without ioints, tough and pliable: the leaues are broad, greater and fuller of wrinckles than those of the Alder tree, cut in the edges like a saw, of colour greene, and on the backside more white, the bark is thin: the root is thicke, strong, and growing deep; in stead of floures hang downe catkins, aglets, or blowings, slender, and well compact: after which come the Nuts standing in a tough cup of a greene colour, and iagged at the vpper end, like almost vnto the beards in Roses. The shell is smooth and wooddie: the kernel within consisteth of a white, hard, and sound pulpe, and is couered with a thin skin, oftentimes red, most commonly white; this kernell is sweet and pleasant vnto the taste.

1 *Nux Auellana, sive Corylus.*
The Filberd Nut.

2 *Corylus sylvestris.*
The wilde hedge Nut.



2 *Corylus*

2 *Corylus ſylueſtris* is our hedge Nut or Haſell Nut tree, which is very well knowne, and therefore needeth not any deſcription: whereof there are alſo ſundry ſorts, ſome great, ſome little, ſome rathe ripe, ſome later, as alſo one that is manured in our gardens, which is very great, bigger than any Filberd, and yet a kinde of Hedge nut: this then that hath beene ſaid ſhall ſuffice for Hedge-Nuts.

‡ 3 The ſmall Turky Nut tree growes but low, and the leaues grow without order, vpon the twigs, they are in ſhape like thoſe of the former, but ſomewhat longer: the chiefe difference conſiſts in the fruit, which is ſmall, and like an Haſell Nut, but ſhorter: the huske, wherein ſomtimes one, otherwhiles more Nuts are contained, is very large, tough, and hard, diuided both aboue and below into a great many iags, which on euery ſide couer and hold in the Nuts, and theſe cups are very rough without, but ſmooth on the inſide. *Cluſius* firſt ſet this forth (hauing receiued it from Conſtantinople) by the name of *Auellana pumila Byzantina*. ‡

3 *Auellana pumila Byzantina cum ſuo fructu.*
The Filberd Nut of Conſtantinople.

¶ *The Place.*

The Haſell trees do commonly grow in Woods and in dankiſh vntoiled places: they are alſo ſet in Orchards, the Nuts whereof are better, and of a ſweeter taſte, and be moſt commonly red within.

¶ *The Time.*

The catkins or aglets come forth very timely, before winter be fully paſt, and fall away in March or Aprill, ſo ſoone as the leaues come forth: the Nuts be ripe in Auguſt.

¶ *The Names.*

This ſhrub is called in Latine, *Corylus*: in Greeke, κόρυλλος, that is, *Nux Pontica*, or Ponticke Nut: in high-Dutch, **Haſel ſtrauck**: in low-Dutch, **Haſeleer**: in Engliſh, Haſel tree, and Filberd tree; but the Filberd tree is properly that which groweth in gardens and Orchards, and whoſe fruit is commonly wholly couered ouer with the huske, and the ſhell is thinner.

The Nut is named in Latine, *Nux Pontica, tennis Nux, parua Nux*: it is alſo called *Nux Præneſtina, Nux Heracleotica*, and commonly *Nux auellana*, by which name it is vſually knowne to the Apothecaries: in high-Dutch, **Haſel Nutz**: in low-Dutch, **Haſel Noten**: in Italian, *Nocciuole, Auellane, Nocelle*: in French, *Noiſettes & Noiſelles*: in Spaniſh, *Anellanas*: in Engliſh, Haſell nut, and Filberd.

Theſe

Theſe Nuts that haue their skinnes red are the garden and planted Nuts, and the right Pontick Nuts or Filberds: they are called in high-Dutch, **Rhurnuſz**, and **Rotnuſz**: in low-Dutch, **Roode Haſel Noten**: in Engliſh, Filberds, and red Filberds.

The other Nuts which be white are iudged to be wilde.

¶ *The Temperature and Vertues.*

A Haſell Nuts newly gathered, and not as yet dry, containe in them a certaine ſuperfluous moiſture, by reaſon whereof they are windie: not onely the new gathered Nuts, but the dry alſo, be very hard of digeſtion; for they are of an earthy and cold eſſence, and of an hard and ſound ſubſtance, for which cauſe alſo they very ſlowly paſſe thorow the belly, therefore they are troubleſome and clogging to the ſtomacke, cauſe head-ache, eſpecially when they be eaten in too great a quantitie.

B The kernells of Nuts made into milke like Almonds do mightily bind the belly, and are good for the laske and the bloudy flix.

C The ſame doth coole exceedingly in hot feuers and burning agues.

D The catkins are cold and dry, and likewiſe binding: they alſo ſtay the lask.

E ‡ The kernels of Nuts rather cauſe than cure the bloudy flix and lasks, wherefore they are not to be vſed in ſuch diſeaſes. ‡

Chap. 90. *Of the Wall-nut tree.*

Nux Iuglans.
The Walnut tree.

¶ *The Deſcription.*

THis is a great tree with a thicke and tall body: the barke is ſomewhat greene, and tending to the colour of aſhes, and oftentimes full of clefts: the boughes ſpread themſelues far abroad: the leaues conſiſt of fiue or ſix faſtned to one rib, like thoſe of the Aſh tree, and with one ſtanding on the top, which be broader and longer than the particular leaues of the Aſh, ſmooth alſo, and of a ſtrong ſmell: the catkins or aglets come forth before the Nuts: theſe Nuts do grow hard to the ſtalke of the leaues, by couples, or by three & three; which at the firſt when they be yet but tender haue a ſweet ſmel, and be couered with a green huske: vnder that is a wooddy ſhell in which the kernell is contained, being couered with a thin skin, parted almoſt into foure parts with a woody skin as it were: the inner pulp whereof is white, ſweet and pleaſant to the taſt; and that is when it is new gathered, for after it is dry it becommeth oily and ranck.

¶ *The Place.*

The Walnut tree groweth in fields neere common high-wayes, in a fat and fruitfull ground, and in orchards: it proſpereth on high fruitfull bankes, it loueth not to grow in waterie places.

¶ *The Time.*

The leaues together with the catkins come forth in the Spring: the Nuts are gathered in Auguſt.

¶ *The Names.*

The tree is called in Greeke, Κάρυα: in Latine, *Nux*, which name doth ſignifie both the tree and the fruit: in high-Dutch, **Nuſzbaum**: in low-Dutch, **Noote boome**, and **Nootelaer**: in French, *Neiſier*: in Spaniſh, *Nogueyra*: in Engliſh, Walnut tree, and of ſome, Walſh nut tree. The Nut is called in Greeke, Κάρυον Βασιλικὸν, that is to ſay, *Nux Regia*, or the Kingly Nut: it is likewiſe named

Nux

Nux Inglans, as though you ſhould ſay *Iouis glans*, Iupiters Acorne; or *Iuvans glans*, the helping Acorne: and of diuers, *Perſica Nux*, or the Perſian Nut: in high-Dutch, **Welſch Nuſz**, and **Baumnuſz**: in low-Dutch, **Dokernoten, Walſch Noten**: In Italian, *Noci*: in French, *Noix*: in Spaniſh, *Nueẑes*, and *Nous*: in Engliſh, Walnut; and of ſome, Walſh nut.

¶ *The Temperature and Vertues.*

The freſh kernels of the nuts newly gathered are pleaſant to the taſte: they are a little cold, and haue no ſmall moiſture, which is not perfectly concocted: they be hard of digeſtion, and nouriſh little: they ſlowly deſcend. A

The dry nuts are hot and dry, and thoſe more which become oily and ranke: theſe be very hurtfull to the ſtomacke, and beſides that they be hardly concocted, they increaſe choler, cauſe headache, and be hurtfull for the cheſt, aud for thoſe that be troubled with the cough. B

Dry Nuts taken faſting with a fig and a little Rue withſtand poyſon, preuent and preſerue the body from the infection of the plague, and being plentifully eaten they driue wormes forth of the belly. C

The greene and tender Nuts boiled in Sugar and eaten as Suckad, are a moſt pleaſant and delectable meate, comfort the ſtomacke, and expell poyſon. D

The oile of Walnuts made in ſuch manner as oile of Almonds, maketh ſmooth the hands and face, and taketh away ſcales or ſcurfe, blacke and blew marks that come of ſtripes or bruiſes. E

Milke made of the kernels, as Almond milke is made, cooleth and pleaſeth the appetite of the languiſhing ſicke body. F

With onions, ſalt, and hony, they are good againſt the biting of a mad dog or man, if they be laid vpon the wound. G

Being both eaten, and alſo applied, they heale in ſhort time, as *Dioſcorides* ſaith, Gangrens, Carbuncles, ægilops, and the pilling away of the haire: this alſo is effectually done by the oile that is preſſed out of them, which is of thin parts, digeſting and heating. H

The outward greene huske of the Nuts hath a notable binding facultie. I

Galen deuiſed and taught to make of the iuyce thereof a medicine for the mouth, ſingular good againſt all inflammations thereof. K

The leaues and firſt buds haue a certaine binding qualitie, as the ſame Authour ſheweth; yet there doth abound in them an hot and dry temperature. L

Some of the later Phyſitions vſe theſe for baths and lotions for the body, in which they haue a force to digeſt and alſo to procure ſweat. M

Chap. 91. *Of the Cheſtnut tree.*

¶ *The Deſcription.*

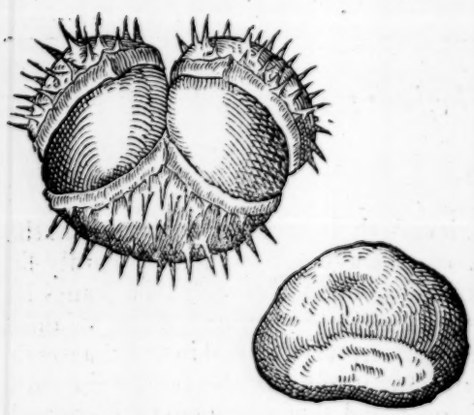
1 THe Cheſtnut tree is a very great an high tree: it caſteth forth very many boughes: the body is thicke, and ſometimes of ſo great a compaſſe as that two men can hardly fathom it: the timber or ſubſtance of the wood is ſound and durable: the leaues be great, rough, wrinkled, nicked in the edges, and greater than the particular leaues of the Walnut tree. The blowings or catkins be ſlender, long, and greene: the fruit is incloſed in round a rough and prickly huske like to an hedge-hog or Vrchin, which opening it ſelfe doth let fall the ripe fruit or Nut. This nut is not round, but flat on the one ſide, ſmooth, and ſharpe pointed: it is couered with a hard ſhell, which is tough and very ſmooth, of a darke browne colour: the meate or inner ſubſtance of the nut is hard and white, and couered with a thin skin which is vnder the ſhell.

2 The Horſe Cheſtnut groweth likewiſe to be a very great tree, ſpreading his great and large armes or branches far abroad, by which meanes it maketh a very good coole ſhadow. Theſe branches are garniſhed with many beautifull leaues, cut or diuided into fiue, ſix, or ſeuen ſections or diuiſions, like to the Cinkfoile, or rather like the leaues of *Ricinus*, but bigger. The floures grow at the top of the ſtalks, conſiſting of foure ſmall leaues like the Cherry bloſſome, which turne into round rough prickly heads like the former, but more ſharpe and harder: the nuts are alſo rounder. ‡ The floures of this, ſaith *Cluſius* (whoſe figure of them I here giue you) come out of the boſom of the leafe which is the vppermoſt of the branch, and they are many in number growing vpon prettie long foot-ſtalkes, conſiſting each of them of foure white leaues of no great bigneſſe; the two vppermoſt are a little larger than the reſt, hauing round purple ſpots in their middles: out of the middle of the floure come forth many yellowiſh threds with golden pendants. The fruit is contained in a prickly huske that opens in three parts, and it is rounder and not ſo ſharpe pointed as

the

1 *Caſtanea.*
Cheſtnut tree.

Caſtanea Equina fructus.



‡ 3 *Caſtanea Peruana fructus.*

2 *Caſtanea Equina cum flore.*
Horſe Cheſtnut tree in floure.

the ordinary Cheſtnut, neither vnder the vtter coat hath it any peeling within as the other hath, neither is it of ſo good a taſte. ‡

‡ 3 This Americane Cheſtnut is almoſt round, but that it is a little flatted on the ſides, eſpecially whereas it is faſtned to the ſtalke: the vtter coat is ſufficiently thicke, yet brittle, and as it were fungous, of a browniſh yellow colour: vnder this are aboundance of ſmall yet ſtiffe prickles, faſt ſticking to the ſhell that containes the kernell: the ſhell it ſelfe is browniſh, not thick, but tough and hard to breake, ſmooth and ſhining on the inſide, wherein is contained a kernel of the bigneſſe and colour of an hares kidney, white within, and ſweet in taſte like an almond or the common Cheſtnut. *Cluſius* cals this *Caſtanea Peruana*, or Cheſtnut of Peru; and hee ſaith hee had it from the famous Geographer *Abraham Ortelius*, who had it ſent him by *Benedictus Arias Montanus*. The figure is expreſt vnder that of the Horſe Cheſtnut. ‡

¶ *The Place.*

The firſt growes on mountaines and ſhadowie places, and many times in the vallies: they loue a ſoft and blacke ſoile. There be ſundry woods of Cheſtnuts in England, as a mile

mile and a halfe from Feuersham in Kent, and in sundry other places: in some countries they be greater and pleasanter: in others smaller, and of worse taste.

The Horse Chestnut groweth in Italy, and in sundry places of the East countries. ‡ It is now growing with Mr. *Tradescant* at South Lambeth. ‡

¶ *The Time.*

The blowings or aglets come forth with the leaues in Aprill; but the Nuts later, and be not ripe till Autumne.

¶ *The Names.*

The Chestnut tree beares the name of the Nut both in Greeke and Latine: in high-Dutch **Kestenbaum**, and **Kastanibaum**: in low-Dutch, **Castaniboom**: in French, *Castaignier*: in English, Chestnut tree.

The Nut is called in Greeke, κάστανον: in Latine, *Castanea*, *Iouis glans*, *Sardinia glans*: in high-Dutch **Kesten**: in low-Dutch, **Castanien**: in Italian, *Castagne*: in French, *Chastaigne*: in Spanish, *Morones*, *Castanas*: in English, Chestnut: the greater Nuts be named of the Italians, *Marroni*: of the French men and of divers base Almaines, *Marons*.

The Horse Chestnut is called in Latine, *Equina Castanea*: in English, Horse Chestnut, for that the people of the East countries do with the fruit thereof cure their horses of the cough, shortnesse of breath, and such like diseases.

¶ *The Temperature and Vertues.*

A Our common Chestnuts are very dry and binding, and be neither hot nor cold, but in a mean betweene both: yet haue they in them a certaine windinesse, and by reason of this, vnlesse the shell be first cut, they skip suddenly with a cracke out of the fire whilest they be rosting.

B Of all the Acornes, saith *Galen*, the Chestnuts are the chiefest, and doe onely of all the wilde fruits yeeld to the body commendable nourishment; but they slowly descend, they be hardly concocted, they make a thicke bloud, and ingender winde: they also stay the belly, especially if they be eaten raw.

C Being boiled or rosted they are not of so hard digestion, they more easily descend, and are lesse windy, yet they also make the body costiue.

D Some affirme, that of raw Chestnuts dried, and afterwards turned into meale, there is made a kinde of bread: yet it must needs be, that this should be dry and brittle, hardly concocted, and verie slow in passing thorow the belly; but this bread may be good against the laske and bloudy flix.

E An Electuarie of the meale of Chestnuts and hony is very good against the cough and spitting of bloud.

F The barke of the Chestnut tree boiled in wine and drunke, stops the laske, the bloudy flix, and all other issues of bloud.

Chap. 92. *Of the Beech tree.*

¶ *The Description.*

THe Beech is an high tree, with boughes spreading oftentimes in manner of a circle, and with a thicke body hauing many armes: the barke is smooth: the timber is white, hard, and verie profitable: the leaues be smooth, thin, broad, and lesser than those of the blacke Poplar: the catkins or blowings be also lesser and shorter than those of the Birch tree, and yellow: the fruit or Mast is contained in a huske or cup that is prickly, and rough bristled, yet not so much as that of the Chestnut: which fruit being taken forth of the shells or vrchin husks, be couered with a soft and smooth skin like in colour and smoothnesse to the Chestnuts, but they be much lesser, and of another forme, that is to say, triangled or three cornered: the kernell within is sweet, with a certaine astriction or binding qualitie: the roots be few, and grow not deepe, and little lower than vnder the turfe.

¶ *The Place.*

The Beech tree loueth a plaine and open countrey, and groweth very plentifully in many Forests and desart places of Sussex, Kent, and sundry other countries.

¶ *The Time.*

The Beech floureth in Aprill and May, and the fruit is ripe in September, at what time the Deere do eate the same very greedily, as greatly delighting therein; which hath caused forresters and huntsmen to call it Buck-mast.

¶ *The*

Fagus.
The Beech.

¶ *The Names.*

The tree is called in Greeke, φηγὸς: in Latine, *Fagus*: in high-Dutch, **Buchbaum**, or **Buch**: in low-Dutch, **Bukenboom**: in Italian, *Faggi*: in Spaniſh, *Haia*, *Faia*, and *Fax*: in French, *Fau*, or *Heſtre*: in Engliſh, Beech tree, Beech-maſt, and Buck-maſt.

The fruit is called in Latine, *Nuces Fagi*: in Greeke, βάλανοι τῆς φηγοῦ: in low-Dutch, **Bukken nootkens**: in French, *Faine*: in Engliſh, Beech-maſt. *Dioſcorides* reckons the Beech among the Acorne trees; and yet is the maſt nothing at all like to an Acorne. Of *Theophraſtus* it is called *Oxya*: of *Gaza*, *Sciſcina*.

Pliny alſo makes mention of this tree, but vnder the name of *Oſtrya* (if ſo be in ſtead of *Oſtrya* we muſt not reade *Oxya*) *lib.* 13. *ca.* 21. It bringeth forth (ſaith he, meaning Greece) the tree *Oſtrys*, which they likewiſe call *Oſtrya*, growing alone among waterie ſtones, like to the Aſh tree in barke and boughes, with leaues like thoſe of the Peare tree, but ſomewhat longer and thicker, and with wrinkled cuts which runne quite thorow, with a ſeed like in colour to a Cheſtnut, and not vnto barley: the wood is hard and firme, which being brought into the houſe there followes hard trauell of childe, and miſerable deaths, as it is reported; and therefore it is to be forborne, and not vſed as fire wood, if *Plinies* copies be not corrupted.

¶ *The Temperature.*

The leaues of Beech do coole: the kernell of the Nut is ſomwhat moiſt.

¶ *The Vertues.*

A The leaues of Beech are very profitably applied vnto hot ſwellings, bliſters, and excoriations; and being chewed they are good for chapped lips, and paine of the gums.

B The kernels or maſt within are reported to eaſe the paine of the kidneyes proceeding of the ſtone, if they be eaten, and to cauſe the grauell and ſand the eaſier to come forth. With theſe, mice and Squirrels are greatly delighted, who do mightily encreaſe by feeding thereon: Swine alſo be fatned herewith, and certaine other beaſts: alſo Deere do feed thereon very greedily: they be likewiſe pleaſant to Thruſhes and Pigeons.

C *Petrus Creſcentius* writeth, That the aſhes of the wood is good to make glaſſe with.

D The water that is found in the hollowneſſe of Beeches cureth the naughty ſcurfe, tetters, and ſcabs of men, horſes, kine, and ſheepe, if they be waſhed therewith.

Chap. 93. *Of the Almond tree.*

¶ *The Deſcription.*

THe Almond tree is like to the Peach tree, yet is it higher, bigger, of longer continuance: the leaues be very long, ſharpe pointed, ſnipt about the edges like thoſe of the Peach tree: the floures be alike: the fruit is alſo like a peach, hauing on one ſide a cleft, with a ſoft skin without, and couered with a thin cotton; but vnder this there is none, or very little pulp, which is hard like a griſtle not eaten: the nut or ſtone within is longer than that of the peach, not ſo rugged, but ſmooth; in which is contained the kernel, in taſte ſweet, and many times bitter: the root of the tree groweth deepe: the gum which ſoketh out hereof is like that of the peach tree.

‡ There are diuers ſorts of Almonds, differing in largenes and taſte: we commonly haue three or foure ſorts brought to vs, a large ſweet Almond, vulgarly termed a Iordan almond; and a leſſer, called a Valence Almond: a bitter Almond of the bigneſſe of the Valence almond, and ſomtimes another bitter one leſſe than it. ‡

¶ *The*

Amygdalus.
The Almond tree.

¶ *The Place.*

The natural place of the Almond is in the hot regions, yet we haue them in our London gardens and orchards in great plenty.

¶ *The Time.*

The Almond floureth betimes with the Peach: the fruit is ripe in Auguſt.

¶ *The Names.*

The tree is called is Greek, Ἀμυγδαλὴ: in Latine, *Amygdalus*: in French, *Amandier*: in Engliſh, Almond tree.

The fruit is called in Greeke, Ἀμύγδαλον: in Latine, *Amygdalum*: in ſhops, *Amygdala*: in high-Dutch, **Mandel**: in low-Dutch, **Almandelen**: in Italian, *Mandole*: in Spaniſh, *Almendras*, *Amelles*, and *Amendoas*: in French, *Amandes*: in Engliſh, Almond.

¶ *The Temperature and Vertues.*

Sweet Almonds when they be dry be moderatly hot; but the bitter ones are hot and dry in the ſecond degree. There is in both of them a certaine fat and oily ſubſtance, which is drawne out by preſſing. A

Sweet Almonds being new gathered are pleaſant to the taſte, they yeeld ſome kind of nouriſhment, but the ſame groſſe and earthy, and groſſer than thoſe that be dry, and not as yet withered. Theſe do likewiſe ſlowly deſcend, eſpecially being eaten without their skins; for euen as the huskes or branny parts of corne doe ſerue to driue downe the groſſe excrements of the belly, ſo doe likewiſe the skins or husks of the almonds: therefore thoſe that be blanched do ſo ſlowly deſcend, as that they dowithall binde the belly; whereupon they are giuen with good ſucceſſe to thoſe that haue the laske or the bloudy flix. B

There is drawne out of ſweet Almonds, with liquor added, a white iuice like milke, which ouer and beſides that it nouriſheth, and is good for thoſe that are troubled with the laske and bloudie flix, it is profitable for thoſe that haue the pleuriſie and ſpit vp filthy matter, as *Alexander Trallianus* witneſſeth: for there is likewiſe in the Almonds an opening and concocting qualitie, with a certaine clenſing faculty, by which they are medicinable to the cheſt and lungs, or lights, and ſerue for the raiſing vp of flegme and rotten humors. C

Almonds taken before meate do ſtop the belly, and nouriſh but little; notwithſtanding many excellent meates and medicines are therewith made for ſundry griefes, yea very delicat and wholſome meates, as Almond butter, creame of Almonds, marchpane, and ſuch like, which dry and ſtay the belly more than the extracted iuyce or milke; and they are alſo as good for the cheſt and lungs. D

They do ſerue alſo to make the Phyſicall Barley water, and Barley Creame, which are giuen in hot Feuers, as alſo for other ſicke and feeble perſons, for their further refreſhing and nouriſhments. E

The oile which is newly preſſed out of the ſweet Almonds is a mitigater of paine and all maner of aches. It is giuen to thoſe that haue the pleuriſie, being firſt let bloud; but eſpecially to thoſe that are troubled with the ſtone of the kidnies, it ſlackens the paſſages of the vrine, and maketh them glib or ſlipperie, and more ready to ſuffer the ſtone to haue free paſſage: it maketh the belly ſoluble, and therefore it is likewiſe vſed for the collicke. F

It is good for women that are newly deliuered; for it quickly remoueth the throwes which remaine after their deliuery. G

The oile of Almonds makes ſmooth the hands and face of delicat perſons, and clenſeth the skin from all ſpots, pimples, and lentils. H

Bitter Almonds doe make thinne and open, they remoue ſtoppings out of the liuer and ſpleene, therfore they be good againſt paine in the ſides: they make the body ſoluble, prouoke vrine, bring I

downe the menſes, helpe the ſtrangurie, and clenſe forth of the cheſt and lungs clammie humors: if they be mixed with ſome kinde of looch or medicine to licke on: with ſtarch they ſtay the ſpitting of bloud.

L And it is reported that fiue or ſix being taken faſting do keepe a man from being drunke.

M Theſe alſo clenſe and take away ſpots and blemiſhes in the face, and in other parts of the body; they mundifie and make cleane foule eating vlcers.

N With hony they are laid vpon the biting of mad dogs; being applied to the temples with vineneger or oile of Roſes, they take away the head-ache, as *Dioſcorides* writeth.

O They are alſo good againſt the cough and ſhortneſſe of winde.

P They are likewiſe good for thoſe that ſpit bloud, if they be taken with the fine floure of *Amylum*.

Q There is alſo preſſed out of theſe an oile which prouoketh vrine, but eſpecially if a few ſcorpions be drowned, and ſteeped therein.

R With oile it it ſingular good for thoſe that haue the ſtone, and cannot eaſily make water but with extremitie of paine, if the ſhare and place betweene the cods and fundament be anoynted therewith.

S *Dioſcorides* ſaith, that the gum doth heate and binde, which qualities notwithſtanding are not perceiued in it.

T It helpeth them that ſpit bloud, not by a binding facultie, but thorow the clammineſſe of his ſubſtance, and that is by cloſing vp of the paſſages and pores, and ſo may it alſo cure old coughes, and mitigate extreame paines that proceed of the ſtone, and eſpecially take away the ſharpeneſſe of vrine, if it be drunke with Baſtard, or with any other ſweet potion, as with the decoction of Licorice or of Raiſons of the ſunne. The ſame doth likewiſe kill tetters in the outward parts of the bodie (as *Dioſcorides* addeth) if it be diſſolued in vineger.

Chap. 94. *Of the Peach tree.*

¶ *The Kindes.*

‡ There are diuers ſorts of Peaches beſides the foure here ſet forth by our Author, but the trees do not much differ in ſhape, but the difference chiefely conſiſts in the fruit, whereof I will giue you the names of the choice ones, and ſuch as are to be had from my friend M^r. *Millen* in Old-ſtreet, which are theſe; two ſorts of Nutmeg Peaches; The Queenes Peach; The Newington Peach; The grand Carnation Peach; The Carnation Peach; The Blacke Peach; the Melocotone; the White; The Romane; The Alberza; The Iſland Peach; Peach du Troy. Theſe are all good ones. He hath alſo of that kinde of Peach which ſome call *Nuciperſica* or Nectorins, theſe following kindes; the Roman red, the beſt of fruits; the baſtard Red; the little dainty green; the yellow; the white; the ruſſet, which is not ſo good as the reſt. Thoſe that would ſee any fuller diſcourſe of theſe may haue recourſe to the late worke of M^r. *Iohn Perkinſon*, where they may finde more varieties, and more largely handled, and therefore not neceſſarie for me in this place to inſiſt vpon them. ‡

¶ *The Deſcription.*

1 The Peach tree is a tree of no great bigneſſe: it ſendeth forth diuers boughes, which be ſo brittle, as oftentimes they are broken with the weight of the fruit or with the winde. The leaues be long, nicked in the edges, like almoſt to thoſe of the Walnut tree, and in taſte bitter: the floures be of a light purple colour. The fruit or Peaches be round, and haue as it were a chinke or cleft on the one ſide; they are couered with a ſoft and thin downe or hairie cotton, being white without, and of a pleaſant taſte; in the middle whereof is a rough or rugged ſtone, wherein is contained a kerneil like vnto the Almond; the meate about the ſtone is of a white colour. The root is tough and yellowiſh.

2 The red Peach tree is likewiſe a tree of no great bigneſſe: it alſo ſendeth forth diuers boughes or branches, which be very brittle. The leaues be long, and nicked in the edges like to the precedent. The floures be alſo like vnto the former; the fruite or Peaches be round, of a red colour on the outſide; the meate likewiſe about the ſtone is of a gallant red colour. Theſe kindes of Peaches are very like to wine in taſte, and therefore maruellous pleaſant.

3 *Perſica præcocia*, or the d'auant Peach tree is like vnto the former, but his leaues are greater and larger. The fruit or Peaches be of a ruſſet colour on the one ſide, and on the other ſide next vnto the ſun of a red colour, but much greater than the red Peach: the ſtones whereof are like vnto the former: the pulpe or meate within is of a golden yellow colour, and of a pleaſant taſte.

4 *Perſica*

Perſica alba.
The white Peach.

4 *Perſica lutea*, or the yellow Peach tree, is like vnto the former in leaues and floures: his fruit is of a yellow colour on the outſide, and likewiſe on the inſide, harder than the reſt, in the middle of the Peach is a woodly, hard, and rough ſtone, full of creſts and gutters, in which doth lie a kernell much like to that of the Almond, and with ſuch a like skin: the ſubſtance within is white, and in taſte ſomething bitter. The fruit hereof is of greateſt pleaſure, and beſt taſte of all the other of his kinde; although there be found at this day diuers other ſorts that are of very good taſte, not remembred of the ancient, or ſet downe by the later writers, whereof to ſpeake particularly, would not be greatly to our pretended purpoſe, conſidering we haſten to an end.

‡ 5 There is alſo kept in ſome of our choiſe gardens a kind of Peach which hath a very double and beautiful floure, but it is ſeldome ſucceeded by any fruit; they call this, *Perſica flore pleno*, The double bloſſomed Peach. ‡

¶ *The Place.*

They are ſet and planted in gardens and vineyards: I haue them all in my garden, with many other ſorts.

¶ *The Time.*

The Peach tree ſoone commeth vp: it beares fruit the third or fourth yeere after it is planted, and it ſoone decaieth, and is not of long continuance; it floureth in Aprill, or a little while after that the leaues appeare, and hath his fruit ripe in September.

¶ *The Names.*

The Peach tree is called in Greeke, μηλέα περσική: in Latine, *Malus Perſica*, and *Perſica*: in high Dutch, **Perſichboum**: in low Dutch, **Perſe boom**: in French, *Perſcher*: in Engliſh, Peach tree.

The fruit, as *Galen* teſtifieth, is named μῆλον περσικὸν, and περσικὸν alſo without any addition: in Latine, *Malum Perſicum*, and *Perſicum*: in high Dutch, **Pferſing**: in low Dutch, **Perſen**: in Italy, *Peſche*: in Spaniſh, *Pexegos*: in French, *Piſches*: in Engliſh, Peach.

¶ *The Temperature and Vertues.*

Peaches be cold and moiſt, and that in the ſecond degree; they haue a juice and alſo a ſubſtance A
that doth eaſily putrifie, which yeeldeth no nouriſhment, but bringeth hurt, eſpecially if they be eaten after other meates; for then they cauſe the other meates to putrifie. But they are leſſe hurtfull if they be taken firſt; for by reaſon that they are moiſt and ſlippery, they eaſily and quickly deſcend; and by making the belly ſlippery, they cauſe other meates to ſlip downe the ſooner.

The kernels of the Peaches be hot and dry, they open and cleanſe; they are good for the ſtop- B
pings of the liuer and ſpleene.

Peaches before they be ripe do ſtop the laske, but being ripe they looſe the belly, and ingender C
naughty humors, for they are ſoone corrupted in the ſtomacke.

The leaues of the Peach tree do open the ſtopping of the liuer, and do gently looſen the belly: D
and being applied plaiſterwiſe vnto the nauell of young children, they kill the wormes, and driue them forth.

The ſame leaues boiled in milke, do kill the wormes in children very ſpeedily. E

The ſame being dried, and caſt vpon greene wounds, cure them. F

The floures of the Peach tree infuſed in warme water for the ſpace of ten or twelue houres, and G
ſtrained, and more floures put to the ſaid liquor to infuſe after the ſame manner, and ſo iterated ſix or eight times, and ſtrained again, then as much ſugar as it will require added to the ſame liquor and boiled vnto the conſiſtence or thicknes of a ſyrrup, and two ſpoonefulls hereof taken, doth ſo ſingularly well purge the belly, that there is neither Rubarbe, Agaricke, nor any other purger comparable vnto it; for this purgeth downe wateriſh humors mightily, and yet without griefe or trouble, either to the ſtomacke, or lower parts of the body.

H The kernell within the Peach ſtone ſtamped ſmall, and boiled with Vineger vntill it be brought to the forme of an ointment, is good to reſtore and bring again the haire of ſuch as be troubled with the *Alopecia*.

I There is drawne forth of the kernels of Peaches, with Peniroyall water, a iuice like vnto milke, which is good for thoſe that haue the Apoplexy: if the ſame be oftentimes held in the mouth it draweth forth water and recouereth the ſpeech.

K The gum is of a meane temperature, but the ſubſtance thereof is tough and clammy, by reaſon whereof it dulleth the ſharpnes of thin humors: it ſerueth in a looch or licking medicine for thoſe that be troubled with the cough, and haue rotten lungs, and ſtoppeth the ſpitting and raiſing vp of bloud, and alſo ſtayeth other fluxes.

Chap. 95.

Of the Aprecocke or Abrecocke tree.

1 *Armeniaca malus maior.*
The greater Aprecocke tree.

2 *Armeniaca malus minor.*
The leſſer Aprecocke tree.

¶ *The Deſcription.*

1 THis tree is greater than the Peach tree, and hath a bigger body, it laſteth longer, eſpecially if it be grafted or inoculated: the leaues hereof are broad, and ſharpe pointed, like thoſe of blacke Poplar, but leſſer, and comming more neere to the leaues of birch, nicked in the edges: the floures are ſomewhat white: the fruit round like a peach, yellow within and without, in which doth lie a browne ſtone, nothing rough at all as is that of the Peach, ſhorter alſo, and leſſer, in which is included a ſweet kernell.

2 We haue another ſort of Aprecocke, whoſe trunk or body is equall with the other in greatneſſe, it is like alſo in leaues and brittle branches: his time of flouring, flouriſhing, and manner of growing accordeth: the only point wherein they differ is, that this tree bringeth forth leſſe fruit, and not ſo good in taſte; in euery other reſpect it is like.

‡ Of this alſo Mr. *Parkinſon* hath ſet forth diuers varieties; and my forementioned friend Mr. *Millen* hath theſe fiue ſorts; the common, the long and great, the Muske, the Barbary, and the early Aprecocke. ‡

¶ *The*

¶ *The Place.*

These trees do grow in my garden, and now adaies in many other gentlemens gardens throughout all England.

¶ *The Time.*

They floure and flouriſh in Aprill, and their fruit is ripe in Iuly.

¶ *The Names.*

This tree is called in Greeke, Μηλέα Αρμενιακή: in Latine, *Malus Armeniaca:* in Engliſh, Abrecocke tree, and Aprecocke tree.

The fruit is named Μῆλα Αρμενιακά, and of diuers ὠρικόκκια, or βερικόκκια, which be words corrupted from the Latine; for *Præcox* in Latine is diuers times called *Præcoquum:* it is named *Malum Armeniacum*, and commonly *Armeniacum:* it is called in high-Dutch, **Mollerteu Mollelin, S. Johans Pferſing:** in low-Dutch, **Vroege Perſen, Auant Perſen:** in Italian, *Armeniache, Bacoche, Griſomele, Moniache:* in French, *Abricoz:* in Spaniſh, *Aluarcoques, Aluarchigas*, and *Albercocs:* in Engliſh, Abrecocke, and of ſome, Aprecocke, and Aprecox.

Galen ſeemeth to make a difference betweene *Præcocia* and *Armeniaca*, in his booke of the Faculties of nouriſhments, preferring *Præcocia* before *Armeniaca*; yet he doth confeſſe that both of them be called *Armeniaca:* others pronounce them *Armenia* with foure ſyllables. And in his booke of the faculties of ſimple medicines he affirmeth, that both the fruit and the tree are called ὠρικόκκια: diuers of the later Phyſitions do betweene theſe alſo make a difference, ſaying, that the greater ones and thoſe that are graſted be *Armeniaca* (which the French men call *Auant Perſes*) and the leſſer *Præcocia:* in French, *Abricoz.*

¶ *The Temperature and Vertues.*

Aprecocks are cold and moiſt in the ſecond degree, but yet not ſo moiſt as Peaches, for which cauſe they do not ſo ſoone or eaſily putrifie, and they are alſo more wholeſome for the ſtomacke, and pleaſant to the taſte; yet do they likewiſe putrifie, and yeeld but little nouriſhment, and the ſame cold, moiſt, and full of excrements: being taken after meate they corrupt and putrifie in the ſtomacke; being firſt eaten before other meate they eaſily deſcend, and cauſe the other meates to paſſe downe the ſooner, like as alſo the Peaches do. A

The kernell within the ſame is ſweet, and nothing at all like in facultie to that of the Peach. B

The vertues of the leaues of this tree are not as yet found out. C

Chap. 96. *Of Pomegranat tree.*

¶ *The Kindes.*

AS there be ſundry ſorts of Apples, Peares, Plums, and ſuch like fruits: ſo there are two ſorts of Pomegranates, the garden and the wilde, and a third ſort which is barren and fruitles: the fruit of the garden Pomegranat is of three ſorts; one hauing a ſoure iuyce or liquour; another hauing a very ſweet and pleaſant liquor, and the third the taſte of Wine: of the wilde alſo there be two ſorts, and the difference betweene them is no more than betwixt crabs and weildings, which are both wilde kindes of Apples: therefore the deſcription of the garden Pomegranat ſhal ſuffice for the reſt.

¶ *The Deſcription.*

1 THe manured Pomegranat tree groweth vp to the height of a hedge tree, being ſeuen or eight cubits high, hauing many pliant and twiggy branches, very limber, tough, and of a browne colour: whereon are ſet very many leaues in ſhape like thoſe of the Priuet, but more like thoſe of the Myrtle tree, of a bright ſhining greene colour tending to yellowneſſe: amongſt which there ſtand certaine ſharpe thornes confuſedly ſet, and likewiſe hollow floures like vnto the hedge Roſe, indented on the edges like a ſtarre, of a Carnation colour, and very ſingle: after which commeth the fruit, couered with a hard barke, of an ouerworne purpliſh colour, full of graines and kernels, which after they be ripe are of a gallant crimſon colour, and ful of iuyce, which differeth in taſte according to the ſoile, clymat, and countrey where they grow; ſome be ſweet, others ſoure, and the third are in a middle betweene them both, hauing the taſte of Wine.

1 *Malus Granata, ſiue Punica.*
The Pomegranat tree.

2 *Malus Punica ſylueſtris.*
The wilde Pomegranat.

Balauſtia, ſiue Pleni flores Gran. ſyl.
The double floures of wild Pomegranat.

† 2 The wilde Pomegranat tree is like the other in leaues and twiggy branches, but it is more prickly and horrid: of this there are two ſorts, the one hauing ſuch floures & fruit as the tame Pomgranat; the other bearing floures very double, as may appeare by the figure, which wither and fall away, leauing no fruit behind them, as the double floured Cherry doth, and diuers other herbes and trees alſo; & it is altogether barren of fruit: of this *Dioſcorides* makes ſundry ſorts, differing in colour: one is white, ſaith he; another yellowiſh red, and a third ſort of the colour of the Roſe: this with red floures is beſt knowne among the Apothecaries.

¶ *The Place.*

Pomegranats grow in hot countries toward the South, in Italy, Spaine, and chiefely in the kingdome of Granado, which is thought to be ſo named of the great multitude of Pomgranats, which be commonly called *Granata*. they grow in a number of places alſo without manuring: yet being manured they proſper better; for in gardens, vineyards, orchards, and other like husbanded grounds they come vp more cheerefully: I haue recouered diuers yong trees hereof, by ſowing of the ſeed or grains, of the height of three or foure cubits, attending Gods leiſure for floures and fruit.

¶ *The Time.*

The Pomegranate floureth in the moneths of May and Iune: the fruit is ripe in the end of Auguſt.

¶ *The*

¶ *The Names.*

The Pomegranate tree is called in Latine, *Malus Punica*: in Greeke, of the Athenians, μηλέα, and ροιὰ, as *Galen* ſaith: in Engliſh, Pomegranate tree: the fruit is alſo named ῥόα, or ῥοιὰ: in Latine, *Malum Punicum*: in ſhops, *Malum*, or *Pomum Granatum*: in high Dutch, **Granatopffel**: in low Dutch, **Granatappel**: in Italian, *Melagrano*, and *Pomo Granato*: in Spaniſh, *Granadas*, and *Romanas*: in French, *Pommes Granades*: in Engliſh, Pomegranate.

The floure of the fruitfull Pomegranate tree is called of the Grecians, κώνος: which is notwithſtanding properly the cup of the floure: the Latines name it alſo *Cytinus*.

The floure of the wilde and barren Pomegranate tree is called βαλαύστιον: the Apothecaries doe likewiſe terme it *Balauſtium*.

The pill or rinde of the Pomegranate which is ſo much in vſe, is named in Greeke σίδιον: in Latine, *Malicorium*, and *Sidium*: in ſhops it is called *Cortex granatorum*, or Pomegranate Pill.

¶ *The Temperature and Vertues.*

The iuicie grains of the Pomegranate are good to be eaten, hauing in them a meetly good iuice: they are wholeſome for the ſtomacke, but they all containe in them a thin and ſmall nouriſhment, or none at all. A

The ſweet ones be not ſo cold as the reſt, but they eaſily cauſe hot ſwellings to ariſe, and they are not ſo much commended for agues. B

The ſoure ones, and eſpecially if they be withall ſomething harſh, doe euidently coole, dry, and ſomething binde. C

They are good for the heart burne, they repreſſe and ſtay the ouermuch vomiting of choler, called the Felonie: they are a remedie againſt the bloudy flixe, aptneſſe to vomite, and vomite it ſelfe. D

There is made of the iuice of theſe ſoure Pomegranats a ſyrrup, which ſerueth for the ſame purpoſes, and is alſo many times very profitable againſt the longing of women with childe, vnleſſe the coldneſſe of the ſtomacke be a hinderance thereunto. E

The ſeeds of the graines, and eſpecially of the ſower Pomegranat, being dried, do likewiſe coole and binde. F

They ſtop the flix, ſtay vomiting, and ſtanch the ſpitting vp of bloud, they ſtrengthen the ſtomacke. G

Of the ſame effect be the floures, both of the tame and wilde Pomegranate tree, being like to the ſeeds in temperature and vertues. H

They faſten the teeth, and ſtrengthen the gums, if the ſame be waſhed therewith. I

They are good againſt burſtings that come by falling downe of the guts, if they be vſed in plaiſters and applied. K

The rinde or pill is not onely like in facultie to the ſeeds, and both the ſorts of floures, but alſo more auaileable; for it cooleth and bindeth more forceably; it bringeth downe the hot ſwellings of the almonds in the throat, being vſed in a gargariſme or a lotion for the throat, and it is a ſingular remedy for all things that need cooling and binding. L

Dioſcorides writeth, that there is alſo gathered a iuice out of both thoſe ſorts of floures, which is very like in facultie and vertue to *Hypociſtis*, as the ſame Author affirmeth. M

The bloſſomes of the tame and wilde Pomegranates, as alſo the rinde or ſhell thereof made into pouder, and drunke in red wine, or boyled in red wine, and the decoction drunke, is good againſt the bloudy flix, and all other iſſues of bloud; yea it is good for women to ſit ouer, & bathe themſelues in the decoction hereof: theſe foreſaid bloſſomes and ſhels are good alſo to put into reſtraining pouders, for the ſtanching of bloud in wounds. N

The ſeeds or ſtones of Pomegranats dried in the Sun, and beaten to pouder, are of like operation with the floures: they ſtop the laske and all iſſues of bloud in man or woman, being taken in the manner aforeſaid. O

Chap. 97. *Of the Quince Tree.*

¶ *The Kindes:*

Columella maketh three kindes of Quinces, *Struthia*, *Chryſomeliana*, and *Muſtela*, but what manner ones they be hee doth not declare, notwithſtanding wee finde diuers ſorts differing as well in forme,

forme, as taſte and ſubſtance of the fruit, wherof ſome haue much core and many kernels, and others fewer.

Malus Cotonea.
The Quince tree.

¶ *The Deſcription.*

THe Quince tree is not great, but groweth low, and many times in maner of a ſhrub: it is couered with a rugged barke, which hath on it now and then certaine ſcales: it ſpreadeth his boughes in compaſſe like other trees; about which ſtand leaues ſomewhat round, like thoſe of the common Apple tree, greene and ſmooth aboue, and vnderneath ſoft and white: the floures be of a white purple colour: the fruit is like an apple, ſaue that many times it hath certaine embowed and ſwelling diuiſions: it differeth in faſhion and bigneſſe; for ſome Quinces are leſſer and round truſt vp together at the top with wrinkles, others longer and greater: the third ſort be after a middle manner betweene both; they are all of them ſet with a thin cotton or freeze, and be of the colour of gold, and hurtfull to the head by reaſon of their ſtrong ſmell; they all likewiſe haue a kinde of choking taſte: the pulp within is yellow, and the ſeed blackiſh, lying in hard skins, as doe the kernels of other apples.

¶ *The Place.*

The Quince tree groweth in gardens and orchards, and is planted oftentimes in hedges and fences belonging to gardens & vineyards: it delighteth to grow on plaine and euen grounds, and ſomewhat moiſt withall.

¶ *The Time.*

Theſe apples be ripe in the fall of the leafe, and chiefely in October.

¶ *The Names.*

The tree is called in Greeke μηλέα κυδωνία: in Latine, *Malus Cotonea*: in Engliſh, Quince tree.

The fruit is named μῆλον κυδώνιον: *Malum Cotoneum*, *Pomum Cydonium*, and many times, *Cydonium*, without any addition; by which name it is made known to the Apothecaries: it is called in high Dutch, **Quitten**, **Quittenopfell**, or **Kuttenopffel**: in low Dutch, **Queappel**: in Italian, *Mele cotogne*: in Spaniſh, *Codoyons*, *Membrilhos*, and *Marmellos*: in French, *Pomme de coing*: in Engliſh, Quince.

¶ *The Temperature and Vertues.*

A Quinces be cold and dry in the ſecond degree, and alſo very much binding, eſpecially when they be raw: they haue likewiſe in them a certaine ſuperfluous and excrementall moiſture, which will not ſuffer them to lie long without rotting: they are ſeldom eaten raw: being roſted or baked they be more pleaſant.

B They ſtrengthen the ſtomacke, ſtay vomiting, ſtop lasks, and alſo the bloudy flix.

C They are good for thoſe that ſpit vp bloud, or that vomit bloud; and for women alſo that haue too great plenty of their monethly courſes.

D *Simeon Sethi* writeth, that the woman with childe, which eateth many Quinces during the time of her breeding, ſhall bring forth wiſe children, and of good vnderſtanding.

E The Marmalade, or Cotiniate, made of Quinces and ſugar, is good and profitable for the ſtrengthening of the ſtomacke, that it may retaine and keepe the meat therein vntill it be perfectly digeſted: it likewiſe ſtayeth all kindes of fluxes, both of the belly and other parts, and alſo of bloud: which Cotiniate is made in this manner:

F Take faire Quinces, pare them, cut them in pieces, and caſt away the core, then put vnto euery pound of Quinces a pound of ſugar, and to euery pound of ſugar a pinte of water: theſe muſt bee boiled together ouer a ſtill fire till they be very ſoft, then let it be ſtrained or rather rubbed through a ſtrainer, or an hairy ſieue, which is better, and then ſet it ouer the fire to boile againe, vntill it be ſtiffe,

ſtiffe,and ſo box it vp,and as it cooleth put thereto a little Roſe water,and a few graines of Muske, well mingled together,which will giue a goodly taſte vnto the Cotiniat. This is the way to make Marmalade:

Take whole Quinces and boile them in water vntill they be as ſoft as a ſcalded codling or apple, then pill off the skin,and cut off the fleſh, and ſtampe it in a ſtone morter; then ſtraine it as you did the Cotiniate;afterward put it into a pan to drie, but not to ſeeth at all: and vnto euery pound of the fleſh of Quinces,put three quarters of a pound of ſugar,and in the cooling you may put in roſe water and a little Muske, as was ſaid before. G

There is boiled with Quinces oile which therefore is called in Greeke *Melinon*, or oile of Quinces,which we vſe,ſaith *Dioſcorides*,ſo oft as we haue need of a binding thing. H

The ſeed of Quinces tempered with water, doth make a muſcilage, or a thing like ielly,which being held in the mouth,is maruellous good to take away the roughneſſe of the tongue in hot burning feuers. I

The ſame is good to be layed vpon burnings or ſcaldings, and to be put into cliſters againſt the bloudy flix; for it eaſeth the paine of the guts,and alaieth the ſharpneſſe of biting humors. K

Many other excellent,dainty and wholeſome confections are to be made of Quinces,as ielly of Quinces,and ſuch odde conceits,which for breuitie ſake I do now let paſſe. L

Chap. 98. *Of the Medlar Tree.*

¶ *The Kindes.*

THere are diuers ſorts of Medlars,ſome greater, others leſſer: ſome ſweet, and others of a more harſh taſte: ſome with much core,and many great ſtony kernels,others fewer:and likewiſe one of Naples called *Aronia*.

1 *Meſpilus ſativa.*
The manured Medlar.

‡ 2 *Meſpilus ſativa altera.*
The other Garden Medlar.

The

¶ *The Deſcription.*

1 THe manured Medlar tree is not great, the body whereof is writhed, the boughes hard, not eaſie to be broken: the leaues be longer, yet narrower than thoſe of the apple tree, darke, greene aboue, and ſomewhat whiter and hairy below: the floures are white and great, hauing fiue leaues a piece: the fruit is ſmall, round, and hath a broad compaſſed nauell or crowne at the top: the pulpe or meat is at the firſt white, and ſo harſh or choking, that it cannot be eaten before it become ſoft; in which are contained fiue ſeeds or ſtones, which be flat and hard.

‡ 2 There is another which differeth from the laſt deſcribed, in that the leaues are longer and narrower, the ſtocke hath no prickles vpon it: the fruit alſo is larger and better taſted: in other reſpects it is like to the laſt deſcribed. This is the *Meſpilus fructu preſtantiore* of *Tragus*, and *Meſpilus Domeſtica* of *Lobel*. ‡

3 The Neapolitane Medlar tree groweth to the height and greatneſſe of an Apple tree, hauing many tough and hard boughes or branches, ſet with ſharp thornes like the white Thorne, or Hawthorne: the leaues are very much cut or iagged like the Hawthorne leaues, but greater, and more like Smallage or Parſley, which leaues before they fal from the tree do wax red: among theſe leaues come forth great tufts of floures of a pale herby colour: which being paſt, there ſucceed ſmall long fruit, leſſer than the ſmalleſt Medlar, which at the firſt are hard, and greene of colour, but when they be ripe, they are both ſoft and red, of a ſweet and pleaſant taſte: wherein is contained three ſmall hard ſtones, as in the former, which be the kernels or ſeeds thereof.

3 *Meſpilus Aronia.*
The Neapolitane Medlar.

‡ 4 *Chamæmeſpilus.*
Dwarfe Medlar.

4 There is a dwarfe kinde of Medlar growing naturally vpon the Alpes, and hils of Narbone, and on the rocks of Mount Baldus nigh Verona, which hath been by ſome of the beſt learned eſteemed for a kinde of Medlar: others, whoſe iudgements cannot ſtand with truth or probability, haue ſuppoſed it to be *Euonymus*, of the Alpes: this dwarfe Medlar groweth like a ſmall hedge tree, of four or fiue cubits high, bearing many ſmal twiggie wands or crops, beſet with many ſlender leaues greene aboue, and of a skie colour vnderneath, in ſhew like to a dwarfe Apple tree, but the fruit is very

very like the Haw,or fruit of the white Thorne,and of a red colour. ‡ The floures come forth in the Spring three or foure together,hollow,and of an herbie colour, it growes in diuers places of the Alpes: it is the *Chamæmeſpilum* of the *Aduerſ.* and the *Chamæmeſpilus Geſneri*,of *Cluſius*. ‡

¶ *The Place.*

The Medlar trees do grow in Orchards,and oftentimes in hedges among Briars and Brambles; being graſted in a white Thorne it proſpereth wonderfull well, and bringeth forth fruit twiſe or thriſe bigger than thoſe that are not graſted at all,almoſt as great as little apples: we haue diuers ſorts of them in our Orchards.

¶ *The Time.*

It is very late before Medlars be ripe,which is in the end of October, but the floures come forth timely enough.

¶ *The Names.*

The firſt is called in Greeke by *Theophraſtus* μεσπίλη: in Latine,*Meſpilus*: in high Dutch, **Meſpelbaum**: in low Dutch, **Miſpelboome**: in French,*Neſſlier*: in Engliſh, Medlar tree.

The Apple or fruit is named in Greeke, μέσπιλον: in Latine likewiſe, *Meſpilum*: in high Dutch, **Neſpel**,in low Dutch, **Miſpele**: in Italian,*Neſpolo*: in French,*Neſſle*: in Spaniſh, *Neſperas*:in Engliſh,Medlar.

Dioſcorides affirmeth,that this Medlar tree is called ἔπιμελις, and of diuers, *Sitanion*: *Galen* alſo in his booke of the faculties of ſimple medicines nameth this *Epimelis*,which is called,as he ſaith, by the countrey men in Italy,*Vnedo*,and groweth plentifully in Calabria; for vnder the name of *Meſpilus*,or Medlar tree,he meaneth no other than *Tricoccus*, which is alſo named *Aronia*.

The Neapolitane Medlar tree is called in Greeke μέσπιλα and μέσπιλος: *Galen* calleth it *Epimelis*.

The fruit hereof is called *Tricoccos*.of the three graines or ſtones that it hath:they of Naples call it *Azarolo*: and we may name it in Engliſh,three graine Medlar,or Neapolitane Medlar,or Medlar of Naples.

¶ *The Temperature.*

The Medlars are cold,drie,and aſtringent;the leaues are of the ſame nature: the dwarfe Medlar is dry,ſharpe,and aſtringent.

¶ *The Vertues.*

Medlars do ſtop the belly,eſpecially when they be greene and hard,for after that they haue been kept a while,ſo that they become ſoft and tender, they doe not binde or ſtop ſo much,but are then more fit to be eaten. A

The fruit of the three grain Medlar,is eaten both raw and boiled,and is more wholeſome for the ſtomacke. B

Theſe Medlars be oftentimes preſerued with ſugar or hony:and being ſo prepared they are pleaſant and delightfull to the taſte. C

Moreouer,they are ſingular good for women with childe: for they ſtrengthen the ſtomacke,and ſtay the lothſomneſſe thereof. D

The ſtones or kernels of the Medlars,made into pouder and drunke, doe breake the ſtone,expell grauell,and procure vrine. E

Chap. 99. *Of the Peare tree.*

¶ *The Deſcription.*

TO write of Peares and Apples in particular, would require a particular volume: the ſtocke or kindred of Peares are not to be numbred:euery country hath his peculiar fruit:my ſelfe knows one curious in graſſing and planting of fruits,who hath in one piece of ground,at the point of three ſcore ſundry ſorts of Peares,and thoſe exceeding good, not doubting but if his minde had been to ſeeke after multitudes,he might haue gotten together the like number of thoſe of worſe kinds:beſides the diuerſities of thoſe that be wilde,experience ſheweth ſundry ſorts: and therefore I thinke it not amiſſe to ſet downe the figures of ſome few with their ſeuerall titles,as well in Latine as Engliſh,and one generall deſcription for that,that might be ſaid of many, which to deſcribe apart, were to ſend an owle to Athens,or to number thoſe things that are without number.

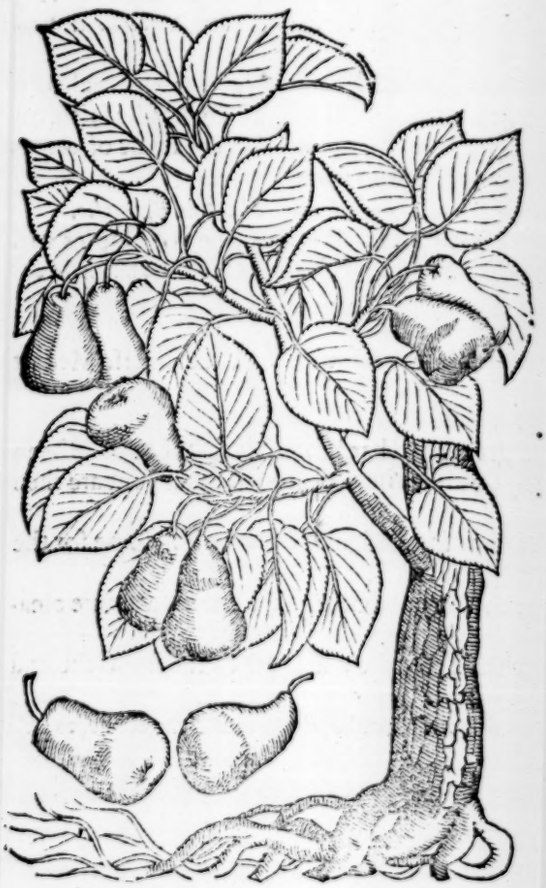
‡ Our Author in this chapter gaue eight figures with ſeuerall titles to them,ſo I pluckt a peare from each tree,and put his title to it,but not in the ſame order that he obſerued, for hee made the Katherine peare tree the ſeuenth,which I haue now made the firſt, becauſe the figure expreſſes the whole tree. ‡

¶ *The*

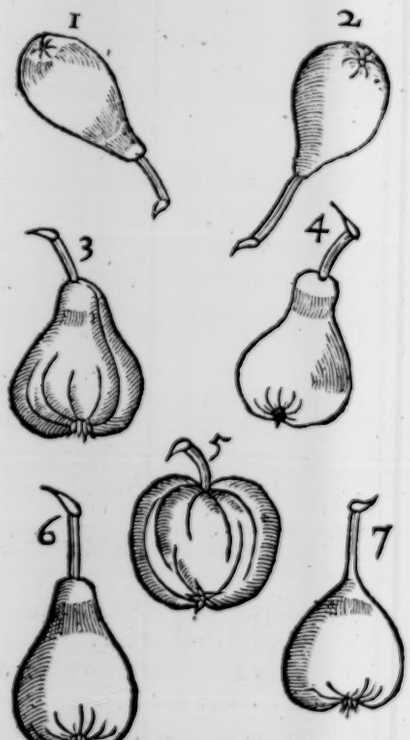
¶ *The generall deſcription.*

THe Peare tree is for the moſt part higher than the Apple tree, hauing boughes not ſpread abroad, but growing vp in height: the body is many times great: the timber or wood it ſelfe is very tractable or eaſie to be wrought vpon, exceeding fit to make moulds or prints to be grauen on, of colour tending to yellowneſſe: the leafe is ſomewhat broad, finely nicked in the edges, greene aboue, and ſomewhat whiter vnderneath: the floures are white: the Peares, that is to ſay, the fruit, are for the moſt part long, and in forme like a Top; but in greatnes, colour, forme, and taſt very much differing among themſelues; they be alſo couered with skins or coats of ſundry colours: the pulpe or meat differeth, as well in colour as taſt: there is contained in them kernels, blacke when they be ripe: the root groweth ſtrait downe with ſome braunches running aſlope.

Pirus ſuperba, ſiue Katherina.
The Katherine Peare tree.



1 *Pyra Præcocia.* The Ienneting Peare.
2 *Pyra Iacobæa.* Saint Iames Peare.
3 *Pyrum regale.* The Peare royall.



4 *Pyrum Palatinum.* The Burgomot Peare.
5 *Pyrum Cydonium.* The Quince peare.
6 *Pyrum Epiſcopatum.* The Biſhops peare.
7 *Pyrum hyemale.* The Winter peare.

¶ *The Place.*

The tame Peare trees are planted in Orchards, as be the apple trees, and by grafting, though vp on wilde ſtockes, come much varietie of good and pleaſant fruits. All theſe before ſpecified, and many ſorts more, and thoſe moſt rare and good, are growing in the ground of Maſter *Richard Pointer*, a moſt cunning and curious graffer and planter of all manner of rare fruits, dwelling in a ſmall village neere London called Twicknam; and alſo in the ground of an excellent graffer and painfull planter, M^r. *Henry Banbury*, of Touthill ſtreet neere Weſtminſter, and likewiſe in the ground of a diligent and moſt affectionate louer of plants M^r. *Warner* neere Horſey downe by London, and in diuers other grounds about London. ‡ Moſt of the beſt peares are at this time to be had with M^r. *Iohn Millen* in Old-ſtreet, in whoſe nurſery are to be found the choiſeſt fruits this kingdom yeelds.‡

¶ *The Time.*

The floures do for the moſt part come forth in Aprill, the leaues afterwards: all peares are not ripe at one time: ſome be ripe in Iuly, others in Auguſt, and diuers in September and later.

¶ *The Names.*

The tame or Orchard peare tree is called in Greeke ἀπίος, or with a double ππ ἄπιος: in Latine, *Pyrus vrbana,*

vrbana, or *Cultiua*: of *Tarentinus* in his Geoponikes: in high Dutch, **Birrbaum**, in low Dutch, **Peerboom**: in French, *Porrier*.

The Peare or fruit it selfe is called in Greeke: in Latine, *Pyrum*: in high Dutch, **Birn**: in low Dutch, **Peere**: in Italian, *Pere*: in French, *Poyre*: in Spanish, *Peras*: in English, Peare.

¶ *The Temperature and Vertues.*

Leauing the diuers and sundry surnames of Peares, let vs come to the faculties which the Physitions ought to know, which also varie according to the differences of their tastes: for some Peares are sweet, diuers fat and vnctuous, others soure, and most are harsh, especially the wilde peares, and some consist of diuers mixtures of tastes, and some hauing no taste at all, but as it were a waterish taste. A

All Pears are cold, and all haue a binding qualitie and an earthie substance: but the Choke pears and those that are harsh be more earthie, and the sweet ones lesse: which substance is so full of superfluous moisture in some, as that they cannot be eaten raw. All manner of Peares doe binde and stop the belly, especially the Choke and harsh ones, which are good to be eaten of those that haue the laske and the bloudy flix. B

The harsh and austere Peares may with good successe be laied vpon hot swellings in the beginning, as may be the leaues of the tree, which do both binde and coole. C

Wine made of the iuice of peares called in English, Perry, is soluble, purgeth those that are not accustomed to drinke thereof, especially when it is new; notwithstanding it is as wholsome a drink being taken in small quantitie as wine; it comforteth and warmeth the stomacke, and causeth good digestion. D

Chap. 100. *Of the wilde Peare tree.*

¶ *The Kindes.*

As there be sundry kindes of the manured Peares, so are there sundry wilde; wherof to write apart were to small purpose: therefore one description with their seuerall titles shall be sufficient for their distinctions.

Pyrum strangulatorium maius.
The great Choke peare.

¶ *The generall Description.*

The wilde Peare tree grows likewise great, vpright, full of branches, for the most part Pyramides like, or of the fashion of a steeple, not spread abroad as is the Apple or Crab tree: the timber of the trunke or body of the tree is very firme and sollid, and likewise smooth, a wood very fit to make diuers sorts of instruments of, as also the hafts of sundry tooles to worke withal; and likewise serueth to be cut into many kindes of moulds, not only such prints as these figures are made of, but also many sorts of pretty toies, for coifes, brest-plates, and such like, vsed among our English gentlewomen: the branches are smooth, couered with a blackish barke, very fragile or easie to break, whereon do grow leaues, in some greater, in other lesser: the floures are like those of the manured Pear tree, yet some whiter than others: the fruit differ not in shape, yet some greater than others; but in taste they differ among themselues in diuers points, some are sharpe, soure, and of an austere taste; some more pleasant, others harsh and bitter, and some of such a choking taste, that they are not to be eaten of hogs & wild beasts, much lesse of men: they also differ in colour, euery circumstance whereof to distinguish apart would greatly enlarge our volume, and bring to the Reader small profit or commoditie.

1 *Pyrum ſtrangulatorium maius.*
The great Choke peare:

2 *Pyrum ſtrangulatorium minus.*
The ſmall Choke peare.

3 *Pyrus ſylueſtris.*
The wilde hedge Peare tree.

4 *Pyrus ſylueſtris minima.*
The wilde Crab peare tree.

5 *Pyrus pedicularia.*
The Lowſie wilde peare.

6 *pyrus Coruina.*
The Crow peare tree.

¶ *The Place.*

The wilde peares grow of themſelues without manuring in moſt places, as woods, or in the borders of fields, and neere to high waies.

¶ *The Time.*

The time of wilde peares anſwereth the tame or manured peare, notwithſtanding for the moſt part they are not ripe much before Winter.

¶ *The Names.*

The wilde peare tree is called in Latine, *Pyrus ſylueſtris* and *Pyraſter*: in Greeke, [illegible] by which name both the fruit and tree are knowne. Peares haue diuers ſyrnames among the antient Writers, and ſpecially in *Pliny*, in his 15. booke, 15. chapter, none of which are knowne to the later Writers (or not deſired:) euery citie or euery countrey haue names of themſelues, and peares haue alſo diuers names according to to the places.

The Temperature.

All peares are of a cold temperature, and the moſt part of them of a binding qualitie and an earthie ſubſtance.

¶ *The Vertues.*

The vertues of the wilde peares are referred vnto the garden peares as touching their binding facultie, but are not to be eaten, becauſe their nouriſhment is little and bad.

Chap. 101. *Of the Apple tree.*

¶ *The Kindes.*

THe Latine name *Malus* reacheth far among the old Writers, and is common to many trees, but we will briefely firſt intreat of *Mali*, properly called Apple trees, whoſe ſtocke or kindred is ſo infinite, that we haue thought it not amiſſe, to vſe the ſame order or method with Apples that wee haue done with peares; that is, to giue them ſeuerall titles in Latine and Engliſh, and one generall deſcription for the whole.

¶ *The Deſcription.*

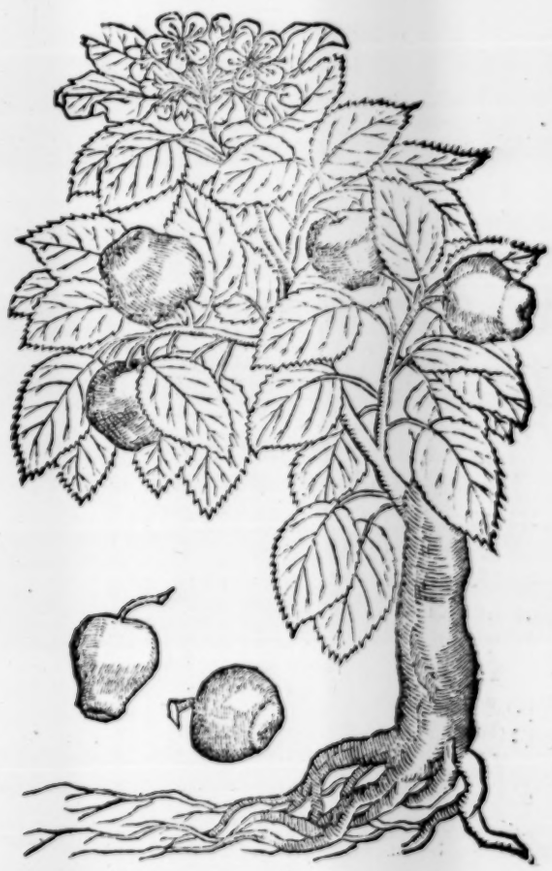
THe Apple tree hath a body or truncke commonly of a meane bigneſſe, not very high, hauing long armes or branches, and the ſame diſordered: the barke ſomewhat plaine, and not verie rugged: the leaues bee alſo broad, more long than round, and finely nicked in the edges. The floures are whitiſh tending vnto a bluſh colour. The fruit or Apples doe differ in greatneſſe, forme, colour, and taſte; ſome couered with a red skinne, others yellow or greene, varying infinitely

nitely according to the ſoyle and climate, ſome very great, ſome little, and many of a middle ſort; ſome are ſweet of taſte, or ſomething ſoure; moſt be of a middle taſte betweene ſweet and ſoure, the which to diſtinguiſh I thinke it impoſſible; notwithſtanding I heare of one that intendeth to write a peculiar volume of Apples, and the vſe of them; yet when he hath done what hee can doe, hee hath done nothing touching their ſeuerall kindes to diſtinguiſh them. This that hath beene ſaid ſhall ſuffice for our Hiſtorie.

‡ Our Author gaue foure figures more out of *Tabernamontanus*, with theſe titles. 3. *Malum reginale*, the Queening or Queene of Apples. 5 *Platomela ſive Pyra æſtiua*: The Sommer Pearemaine. 6 *Platurchapia ſive Pyra hyemalia*: the Winter Pearemaine.

1 *Malus Carbonaria.*
The Pome Water tree.

2 *Malus Carbonaria longo fructu.*
The Bakers ditch Apple tree.



¶ *The Place.*

The tame and graffed Apple trees are planted and ſet in gardens and orchards made for that purpoſe: they delight to grow in good and fertile grounds: Kent doth abound with apples of moſt ſorts. But I haue ſeene in the paſtures and hedge-rows about the grounds of a worſhipful gentleman dwelling two miles from Hereford called Maſter *Roger Bodnome*, ſo many trees of all ſorts, that the ſeruants drinke for the moſt part no other drinke but that which is made of Apples; The quantity is ſuch, that by the report of the Gentleman himſelfe, the Parſon hath for tithe many hogſheads of Syder. The hogs are fed with the fallings of them, which are ſo many, that they make choiſe of thoſe Apples they do eat, who will not taſte of any but of the beſt. An example doubtles to be followed of Gentlemen that haue land and liuing: but enuie ſaith, the poore wil break down our hedges, and we ſhall haue the leaſt part of the fruit) but forward in the name of God, graffe, ſet, plant and nouriſh vp trees in euery corner of your grounds, the labour is ſmall, the coſt is nothing, the commoditie is great, your ſelues ſhall haue plenty, the poore ſhall haue ſomewhat in time of want to relieue their neceſſitie, and God ſhall reward your good mindes and diligence.

¶ *The Time.*

They bloom about the end of Aprill, or in the beginning of May. The forward apples be ripe about the Calends of Iuly, others in September.

¶ *The Names.*

The Apple tree is called in Greeke μηλέα: in Latine, *Malus* and *Pomus*: in high Dutch, **Opffelbaum**: in low Dutch, **Appelboom**: in French, *Pommier*: in Engliſh, Apple-tree.

The Grecians name the fruit μῆλον: the Latines, *Malum* or *Pomum*: in high Dutch, **Opfell**: in low Dutch, **Appel**: in French and Spaniſh, *Manſanas*: in Engliſh, Apple.

¶ *The Temperature.*

All Apples be of temperature cold and moiſt, and haue ioined with them a certaine excrementall or ſuperfluous moiſture: but as they be not all of like coldneſſe, ſo neither haue they like quantitie of ſuperfluous moiſture. They are ſooneſt rotten that haue greateſt ſtore of moiſture, and they may be longer kept in which there is leſſe ſtore: for the abundance of excrementall moiſture is the cauſe why they rot.

Sweet Apples are not ſo cold and moiſt, which being roſted or boyled, or otherwiſe kept, retaine or keepe the ſoundneſſe of their pulpe.

They yeeld more nouriſhment, and not ſo moiſt a nouriſhment as do the other Apples, and doe not ſo eaſily paſſe through the belly.

Soure Apples are colder and alſo moiſter: the ſubſtance or pulpe of theſe when they be boiled doth run abroad, and retaineth not his ſoundneſſe: they yeeld a leſſer nouriſhment, and the ſame raw and cold.

They do eaſily and ſpeedily paſſe through the belly, and therefore they do mollifie the belly, eſpecially being taken before meat.

Harſh or Auſtere Apples being vnripe, are cold; they ingender groſſe bloud, and great ſtore of winde, and often bring the Collicke.

Thoſe Apples which be of a middle taſte containe in them oftentimes two or three ſorts of taſts, and yet do they retaine the faculties of the other.

¶ *The Vertues.*

A Roſted Apples are alwaies better than the raw, the harm whereof is both mended by the fire, and may alſo be corrected by adding vnto them ſeeds or ſpices.

B Apples be good for an hot ſtomacke: thoſe that are auſtere or ſomewhat harſh doe ſtrengthen a weake and feeble ſtomacke proceeding of heat.

C Apples are alſo good for all inflammations or hot ſwellings, but eſpecially for ſuch as are in their beginning, if the ſame be outwardly applied.

D The iuice of Apples which be ſweet and of a middle taſte, is mixed in compoſitions of diuers medicines, and alſo for the tempering of melancholy humours, and likewiſe to mend the qualities of medicines that are dry: as are *Serapium ex pomis Regis Saporis*, *Confectio Alkermes*, and ſuch like compoſitions.

E There is likewiſe made an ointment with the pulpe of Apples and Swines greaſe and Roſe water, which is vſed to beautifie the face, and to take away the roughneſſe of the skin, which is called in ſhops *Pomatum*: of the Apples whereof it is made.

F The pulpe of the roſted apples, in number foure or fiue, according to the greatneſſe of the Apples, eſpecially of the Pome-water, mixed in a wine quart of faire water, laboured together vntill it come to be as apples and Ale, which wee call Lambes Wooll, and the whole quart drunke laſt at night, within the ſpace of an houre, doth in one night cure thoſe that piſſe by droppes with great anguiſh and dolour; the ſtrangurie, and all other diſeaſes proceeding of the difficultie of making water; but in twiſe taking it, it neuer faileth in any: oftentimes there happeneth with the foreſaid diſeaſes the Gonorrhæa, or running of the Raines, which it likewiſe healeth in thoſe perſons, but not generally in all; which my ſelfe haue often proued, and gained thereby both crownes and credit.

G The leaues of the tree do coole and binde, and be alſo counted good for inflammations, in the beginning.

H Apples cut in pieces, and diſtilled with a quantitie of Camphere and butter-milke, take away the markes and ſcarres gotten by the ſmall pockes, being waſhed therewith when they grow vnto their ſtate and ripeneſſe: prouided that you giue vnto the patient a little milk and Saffron, or milk and mithridate to drinke, to expell to the extreme parts that venome which may lie hid, and as yet not ſeene.

Chap. 102 *Of the Wilding or Crab tree.*

¶ *The Kindes.*

Like as there be diuers manured Apples, ſo are there ſundry wilde Apples, or Crabs, whereof to write apart were to ſmall purpoſe, and therefore one deſcription ſhall ſuffice for the reſt.

Malus ſylueſtris.
The wilding or Crab tree.

¶ *The generall Deſcription.*

THere be diuers wilde Apple trees not huſbanded, that is to ſay, not grafted; the fruit whereof is harſh and binding: for by grafting both Apples and Peares become more milde and pleaſant. The crab or wilding tree growes oftentimes to a reaſonable greatneſſe, equall with the Apple tree: the wood is hard, firme, and ſollid; the barke rough; the branches or boughes many; the floures and fruit like thoſe of the apple tree, ſome red, others white, ſome greater, others leſſer: the difference is known to all, therefore it ſhall ſuffice what hath been ſaid for their ſeuerall diſtinctions: we haue in our London gardens a dwarfe kinde of ſweet Apple, called *Chamæmalus*, the dwarfe apple tree, or Paradiſe apple, which beareth apples very timely without grafting.

‡ Our Author here alſo (out of *Tabernamontanus*) gaue foure figures, whereof I onely retaine the beſt, with their ſeueral titles. 1 *Malus ſylueſtris rubens*. The great wilding or red Crab tree: 2 *Malus ſylueſtris alba*. The white wilding or Crab tree: 3 *Malus ſylueſtris minor*. The ſmaller Crab tree: 4 *Malus duracina ſylueſtris*. The choking leane Crab-tree. ‡

¶ *The Place.*

The Crab tree groweth wilde in woods and hedge rowes almoſt euery where.

¶ *The Time.*

The time anſwereth thoſe of the garden.

¶ *The Names.*

Their titles doth ſet forth their names in Latine and Engliſh.

¶ *The Temperature.*

Of the temperature of wilde apples hath beene ſufficiently ſpoken in the former Chapter.

¶ *The Vertues.*

The iuice of wilde Apples or crabs taketh away the heate of burnings, ſcaldings, and all inflam- A
mations: and being laid on in ſhort time after it is ſcalded, it keepeth it from bliſtering.

The iuice of crabs or Veriuice is aſtringent or binding, and hath withall an abſterſiue or clenſing B
qualitie, beeing mixed with hard yeeſt of Ale or Beere, and applied in manner of a cold ointment, that is, ſpread vpon a cloth firſt wet in the Veriuice and wrung out, and then laid to, taketh away the heat of Saint Anthonies fire, all inflammations what ſoeuer, healeth ſcab'd legs, burnings and ſcaldings whereſoeuer it be.

Chap. 103. *Of the Citron, Limon, Orange, and Aſſyrian Apple trees.*

¶ *The Kindes.*

THe Citron tree is of kindred with the Limon tree, the Orange is of the ſame houſe or ſtocke, and the Aſſyrian Apple tree claimeth a place as neereſt in kinred and neighbourhood: wherefore I intend to comprehend them all in this one chapter.

¶ *The Deſcription.*

1 THe Citron tree is not very great, hauing many boughes or branches, tough and pliable, couered with a greene barke: whereon do grow greene leaues, long, ſomewhat broad, very ſmooth, and ſweet of ſmell like thoſe of the Bay tree: among which come forth here and there certaine prickles, ſet far in ſunder: from the boſome whereof come forth ſmal floures, conſiſting of fiue little leaues, of a white colour tending to purple, with certaine threds like haires growing in the middle: the fruit is long, greater many times than the Cucumber, often leſſer, and not much

1 *Malus medica.*
The Pome Citron tree.

2 *Malus Limonia.*
The Limon tree.

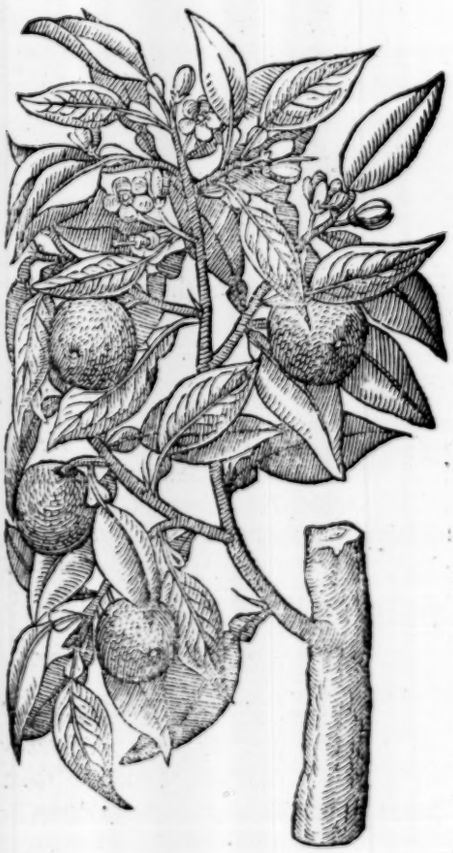
greater than the Limon: the barke or rinde is of a light golden colour, ſet with diuers knobs or bumps, and of a very pleaſant ſmell: the pulpe or ſubſtance next vnto it is thick, white, hard, hauing a kinde of aromaticall or ſpicie ſmell, almoſt without any taſte at all: the ſofter pulpe within that is not ſo firme or ſolid, but more ſpungie, and full of a ſower iuice, in which the ſeed lieth hid, greater and thicker than a graine of Barley.

2 The Limon tree is like vnto the Pome Citron tree in growth, thorny branches, and leaues of a pleaſant

a pleaſant ſweet ſmell, like thoſe of the Bay-tree: the floures hereof are whiter than thoſe of the Citron tree, and of a moſt ſweet ſmell: the fruit is long and thicke, leſſer than the Pome Citron: the rinde is yellow, ſomewhat bitter in taſte, and ſweet of ſmell: the pulpe is white, more in quantitie than that of the Citron, reſpecting the bignes; in the middle part whereof is conteined more ſoft ſpungie pulpe, and fuller of ſoure juice: the ſeeds are like thoſe of the Pome Citron.

3 The Orenge tree groweth vp to the height of a ſmall Peare tree, hauing many thornie boughes or branches, like thoſe of the Citron tree: the leaues are alſo like thoſe of the Bay-tree, ‡ but that they differ in this, that at the lower end next the ſtalke there is a leſſer leafe made almoſt after the vulgar figure of an heart, whereon the bigger leafe doth ſtand, or is faſtned: ‡ & they are of a ſweet ſmell: the floures are white, of a moſt pleaſant ſweet ſmell alſo: the fruit is round like a ball, euery circumſtance belonging to the forme is very well knowne to all; the taſte is ſoure, ſometimes ſweet, and often of a taſte betweene both: the ſeeds are like thoſe of the Limon.

3 *Malus arantia.*
The Orange tree.



4 *Malus Aſſyria.*
The Aſſyrian Apple tree.

4 The Aſſyrian Apple tree is like vnto the Orange tree: the branches are like: the leaues are greater: the floures are like thoſe of the Citron tree: the fruit is round, three times as big as the Orange: the barke or peeling is thicke, rough, and of a pale yellow colour, wherein appeare often as it were ſmall clifts or crackes: the pulpe or inner ſubſtance is full of iuice, in taſte ſharpe, as that of the Limon, but not ſo pleaſant: the ſeeds are like thoſe of the Citron.

¶ *The Place.*

The Citron, Limon, and Orange trees do grow eſpecially on the ſea coaſts of Italy, and on the Iſlands of the Adriaticke Turrhene, and alſo Ægæan Seas, & likewiſe on the maine land, neer vnto meeres and great lakes: there is alſo great ſtore of them in Spaine, but in places eſpecially ioining to the ſea, or not farre off: they are alſo found in certaine prouinces of France which lie vpon the midland ſea. They were firſt brought out of Media, as not onely *Plinie* writeth, but alſo the Poet *Virgil* affirmeth in the ſecond book of his Georgickes, writing of the Citron tree after this maner:

Media fert triſtes ſuccos, tardumque ſaporem
Felicis mali, quo non præſentius vllum,
Pocula ſi quando ſæuæ infecere nouercæ,

Miſcuerunt que

Miſcueruntque herbas, & non innoxia verba,
Auxilium venit, ac membris agit atra venena.
Ipſa ingens arbos, facieſque ſimillima Lauro;
Et, ſi non alium late iactaret odorem,
Laurus erit; folia haud vllis labentia ventis;
Flos apprime tenax. Animas & olentia Medi
Ora fouent illo, & ſenibus medicantur anhelis.

The Countrey Media beareth iuyces ſad,
And dulling taſtes of happy Citron fruit,
Than which, no helpe more preſent can be had,
If any time ſtepmothers worſe than brute
haue poyſon'd pots, and mingled berbs of ſute
With hurtfull charmes: this Citron fruit doth chaſe
Blacke venome from the body in euery place.
The tree it ſelfe in growth is large and big,
And very like in ſhew to th' Laurell tree;
And would be thought a Laurell, leafe and twig,
But that the ſmell it caſts doth diſagree:
The floure it holds as faſt as floure may be:
Therewith the Medes a remedie do finde
For ſtinking breaths and mouthes a cure moſt kinde,
And helpe old men which hardly fetch their winde.

¶ *The Time.*

Theſe trees be alwaies greene, and do, as *Pliny* ſaith, beare fruit at all times of the yere, ſome falling off, others waxing ripe, and others newly comming forth.

¶ *The Names.*

The firſt is called in Greeke, Μηλα μηδικα: in Latine, *Malus Medica*, and *Malus Citria*: in Engliſh, Citron tree, and Pomecitron tree.

The fruit is named in Greeke, Μηλον μηδικον: in Latine, *Malum Medicum*, and *Malum Citrium*: and *Citromalum*. *Æmilyanus* in *Athenæus* ſheweth, that *Iuba* King of Mauritania hath made mention of the Citron, who ſaith that this Apple is named among them, *Malum Heſpericum*: *Galen* denieth it to be called any longer *Malum Medicum*, but *Citrium*; and ſaith, that they who call it *Medicum* do it to the end that no man ſhould vnderſtand what they ſay: the Apothecaries call theſe apples *Citrones*: in high-Dutch, **Citrin opffel, Citrinaten**: in low-Dutch, **Citroenen**: in Italian, *Citroni*, and *Cedri*: in Spaniſh, *Cidras*: in French, *Citrons*: in Engliſh, Citron Apple, and Citron.

The ſecond kinde of Citron is called in Latine, *Limonium Malum*; in ſhops, *Limones*: in French, *Limons*: in low-Dutch, **Limonen**: in Engliſh, Limon, and Lemon.

The third is named in Latine, *Malum anarantium* or *Anerantium*: and of ſome *Aurantium*: of others, *Aurengium*, of the yellow colour of gold: ſome would haue them called *Arantia*, of *Arantium*, a towne in Achaia or Arania, of a countrey bearing that name in Perſia: it is termed in Italian *Arancio*: in high-Dutch, **Pomeranken**: in low-Dutch, **Aracngie Appelen**: in French, *Pommes d' Orenges*: in Spaniſh, *Naranſas*: in Engliſh, Orenges.

The fourth is named of diuers, *Pomum Aſſyrium*, or the Citron of Aſſyria, and may be Engliſhed Adams Apple, after the Italian name; and among the vulgar ſort of Italians, *Lomie*, of whom it is alſo called *Pomum Adami*, or Adams Apple; and that came by the opinion of the common rude people, who thinke it to be the ſame Apple which *Adam* did eate of in Paradiſe, when he tranſgreſſed Gods commandment; whereupon alſo the prints of the biting appeare therein, as they ſay: but others ſay that this is not the Apple, but that which the Arabians do call *Muſa* or *Moſa*, whereof *Auicen, cap.* 395. maketh mention: for diuers of the Iewes take this for that through which by eating, *Adam* offended, as *Andrew Theuet* ſheweth.

¶ *The Temperature and Vertues.*

A All theſe fruits conſiſt of vnlike parts, and much differing in facultie.
B The rindes are ſweet of ſmell, bitter, hot, and dry.
C The white pulpe is cold, and containeth in it a groſſe iuice, eſpecially the Citron.
D The inner ſubſtance or pap is ſoure, as of the Citrons and Limons, cold and dry, with thinneſſe of parts.
E The ſeed becauſe it is bitter is hot and dry.
F The rinde of the Pomecitron is good againſt all poyſons, for which cauſe it is put into treacles and ſuch like confections.

It is

It is good to be eaten againſt a ſtinking breath, for it maketh the breath ſweet; and being ſo taken it comforteth the cold ſtomacke exceedingly. G

The white, ſound, and hard pulpe is now and then eaten, but very hardly concocted, and ingendreth a groſſe, cold, and phlegmaticke iuyce, but being condite with ſugar, it is both pleaſant in taſte, and eaſie to be digeſted, more nouriſhing, and leſſe apt to obſtruction and binding or ſtopping. H

Galen reporteth, that the inner iuice of the Pomecitron was not wont to be eaten, but it is now vſed for ſauce; and being often vſed, it repreſſeth choler which is in the ſtomacke, and procures appetite: it is excellent good alſo to be giuen in vehement and burning feuers, and againſt all peſtilent and venomous or infectious diſeaſes: it comforteth the heart, cooleth the inward parts, cutteth, diuideth, and maketh thin, groſſe, tough, and ſlimy humors. I

Of this foreſaid ſharpe iuice there is a ſyrrup ptepared, which is called in ſhops, *Syrupus de Acetoſitate Citri*, very good againſt the foreſaid infirmities. K

Such a ſirrup is alſo prepared of the ſharpe iuice of Limons, of the ſame quality and operation, ſo that in ſtead of the one, the other will ſerue very well. L

A dozen of Orenges cut in ſlices and put into a gallon of water, adding thereto an ounce of Mercurie ſublimate, and boiled to the conſumption of the halfe, cureth the itch and mangineſſe of the body. M

Men in old time (as *Theophraſtus* writeth in his fourth booke) did not eate Citrons, but were contented with the ſmell, and to lay them amongſt cloathes, to preſerue them from Moths. N

As often as need required they vſed them againſt deadly poyſons; for which thing they were eſpecially commended euen by *Virgils* verſes, which we haue before alledged. O

Athenæus, lib. 3. hath extant a ſtory of ſome that for certaine notorious offences were condemned to be deſtroyed of Serpents, who were preſerued and kept in health and ſafetie by the eating of Citrons. P

The diſtilled water of the whole Limons, rinde and all, drawne out by a glaſſe Still, takes away tetters and blemiſhes of the skin, and maketh the face faire and ſmooth. Q

The ſame being drunke prouoketh vrine, diſſolueth the ſtone, breaketh and expelleth it. R

The rinde of Orenges is much like in facultie to that of the Citrons and Limons, yet it is ſo much the more hot as it is more biting and bitter. S

The inner ſubſtance or ſoure pap which is full of iuice is of like facultie, or not much inferiour to the facultie of the pap of Citrons or Limons; but the ſweet pap doth not much coole or drie, but doth temperatly heate and moiſten, being pleaſant to the taſte: it alſo nouriſheth more than doth the ſoure pap, but the ſame nouriſhment is thin and little; and that which is of a middle taſt, hauing the ſmacke of wine, is after a middle ſort more cold than ſweet, and leſſer cold than ſoure: the ſweet and odoriferous floures of orenges be vſed of the perfumers in their ſweet ſmelling ointments. T

Two ounces of the iuice of Limons, mixed with the like quantitie of the ſpirit of wine, or the beſt *Aqua vitæ* (but the ſpirit of wine rectified is much better) and drunk at the firſt approch of the fit of an ague, taketh away the ſhaking preſently: the medicine ſeldome faileth at the ſecond time of the taking thereof perfectly to cure the ſame; but neuer at the third time, prouided that the Patient be couered warme in a bed, and cauſed to ſweat. V

There is alſo diſtilled out of them in a glaſſe ſtill, a water of a maruellous ſweet ſmell, which being inwardly taken in the weight of an ounce and a halfe, moueth ſweat, and healeth the ague. X

The ſeed of all theſe doth kill wormes in the belly, and driueth them forth: it doth alſo mightily reſiſt poyſon, and is good for the ſtinging of ſcorpions, if it be inwardly taken. Y

Thoſe which be called Adams Apples are thought to be like in faculties to the ſoure iuyce, eſpecially of the Limons, but yet they be not ſo effectuall. Z

Chap. 104. *Of the Cornell tree.*

¶ *The Deſcription.*

THe tame Cornell tree groweth ſomtime of the height and bigneſſe of a ſmal tree, with a great number of ſprings: it is couered with a rugged barke: the wood or timber is very hard and dry, without any great quantity of ſap therein: the leaues are like vnto the Dog berry leaues, crumpled rugged, and of an ouerworne colour: the floures grow in ſmall bunches before any leaues do appeare, of colour yellow, and of no great value (they are ſo ſmall) in ſhew like the floures of the

Olive

Cornus mas.
The male Cornel tree.

Oliue tree: which being vaded, there come ſmall long berries, which at the firſt bee greene, and red when they be ripe; of an auſtere and harſh taſte, with a certaine ſoureneſſe: within this berry is a ſmall ſtone, exceeding hard, white within like that of the Oliue, wherunto it is like both in the faſhion and oftentimes in the bigneſſe of the fruit.

¶ *The Place.*

This groweth in moſt places of Germanie without manuring: it groweth not wild in England. But yet there be ſundry trees of them growing in the gardens of ſuch as loue rare and dainty plants, whereof I haue a tree or two in my garden.

¶ *The Time.*

The tame Cornell tree floureth ſometime in February, & commonly in March, and afterwards the leaues come forth as an vntimely birth: the berries or fruit are ripe in Auguſt.

¶ *The Names.*

The Grecians call it Κρανία: the Latines, *Cornus*: in high-Dutch, **Cornelbaum**: in low-Dutch **Cornoele boom**: the Italians, *Corniolo*: in French, *Cornillier*: in Spaniſh, *Cornizolos*: in Engliſh, the Cornell tree, and the Cornelia tree; of ſome, long Cherrie tree.

The fruit is named in Latine, *Cornum*: in high-Dutch, **Cornell**: in low-Dutch, **Cornoele**: in Italian, *Cornole*: in Engliſh, Cornel berries and Cornelian Cherries.

This is *Cornus mas Theophraſti*, or *Theophraſtus* his male Cornell tree; for he ſetteth downe two ſorts of the Cornell trees, the male and the female: he maketh the wood of the male to be ſound, as in this Cornell tree; which we both for this cauſe and for others alſo haue made to be the male. The female is that which is commonly called *Virga ſanguinea*, or Dogs berry tree, and *Cornus ſylueſtris*, or the wilde Cornell tree, of which we will treat in the next Chapter following.

¶ *The Temperature and Vertues.*

A The fruit of the Cornell tree hath a very harſh or choking taſte: it cooleth, drieth, and bindeth, yet may it alſo be eaten, as it is oftentimes.

B It is a remedie againſt the laske and bloudy flix, it is hurtfull to a cold ſtomacke, and increaſeth the rawneſſe thereof: the leaues and tender crops of the tree are likewiſe of an harſh and choking taſte, and do mightily dry.

C They heale greene wounds that are great and deepe, eſpecially in hard bodies, but they are not ſo good for ſmall wounds and tender bodies, as *Galen* writeth.

Chap. 105.

Of the female Cornell or Dog-Berry tree.

¶ *The Deſcription.*

That which the Italians call *Virga ſanguinea*, or the bloudy Rod, is like to the Cornel tree, yet it groweth not into a tree, but remaineth a ſhrub: the yong branches thereof are iointed, and be of an obſcure red purple: they haue within a white ſpongie pith like that of Elder, but the old ſtalks are hard and ſtiffe, the ſubſtance of the which is alſo white, and anſwerable to thoſe of the Cornell tree: the leaues are alſo like, the middle rib whereof as alſo the brittle foot-ſtalkes are ſomewhat reddiſh: at the top whereof ſtand white floures in ſpoky rundles, which turne into berries,

Cornus fœmina.
The Dog-berry tree.

greene at the firſt, and of a ſhining black colour when they be ripe, in taſte vnpleaſant, and not cared for of the birds.

¶ *The Place.*

This ſhrub groweth in hedges and buſhes in euery countrey of England.

¶ *The Time.*

The floures come forth in the Spring in the moneth of Aprill: the berries are ripe in Autumne.

¶ *The Names.*

The Italians do commonly call it *Sanguino*, and *Sanguinello*: *Petrus Creſcentius* termes it *Sanguinus*; and *Matthiolus*, *Virga ſanguinea*: *Pliny*, *lib.* 24. *cap.* 10. hath written a little of *Virga Sanguinea*: Neither is *Virga Sanguinea*, ſaith hee, counted more happy, the inner barke whereof doth breake open the ſcarres which they before haue healed. It is an hard thing, or peraduenture a raſh part, to affirme by theſe few words, that *Pliny* his *Virga Sanguinea* is the ſame that the Italian *Sanguino* is. This is called in high-Dutch, **Hartriegel**: in low-Dutch, **wilde Cornoelle**, that is to ſay, *Cornus ſylueſtris*, or wilde Cornell tree: and in French, *Cornellier ſauuage*: in Engliſh, Hounds tree, Hounds berry, Dogs berry tree, Pricke-Timber: in the North countrey they call it Gaten tree, or Gater tree; the berries whereof ſeem to be thoſe which *Chaucer* calleth Gater berries: *Valerius Cordus* nameth it ψευδοκρανία, that is to ſay, *Falſa* or *Spuria Cornus*, falſe or baſtard Cornell tree: this ſeemeth alſo to be *Theophraſtus* his θηλυκρανία, or *Cornus fœmina*, female Cornell tree. This hath little branches hauing pith within, neither be they hard nor ſound, like thoſe of the male: the fruit is ἄβρωτος, that is, not fit to be eaten, and a late fruit which is not ripe till after the Autumne Æquinoctiall; and ſuch is the wilde Cornell tree or Gater tree, the yong and tender branches whereof be red, and haue (as wee haue written) a pith within: the fruit or berries be vnpleaſant, and require a long time before they can be ripe.

¶ *The Temperature.*

The berries hereof are of vnlike parts; for they haue ſome hot, bitter, and clenſing, and very many cold, dry, harſh, and binding, yet they haue no vſe in medicine.

¶ *The Vertues.*

Matthiolus writeth, that out of the berries firſt boiled, and afterwards preſſed, there iſſueth an oyle which the Anagnian countrey people do vſe in lamps: but it is not certaine, nor very like, that the barke of this wilde Cornell tree hath that operation which *Pliny* reporteth of *Virga Sanguinea*; for he ſaith, as we haue already ſet downe, that the inner barke thereof doth break and lay open the ſcars which they before haue healed. A

Chap. 106. *Of Spindle tree or Pricke-wood.*

¶ *The Deſcription.*

1 Prickewood is no high ſhrub, of the bigneſſe of the Pomegranat tree: it ſpreadeth farre with his branches: the old ſtalks haue their barke ſomewhat white; the new and thoſe that be lately growne be greene, and foure ſquare: the ſubſtance of the wood is hard, and mixed with a light yellow: the leaues be long, broad, ſlender, and ſoft: the floures be white, many ſtanding vpon one foot-ſtalke, like almoſt to a ſpoked rundle: the fruit is foure ſquare, red, and containing foure white ſeeds, euery one whereof is couered with a yellow coat, which being taken off giueth a yellow die.

2 This

1 *Euonymus Theophraſti.*
Engliſh Prick-timber tree.

2 *Euonymus latifolius.*
Broad leafed Spindle tree.

3 *Euonymus Pannonicus.*
Hungarie Spindle tree.

2 This other ſort of *Euonymus* groweth to the forme of an hedge tree, of a meane bigneſſe, the trunke or body whereof is of the thickneſſe of a mans leg, couered with a rough or ſcabbed barke of an ouerworn ruſſet colour. The branches thereof are many, ſlender, and very euen, couered with a greene barke whileſt they be yet young and tender; they are alſo very brittle, with ſome pith in the middle like that of the Elder. The leaues are few in number, full of nerues or ſtrings diſperſed like thoſe of Plantaine, in ſhape like thoſe of the Pomecitron tree, of a lothſome ſmell and bitter taſte: amongſt which come forth ſlender footſtalks very long and naked, whereon do grow ſmall floures conſiſting of foure ſmall leaues like thoſe of the Cherrie tree, but leſſer, of a white colour tending to a bluſh, with ſome yellowneſſe in the middle: after commeth the fruit, which is larger than the former, and as it were winged, parted commonly into foure, yet ſomtimes into fiue parts; and opening when it is ripe, it ſheweth the white graines filled with a yellow pulpe. The root is tough and wooddy, diſperſing it ſelfe farre abroad vnder the vpper cruſt of the earth.

3 The

3 The ſame Author ſetteth forth another ſort which he found in the mountaines of Morauia and Hungary, hauing a trunke or ſtocke of the height of three or foure cubits, couered with a bark greene at the firſt, afterward ſprinkled ouer with many blacke ſpots: the boughes are diuided toward the top into diuers ſmall branches, very brittle and eaſie to breake, whereon are placed leaues by couples alſo, one oppoſite to another, ſomewhat ſnipt about the edges, in ſhape like thoſe of the great Myrtle, of an aſtringent taſte at the beginning, after ſomewhat hot and bitter: amongſt which come forth ſmall floures ſtanding vpon long naked foot-ſtalkes, conſiſting of foure little leaues of a bright ſhining purple colour, hauing in the middle ſome few ſpots of yellow: after commeth the fruit, foure cornered, not vnlike to the common kinde, of a ſpongious ſubſtance, and a gold yellow colour: wherein is contained not red berries like the other, but blacke, very like to thoſe of *Fraxinella*, of a ſhining blacke colour like vnto burniſhed horne; which are deuoured of birds when they be ripe, and the rather becauſe they fall of themſelues out of their huskes, otherwiſe the bitterneſſe of the husks would take away the delight.

¶ *The Place.*

The firſt commeth vp in vntoiled places, and among ſhrubs, vpon rough bankes and heapes of earth: it ſerueth alſo oftentimes for hedges in fields, growing amongſt Brambles and ſuch other Thornes.

The other ſorts *Carolus Cluſius* found in a wood of Hungarie beyond the riuer Drauus, and alſo vpon the mountaines of Morauia and other places adiacent.

¶ *The Time.*

The floures appeare in Aprill: the fruit is ripe in the end of Auguſt, or in the moneth of September.

¶ *The Names.*

Theophraſtus calleth this ſhrub Εὐώνυμος, and deſcribeth it in his third booke of the Hiſtorie of Plants: diuers alſo falſly reade it *Anonymos*: *Petrus Creſcentius* calleth it *Fuſanum*, becauſe ſpindles be made of the wood hereof; and for that cauſe it is called in high-Dutch, **Spindelbaum**, yet moſt of them **Hanhodlin**: in low Dutch, **Papenhout**: in Italian, *Fuſano*: in French, *Fuſin*, and *Bonnet de preſtre*: in Engliſh, Spindle tree, Prick-wood, and Prick-timber.

¶ *The Temperature and Vertues.*

This ſhrub is hurtfull to all things, as *Theophraſtus* writeth, and namely to Goats: hee ſaith the fruit hereof killeth; ſo doth the leaues and fruit deſtroy Goats eſpecially, vnleſſe they ſcoure as well vpwards as downwards: if three or foure of theſe fruits be giuen to a man they purge both by vomit and ſtoole. A

CHAP. 107. *Of the blacke Aller tree.*

¶ *The Deſcription.*

THe blacke Aller tree bringeth forth from the root ſtraight ſtalkes diuided into diuers branches: the outward barke whereof is blacke, and that next to the wood yellow, and giueth a colour as yellow as Saffron: the ſubſtance of the wood is white and brittle, with a reddiſh pith in the midſt: the leaues be like thoſe of the Alder tree, or of the Cherry tree, yet blacker, and a little rounder: the floures be ſomewhat white: the fruit are round berries, in which appeare a certaine riſt or chinke, as though two were ioined together, at the firſt greene, afterwards red, and laſt of all blacke: in this there be two little ſtones: the root runneth along in the earth.

¶ *The Place.*

The Aller tree groweth in moiſt woods and copſes: I found great plenty of it in a wood a mile from Iſlington, in the way from thence toward a ſmall village called Harnſey, lying vpon the right hand of the way; and in the woods at Hampſted neere London, and in moſt woods in the parts about London.

¶ *The Time.*

The leaues and floures appeare in the beginning of the Spring; and the berries in Autumne.

¶ *The Names.*

This ſhrub is called *Alnus nigra*, or blacke Alder: and by others, *Frangula*: *Petrus Creſcentius* nameth it *Auornus*: in low Dutch, **Sparkenhout**, and oftentimes **Pilhout**, becauſe boies make for themſelues arrowes hereof: in high Dutch, **Faulbaum**: it is called in Engliſh, blacke Aller tree; and of diuers Butchers pricke tree.

Alnus nigra, ſiue Frangula.
The blacke Aller tree.

¶ *The Temperature.*

The inner barke of the blacke Aller tree is of a purging and dry qualitie.

¶ *The Vertues.*

The inner barke hereof is vſed of diuers country men, who drink the infuſion thereof when they would be purged: it purgeth thicke phlegmaticke humors, and alſo cholericke, and not only by the ſtoole, but many times alſo by vomit, not without great trouble and paine to the ſtomacke: it is therefore a medicine more fit for clownes than for ciuill people, and rather for thoſe that feed groſſely, than for dainty people.

There be others who affirme that the dried barke is more gentle, and cauſeth leſſer paine: for the greene bark (ſay they) which is not yet dried containeth in it a certaine ſuperfluous moiſture which cauſeth gripings and vomitings, and troubles the ſtomacke.

The ſame barke being boiled in wine or vineger makes a lotion for the tooth-ache; and is commended againſt ſcabs and filthineſſe of the skin.

The leaues are reported to be good fodder for cattell, eſpecially for kine, and to cauſe them to yeeld good ſtore of milke.

Chap. 108. *Of the Seruice tree.*

¶ *The Deſcription.*

1 THe Seruice tree groweth to the height and bigneſſe of a great tree, charged with many great armes or boughes which are ſet with ſundry ſmall branches, garniſhed with many great leaues ſomewhat long like thoſe of the Aſh: the floures are white, and ſtand in cluſters, which turne into ſmall browne berries ſomewhat long, which are not good to be eaten vntill they haue lien a while, and vntill they be ſoft like the Medlar, whereto it is like in taſte and operation.

2 The common Seruice tree groweth likewiſe to the height of a great tree, with a ſtraight body of a browniſh colour, full of branches, ſet with large diſplayed leaues like the Maple or the White-Thorne, ſauing that they are broader and longer: the floures are white, and grow in tufts; which being fallen, there come in place thereof ſmall round berries, browne vpon one ſide and reddiſh toward the Sun, of an vnpleaſant taſte in reſpect of the former: in which are contained little blackiſh kernels.

¶ *The Place.*

Theſe trees are found in woods and groues in moſt places of England: there be many ſmal trees thereof in a little wood a mile beyond Iſlington from London: in Kent it groweth in great aboundance, eſpecially about Southfleet and Grauеſend. ‡ The later of theſe I haue ſeene growing wilde in diuers places, but not the former in any place as yet. ‡

¶ *The Time.*

They floure in March, and their fruit is ripe in September.

¶ *The Names.*

The firſt is called in Greeke, ᾰ, and ὄρον: in Latine, *Sorbus*: in high-Dutch, **Sperwerbaum**: in low-Dutch, **Sorbedboom**: in French, *Cormier*: in Engliſh, Seruice tree, and of ſome after the Latines, Sorbe tree.

The

1 *Sorbus.*
The Seruice tree.

2 *Sorbus terminalis.*
Common Seruice tree.

The common Seruice tree is named of *Pliny*, *Sorbus terminalis*: in high-Dutch, **Arellel, Eſchzo-lel**, and **Wilder Sperwerbaum**: in Engliſh, Common Seruice tree.

The berries or fruit of the Seruice tree is called ὄον, or ὄσον: in Latine, *Sorbum*: in high Dutch, **Speierling, Spozopffel**: in low-Dutch, **Sozben**: in Italian, *Sorbe*, and *Sorbole*: in French, *Cormes*: in Spaniſh, *Seruas*, and *Sorbas*: in Engliſh, Seruice; of ſome, Sorbe Apple.

¶ *The Temperature and Vertues.*

Seruice berries are cold and binding, and much more when they be hard, than when they are milde and ſoft: in ſome places they are quickly ſoft, either hanged in a place which is not altogether cold, or laid in hay or chaffe: thoſe Seruices are eaten when the belly is too ſoluble, for they ſtay the ſame; and if they yeeld any nouriſhment at all, the ſame is very little, groſſe, and cold; and A therefore it is not expedient to eate of theſe or other-like fruits, nor to vſe them otherwiſe than in medicines.

Theſe do ſtay all manner of fluxes of the belly, and likewiſe the bloudy flixe; as alſo vomiting: they ſtanch bleeding if they be cut and dried in the ſunne before they be ripe, and ſo reſerued for vſe: theſe we may vſe diuers waies according to the manner of the greiſe and grieued part.

CHAP. 109. *Of the Aſh tree.*

¶ *The Deſcription.*

1 THe Aſh alſo is an high and tall tree: it riſeth vp with a ſtraight body, now and then of no ſmall bigneſſe, now and then of a middle ſize, and is couered with a ſmooth bark: the wood is white, ſmooth, hard, and ſomewhat rough grained: the tender branches hereof and ſuch as be new growne vp are ſet with certaine ioints, and haue within a white and ſpongie pith: but the old boughes are wooddy throughout, and be without either ioints or much pith: the leaues are long and winged, conſiſting of many ſtanding by couples, one right againſt another vpon one rib or ſtalke, the vpermoſt of all excepted, which ſtandeth alone; of which euery particular one is long, broad, like to a Bay leafe, but ſofter, and of a lighter greene, without any ſweet

ſmell, and nicked round about the edges: out of the yonger ſort of the boughes, hard to the ſetting on of the leaues, grow forth hanging together many long narrow and flat cods, as it were like almoſt to diuers birds tongues, where the ſeed is perfected, which is of a bitter taſte: the roots be many, and grow deepe in the ground.

Fraxinus.
The Aſh tree.

A
B

¶ *The Place.*

The Aſh doth better proſper in moiſt places, as about the borders of Medowes and Riuer ſides, than in dry grounds.

¶ *The Time.*

The leaues and keyes come forth in Aprill and May, yet is not the ſeed ripe before the fall of the leafe.

¶ *The Names.*

This tree is called in Greeke, μελία, and of diuers, φάξια: in Latine, *Fraxinus*: in high-Dutch, **Eſchernbaum**, **Eſchernholtz**, and **Steyneſchern**: in low-Dutch, **Eſſchen**, and **Eſſchenboom**: in Italian, *Fraßino*: in French, *Freſne*: in Spaniſh, *Freſno*, *Fraxino*, and *Freixo*: in Engliſh, Aſh tree.

The fruit like vnto cods is called of the Apothecaries, *Lingua Auis*, and *Lingua Paſſerina*: it may be named in Greeke, Ὀρνιθόγλωσσα: yet ſome would haue it called *Orneogloſſum*: others make *Ornus* or the wilde Aſh to be called *Orneogloſſum*: it is termed in Engliſh, Aſh keyes, and of ſome, Kite-keyes.

¶ *The Temperature and Vertues.*

The leaues and bark of the Aſh tree are dry and moderatly hot: the ſeed is hot and dry in the ſecond degree.

The iuice of the leaues or the leaues themſelues being applied, or taken with wine, cure the bitings of vipers, as *Dioſcorides* ſaith.

C The leaues of this tree are of ſo great vertue againſt ſerpents, as that they dare not ſo much as touch the morning and euening ſhadowes of the tree, but ſhun them afar off, as *Pliny* reports, *li. 16. cap. 13.* He alſo affirmeth, that the ſerpent being penned in with boughes layd round about, will ſooner run into the fire, if any be there, than come neere the boughes of the Aſh: and that the Aſh doth floure before the Serpents appeare, and doth not caſt his leaues before they be gon againe.

D We write (ſaith he) vpon experience, that if the ſerpent be ſet within the circle of a fire and the boughes, the ſerpent will ſooner run into the fire than into the boughes. It is a wonderfull courteſie in nature, that the Aſh ſhould floure before theſe ſerpents appeare, and not caſt his leaues before they be gon againe.

E Both of them, that is to ſay the leaues and the barke, are reported to ſtop the belly: and being boiled with vineger and water, do ſtay vomiting, if they be laid vpon the ſtomacke.

F The leaues and barke of the Aſh tree boiled in wine and drunk, do open the ſtoppings of the liuer and ſpleene, and do greatly comfort them.

G Three or foure leaues of the Aſh tree taken in wine each morning from time to time, doe make thoſe leane that are fat, and keepeth them from feeding which do begin to wax fat.

H The ſeed or Kite-keyes of the Aſh tree prouoke vrine, increaſe naturall ſeed, and ſtirre vp bodily luſt, eſpecially being poudred with nutmegs and drunke.

I The wood is profitable for many things, being exalted by *Homers* commendations, and *Achilles* ſpeare, as *Pliny* writeth. The ſhauings or ſmall pieces thereof being drunke are ſaid to be pernicious and deadly, as *Dioſcorides* affirmeth.

K The Lee which is made with the Aſhes of the barke cureth the white ſcurfe, and ſuch other like roughneſſe of the skin, as *Pliny* teſtifieth.

CHAP.

Chap. 110.

Of the wilde Aſh, otherwiſe called Quicke-Beame or Quicken tree.

Sorbus ſylueſtris, ſiue Fraxinus Bubula.
The Quicken tree, wilde Aſh, or wilde Seruice tree.

¶ *The Deſcription.*

THe wilde Aſh or Quicken Tree *Pena* ſetteth forth for the wilde Seruice: this tree groweth ſeldome or neuer to the ſtature and height of the Aſh tree, notwithſtanding it growes to the bignes of a large tree: the leaues be great and long, and ſcarcely be diſcerned from the leaues of the Seruice tree: the floures bee white, and ſweet of ſmell, and grow in tufts, which do turne into round berries, greene at the firſt, but when they be ripe of a deepe red colour, and of an vnpleaſant taſte: the branches are as full of iuice as the Oſier, which is the cauſe that boyes doe make Pipes of the barke thereof as they doe of Willowes.

¶ *The Place.*

The wilde Aſh or Quicken tree groweth on high mountaines, and in thicke high woods in moſt places of England, eſpecially about Namptwich in Cheſhire, in the Weilds of Kent, in Suſſex and diuers other places.

¶ *The Time.*

The wild Aſh floures in May, and the berries are ripe in September.

¶ *The Names.*

The Latines call this tree *Ornus*, and oftentimes *Sylueſtris Fraxinus*, or wilde Aſh: and it is alſo *Fraxini ſpecies*, or a kinde of Aſh; for the Grecians (as not only *Pliny* writeth, but alſo *Theophraſtus*) hath made two kindes of Aſh, the one high and tall, the other lower: the high and tall one is *Fraxinus vulgaris*, or the common Aſh; and the lower *Ornus*, which alſo is named ὀρεινὴ μελία, or *Montana Fraxinus*, mountaine Aſh; as the other, πεδινὴ, or field Aſh; which is alſo named βουμελία, or as *Gaza* tranſlateth it, *Bubula Fraxinus*, but more truly *Magna Fraxinus*, or great Aſh; for the ſyllable βοῦ is a ſigne of bigneſſe: this *Ornus* or great Aſh is named in high-Dutch, **Walbaum**: in low-Dutch, **Hauereſſchen**, or **Quereſchen**, of diuers, **Qualſter**: in French, *Freſne ſauuage*: in Engliſh, Wilde Aſh, Quicken tree, Quick-beame tree, and Wicken tree. *Matthiolus* makes this to be *Sorbus ſylueſtris*, or wilde Seruice tree.

¶ *The Temperature and Vertues.*

Touching the faculties of the leaues, barke, or berries, as there is nothing found among the old, A
ſo is there nothing noted among the later writers: but *Pliny* ſeemeth to make this wilde Aſh like in faculties to the common Aſh; for *lib. 16. cap. 13.* where he writes of both the Aſhes, hee ſaith, that the common Aſh is *Criſpa*, and the mountaine Aſh *Spiſſa*: and forthwith he addeth this: The Grecians write, that the leaues of them do kill cattell, and yet hurt not thoſe that chew their cud; which the old writers haue noted of the Yew tree, and not of the Aſh tree. *Pliny* was deceiued by the neereneſſe of the words μίλος and μελία· μίλος is the Yew tree, and μελία the Aſh tree: ſo that hee hath falſly attributed that deadly facultie to the Aſh tree, which doth belong to the Yew tree.

The leaues of the wilde Aſh tree boiled in wine are good againſt the paine in the ſides, and the B
ſtopping of the liuer, and aſſwage the bellies of thoſe that haue the tympanie and dropſie.

Benedictus Curtius Symphoryanus is deceiued in the hiſtorie of *Ornus*, when he thinketh out of *Virgils Georgicks*, that *Ornus* hath the floure of the Peare tree; for out of *Virgils* verſes no ſuch thing at C

all can be gathered: for he in intreateth not of the forms of trees, but of the graffing of diuers into others, vnlike and differing in nature; as of the graffing of the Nut tree into the Strawberry tree; the Apple into the Plane tree, the Beech into the Cheſtnut tree; the Peare into the wilde Aſh or Quick-beame tree, the Oke into the Elme tree: and in this reſpect hee writeth, that the Plane tree bringeth forth an Apple, the Beech tree a Cheſtnut; the wilde Aſh tree bringeth forth the white floure of the Peare tree, as is moſt manifeſt out of *Virgils* owne words, after this manner, in the ſecond booke of his Georgicks:

Inſeritur vero ex fœtu nucis Arbutus horrida,
Et ſteriles Platani malos geſſere valentes,
Caſtaneæ Fagos: Ornus incanuit albo
Flore Pyri, glandémque ſues fregere ſub Vlmis.

The Tree-Strawb'ry on Walnuts ſtocke doth grow,
And barren Planes faire Apples oft haue borne;
Cheſtnuts, Beech-Maſt; the Quicken tree doth ſhew
The Peares white floure; and ſwine oft times th' Acorn
Haue gathered vnder Elmes. ——

Chap. III. *Of Coriars Sumuch.*

1 *Rhus Coriaria.*
Coriar Sumach.

2 *Rhus Myrtifolia.*
Wilde or Myrtle Sumach.

¶ *The Deſcription.*

1 COriars Sumach groweth vp vnto the height of a hedge tree, after the manner of the Elder tree, bigger than *Dioſcorides* reporteth it to be, or others, who affirme that *Rhus* groweth two cubits high: whoſe errors are the greater: but this *Rhus* is ſo like to the Seruice

Seruice tree in ſhape and manner of growing, that it is hard to know one from the other; but that the leaues are ſoft and hairy, hauing a red ſinew or rib thorow the midſt of the leafe: the floures grow with the leaues vpon long ſtems cluſtering together like cats taile, or the catkins of the nut tree, but greater, and of a whitiſh green colour: after which come cluſters of round berries, growing in bunches like grapes,

2 *Pliny* his Sumach, or the Sumach of *Plinies* deſcription, groweth like a ſmall hedge tree, hauing many ſlender twiggie branches, garniſhed with little leaues like *Myrtus*, or rather like the leaues of the *Iuiube* tree; among which come forth ſlender moſſie floures, of no great account or value, which bring forth ſmall ſeeds, incloſed within a cornered caſe or huske, faſhioned like a ſpoon: the trunke or body of both theſe kindes of Sumach being wounded with ſome iron Inſtrument, yeeldeth a gum or liquour.

¶ *The Place.*

Sumach groweth, as *Dioſcorides* ſaith, in ſtony places: it is found in diuers mountaines & woods in Spaine, and in many places on the mount Apennine in Italy, and alſo neere vnto Pontus. *Archigenes* in *Galen*, in the 8. book of medicines according to the places affected, ſheweth, that it groweth in Syria, making choice of that of Syria.

¶ *The Time.*

The floures of Sumach come forth in Iuly, the ſeed with the berries are ripe in Autumne.

¶ *The Names.*

This is called in Greeke [illegible] *Rhus*, ſaith *Pliny*, hath no Latine name; yet *Gaza* after the ſignification of the Greeke word, faineth a name, calling it *Fluida*: the Arabians name it *Sumach*: the Italians, *Sumacho*: the Spaniards, *Sumagre*: in low Dutch, by contracting of the word they cal it **Smack** or **Sumach**: in Engliſh, Sumach, Coriars Sumach, and Leather Sumach: the leaues of the ſhrub be called [illegible]: in Latine, *Rhus coriaria*, or *Rhoe*.

The ſeed is named *Eruthros*: and [illegible]: in Latine, *Rhus Culinaria*, and *Rhus obſoniorum*: in Engliſh, Meat Sumach, and Sauce Sumach.

¶ *The Temperature.*

The fruit, leaues, and ſeed hereof do very much binde, they alſo coole and drie: drie they are in the third degree, and cold in the ſecond, as *Galen* teacheth.

¶ *The Vertues.*

The leaues of Sumach boyled in wine and drunken, do ſtop the laske, the inordinate courſe of womens ſickneſſes, and all other inordinate iſſues of bloud. A

The ſeed of Sumach eaten in ſauces with meat, ſtoppeth all manner of fluxes of the belly, the bloudy flix, and all other iſſues, eſpecially the white iſſues of women. B

The decoction of the leaues maketh haires blacke, and is put into ſtooles to fume vpward into the bodies of thoſe that haue the Dyſenterie, and is to be giuen them alſo to drinke. C

The leaues made into an ointment or plaiſter with hony and vineger, ſtaith the ſpreading nature of *Gangrænes* and *Pterygia*. D

The drie leaues ſodden in water vntill the decoction be as thicke as hony, yeeld forth a certaine oilineſſe, which performeth all the effects of *Licium*. E

The ſeed is no leſſe effectuall to be ſtrowed in pouder vpon their meats which are *Cœliaci* or *Dyſenterici*. F

The ſeedes pouned, mixed with honie and the powder of Oken coles, healeth the Hemorrhoides. G

There iſſueth out of the ſhrub a gum, which being put into the hollowneſſe of the teeth, taketh away the paine, as *Dioſcorides* writeth. H

Chap. 112. *Of red Sumach.*

¶ *The Deſcription.*

1 THeſe two figures are of one and the ſelfe ſame plant; the firſt ſheweth the ſhrub being in floure: the other when it is full floured with the fruit growne to ripeneſſe, notwithſtanding ſome haue deemed them to be of two kindes, wherein they were deceiued.

† This excellent and moſt beautifull plant *Coggygria* (beeing reputed of the Italians and the Venetians for a kind of *Rhus* or Sumach, becauſe it is vſed for the ſame purpoſes whereto *Rhus* ſerueth,

ueth and therein doth farre excell it) is an hedge plant growing not aboue the height of foure or fiue cubits, hauing tough and pliant ſtalks and twiggie branches like to Oziers, of a brown colour. The leaues be round, thick, and ſtiffe like the leaues of *Capparis*, in colour and ſauor of *Piſtacia* leaues, or *Terebinthus*; among which ariſeth a ſmall vpright ſprig, bearing many ſmal cluſtering little greeniſh yellow floures, vpon long and red ſtalks. After which follow ſmall reddiſh Lentill-like ſeeds that carry at the tops a moſt fine woolly or flockie tuft, criſped and curled like a curious wrought ſilken fleece, which curleth and foldeth it ſelfe abroad like a large buſh of haires.

1 *Coggygria Theophraſti.* Venice Sumach.

&

or

Cotinus Coriarius Plinij. Red Sumach.

¶ *The Place.*

Coggygria groweth in Orleans neere Auignion, and in diuers places of Italy, vpon the Alpes of Styria, and many other places. It groweth on moſt of the hils of France, in the high woods of the vpper Pannonia or Auſtria, and alſo of Hungaria and Bohemia.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iuly.

¶ *The Names.*

The firſt is called *Coggygria*, and *Coccygria* · in Engliſh, Venice Sumach, or Silken Sumach; of *Plinie*, *Cotinus*, in his 16. booke, 18. chapter. There is, ſaith he, on mount Apennine a ſhrub which is called *Cotinus ad lineamenta modo Conchylij colore inſignis*, and yet *Cotinus* is *Oleaſter*, or *Olea ſylueſtris*, the wilde Oliue tree, from which this ſhrub doth much differ; and therfore it may rightly be called *Cotinus Coriaria*. Diuers would haue named it *Scotinus*, which name is not found in any of the old writers. The Pannonians do call it *Farblauff*: it is alſo thought that this ſhrub is *Coggygria Plinij*, of which in his 13. booke, 22. chapter he writeth in theſe words: *Coggygria* is alſo like to *Vnedo* in leafe, not ſo great; it hath a property to looſe the fruit with downe, which thing happeneth vnto no other tree.

¶ *The Temperature.*

The leaues and ſlender branches together with the ſeeds are very much binding, cold and drie as the other kindes of Sumach are.

¶ *The Vertues.*

A The leaues of *Coggygria*, or Silken Sumach, are ſold in the markets of Spaine and Italy for great ſummes

ſummes of money, vnto thoſe that dreſſe Spaniſh skinnes, for which purpoſe they are verie excellent.

The root of *Cotinus*, as *Anguillara* noteth, ſerueth to die with, giuing to wooll and cloth a reddiſh colour, which *Pliny* knew, ſhewing that this ſhrub (that is to ſay the root) is *ad lineamenta modo Conchylij colore inſignis*. B

CHAP. 113. *Of the Alder Tree.*

¶ *The Deſcription.*

1 THe Alder tree or Aller, is a great high tree hauing many brittle branches, the barke is of a browne colour, the wood or timber is not hard, and yet it will laſt and indure verie long vnder the water, yea longer than any other timber whatſoeuer: wherefore in the fenny and ſoft mariſh grounds they do vſe to make piles and poſts thereof, for the ſtrengthening of the walls and ſuch like. This timber doth alſo ſerue very well to make troughes to conuey water in ſtead of pipes of Lead. The leaues of this tree are in ſhape ſomewhat like the Haſell, but they are blacker & more wrinckled, very clammie to handle, as though they were ſprinckled with honie. The bloſſome or floures are like the aglets of the Birch tree: which being vaded, there followeth a ſcaly fruit cloſely growing together, as big as a Pigeons egge, which toward Autumne doth open, and the ſeed falleth out and is loſt.

1 *Alnus.*
The Alder tree.

‡ 2 *Alnus hirſuta.*
Rough leaued Alder.

‡ 2 *Cluſius* and *Bauhine* haue obſerued another kinde of this which differs from the ordinary, in that it hath larger and more cut leaues, and theſe not ſhining aboue, but hoary vnderneath: the catkins, as alſo the rough heads are not ſo large as thoſe of the former: the barke alſo is whiter. *Cluſius* makes it his *Alnus altera*: and *Bauhine*, his *Alnus hirſutus*, or *folio incano*. ‡

The

¶ *The Place.*

The Aller or Alder tree delighteth to grow in low and moiſt wateriſh places.

¶ *The Time.*

The Aller bringeth forth new leaues in Aprill, the fruit whereof is ripe in September.

¶ *The Names.*

This tree is called in Greeke κλήθρα: in Latine, *Alnus: Petrus Creſcentius* nameth it *Amedanus:* it is called in high Dutch, **Erlenbaum** and **Ellernbaum:** in low Dutch, **Elſen** and **Elſen-boom:** in Italian, *Alno:* in French, *Aulne:* in Engliſh, Alder and Aller.

¶ *The Temperature.*

The leaues and barke of the Alder tree are cold, drie, and aſtringent.

¶ *The Vertues.*

A The leaues of Alder are much vſed againſt hot ſwellings, vlcers, and all inward inflammations, eſpecially of the Almonds and kernels of the throat.

B The barke is much vſed of poore countrey Diers, for the dying of courſe cloth, cappes, hoſe, and ſuch like into a blacke colour, whereunto it ſerueth very well.

Chap. 114. *Of the Birch tree.*

Betula.
The Birch tree.

¶ *The Deſcription.*

THe common Birch tree waxeth likewiſe a great tree, hauing many boughes beſet with many ſmall rods or twigs, very limber and pliant: the barke of the young twigs and branches is plaine, ſmooth, and full of ſap, in colour like the Cheſtnut; but the rind of the body or trunk is hard without, white, rough, and vneuen, full of chinkes or creuiſes: vnder which is found another fine barke, plaine, ſmooth, and as thin as paper which heretofore was vſed in ſtead of paper, to write vpon, before the making of paper was knowne: in Ruſſia and theſe cold regions it ſerueth in ſtead of tiles and ſlate to couer their houſes withall: this tree beareth for his floures certaine aglets like the Haſell tree, but ſmaller, wherein the ſeed is contained.

¶ *The Place.*

This common Birch tree grows in woods, fenny grounds, and mountaines, in moſt places of England.

¶ *The Time.*

The catkins or aglets do firſt appeare, and then the leaues, in Aprill or a little later.

¶ *The Names.*

Theophraſtus calleth this tree in Greeke, σμίδα: diuers, σμῦς: others σμῦα: it is named in Latine, *Betula:* diuers alſo write it with a double *ll Betulla*, as ſome of *Plinies* copies haue it: it is called in high Dutch, **Birkenbaum:** in low Dutch, **Berckenboom:** in Italian, *Betula:* by them of Trent, *Bedallo:* in French, *Bouleau:* in Engliſh, Birch tree.

¶ *The Temperature and Vertues.*

Concerning the medicinable vſe of the Birch tree, or his parts, there is nothing extant either in the old or new writers.

This tree, ſaith *Pliny* in his 16. booke, 18. chapter, *Mirabili candore & tenuitate terribilis magiſtratuum virgis:* for in times paſt the Magiſtrates roddes were made heereof: and in our time alſo the Schoolemaſters and parents do terrifie their children with rods made of Birch.

It ſerueth well to the decking vp of houſes, and banquetting roomes, for places of pleaſure, and beautifying of ſtreets in the croſſe or gang weeke, and ſuch like.

CHAP.

Chap. 115. *Of the Hornebeame, or Hard beame Tree.*

Betulus, ſive Carpinus.
The Hornebeame tree.

¶ *The Deſcription.*

Betulus, or the Hornebeam tree grows great, and very like vnto the Elme, or Wich Haſel tree, hauing a great body: the wood or timber whereof is better for arrowes and ſhafts, pulleies for mills, and ſuch like deuiſes, than Elme or Wich Hazell; for in time it waxeth ſo hard, that the toughneſſe and hardneſſe of it may be rather compared vnto horn than vnto wood, and therefore it was called Hornebeame, or Hardbeame: the leaues hereof are like the Elme, ſauing that they be tenderer: among thoſe hang certaine triangled things, vpon which be found knaps, or little heads of the bigneſſe of Ciches, in which is contai ned the fruit or ſeed: the roote is ſtrong and thicke.

¶ *The Place.*

Betulus or the Hornebeame tree growes plentifully in Northamptonſhire, alſo in Kent by Graueſend, where it is commonly taken for a kinde of Elme.

¶ *The Time.*

This tree doth ſpring in Aprill, and the ſeed is ripe in September.

¶ *The Names.*

The Hornebeam tree is called in Greek ζυγία, which is as if you ſhould ſay *Coniugalis*, or belonging to the yoke, becauſe it ſerueth well to make ζυγὰ of, in Latine, *Iuga*, yokes wherewith oxen are yoked together, which are alſo euen at this time made thereof, as witneſſeth *Benedictus Curtius Symphorianus*, and our ſelues haue ſufficient knowledge thereof in our owne country; and therefore it may be Engliſhed Yoke Elme. It is called of ſome, *Carpinus* and *Zugia*: it is alſo called *Betulus*, as if it were a kinde of Birch, but my ſelfe better like that it ſhould be one of the Elmes: in high Dutch, Hoꝛne: in French, *Carne*: in Italian, *Carpino*: in Engliſh, Hornebeame, Hardbeame, Yoke Elme, and in ſome places, Witch-haſell.

¶ *The Temperature and Vertues.*

This tree is not vſed in medicine, the vertues are not expreſſed of the Antients, neither haue wee any certaine experiments of our owne knowledge more than hath beene ſaid for the vſe of Huſbandrie. A

Chap. 116. *Of the Elme tree.*

‡ OVr Author onely deſcribed two Elmes, and thoſe not ſo accurately but that I thinke I ſhall giue the Reader content, in exchanging them for better receiued from Mr. *Goodyer*; which are theſe.

Vlmus vulgatiſſima folio lato ſcabro. The common Elme.

1 THis Elme is a very great high tree, the barke of the young trees, and boughes of the Elder, which are vſually lopped or ſhred, is ſmooth and very tough, and wil ſtrip or pil from the wood a great length without breaking: the bark of the body of the old trees as the trees grow in bigneſſe, teares or rents, which makes it very rough. The innermoſt wood of the tree is of reddiſh

yellow

yellow or browniſh colour,and curled,and after it is drie,very tough,hard to cleaue or rent,whereof aues of Carts are moſt commonly made: the wood next the barke,which is called the ſap, is white. Before the leaues come forth the floures appeare,about the end of March,which grow on the twigs or branches,cloſely compacted or thruſt together, and are like to the chiues growing in the middle of moſt floures,of a reddiſh colour: afterwhich come flat ſeed,more long than broad,not much vnlike the garden Arach ſeed in forme and bigneſſe,and doe for the moſt part fall away before or ſhortly after the leaues ſpring forth,and ſome hang on a great part of the Sommer:the leaues grow on the twigges, of a darke, greene colour; the middle ſize whereof are two inches broad, and three inches long, ſome are longer and broader, ſome narrower and ſhorter, rough or harſh in handling on both ſides,nickt or indented about the edges,and many times crumpled, hauing a nerue in the middle,and many ſmaller nerues growing from him: the leafe on one ſide of the nerue is alwaies longer than on the other. On theſe leaues oftentimes grow bliſters or ſmall bladders, in which at the ſpring are little wormes,about the bigneſſe of Bed-fleas. This Elme is common in all parts of England,where I haue trauelled.

Vlmus minor folio anguſto ſcabro.
The Narrow leaued Elme.

2 This tree is like the other, but much leſſer and lower,the leaues are vſually about two inches and a halfe long, and an inch or an inch and a quarter broad,nickt or indented about the edges, and hath one ſide longer than the other,as the firſt hath,and are alſo harſh or rough on both ſides, the

1 *Vlmus vulgatiſſ. folio lato ſcabro.*
The common Elme tree.

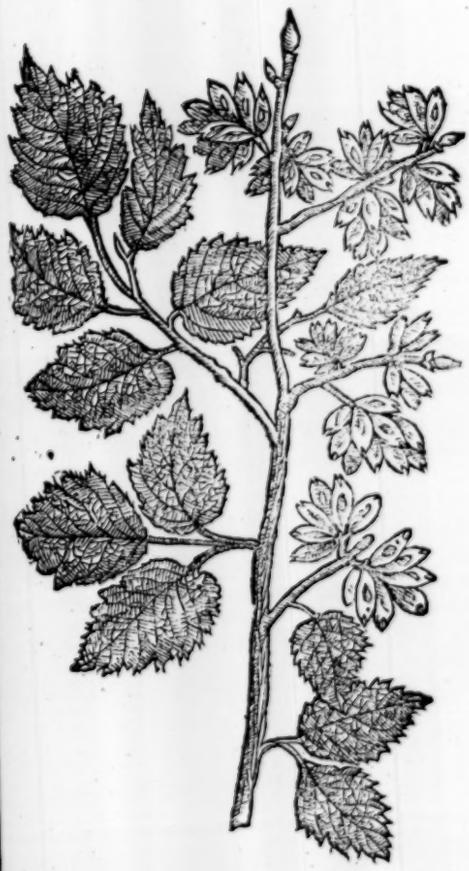
‡ 2 *Vlmus minor folio anguſto ſcabro.*
The narrow leaued Elme.

barke or rinde will alſo ſtrip as the firſt doth: hitherto I haue not obſerued either the floures or ſeed, or bliſters on the leaues, nor haue I had any ſight of the timber, or heard of any vſe thereof. This kinde I haue ſeene growing but once, and that in the hedges by the high way as I rode betweene Chriſt Church and Limmington in the New Forreſt in Hampſhire, about

about the middle of September 1624. from whence I brought ſome ſmall plants of it, not a foot in length, which now, 1633. are riſen vp ten or twelue foot high, and grow with me by the firſt kinde, but are eaſily to be diſcerned apart, by any that will looke on both.

‡ 3 *Vlmus folio latiſſimo ſcabro.*
Witch Haſell, or the broadeſt leaued Elme.

4 *Vlmus folio glabro.*
Witch Elme, or ſmooth leaued Elme.



Vlmus folio latiſſimo ſcabro.
Witch Haſell, or the broadeſt leaued Elme.

3 This groweth to be a very great tree, and alſo very high, eſpecially when he groweth in woods amongſt other trees: the barke on the outſide is blacker than that of the firſt, and is alſo very tough, ſo that when there is plenty of ſap it will ſtrip or peele from the wood of the boughes from the one end to the other, a dozen foot in length or more, without breaking, whereof are often made cords or ropes: the timber hereof is in colour neere like the firſt; it is nothing ſo firme or ſtrong for naues of Carts as the fruit is, but will more eaſily cleaue; this timber is alſo couered with a white ſappe next the barke: the branches or young boughes are groſſer and bigger, and do ſpread themſelues broader, and hang more downewards than thoſe of the firſt; the floures are nothing but chiues, very like thoſe of the firſt kind: the ſeed is alſo like, but ſomething bigger: the leaues are much broader and longer than any of the kindes of Elme, vſually three or foure inches broad, and fiue or ſix inches long, alſo rough or harſh in handling on both ſides, ſnipt or indented about the edges, neere reſembling the leaues of the Haſell: the one ſide of the leaues are alſo moſt commonly longer than the other, alſo on the leaues of this Elme are ſometimes blifters or bladders like thoſe on the firſt kinde. This proſpereth and naturally groweth in any ſoile moiſt or dry, on high hills, and in low vallies in good plenty in moſt places in Hampſhire, wher it is commonly called VVitch Haſell. Old men affirme, that when long boughes were in great vſe, there were very many made of the wood of this tree, for which purpoſe it is mentioned in the ſtatutes of England by the name of VVitch Haſell, as 8. *El.* 10. This hath little affinitie with *Carpinus*, which in Eſſex is called VVitch Haſell.

Vlmus folio glabro.
VVitch Elme, or ſmooth leauen Elme.

4 This kinde is in bigneſſe and height like the firſt, the boughes grow as thoſe of the VVitch Haſell doe, that is hanged more downewards than thoſe of the common Elme, the barke is blacker than that of the firſt kinde, it will alſo peele from the boughes: the floures are like the firſt, and ſo are the ſeeds: the leaues in forme are like thoſe of the firſt kinde, but are ſmooth in handling on both ſides. My worthy friend and excellent Herbariſt of happy memorie Mr. *William Coys* of Stubbers in the pariſh of Northokington in Eſſex told me, that the wood of this kinde was more deſired for naues of Carts than the wood of the firſt. I obſerued it growing very plentifully as I rode between Rumford and the ſaid Stubbers, in the yeere 1620. intermixed with the firſt kinde, but eaſily to be diſcerned apart, and is in thoſe parts vſually called VVitch Elme. ‡

¶ *The Place.*

The firſt kinde of Elme groweth plentifully in all places of England. The reſt are ſet forth in their deſcriptions.

¶ *The Time.*

The ſeeds of the Elme ſheweth it ſelfe firſt, and before the leaues; it falleth in the end of Aprill, at what time the leaues begin to ſpring.

¶ *The Names.*

The firſt is called in Greeke, πτελέα: in Latine, *Vlmus*: in high Dutch, **Ruſt holtz, Ruſtbaum, Ümbaum**: in low Dutch, **Ömen**: in French, *Orme*, and *Omeau*: in Italian, *Olmo*. in Spaniſh, *Vlmo*: in Engliſh, Elme tree.

The ſeed is named by *Plinie* and *Columella*, *Samera*. The little wormes which are found with the liquor within the ſmall bladders be named in Greeke, κόριδες: in Latine, *Culices*, and *Muliones*.

The other Elme is called by *Theophraſtus*, ὀρεινὴ πτελέα; which *Gaza* tranſlateth *Montiulmus* or mountaine Elme. *Columella* nameth it *Vernacula*, or *Noſtras Vlmus*, that is to ſay, *Italica*, or Italian Elme: it is called in low Dutch, **Herſeleer**, and in ſome places, **Heerenteer**.

¶ *The Temperature and Vertues.*

A The leaues and barke of the Elme be moderately hot, with an euident clenſing facultie; they haue in the chewing a certaine clammie and glewing qualitie.

B The leaues of Elme glew and heale vp greene wounds, ſo doth the barke wrapped and ſwadled about the wound like a band.

C The leaues being ſtamped with vineger do take away ſcurffe.

D *Dioſcorides* writeth, that one ounce weight of the thicker barke drunke with wine or water purgeth flegme.

E The decoction of Elme leaues, as alſo of the barke or root, healeth broken bones very ſpeedily, if they be fomented or bathed therewith.

F The liquor that is found in the bliſters doth beautifie the face, and ſcoureth away all ſpots, freckles, pimples, ſpreading tetters, and ſuch like, being applied thereto.

G It healeth greene wounds, and cureth ruptures newly made, being laid on with Spleenwoort and the truſſe cloſely ſet vnto it.

Chap. 117. *Of the Line or Linden Tree.*

¶ *The Deſcription.*

1 The female Line or Linden tree waxeth very great and thicke, ſpreading forth his branches wide and farre abroad, being a tree which yeeldeth a moſt pleaſant ſhadow, vnder and within whoſe boughes may be made braue ſommer houſes and banqueting arbors, becauſe the more that it is ſurcharged with weight of timber and ſuch like, the better it doth flouriſh. The barke is browniſh, very ſmooth, and plaine on the outſide, but that which is next to the timber is white, moiſt and tough, ſeruing very well for ropes, traſes, and halters. The timber is whitiſh, plaine and without knots, yea very ſoft and gentle in the cutting or handling. Better gunpouder is made of the coles of this wood than of VVillow coles. The leaues are greene, ſmooth,

ſmooth, ſhining and large, ſomewhat ſnipt or toothed about the edges: the floures are little, whitiſh, of a good ſauour, and very many in number, growing cluſtering together from out of the middle of the leafe: out of which proceedeth a ſmall whitiſh long narrow leafe: after the floures ſucceed cornered ſharpe pointed Nuts, of the bigneſſe of Haſell Nuts. This tree ſeemeth to be a kinde of Elme, and the people of Eſſex about Heningham (wheras great plenty groweth by the way ſides) do call it broad leafed Elme.

1 *Tilia fœmina.*
The female Line tree.

2 *Tilia maſ.*
The male Line tree.

2 The male *Tilia* or Line tree groweth alſo very great and thicke, ſpreading it ſelfe far abroad like the other Linden tree: his bark is very tough and pliant, and ſerueth to make cords and halters of. The timber of this tree is much harder, more knottie, and more yellow than the timber of the other, not much differing from the timber of the Elme tree: the leaues hereof are not much vnlike Iuy leaues, not very greene, ſomewhat ſnipt about the edges: from the middle whereof come forth cluſters of little white floures like the former: which being vaded, there ſucceed ſmall round pellets, growing cluſtering together, like Iuy berries, within which is contained a little round blackiſh ſeed, which falleth out when the berry is ripe.

¶ *The Place.*

The female Linden tree groweth in ſome woods in Northampton ſhire; alſo neere Colcheſter, and in many places alongſt the high way leading from London to Henningham, in the countie of Eſſex.

The male Linden tree groweth in my Lord Treaſurers garden at the Strand, and in ſundry other places, as at Barn-elmes, and in a garden at Saint Katherines neere London. ‡ The female growes in the places here named, but I haue not yet obſerued the male. ‡

¶ *The Time*

Theſe trees floure in May, and their fruit is ripe in Auguſt.

¶ *The Names.*

The Linden tree is called in Greeke φιλύρα: in Latine, *Tilia*: in high Dutch, **Linden**, and **Lindenbaum**: in low Dutch, **Linde**, and **Lindenboom**: the Italians, *Tilia*: the Spaniards, *Teia*: in French, *Tilet* and *Tilieul*: in Engliſh, Linden tree, and Line tree.

¶ *The Temperature.*

The barke and leaues of the Linden or Line tree, are of a temperate heat, ſomewhat drying and aſtringent.

¶ *The Vertues.*

A The leaues of *Tilia* boiled in Smithes water with a piece of Allom and a little honey, cure the ſores in childrens mouthes.

B The leaues boiled vntill they be tender; and pouned very ſmall with hogs greaſe, and the pouder of Fenugreeke and Lineſeed, take away hot ſwellings and bring impoſtumes to maturation, being applied thereto very hot.

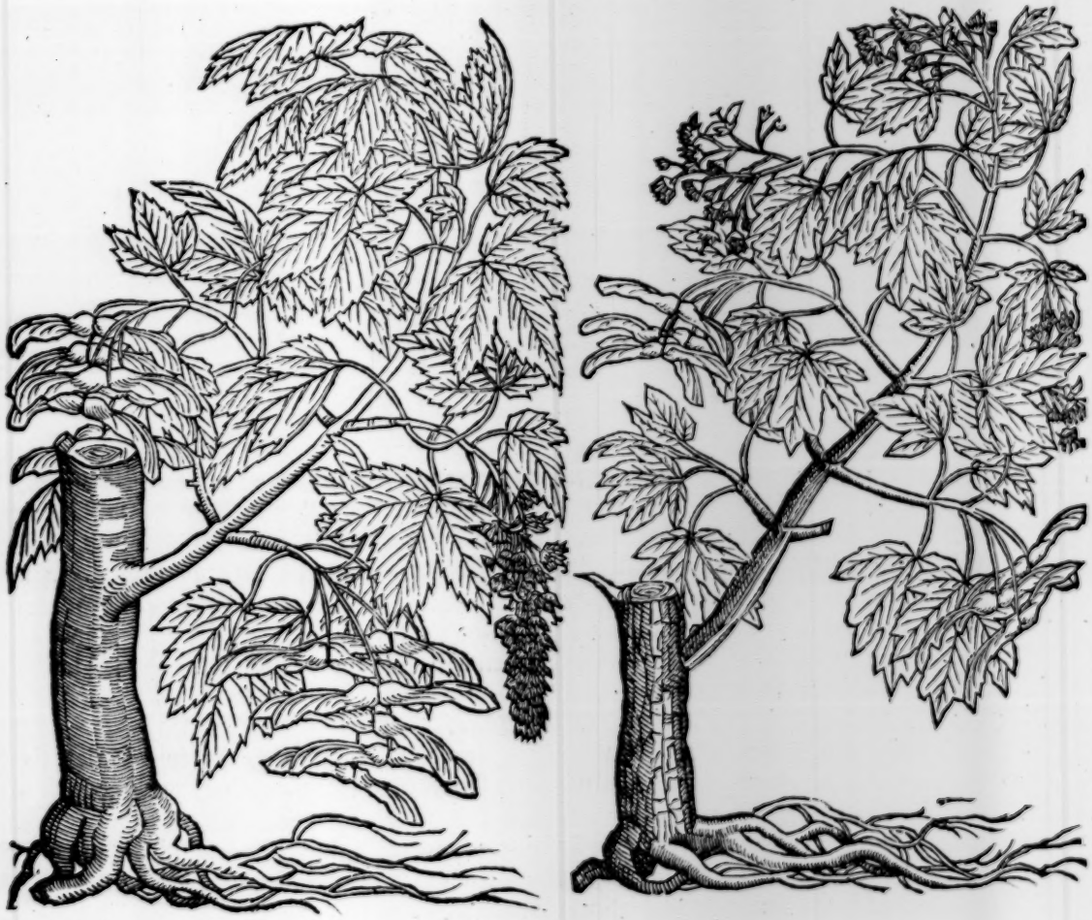
C The floures are commended by diuers againſt paine of the head proceeding of a cold cauſe, againſt diſſineſſe, the Apoplexie, and alſo the falling ſickneſſe, and not onely the floures, but the diſtilled water thereof.

D The leaues of the Linden (ſaith *Theophraſtus*) are very ſweet, and be a fodder for moſt kinde of cattle: the fruit can be eaten of none.

Chap. 118. *Of the Maple tree.*

‡ 1 *Acer maius.*
The great Maple.

† 2 *Acer minus.*
The leſſer Maple.



¶ *The Deſcription.*

THe great Maple is a beautifull and high tree, with a barke of a meane ſmoothneſſe: the ſubſtance of the wood is tender and eaſie to worke on; it ſendeth forth on euery ſide very many goodly boughes and branches, which make an excellent ſhadow againſt the heate of the Sun; vpon which

which are great, broad, and cornered leaues, much like to thoſe of the Vine, hanging by long reddiſh ſtalks: the floures hang by cluſters, of a whitiſh greene colour; after them commeth vp long fruit faſtened together by couples, one right againſt another, with kernels bumping out neere to the place in which they are combined: in all the other parts flat and thin like vnto parchment, or reſembling the innermoſt wings of graſhoppers: the kernels be white and little.

2 There is a ſmall Maple which doth oftentimes come to the bignes of a tree, but moſt commonly it groweth low after the maner of a ſhrub: the barke of the young ſhoots hereof is likewiſe ſmooth; the ſubſtance of the wood is white, and eaſie to be wrought on: the leaues are cornered like thoſe of the former, ſlippery, and faſtened with a reddiſh ſtalke, but much leſſer, very like in bignes, and ſmoothnes to the leafe of Sanicle, but that the cuts are deeper: the floures be as thoſe of the former, greene, yet not growing in cluſters, but vpon ſpoked roundles: the fruit ſtandeth by two and two vpon a ſtem or foot-ſtalke.

¶ *The Place.*

The ſmall or hedge Maple groweth almoſt euery where in hedges and low woods.

The great Maple is a ſtranger in England, only it groweth in the walkes and places of pleaſure of noble men, where it eſpecially is planted for the ſhadow ſake, and vnder the name of Sycomore tree.

¶ *The Time.*

Theſe trees floure about the end of March, and their fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke σφένδαμνος: in Latine, *Acer*: in Engliſh, Maple, or Maple tree.

The great Maple is called in high Dutch, **Ahorne**, and **waldeſcherne**: the French men, *Grand Erable*, and *Plaſne* abuſiuely, and this is thought to be properly called σφένδαμνος: but they are far deceiued that take this for *Platanus*, or the Plane tree, being drawne into this errour by the neereneſſe of the French word, for the Plane tree doth much differ from this. ‡ This is now commonly (yet not rightly) called the Sycomore tree. And ſeeing vſe will haue it ſo, I thinke it were not vnfit to call it the baſtard Sycomore. ‡

The other is called in Latine, *Acer minor*: in high Dutch, **waſſholder**: in low Dutch, **Booghout**: in French, *Erable*: in Engliſh, ſmall Maple, and common Maple.

¶ *The Temperature and Vertues.*

What vſe the Maple hath in medicine we finde nothing written of the Grecians, but *Pliny* in his 14. booke, 8. chapter affirmeth, that the root pouned and applied, is a ſingular remedy for the paine of the liuer. *Serenus Sammonicus* writeth, that it is drunke with wine againſt the paines of the ſide. A

Si latus immeritum morbo tentatur acuto,
Accenſum tinges lapidem ſtridentibus vndis.
Hinc bibis: aut Aceris radicem tundis, & vna.
Cum vino capis: hoc præſens medicamen habetur.

Thy harmeleſſe ſide if ſharpe diſeaſe inuade,
In hiſſing water quench a heated ſtone:
This drinke. Or Maple root in pouder made,
Take off in wine, a preſent med'cine knowne.

Chap. 119. *Of the Poplar tree.*

¶ *The Kindes.*

There be diuers trees vnder the title of Poplar, yet differing very notably, as ſhall be declared in the deſcriptions, whereof one is the white, another the blacke, and a third ſort ſet downe by *Pliny*, which is the Aſpe, named by him *Lybica*; and by *Theophraſtus*, *Kerkus*: likewiſe there is another of America, or of the Indies, which is not to be found in theſe regions of Europe.

¶ *The Deſcription.*

1 THe white Poplar tree commeth ſoone to perfection, and groweth high in ſhort time, full of boughes at the top: the barke of the body is ſmooth, and that of the boughes is likewiſe white withall: the wood is white, eaſie to be cleft: the leaues are broad, deeply gaſhed, & cornered like almoſt to thoſe of the Vine, but much leſſer, ſmooth on the vpper ſide, glib, and ſomwhat greene; and on the nether ſide white and woolly: the catkins are long, downy, at the firſt of a purpliſh colour: the roots ſpread many waies, lying vnder the turfe, and not growing deepe, and therefore it happeneth that theſe trees be oftentimes blowne downe with the winde.

3 *Populus alba.*
The white Poplar tree.

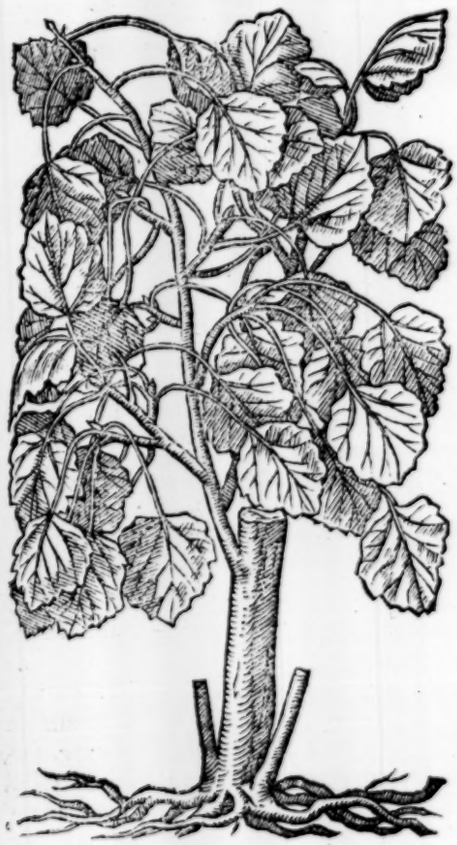
2 *Populus nigra.*
The blacke Poplar tree.

2 The black Poplar tree is as high as the white, and now and then higher, oftentimes fuller of boughes, and with a thicker body: the barke thereof is likewiſe ſmooth, but the ſubſtance of the wood is harder, yellower, and not ſo white, fuller of veines, and not ſo eaſily cleft: the leaues be ſomwhat long, and broad below towards the ſtem, ſharp at the point, and a little ſnipt about the edges, neither white nor woolly, like the leaues of the former, but of a pleaſant greene colour: amongſt which come forth long aglets or catkins, which do turne into cluſters: the buds which ſhew themſelues before the leaues ſpring out, are of a reaſonable good ſauour, of the which is made that profitable ointment called *Vnguentum Populeon.*

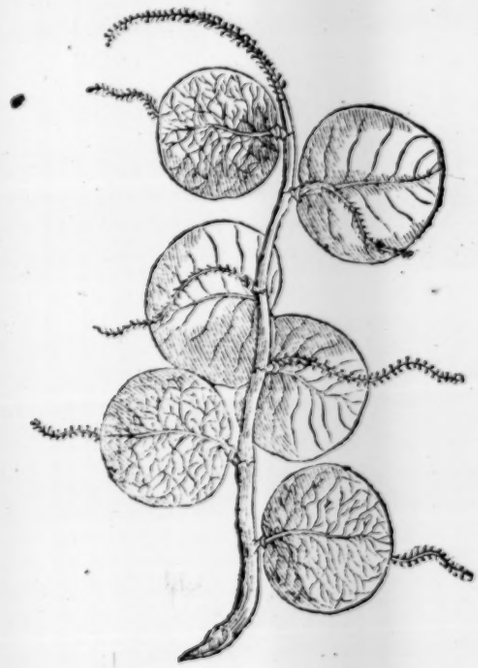
3 The third kinde of Poplar is alſo a great tree: the barke and ſubſtance of the wood is ſomewhat like that of the former: this tree is garniſhed with many brittle and tender branches, ſet full of leaues, in a manner round, much blacker and harder than the blacke Poplar, hanging vpon long and ſlender ſtems, which are for the moſt part ſtil wauering, and make a great noiſe by being beaten one to another, yea though the weather be calme, and ſcarce any winde blowing; and it is knowne by the name of the Aſpen tree: the roots hereof are ſtronger, and grow deeper into the ground than thoſe of the white Poplar.

4 This ſtrange Poplar, which ſome do call *Populus rotundifolia*, in Engliſh, the round leafed Poplar of India, waxeth a great tree, bedeckt with many goodly twiggie branches, tough and limmer like the

3 *Populus Libyca.*
The Aſpen tree.



4 *Populus Americana.*
The Indian Poplar tree.



‡ 5 *Populus alba foliis minoribus.*
The leſſer leaued white Poplar.

the Willow, full of ioints where the leaues do grow, of a perfect roundneſſe, ſaue where it cleaueth or groweth to the ſtalk: from the boſoms or corners of theſe leaues come forth ſmall aglets, like vnto our Poplar, but ſmaller: the leafe is thick, and very like the leaues of *Arbor Iudæ*, but broader, of an aſtringent taſte, ſomewhat heating the mouth, and ſaltiſh.

5 There is alſo another ſort of Poplar which groweth likewiſe vnto a great tree, the branches whereof are knotty and bunched forth as though it were full of ſcabs or ſores: the leaues come forth in tufts moſt commonly at the end of the boughes, not cut or iagged, but reſembling the leaues of that *Atriplex* called *Pes Anſerinus*; in colour like the former, but the aglets are not ſo cloſely packed together, otherwiſe it is like.

¶ *The Place.*

Theſe trees doe grow in low moiſt places, as in medowes neere vnto ditches, ſtanding waters and riuers.

The firſt kinde of white Poplar groweth not very common in England, but in ſome places here and there a tree: I found many both ſmall & great growing in a low medow turning

turning vp a lane at the farther end of a village called Black-wall, from London; and in Eſſex at a place called Ouenden, and in diuers other places.

The Indian Poplar groweth in moſt parts of the Iſlands of the Weſt Indies.

¶ *The Time.*

Theſe trees do bud forth in the end of March and beginning of Aprill, at which time the buds muſt be gathered to ſerue for *Vnguentum Populeon.*

¶ *The Names.*

The white Poplar is called in Greeke, Λευκὴ: in Latine, *Populus alba:* of diuers, *Farfarus*, as of *Plautus* in his Comedie *Penulus*, as you may ſee by his words ſet downe in the chap. of Colts-foot, *pag.* 813.

It is called in high-Dutch, **Poppelbaum, Weiſz Alberbaum:** in low-Dutch, **Abeel**, of his horie or aged colour, and alſo **Abeelboome**; which the Grammarians doe falſly interpret *Abies*, the Firre tree: in Italian, *Popolo nero:* in French, *Peuplier blanc*, *Aubel*, *Obel*, or *Aubean:* in Engliſh, white Poplar tree, and Abeell, after the Dutch name.

The ſecond is called in Greeke, Αἴγειρος: in Latine, *Populus nigra:* by *Petrus Creſcentius*, *Albarus:* in high-Dutch, **Aſpen:** in low-Dutch, **Populier:** in Italian, *Popolo nero:* in French, *Peuplier noir:* in Spaniſh, *Alamo nigailho:* in Engliſh, Poplar tree, blacke Poplar, and Pepler. The firſt or new ſprung buds whereof are called of the Apothecaries, *Oculi Populi*, Poplar buds: others chuſe rather to call it *Gemma Populi:* ſome of the Grecians name it σπίρυς: whereupon they grounded their error, who raſhly ſuppoſed that thoſe roſenny or clammy buds are not to be put or vſed in the compoſition of the ointment bearing the name of the Poplar, and commonly called in Engliſh, Popilion and Pompillion, but the berries that grow in cluſters, in which there is no clammineſſe at all.

They are alſo as far deceiued, who giuing credit to Poets fables, do beleeue that Amber commeth of the clammy roſin falling into the riuer Poo.

The third is called of diuers, *Populus tremula*, which word is borrowed of the French men, who name it *Tremble:* it alſo receiued a name amongſt the low Countrey men, from the noiſe and ratling of the leaues, *viz.* **Rateeler:** this is that which is named of *Pliny*, *Libyca:* and by *Theophr.* κυρὶς, which *Gaza* calleth *Populus montana:* in Engliſh, Aſpe, and Aſpen tree, and may alſo be called Tremble, after the French name, conſidering it is the matter whereof womens tongues were made, (as the Poets and ſome others report) which ſeldom ceaſe wagging.

¶ *The Temperature and Vertues.*

A The white Poplar hath a clenſing facultie, ſaith *Galen*, and a mixt temperature, conſiſting of a waterie warme eſſence, and alſo a thin earthy ſubſtance.

B The barke, as *Dioſcorides* writeth, to the weight of an ounce (or as others ſay, and that more truly, of little more than a dram) is a good remedie for the Sciatica or ache in the huckle bones, and for the ſtrangurie.

C That this barke is good for the Sciatica, *Serenus Sammonicus* doth alſo write:

Sæpius occultus victa coxendice morbus
Perfurit, & greſſus diro languore moratur:
Populus alba dabit medicos de cortice potus.

An hidden diſeaſe doth oft rage and raine,
The hip ouercome and vex with the paine,
It makes with vile aking one tread ſlow and ſhrinke;
The barke of white Poplar is helpe had in drunke.

D The ſame barke is alſo reported to make a woman barren, if it be drunke with the kidney of a Mule, which thing the leaues likewiſe are thought to perform, being taken after the floures or reds be ended.

E The warme iuice of the leaues being dropped into the eares doth take away the paine thereof.

F The roſin or clammy ſubſtance of the blacke Poplar buds is hot and dry, and of thin parts, attenuating and mollifying: it is alſo fitly mixed *acopis & malagmatis:* the leaues haue in a manner the like operation for all theſe things, yet weaker, and not ſo effectuall, as *Galen* teacheth.

G The leaues and yong buds of blacke Poplar doe aſſwage the paine of the gout in the hands or feet, being made into an ointment with May butter.

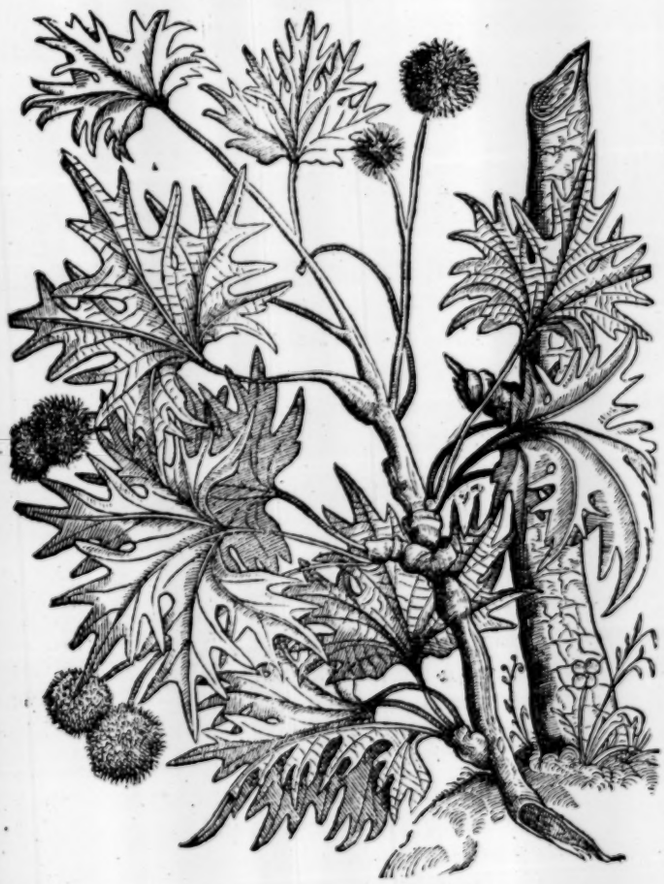
H The ointment made of the buds is good againſt all inflammations, bruſes, ſquats, falls, and ſuch like: this ointment is very well knowne to the Apothecaries.

I *Paulus Æginet a* teacheth to make an oile alſo hereof, called *Ægyrinum*, or oile of blacke Poplar.

CHAP.

Chap. 120. *Of the Plane tree.*

Platanus.
The Plane tree.



¶ *The Deſcription.*

THe Plane is a great tree, hauing very long and farre ſpreading boughes caſting a wonderfull broad ſhadow, by reaſon wherof it was highly commended and eſteemed of among the old Romans: the leaues are cornered like thoſe of *Palma Chriſti*, greater than Vine leaues, and hanging vpon little red foot-ſtalkes: the floures are ſmall and moſſie, and of a pale yellowiſh colour: the fruit is round like a ball, rugged, and ſomewhat hairy; but in Aſia more hairy and greater, almoſt as big as a Walnut: the root is great, diſperſing it ſelfe far abroad.

¶ *The Place.*

The Plane tree delighteth to grow by ſprings or riuers: *Pliny* reports that they were wont to be cheriſhed with wine: they grew afterward (ſaith he) to be of ſo great honour (meaning the Plane trees) as that they were cheriſhed and watered with wine: and it is found by experience that the ſame is very comfortable to the roots, and wee haue alreadie taught, that trees deſire to drinke wine. This tree is ſtrange in Italy, it is no where ſeene in Germany, nor in the low-Countries: in Aſia it groweth plentifully: it is found alſo in Candy, growing in vallies, and neere vnto the hill Athos, as *Petrus Bellonius* in his Singularities doth declare: it groweth in many places of Greece, and is found planted in ſome places of Italy, for pleaſure rather than for profit. My ſeruant *William Marſhall* (whom I ſent into the Mediterranean ſea as Surgeon vnto the Hercules of London) found diuers trees hereof growing in Lepanto, hard by the ſea ſide, at the entrance into the towne, a port of Morea, being a part of Greece, and from thence brought one of thoſe rough buttons, being the fruit thereof. ‡ There are one or two yong ones at this time growing with M^r. *Tradeſcant*. ‡

The Plane trees caſt their leaues in Winter, as *Bellonius* teſtifieth, and therefore it is no maruel that they keepe away the Sun in Sommer, and not at all in Winter: there is, ſaith *Pliny*, no greater commendation of the tree, than that it keepeth away the Sunne in Sommer, and entertaineth it in Winter.

¶ *The Names.*

This tree is called in Greeke, πλάτανος: and likewiſe in Latine *Platanus*: it beareth his name of the bredth: the French mens *Plaſne* doth far differ from this, which is a kind of Maple: this tree is named in Engliſh, Plane tree.

¶ *The Temperature and Vertues.*

The Plane tree is of a cold and moiſt eſſence, as *Galen* ſaith: the greene leaues are good to be laid vpon hot ſwellings and inflammations in the beginning. A

Being boiled in wine they are a remedie for the running and the watering of the eyes, if they be applied. B

The barke and balls do dry: the barke boiled in vineger helpeth the tooth-ache.

The fruit of the Plane tree drunke with wine helpeth the bitings of mad dogs and ſerpents, and mixed with hogs greaſe it maketh a good ointment againſt burning and ſcalding. C

The burned barke doth mightily dry, and ſcoureth withall; it remoueth the white ſcurfe, and cureth moiſt vlcers. D

The

F The duſt or downe, ſaith *Galen*, that lieth on the leaues of the tree is to be taken heed of, for if it be drawne in with the breath, it is offenſiue to the winde-pipe by his extreme drineſſe, and making the ſame rough, and hurting the voice, as it doth alſo the ſight and hearing, if it fall into the eyes or eares. *Dioſcorides* doth not attribute this to the duſt or downe of the leaues onely, but alſo to that of the balls.

Chap. 121. *Of the Wayfaring Tree.*

Lantana, ſiue Viburnum.
The Wayfaringtree.

¶ *The Deſcription.*

THe Wayfaring mans tree growes vp to the height of an hedge tree, of a mean bignes: the trunke or body thereof is couered with a ruſſet barke: the branches are long, tough, and eaſie to be bowed, and hard to be broken, as are thoſe of the Willow, couered with a ſoft whitiſh barke, whereon are broad leaues thicke and rough, ſleightly indented about the edges, of a white colour, and ſomewhat hairy whileſt they be freſhand green; but when they begin to wither and fall away, they are reddiſh, and ſet together by couples one oppoſit to another. The floures are white, and grow in cluſters: after which come cluſters of fruit of the bigneſſe of a peaſe, ſomewhat flat on both ſides, at the firſt greene, after red, and blacke when they be ripe: the root diſperſeth it ſelfe far abroad vnder the vpper cruſt of the earth.

¶ *The Place.*

This tree groweth in moſt hedges in rough and ſtony places, vpon hils and low woods, eſpecially in the chalky grounds of Kent about Cobham, Southfleet, and Grauesend, and in all the tract to Canturbury.

¶ *The Time.*

The floures appeare in Sommer: the berries are ripe in the end of Autumne, and new leaues come forth in the Spring.

This hedge tree is called *Viurna* of *Ruellius*: in French, *Viorne*, and *Viorna*: in Italian, *Lantana*: it is reputed for the tree *Viburnum*, of which *Virgil* maketh mention in the firſt Eclog, where hee commendeth the city Rome for the loftineſſe and ſtatelineſſe thereof, aboue other Cities, ſaying, that as the tall Cypres trees do ſhew themſelues aboue the low and ſhrubby Viorn, ſo doth Rome aboue other cities lift vp her head very high; in theſe verſes:

Verum hæc tantùm alias inter cuput exulit vrbes,
Quantum lenta ſolent inter viburna cupreſſi.

But this all other cities ſo excels,
As Cypreſſe, which 'mongſt bending Viornes dwels.

‡ I iudge *Viburnum* not to be a name to any particular plant, but a generall name to all low and bending ſhrubs; amongſt which this here deſcribed may take place as one. I enquired of a countrey man in Eſſex, if he knew any name of this: he anſwered, it was called the Cotton tree, by reaſon of the ſoftneſſe of the leaues. ‡

¶ *The Temperature.*

The leaues and berries of Lantana are cold and dry, and of a binding qualitie.

¶ *The*

¶ *The Vertues.*

The decoction of the leaues of Lantana is very good to be gargled in the mouth againſt al ſwellings and inflammations thereof, againſt the ſcuruie and other diſeaſes of the gums, and faſtneth looſe teeth. A

The ſame boiled in lee doth make the haires blacke if they be bathed or waſhed therewith, and ſuffered to dry of it ſelfe. B

The berries are of the like facultie, the pouder whereof when they be dried ſtay the laske, all iſſues of bloud, and alſo the whites. C

It is reported, that the barke of the root of the tree buried a certaine time in the earth, and afterwards boiled and ſtamped according to art, maketh good Bird-lime for Fowlers to catch Birds with. D

Chap. 122. *Of the Beade tree.*

1 *Zizypha candida.*
The Beade tree.

‡ 2 *Zizypha Cappadocica.*
The Beade tree of Cappadocia.

¶ *The Deſcription.*

1 THis tree was called *Zizypha candida* by the Herbariſts of Montpellier; and by the Venetians and Italians, *Sycomorus*, but vntruly: the Portugals haue termed it *Arbor Paradizo*: all which and each whereof haue erred together, both in reſpect of the fruit and of the whole tree: ſome haue called it *Zizypha*, though in facultie it is nothing like; for the taſte of this fruit is very vnpleaſant, virulent, and bitter. But deciding all controuerſies, this is the tree which *Auicen* calleth *Azederach*, which is very great, charged with many large armes, that are garniſhed with twiggie branches, ſet full of great leaues conſiſting of ſundry ſmall leaues, one growing right oppoſite to another like the leaues of the Aſh tree or Wicken tree, but more deepely cut about the edges like the teeth of a ſaw: among which come the floures, conſiſting of fiue ſmall blew leaues layd abroad in manner of a ſtarre: from the middeſt whereof groweth forth a ſmall hollow cup reſembling

reſembling a Chalice: after which ſucceedeth the fruit, couered with a browniſh yellow ſhel, very like vnto the fruit of Iuiubes (whereof *Dodonæus* in his laſt edition maketh it a kinde) of a ranke, bitter, and vnpleaſant taſte, with a ſix cornered ſtone within, which being drawne on a ſtring, ſerueth to make Beades of, for want of other things.

2 *Zizyphus Cappadocica* groweth not ſo great as the former, but is of a meane ſtature, and full of boughes: the barke is ſmooth and euen, and that which groweth vpon the trunke and great boughes is of a ſhining ſcarlet colour: out of theſe great armes or boughes grow ſlender twigges, white and ſoft, which are ſet full of whitiſh leaues, but more white on the contrarie or backe part, and are like to the leaues of Willow, but narrower and whiter: amongſt theſe leaues come forth ſmall hollow yellowiſh floures, growing at the ioints of the branches, moſt commonly three together, and of a pleaſant ſauour, with ſome few threds or chiues in the middle thereof. After which ſucceedeth the fruit, of the bigneſſe and faſhion of the ſmalleſt Oliue, white both within and without, wherein is contained a ſmall ſtone which yeeldeth a kernell of a pleaſant taſte, and very ſweet.

¶ *The Place.*

Matthiolus writeth, that *Zizyphus candida* is found in the cloiſters of many monaſteries in Italy; *Lobel* ſaith that it groweth in many places in Venice and Narbon; and it is wont now of late to be planted and cheriſhed in the goodlieſt orchards of all the low-Countries.

Zizyphus Cappadocica groweth likewiſe in many places of Italy, and ſpecially in Spaine: it is alſo cheriſhed in gardens both in Germany and in the low-Countries. ‡ It groweth alſo here in the garden of M^r. *Iohn Parkinſon.* ‡

¶ *The Time.*

Theſe trees floure in Iune in Italy and Spain; their fruit is ripe in September; but in Germany and the low-Countries there doth no fruit follow the floures.

¶ *The Names.*

Zizyphus candida Auicen calleth *Azederach*, or as diuers read it, *Azederaeth*: and they name it, ſaith he, in Rechi, *Arbor Mirobalanorum*, or the Mirobalane tree, but not properly, and in Tabraſten, and Kien, and Thihich. The later writers are far deceiued in taking it to be the Sycomore tree; and they as much, that would haue it to be the Lote or Nettle tree: it may be named in Engliſh, Bead tree, for the cauſe before alledged.

The other is *altera ſpecies Zizyphi*, or the ſecond kinde of Iuiube tree, which *Columella* in his ninth booke and fourth chap. doth call *Zizyphus alba*, or white Iuiube tree, for difference from the other that is ſyrnamed *Rutila*, or glittering red. *Pliny* calleth this *Zizyphus Cappadocica*, in his 21. booke, ninth chapter, where he entreateth of the honour of Garlands, of which he ſaith there be two ſorts, whereof ſome be made of floures, and others of leaues: I would call the floures (ſaith he) brooms, for of thoſe is gathered a yellow floure, and *Rhododendron*, alſo *Zizypha*, which is called *Cappadocica*. The floures of theſe are ſweet of ſmell, and like to Oliue floures. Neither doth *Columella* or *Pliny* vnaduiſedly take this for *Zizyphus*, for both the leaues and floures grow out of the tender and yong ſprung twigs, as they likewiſe do out of the former: the floures are very ſweet of ſmel, and caſt their ſauor far abroad: the fruit alſo is like that of the former.

¶ *The Temperature.*

Auicen writing and intreating of *Azadaraeth*, ſaith, that the floures thereof be hot in the third degree, and dry in the end of the firſt.

Zizyphus Cappadocica is cold and dry of complexion.

¶ *The Vertues.*

A The floures of *Zizyphus*, or *Azadaraeth* open the obſtructions of the braine.

B The diſtilled water thereof killeth nits and lice, preſerueth the haire of the head from falling, eſpecially being mixed with white wine, and the head bathed with it.

C The fruit is very hurtfull to the cheſt, and a troubleſome enemie to the ſtomacke; it is dangerous, and peraduenture deadly.

D Moreouer, it is reported, that the decoction of the barke and of Fumitorie, with Mirobalans added, is good for agues proceeding of flegme.

E The iuice of the vppermoſt leaues with honey is a remedie againſt poiſon.

F The like alſo hath *Rhaſis*: the Beade tree, ſaith he, is hot and dry: it is good for ſtoppings of the head, it maketh the haire long; yet is the fruit thereof very offenſiue to the ſtomacke, and oftentimes found to be pernitious and deadly.

G *Matthiolus* writeth, that the leaues and wood bringeth death euen vnto beaſts, and that the poyſon thereof is reſiſted by the ſame remedies that *Oleander* is.

H *Zizyphus Cappadocica* preuaileth againſt the diſeaſes aforeſaid, but the decoction thereof is verie good for thoſe whoſe water ſcaldeth them with the continuall iſſuing thereof, as alſo for ſuch as haue the running of the reines and the exulcerations of the bladder and priuy parts.

A looch

A looch or licking medicine made thereof or the ſyrrup, is excellent good againſt ſpitting of G bloud proceeding of the diſtillations of ſharpe or ſalt humors.

† The figure that formerly was in the ſecond place, was of the narrow leaued kinde of *Guajacum Peruvianum*, which you ſhall finde in the ſecond place of the next chapter ſaue one.

Chap. 123. *Of the Lote, or Nettle tree.*

Lotus arbor.
The Nettle tree.

¶ *The Deſcription.*

THe Lote whereof we write is a tree as big as a Peare tree, or bigger and higher: the body and armes are very thicke; the barke whereof is ſmooth, of a gallant green colour tending to blewneſſe: the boughes are long, and ſpread themſelues all about: the leaues be like thoſe of the Nettle, ſharpe pointed, and nicked in the edges like a ſaw, and daſht here and there with ſtripes of a yellowiſh white colour: the berries be round, and hang vpon long ſtalkes like Cherries, of a yellowiſh white colour at the firſt, and afterwards red, but when they be ripe they be ſomewhat blacke.

¶ *The Place.*

This is a rare and ſtrange tree in both the Germanies: it was brought out of Italy, where there is found ſtore thereof, as *Matthiolus* teſtifieth: I haue a ſmall tree thereof in my garden. There is likewiſe a tree thereof in the garden vnder London wall, ſometime belonging to Mr. *Gray*, an Apothecary of London; and another great tree in a garden neere Coleman ſtreet in London, being the garden of the Queenes Apothecarie at the impreſſion hereof, called Mr. *Hugh Morgan*, a curious conſeruer of rare ſimples. The Lote tree doth alſo grow in Africke, but it ſomewhat differeth from the Italian Lote in fruit, as *Pliny* in plaine words doth ſhew in his thirteenth booke, ſeuenteenth chapter. That part of Africke, ſaith he, that lieth towards vs, bringeth forth the famous Lote tree, which they call *Celtis*, and the ſame well knowne in Italy, but altered by the ſoile: it is as big as the Peare tree, although *Nepos Cornelius* reporteth it to be ſhorter: the leaues are full of fine cuts, otherwiſe they be thought to be like thoſe of the Holme tree. There be many differences, but the ſame are made eſpecially by the fruit: the fruit is as big as a Beane, and of the colour of Saffron, but before it is thorow ripe, it changeth his color as doth the Grape. It growes thicke among the boughes, after the manner of the Myrtle, not as in Italy, after the manner of the Cherry; the fruit of it is there ſo ſweet, as it hath alſo giuen a name to that countrie and land, too hoſpitable to ſtrangers, and forgetfull of their owne countrey.

It is reported that they are troubled with no diſeaſes of the belly that eate it. The better is that which hath no kernell, which in the other kinde is ſtony: there is alſo preſſed out of it a wine, like to a ſweet wine; which the ſame *Nepos* denieth to endure aboue ten daies, and the berries ſtamped with *Alica* are reſerued in veſſels for food. Moreouer we haue heard ſay, that armies haue been fed therewith, as they haue paſſed too and fro thorow Africke. The colour of the wood is blacke: they vſe to make flutes and pipes of it: the root ſerueth for kniues hafts, and other ſhort workes: this is there the nature of the tree: thus farre *Pliny*. In the ſame place he ſaith, that this renowmed tree doth grow about Syrtes and Naſamonæ: and in his 5. booke, 7. chapter he ſheweth that there is not far from the leſſer Syrtis, the Iſland Menynx, ſurnamed *Lotophagitis*, of the plenty of Lote trees.

Strabo in his 17. booke affirmeth, that not onely *Menynx*, but alſo the leſſer *Syrtis* is ſaid to be *Lotophagitis*: firſt, ſaith he, lieth Syrtis a certaine long Iſland by the name Cercinna, and another leſſer, called Circinnitis; next to this is the leſſer Syrtis, which they call Lotophagitis Syrtis: the compaſſe of this gulfe is almoſt 1600. furlongs; the bredth of the mouth 600. By both the capes there be Iſlands ioined to the maine land, that is, Circinna and Menynx, of like bigneſſe: they thinke that Menynx is the countrey of the Lotophagi, or thoſe that feed of the Lote trees; of which countrie *Homer* maketh mention, and there are certaine monuments to be ſeen, and *Vlyſſes* Altar, and the fruit is ſelfe, for there be in it great plenty of Lote trees, whoſe fruit is wonderful ſweet: thus ſaith *Strabo*.

This Lote is alſo deſcribed by *Theophraſtus*; in his fourth booke he ſaith, that there be very many kindes, which be ſeuered by the fruit: the fruit is of the bignes of a beane, which when it waxeth ripe doth alter his colour as grapes do: the fruit of which the Lotophagi do eate is ſweet, pleaſant, harmeles, and wholeſome for the belly, but that is pleaſanter which is without kernels, and of this they make their wine.

This Lote tree, as the ſame Author affirmeth, is by nature euerlaſting: as for example, the Lote trees whereof *Pliny* hath written in his 16. booke, 44. chapter. At Rome, ſaith he, the Lote tree in *Lucinas* court, how much elder it was than the church of the citie, built in the yeere which was without magiſtrates, 469. it is vncertaine: there is no doubt but that it was elder, becauſe *Lucina* bare the name of that *Lucus* or groue. This is now about 450. yeeres old. That is elder which is ſurnamed *Capillata*, or hairie; becauſe the haire of the veſtall virgins was brought vnto it: but the other Lote tree in *Vulcans* church, which *Romulus* built by the victory of tenths is taken to be as old as the citie, as *Maſſurius* witneſſeth.

¶ *The Time.*

They loſe their leaues at the firſt approch of winter; and recouer them againe in Aprill: the fruit is ripe in September.

¶ *The Names.*

This tree is called in Greeke, Λωτὸς: in Latine by *Pliny*, *Celtis*: in Italian, *Perlaro*: by thoſe of Trent, *Bagolaro*: and in Engliſh, Lote tree, and Nettle tree.

¶ *The Temperature and Vertues.*

A The Lote tree is not greatly binding as *Galen* ſaith, but of thin parts, and of a drying nature.

B The decoction of the wood beaten ſmall, being either drunke or vſed cliſterwiſe, is a remedy for the bloudy flix; and for the whites and reds.

C It ſtoppeth the laske, and maketh the haire yellow, and as *Galen* addeth, keepeth haires from falling.

D The ſhiuers or ſmall pieces thereof, as the ſame Author alleageth, are boiled ſometimes in water, ſometimes in wine, as need ſhall require.

Chap. 124.

Of Italian wood of Life, or Pocke wood, vulgarly called Lignum vitæ.

¶ *The Deſcription.*

1 ITalian *Lignum vitæ*, or Wood of Life, groweth to a faire and beautifull tree, hauing a ſtraight and vpright body, couered ouer with a ſmooth and darke greene barke, yeelding forth many twiggy branches, ſet forth of goodly leaues, like thoſe of the Peare tree, but of greater beautie, and ſomewhat broader: among which commeth forth the fruit, growing cloſe to the branches, almoſt without ſtalkes: this fruit is round, and at the firſt greene, but blacke when it is ripe, as big as Cherries, of an excellent ſweet taſte when it is dried: but this is not the Indian *Lignum ſanctum*, or *Guaiacum*, whereof our bowles and phyſicall drinkes be made, but it is a baſtard kind therof, firſt planted in the common garden at Padua, by the learned *Fallopius*, who ſuppoſed it to be the right *Guaiacum*.

‡ 2 The leaues of this are longer and narrower than the former, but firme alſo and nervous like as they are; the fruit is in ſhape like Sebeſtens, but much leſſe, of a blewiſh colour when it is ripe, with many little ſtones within; the taſte hereof is not vnpleaſant. *Matthiolus* calls this *Pſeudolotus*; and *Tabernamontanus*, *Lotus Africana*: whoſe figure our Author in the laſt chapter ſaue one gaue vnfitly for the *Zizyphus Cappadocica*. ‡

¶ *The Place.*

Guaiacum Patauinum groweth plentifully about Lugdunum, or Lions in France: I planted it in the

the garden of Barne-Elmes neere London two trees: beſides, there groweth another in the garden of M^r. *Gray* an Apothecarie of London, and in my garden likewiſe.

1 *Guaiacum Patauinum latifolium.*
Broad leafed Italian Wood of life.

2 *Guaiacum Patauinum anguſtifol.*
Narrow leafed Italian Guaiacum.

¶ *The Time.*

It floureth in May, and the fruit is ripe in September.

¶ *The Names.*

Guaiacum Patauinum hath been reputed for the *Lotus* of *Theophraſtus*: in Engliſh it is called the baſtard Meuynwood.

‡ This hath no affinitie with the true Indian Guajacum which is frequently vſed in medicine. ‡

¶ *The Temperature and Vertues.*

‡ The fruit of this is thought to be of the ſame temper and qualitie with that of the Nettle-tree. ‡

Chap. 125. *Of the Strawberry tree.*

¶ *The Deſcription.*

THe Strawberry tree groweth for the moſt part low, very like in bigneſſe to the Quince tree (whereunto *Dioſcorides* compareth it.) The body is couered with a reddiſh barke, both rough and ſcaly: the boughes ſtand thicke on the top, ſomewhat reddiſh: the leaues bee broad, long, and ſmooth, like thoſe of Bayes, ſomewhat nicked in the edges, and of a pale greene colour: the floures grow in cluſters, being hollow and white, and now and then on the one ſide ſomewhat of a purple colour: in their places come forth certaine berries hanging downe vpon little long ſtems like vnto Strawberries, but greater, without a ſtone within, but onely with little ſeeds, at the firſt greene, and when they be ripe they are of a gallant red colour, in taſte ſomewhat harſh, and in a manner without any reliſh; of which Thruſhes and Black-birds do feed in Winter.

Arbutus.
The Strawberry tree.

¶ *The Place.*

The Strawberry tree groweth in moſt Countries of Greece, in Candy, Italy, and Spaine, alſo in the vallies of the mountaine Athos, where, being in other places but little, they become great huge trees, as *P. Bellonius* writeth. *Iuba* alſo reporteth, that there be in Arabia of them fifty cubits high. They grow only in ſome few gardens with vs.

¶ *The Time.*

The Strawberry tree floureth in Iuly and Auguſt, and the fruit is ripe in September, after it hath remained vpon the tree by the ſpace of an whole yeare.

¶ *The Names.*

This tree is called in Greek, κόμαρος: in Latine, *Arbutus*: in Engliſh, Strawberry tree, and of ſome, Arbute tree.

The fruit is named in Creeke, μιμέκυλον, or as others reade it, μιμεκυλον: in Latine, *Memecylum*, and *Arbutus*; and *Pliny* calleth it *Vnedo*: Ground Strawberries (ſaith he) haue one body, and *Vnedo*, much like vnto them, another body, which onely in apple is like to the fruit of the earth: The Italians call this Strawberry *Albatro* the Spaniards, *Madrono*, *Medronheyro*, and *Medronho*: in French, *Arboutes*, *Arbous*: It may be termed in Engliſh, Tree Strawberry.

¶ *The Temperature and Vertues.*

A The fruit of the Strawberry tree is of a cold temperature, hurting the ſtomacke, and cauſing head-ache; wherefore no wholeſome food, though it be eaten in ſome places by the poorer ſort of people.

Chap. 126. *Of the Plum tree.*

¶ *The Kindes.*

TO write of Plums particularly would require a peculiar volume, and yet the end not to be attained vnto, nor the ſtocke or kindred perfectly knowne, neither to be diſtinguiſhed apart: the number of the ſorts or kindes are not knowne to any one countrey: euery Clymat hath his owne fruit, far different from that of other countries: my ſelfe haue three ſcore ſorts in my garden, and all ſtrange and rare: there be in other places many more common, and yet yearely commeth to our hands others not before knowne, therefore a few figures ſhall ſerue for the reſt. ‡ Let ſuch as require a larger hiſtorie of theſe varieties haue recourſe to the oft mentioned Worke of M^r. *Parkinſon*: and ſuch as deſire the things themſelues may finde moſt of the beſt with M^r. *Iohn Millen* in Old ſtreet. ‡

¶ *The Deſcription.*

1 THe Plum or Damſon tree is of a meane bigneſſe: it is couered with a ſmooth barke: the branches are long, whereon do grow broad leaues, more long than round, nicked in the edges: the floures are white: the Plums do differ in colour, faſhion, and bignes, they all conſiſt of pulpe and skin, and alſo of kernell, which is ſhut vp in a ſhell or ſtone. Some Plums are of a blackiſh blew, of which ſome be longer, others rounder, others of the colour of yellow wax, diuers of a crimſon red, greater for the moſt part than the reſt. There be alſo green Plums, and withall very long, of a ſweet and pleaſant taſte: moreouer, the pulpe or meate of ſome is drier, and eaſilier ſeparated from the ſtone: of other-ſome it is moiſter, and cleaueth faſter: our common Damſon is knowne to all, and therefore not to be ſtood vpon.

2 The

1 *Prunus Domeſtica.*
The Damſon tree.

2 *Prunus Mirobalana.*
The Mirobalane Plum tree.

3 *Prunus Amygdalina.*
The Almond Plum tree.

5 *Prunus ſylueſtris.*
The Sloe tree.

2 The Mirobalan Plum tree groweth to the height of a great tree, charged with many great armes or boughes, which diuide themſelues into ſmall twiggy branches, by means whereof it yeeldeth a goodly and pleaſant ſhadow: the trunke or body is couered with a finer and thinner barke than any of the other Plum trees: the leaues do ſomewhat reſemble thoſe of the Cherry tree, they are very tender, indented about the edges: the floures be white: the fruit is round, hanging vpon long foot-ſtalkes pleaſant to behold, greene in the beginning, red when it is almoſt ripe, and being full ripe it gliſtereth like purple mixed with blacke: the fleſh or meate is full of iuice pleaſant in taſte: the ſtone is ſmall, or of a meane bigneſſe: the tree bringeth forth plenty of fruit euery other yeare.

3 The Almond Plum groweth vp to the height of a tree of a meane bigneſſe: the branches are long, ſmooth, and euen: the leaues are broad, ſomthing long, and ribbed in diuers places, with ſmall nerues running through the ſame: the floures are white, ſprinkled with a little daſh of purple ſcarcely to be perceiued: the fruit is long, hauing a cleft downe the middle, of a browne red colour, and of a pleaſant taſte.

4 The Damaſcen Plum tree groweth likewiſe to a meane height, the branches very brittle; the leaues of a deepe green colour: the fruit is round, of a blewiſh blacke colour: the ſtone is like vnto that of the Cherry, wherein it differeth from all other Plums.

5 The Bulleſſe and the Sloe tree are wilde kindes of Plums, which do vary in their kind, euen as the greater and manured Plums do. Of the Bulleſſe, ſome are greater and of better taſte than others. Sloes are ſome of one taſte, and ſome of others, more ſharpe; ſome greater, and others leſſer; the which to diſtinguiſh with long deſcriptions were to ſmall purpoſe, conſidering they be all and euery of them knowne euen vnto the ſimpleſt: therefore this ſhall ſuffice for their ſeueral deſcriptions.

¶ *The Place.*

The Plum trees grow in all knowne countries of the world: they require a looſe ground, they alſo receiue a difference from the regions where they grow, not only of the forme or faſhion, but eſpecially of the faculties, as we will forthwith declare.

The Plum trees are alſo many times graffed into trees of other kindes, and being ſo ingraffed, they *faciem parentis, ſuccum adoptionis, vt Plinius dicit, exhibent.*

The greateſt varietie of theſe rare Plums are to be found in the grounds of M^r. *Vincent Poimer* of Twicknam, before remembred in the Chap. of Apples: although my ſelfe am not without ſome, and thoſe rare and delicate.

The wilde Plums grow in moſt hedges through England.

¶ *The Time.*

The common and garden Plum trees do bloome in April: the leaues come forth preſently with them: the fruit is ripe in Sommer, ſome ſooner, ſome later.

¶ *The Names.*

The Plumme tree is called in Greeke, κοκκυμηλέα: in Latine, *Prunus*: in high-Dutch, **Pflaumenbaum**: in low-Dutch, **Pruymen**: in Spaniſh, *Ciruelo*: in French, *Prunier*: in Engliſh, Plum tree.

The fruit is called in Greeke, κοκκύμηλον: in Latine, *Prunum*: in high-Dutch, **Pflaumen**: in low-Dutch, **Pruymen**: in Italian and French, *Prune*: in Spaniſh, *Prunas*: in Engliſh, Prune, and Plum. Theſe haue alſo names from the regions and countries where they grow.

The old Writers haue called thoſe that grow in Syria neere vnto Damaſcus, *Damaſcena Pruna*: in Engliſh, Damſons, or Damaske Prunes: and thoſe that grow in Spain, *Hiſpanica*, Spaniſh Prunes or Plums. So in our age we vſe to call thoſe that grow in Hungarie, *Hungarica*, or *Pannonica*, Plums of Hungarie: ſome, *Gallica Pruna*, or French Prunes. of the country of France. *Clearcus Peripateticus* ſaith, that they of Rhodes and Sicilia do call the Damaske Prunes *Brabula*.

¶ *The Temperature and Vertues.*

A Plummes that be ripe and new gathered from the tree, what ſort ſoeuer they are of, do moiſten and coole, and yeeld vnto the body very little nouriſhment, and the ſame nothing good at all: for as Plummes do very quickly rot, ſo is alſo the iuice of them apt to putrifie in the body, and likewiſe to cauſe the meate to putrifie which is taken with them: onely they are good for thoſe that would keepe their bodies ſoluble and coole; for by their moiſture and ſlipperineſſe they do mollifie the belly.

B Dried Plums, commonly called Prunes, are wholſomer, and more pleaſant to the ſtomack, they yeeld more nouriſhment, and better, and ſuch as cannot eaſily putrifie. It is reported, ſaith *Galen* in his booke of the faculties of Nouriſhments, that the beſt doe grow in Damaſcus a city of Syria; and next to thoſe, they that grow in Spaine: but theſe doe nothing at all binde, yet diuers of the Damaske Damſon Prunes very much; for Damaske Damſon Prunes are more aſtringent, but they of Spaine be ſweeter. *Dioſcorides* ſaith, that Damaske Prunes dried do ſtay the belly; but *Galen* affirmth, in his books of the faculties of ſimple medicines, that they do manifeſtly looſe the belly,

yet

yet lesser than they that bee brought out of Spaine; being boiled with Mead or honied water, which hath a good quantitie of honey in it, they loose the belly very much (as the same Authour saith) although a man take them alone by themselues, and much more if the Mead be supped after them. We most commend those of Hungarie being long and sweet; yet more those of Morauia the chiefe and principall citie in times past of the Prouince of the Marcomans: for these after they be dried, that the waterie humour may be consumed away, be most pleasant to the taste, and do easily without any trouble so mollifie the belly, as that in that respect they go beyond Cassia and Manna, as *Thomas Iordanus* affirmeth.

The leaues of the Plum tree are good against the swelling of the Vuula, the throat, gums, & kernels vnder the throat and iawes; they stop the rheume and falling downe of humors, if the decoction thereof be made in wine, and gargled in the mouth and throat. C

The gumme which commeth out of the Plum-tree doth glew and fasten together, as *Dioscorides* saith. D

Being drunke in wine it wasteth away the stone, and healeth Lichens in infants and young children; if it be layed on with vineger, it worketh the same effects that the gum of the Peach and cherrie tree doth. E

The wilde Plums do stay and binde the belly, and so do the vnripe plummes of what sort soeuer, whiles they are sharpe and sower, for then are they astringent. F

The iuice of Sloes doth stop the belly, the lask and bloudy flix, the inordinat course of womens termes, and all other issues of bloud in man or woman, and may very well be vsed in stead of Acatia, which is a thornie tree growing in Ægypt, very hard to be gotten, and of a deere price, and therfore the better for wantons; albeit our Plums of this countrey are equall vnto it in vertues. G

Chap. 127. *Of Sebesten, or the Assyrian Plum.*

Sebestenæ, Myxa, sive Myxara.
Assyrian Plums.

¶ *The Description.*

SEbestines are also a kinde of Plums: the tree whereof is not vnlike to the Plum tree, saue that it groweth lower than the most of the manured Plum trees; the leaues be harder and rounder; the floures grow at the tops of the branches consisting of fiue small white leaues, with pale yellowish threds in the middle, like those of the Plum tree: after followeth the fruit like to little Plummes, fastened in little skinny cups, which when they be ripe are of a greenish black colour, wherein is contained a small hard stone. The fruit is sweet in taste, the pulpe or meat is very tough and clammie.

¶ *The Place,*

The Sebesten trees grow plentifully in Syria and Egypt; they were in times past forreine and strange in Italy, now they grow almost in euery garden, being first brought thither in *Plinie* his time. Now do the Sebesten trees, saith he, in his 15. booke, 18. chapter, begin to grow in Rome, among the Seruice trees.

¶ *The Time.*

The time answereth the common Plums.

¶ *The Names.*

Pliny calleth the tree *Myxa*, it may bee suspected that this is the tree which *Matron Paradus* in his Atticke banket in *Athenæus* doth call μυξαν, but we cannot certainely affirme it, and especially because diuers haue diuersly deemed thereof. The berry or fruit is named

Myxon,

Myxon and *Myxarion*, neither haue the Latines any other name. The Arabians and the Apothecaries do call it *Sebeſten*: which is alſo made an Engliſh name: we may call it the Aſſyrian Plum.

¶ *The Temperature and Vertues.*

A Sebeſtens be very temperately cold and moiſt, and haue a thicke and clammie ſubſtance; therefore they nouriſh more than moſt fruits do, but withall they eaſily ſtop the intrailes, and ſtuffe vp the narrow paſſages, and breed inflammations.

B They take away the ruggedneſſe of the throat and lungs, and alſo quench thirſt, being taken in a looch or licking medicine, or prepared any other kinde of way, or elſe taken by themſelues.

C The weight of ten drams, or of an ounce and a halfe of the pap or pulpe hereof being inwardly taken, doth looſe the belly.

D There is alſo made of this fruit a purging Electuarie, but ſuch an one as quickly mouldeth, and therefore it is not to be vſed but when it is new made.

Chap. 128. *Of the Indian Plums, or Mirobalans.*

¶ *The Kindes.*

THere be diuers kinds of Mirobalans, as *Chebulæ*, *Bellericæ*, *Emblicæ*, &c. They likewiſe grow vpon diuers trees, and in countries far diſtant one from another, and *Garcias* the Portugall Phyſition is of opinion, that the fiue kindes grow vpon fiue diuers trees.

¶ *The Deſcription.*

1 THe firſt of the Mirobalan trees, called *Chebulæ*, is a ſhrubbie tree altogether wilde (which the Indians doe call *Aretca*:) in ſtature not vnlike to the Plum tree; the branches are many, and grow thicke together, whereon are ſet leaues like thoſe of the Peach tree. The fruit is greater than any of the reſt, ſomwhat long, faſhioned like a peare.

2 This ſecond kinde of Mirobalan, called *Flaua*, or *Citrina*, which ſome do call *Aritiqui*, but the common people of India, *Arare*, groweth vpon a tree of meane ſtature, hauing many boughes ſtanding finely in order, and ſet full of leaues like vnto the Seruice tree.

3 The third kinde of Mirobalans, called *Emblica*, the Indians doe call *Amiale*, which grow vpon a tree of mean ſtature, like the former, but the leaues are very much iagged, in ſhape like the leaues of Ferne, but that they be ſomewhat thicker: the Indians do not put the fruit hereof vnto phyſicall vſes, but occupie it for the thickening and tanning of their leather in ſtead of *Rhus*, or Coriars Sumach, as alſo to make inke and bletch for other purpoſes.

4 *Mirobalani Bellirica*, called of the Sauages *Gotni*, and *Guti*, groweth vp to a meane ſtature, garniſhed with leaues like vnto Laurell or the Bay tree, but ſomewat leſſer, thinner, and of a pale greene colour.

5 The fift kinde of Mirobalans is called *Indica*, which the Indians do call *Re Zannale*; it groweth vpon a tree of meane ſtature, or rather vpon a ſhrub or hedge plant, bearing leaues like the Willow, and a fruit eight ſquare. There is a fift kinde, the tree whereof is not mentioned in Authors.

¶ *The Place and Time.*

The laſt foure kindes of Mirobalans do grow in the kingdome of Cambaia: they grow likewiſe in Goa, Batecala, Malanor, and Dabul: the *Kebula* in Biſnager, Decan, Guzarate, and Bengala, & many other places of the Eaſt Indies. The time agreeth with other fruits in thoſe countries.

¶ *The Names.*

Thoſe which we haue ſaid to be yellow, the inhabitants of thoſe countries where they grow doe call

call them *Arare*; thoſe that be blacke they call *Rezennale*; the *Bellericæ*, *Gotim*; the *Chebulæ*, *Aretca*; the *Emblicæ* are called *Aretiqui*.

¶ *The Temperature.*

All the kindes of Mirobalans are in taſte aſtringent and ſharpe like vnto the vnripe *Sorbus* or Seruice berries, and therefore they are of complexion cold and drie.

¶ *The Vertues.*

The Indians vſe them rather to bind than purge; but if they do vſe them for a purge, they vſe the decoction of them, and vſe them much conſerued in ſugar, and eſpecially the *Chebulæ*; the yellow and blacke be good that way likewiſe. A

The yellow and *Bellericæ* taken before meat, are good againſt a laske, or weake ſtomacke, as *Garcias* writeth. B

The yellow and blacke, or *Indicæ*, and the *Chebulæ*, purge lightly, if two or three drams be taken, and draw ſuperfluous humors from the head. C

The yellow, as ſome write, purge choler, *Chebulæ* flegme, *Indicæ* melancholie, and ſtrengthen the inward parts, but roſted in the embers, or otherwiſe waſted, they drie more than they purge. D

There are two ſorts eſpecially brought into theſe parts of the world conſerued, the *Chebulæ*, and of them the beſt are ſomewhat long like a ſmall Limon, with a hard rinde and black pith, of the taſt of a conſerued Wall-nut; and the *Bellericæ*, which are round and leſſer, and tenderer in eating. E

Lobel writeth, that of them the *Emblicæ* do meanly coole, ſome do drie in the firſt degree, they purge the ſtomacke of rotten flegme, they comfort the braine, the ſinewes, the heart, and liuer, procure appetite, ſtay vomite, and coole the heat of choler, helpe the vnderſtanding, quench thirſt, and the heate of the intrailes: the greateſt and heavieſt be the beſt. F

They purge beſt, and with leſſer paine, if they be laid in water in the Sun vntill they ſwell, & ſod on a ſoft fire, & after they haue ſod and be cold, preſerued in foure times ſo much white honey, put to them. G

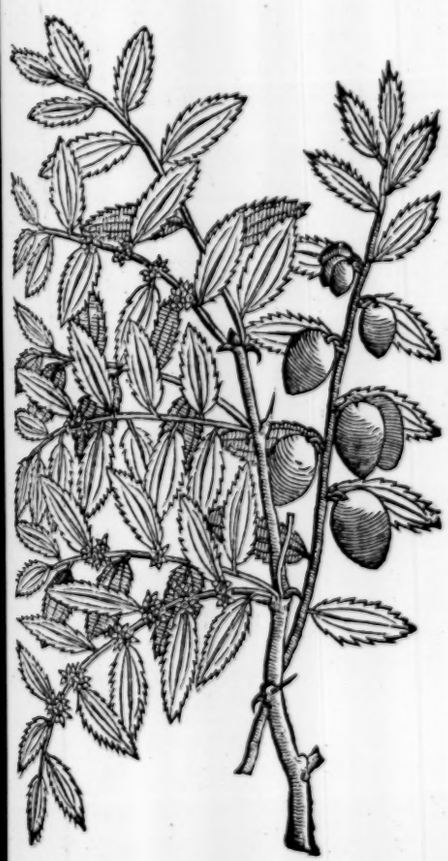
Garcias found the diſtilled water to be right profitable againſt the French diſeaſe, and ſuch like infections. H

The *Bellericæ* are alſo of a milde operation, and do comfort, and are cold in the firſt degree, and drie in the ſecond: the others come neere to the *Emblicæ* in operation. I

† Ihaue in this chapter contented my ſelfe with the expreſſing of the fruits out of *Cluſius* and *Lobel*, and omitted the figures of the three Mirabalan trees, which the Author gaue vs out of *Tabernamontanus*; becauſe I iudge them rather drawne by fancy than by the things themſelues.

CHAP. 129. *Of the Iuiube tree.*

Iuiube Arabum, ſive Ziziphus Dodonæi.
The Iuiube tree.



¶ *The Deſcription.*

THe Iuiube tree is not much leſſer than *Ziziphus candida*, hauing a wreathed trunke or body, and a rough barke full of rifts or cranies, and ſtiffe branches, beſet with ſtrong and hard prickles; from whence grow out many long twigs, or little ſtalkes, halfe a foot or more in length, in ſhew like Ruſhes, limmer, and eaſily bowing themſelues, and very ſlender like the twigges of Spartum: about which come forth leaues one aboue another, which are ſomewhat long, not very great, but hard and tough like to the leaues of *Peruinca* or Peruinckle; & among theſe leaues come forth pale and moſſie little floures: after which ſucceed long red well taſted ſweet berries as big as Oliues (of a meane quantity) or little Prunes, or ſmal Plums, wherein there are hard round ſtones, or in which a ſmall kernell is contained.

¶ *The Place.*

There be now at this day Iuiube trees growing in very many places of Italy, which in times paſt were newly brought thither out of Syria, and that about *Pliny* his time, as he himſelfe hath written in his 17. book, 10. chap.

¶ *The Time.*

It floureth in Aprill, at which time the ſeeds or ſtones are to be ſet or ſowne for increaſe.

¶ *The*

¶ *The Names.*

This tree is called in Greeke ζιζυφος and ζιζυφον with *Iota* in the ſecond ſyllable: in Latine likewiſe *Zizyphus*; and of *Petrus Creſcentius*, *Ziziulus*: in Engliſh, Iuiube tree.

The fruit or Plums are named in Greeke ζιζυφα, ζιζυφια: *Galen* calleth them ονηκα, as *Auicen* plainely ſheweth in his 369. chapter, intreating of the Iuiube, in which he ſet downe thoſe things that are mentioned concerning *Serica* in *Galens* books of the faculties of Nouriſhments: in Latine likewiſe *Zizypha* and *Serica*: in ſhops, *Iuiuba*: in Engliſh, Iuiubes.

¶ *The Temperature.*

Iuiubes are temperate in heate and moiſture.

¶ *The Vertues.*

A The fruit of the Iuiube tree eaten is of hard digeſtion, and nouriſheth very little; but being taken in ſyrrups, electuaries, and ſuch like confections, it appeaſeth and mollifieth the roughneſſe of the throat, the breſt and lungs, and is good againſt the cough, but exceeding good for the reines of the backe, and kidneies and bladder.

Chap. 130. *Of the Cherrie Tree.*

¶ *The Kindes.*

THe antient Herbariſts haue ſet down foure kindes of Cherrie trees, the firſt is great and wilde; the ſecond tame or of the garden: the third, whoſe fruit is foure: the fourth is that which is called in Latine *Chamæceraſus*, or the dwarfe Cherrie tree. The later writers haue found diuers ſorts more, ſome bringing forth great fruit, others leſſer; ſome with white fruit, ſome with blacke, others of the colour of blacke bloud, varying infinitely according to the climate and countrey where they grow.

1 *Ceraſus vulgaris.*
The common Engliſh Cherrie tree.

3 *Ceraſus Hiſpanica.*
The Spaniſh Cherrie tree.

¶ *The*

¶ *The Deſcription.*

1 THe Engliſh Cherrie tree groweth to an high and great tree, the body whereof is of a meane bigneſſe, which is parted aboue into very many boughes, with a barke ſomewhat ſmooth, and of a browne crimſon colour, tough and pliable: the ſubſtance or timber is alſo browne in the middle, and the outward part is ſomewhat white. The leaues be great, broad, long, ſet with veines or nerues, and ſleightly nicked about the edges: the floures are white, of a mean bignes, conſiſting of fiue leaues, and hauing certaine threds in the middle, of the like colour: the Cherries be round, hanging vpon long ſtems or foot-ſtalks, with a ſtone in the midſt which is couered with a pulpe or ſoft meat; the kernell thereof is not vnpleaſant to the taſte, though ſomewhat bitter.

2 The Flanders Cherry tree differeth not from our Engliſh Cherrie tree in ſtature or forme of leaues or floures; the difference conſiſteth in this, that this tree bringeth forth his fruit ſooner, and greater than the other: wherefore it may be called in Latine, *Ceraſus precox, ſiue Belgica.*

5 *Ceraſus Serotina.*
Late ripe Cherrie tree.

6 *Ceraſus vno pediculo plura.*
The Cluſter Cherrie tree.

3 The Spaniſh Cherrie tree groweth vp to the height of our common Cherrie tree: the wood or timber is ſoft and looſe, couered with a whitiſh ſcalie barke: the branches are knottie, greater & fuller of ſubſtance than any other Cherry tree: the leaues are likewiſe greater and longer than any of the reſt, in ſhape like thoſe of the Cheſtnut tree: the floures are like the others in forme, but whiter of colour: the fruit is greater and longer than any, white for the moſt part all ouer, except thoſe that ſtand in the hotteſt place where the Sun hath ſome reflexion againſt a wall: they are alſo white within, and of a pleaſant taſte.

4 The Gaſcoine Cherrie tree groweth very like to the Spaniſh Cherry tree in ſtature, floures, and leaues: it differeth in that it bringeth forth very great Cherries, long, ſharpe pointed, with a certaine hollowneſſe vpon one ſide, and ſpotted here and there with certaine prickles of purple colour as ſmall as ſand: the taſte is moſt pleaſant, and excelleth in beautie.

5 The late ripe Cherry tree groweth vp like vnto our wilde Engliſh Cherry tree, with the like leaues,

7 *Ceraſus multiflora fructus edens.*
The double floured Cherry tree bearing fruit.

8 *Ceraſus multiflora pauciores fructus edens.*
The doule floured barren Cherry tree.

9 *Ceraſus auium nigra & racemoſa.*
Birds Cherry, and blacke Grape Cherry tree.

10 *Ceraſus racemoſa rubra.*
Red Grape Cherry tree.

leaues, branches, and floures, ſauing that they are ſometimes once doubled: the fruit is ſmall, round, and of a darke bloudy colour when they be ripe, which the French-men gather with their ſtalkes, and hang them vp in their houſes in bunches or handfulls againſt winter, which the Phyſitians do giue vnto their patients in hot and burning feuers, being firſt ſteeped in a little warme water, that cauſeth them to ſwell and plumpe vp as full and freſh as when they did grow vpon the tree.

6 The Cluſter Cherry-tree differeth not from the laſt deſcribed either in leaues, branches, or ſtature: the floures are alſo like, but neuer commeth any one of them to be double. The fruit is round, red when they be ripe, and many growing vpon one ſtem or footſtalke in cluſters, like as the Grapes do. The taſte is not vnpleaſant, although ſomewhat ſoure.

7 This Cherrie-tree with double floures growes vp vnto a ſmall tree, not vnlike to the common Cherrie-tree in each reſpect, ſauing that the flours are ſomewhat doubled, that is to ſay, three or foure times double; after which commeth fruit (though in ſmall quantitie) like the other common Cherrie.

8 The double floured Cherrie-tree growes vp like vnto an hedge buſh, but not ſo great nor high as any of the others; the leaues and branches differ not from the reſt of the Cherrie-trees. The floures hereof are exceeding double, as are the floures of Marigolds, but of a white colour, and ſmelling ſomewhat like the Hawthorne floures; after which come ſeldome or neuer any fruit, although ſome Authors haue ſaid that it beareth ſometimes fruit, which my ſelfe haue not at any time ſeen; notwithſtanding the tree hath growne in my garden many yeeres, and that in an excellent good place by a bricke wall, where it hath the reflection of the South ſunne, fit for a tree that is not willing to beare fruit in our cold climat.

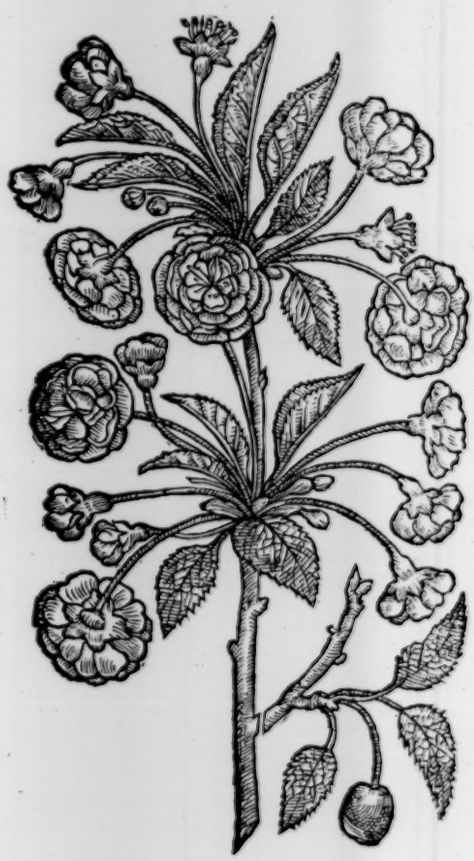
11 *Ceraſus nigra.*
The common blacke Cherry-tree

12 *Chamæceraſus.*
The dwarfe Cherry-tree.

9 The Birds Cherry-tree, or the blacke Cherry-tree, that bringeth forth very much fruit vpon one branch (which better may be vnderſtood by ſight of the figure, than by words) ſpringeth vp like an hedge tree of ſmall ſtature, it groweth in the wilde woods of Kent, and are there vſed for ſtockes to graft other Cherries vpon, of better taſte, and more profit, as eſpecially thoſe called the Flanders Cherries: this wilde tree growes very plentifully in the North of England, eſpecially at a place called Heggdale, neer vnto Roſgill in Weſtmerland, and in diuers other places about Croſbie Ruenſwaith, and there called Hegberrie-tree: it groweth likewiſe in Martome Parke, foure

7 *Ceraſus multiflora fructus edens.*
The double floured Cherry tree bearing fruit.

8 *Ceraſus multiflora pauciores fructus edens.*
The doule floured barren Cherry tree.



9 *Ceraſus auium nigra & racemoſa.*
Birds Cherry, and blacke Grape Cherry tree.

10 *Ceraſus racemoſa rubra.*
Red Grape Cherry tree.

leaues, branches, and floures, ſauing that they are ſometimes once doubled: the fruit is ſmall, round, and of a darke bloudy colour when they be ripe, which the French-men gather with their ſtalkes, and hang them vp in their houſes in bunches or handfulls againſt winter, which the Phyſitians do giue vnto their patients in hot and burning feuers, being firſt ſteeped in a little warme water, that cauſeth them to ſwell and plumpe vp as full and freſh as when they did grow vpon the tree.

6 The Cluſter Cherry-tree differeth not from the laſt deſcribed either in leaues, branches, or ſtature: the floures are alſo like, but neuer commeth any one of them to be double. The fruit is round, red when they be ripe, and many growing vpon one ſtem or footſtalke in cluſters, like as the Grapes do. The taſte is not vnpleaſant, although ſomewhat ſoure.

7 This Cherrie-tree with double floures growes vp vnto a ſmall tree, not vnlike to the common Cherrie-tree in each reſpect, ſauing that the flours are ſomewhat doubled, that is to ſay, three or foure times double; after which commeth fruit (though in ſmall quantitie) like the other common Cherrie.

8 The double floured Cherrie-tree growes vp like vnto an hedge buſh, but not ſo great nor high as any of the others; the leaues and branches differ not from the reſt of the Cherrie-trees. The floures hereof are exceeding double, as are the floures of Marigolds, but of a white colour, and ſmelling ſomewhat like the Hawthorne floures; after which come ſeldome or neuer any fruit, although ſome Authors haue ſaid that it beareth ſometimes fruit, which my ſelfe haue not at any time ſeen; notwithſtanding the tree hath growne in my garden many yeeres, and that in an excellent good place by a bricke wall, where it hath the reflection of the South ſunne, fit for a tree that is not willing to beare fruit in our cold climat.

11 *Ceraſus nigra.*
The common blacke Cherry-tree

12 *Chamæceraſus.*
The dwarfe Cherry-tree.

9 The Birds Cherry-tree, or the blacke Cherry-tree, that bringeth forth very much fruit vpon one branch (which better may be vnderſtood by ſight of the figure, than by words) ſpringeth vp like an hedge tree of ſmall ſtature, it groweth in the wilde woods of Kent, and are there vſed for ſtockes to graft other Cherries vpon, of better taſte, and more profit, as eſpecially thoſe called the Flanders Cherries: this wilde tree growes very plentifully in the North of England, eſpecially at a place called Heggdale, neer vnto Roſgill in Weſtmerland, and in diuers other places about Croſbie Ruenſwaith, and there called Hegberrie-tree: it groweth likewiſe in Martome Parke, foure miles

miles from Blackeburne, and in Harward neere thereunto; in Lancaſhire almoſt in euery hedge: the leaues and branches differ not from thoſe of the wilde Cherry-tree: the floures grow alongſt the ſmall branches, conſiſting of fiue ſmall white leaues, with ſome greeniſh and yellow thrums in the middle: after which come the fruit, greene at the firſt, blacke when they be ripe, and of the bigneſſe of Sloes; of an harſh and vnpleaſant taſte.

10 The other birds Cherry-tree differeth not from the former in any reſpect, but in the colour of the berries; for as they are blacke; ſo on the contrary, theſe are red when they be ripe, wherein they differ.

11 The common blacke Cherry-tree growes vp in ſome places to a great ſtature: there is no difference betweene it and our common Cherry-tree, ſauing that the fruit hereof is very little in reſpect of other Cherries, and of a blacke colour.

12 The dwarfe Cherry-tree groweth very ſeldome to the height of three cubits: the trunke or body ſmall, couered with a darke coloured blacke: whereupon do grow very limber and pliant twiggy branches: the leaues are very ſmall, not much vnlike to thoſe of the Priuite buſh: the floures are ſmall and white: after which come Cherries of a deepe red colour when they be ripe, of taſte ſomewhat ſharpe, but not greatly vnpleaſant: the branches laid downe in the earth, quickly take root, whereby it is greatly increaſed.

My ſelfe with diuers others haue ſundry other ſorts in our gardens, one called the Hart Cherry, the greater and the leſſer; one of a great bigneſſe, and moſt pleaſant in taſte, which we call *Luke Wardes* Cherry, becauſe he was the firſt that brought the ſame out of Italy; another we haue called the Naples Cherry, becauſe it was firſt brought into theſe parts from Naples: the fruit is very great, ſharpe pointed, ſomewhat like a mans heart in ſhape, of a pleaſant taſte, and of a deepe blackiſh colour when it is ripe, as it were of the colour of dried bloud.

We haue another that bringeth forth Cherries alſo very great, bigger than any Flanders Cherrie, of the colour of Iet, or burniſhed horne, and of a moſt pleaſant taſte, as witneſſeth M^r. *Bull*, the Queenes Maieſties Clockemaker, who did taſte of the fruit (the tree bearing onely one Cherry, which he did eate; but my ſelfe neuer taſted of it) at the impreſſion hereof. We haue alſo another, called the Agriot Cherry, of a reaſonable good taſte. Another we haue with fruit of a dun colour, tending to a watchet. We haue one of the dwarffe Cherries, that bringeth forth fruit as great as moſt of our Flanders Cherries, whereas the common ſort hath very ſmall Cherries, and thoſe of an harſh taſte. Theſe and many ſorts more we haue in our London gardens, whereof to write particularly would greatly enlarge our volume, and to ſmall purpoſe: therefore what hath been ſaid ſhall ſuffice. ‡ I muſt here (as I haue formerly done, in Peares, Apples and other ſuch fruites) refer you to my two friends M^r. *Iohn Parkinſon*, and M^r. *Iohn Millen*, the one to furniſh you with the hiſtory, and the other with the things themſelues, if you deſire them. ‡

¶ *The Time.*

The Cherrie-trees bloome in Aprill; ſome bring forth their fruit ſooner; ſome later: the red Cherries be alwaies better than the blacke of their owne kinde.

¶ *The Names.*

The Cherry-tree is called in Greeke, κερασος: and alſo in Latine, *Ceraſus*: in high-Dutch, **Kirſchenbaum**: in low-Dutch, **Kerſenboome**, and **Crieckenboom**: in French, *Ceriſier*: in Engliſh, Cherry-tree.

The fruit or Cherries be called in Greeke, κερασια, and κερασα: and in Latine likewiſe, *Ceraſa*: in Engliſh, Cherries: the Latine and Engliſh names in their ſeuerall titles ſhall ſuffice for the reſt that might be ſaid.

¶ *The Temperature and Vertues.*

A The beſt and principall Cherries be thoſe that are ſomewhat ſower: thoſe little ſweet ones which be wilde and ſooneſt ripe be the worſt: they containe bad juice, they very ſoon putrifie, and do ingender ill bloud, by reaſon whereof they do not onely breed wormes in the belly, but troubleſome agues, and often peſtilent feuers: and therefore in well gouerned common wealths it is carefully prouided, that they ſhould not be ſold in the markers in the plague time.

B Spaniſh Cherries are like to theſe in faculties, but they do not ſo ſoone putrifie: they be likewiſe cold, and the iuice they make is not good.

C The Flanders or Kentiſh Cherries that are through ripe, haue a better juice but watery, cold and moiſt: they quench thirſt, they are good for an hot ſtomacke, and profitable for thoſe that haue the ague: they eaſily deſcend and make the body ſoluble: they nouriſh nothing at all.

D The late ripe Cherries which the French-men keep dried againſt winter, and are by them called *Morelle*, and we after the ſame name call them Morell Cherries, are dry, and do ſomewhat binde; theſe being dried are pleaſant to the taſte, and wholeſome for the ſtomacke, like as Prunes be, and do ſtop the belly.

Generally

Generally all the kindes of Cherries are cold and moiſt of temperature, although ſome more E
cold and moiſt than others: the which being eaten before meat doe ſoften the belly very gently,
they are vnwholſome either vnto moiſt and rheumaticke bodies, or for vnhealthie and cold ſto-
mackes.

The common blacke Cherries do ſtrengthen the ſtomack, and are wholeſomer than the red Cher- F
ries, the which being dried do ſtop the laske.

The diſtilled water of Cherries is good for thoſe that are troubled with heate and inflammati- G
ons in their ſtomackes, and preuaileth againſt the falling ſickneſſe giuen mixed with wine.

Many excellent Tarts and other pleaſant meats are made with Cherries, ſugar, and other delicat H
ſpices, whereof to write were to ſmall purpoſe.

The gum of the Cherrie tree taken with wine and water, is reported to helpe the ſtone; it may do I
good by making the paſſages ſlippery, and by tempering & alaying the ſharpneſſe of the humors;
and in this maner it is a remedy alſo for an old cough. *Dioſcorides* addeth, that it maketh one well
coloured, cleareth the ſight, and cauſeth a good appetite to meat.

Chap. 131. *Of the Mulberrie tree.*

1 *Morus.*
The Mulberrie tree.

2 *Morus alba.*
The white Mulberrie tree.

¶ *The Deſcription.*

1 THe common Mulberie tree is high, and ful of boughes: the body wherof is many times great, the barke rugged; & that of the root yellow: the leaues are broad and ſharp pointed, ſomething hard, and nicked on the edges; in ſtead of floures, are blowings or catkins, which are downie: the fruit is long, made vp of a number of little graines, like vnto a blacke-Berrie, but thicker, longer, and much greater, at the firſt greene, and when it is ripe blacke, yet is the iuice (whereof it is full) red: the root is parted many waies.

2 The white Mulberrie tree groweth vntill it be come vnto a great and goodly ſtature, almoſt as big as the former: the leaues are rounder, not ſo ſharpe pointed, nor ſo deeply ſnipt about the edges, yet ſometimes ſinuated or deeply cut in on the ſides, the fruit is like the former, but that it is white and ſomewhat more taſting like wine.

¶ *The Place.*

The Mulberry trees grow plentifully in Italy and other hot regions, where they doe maintaine great woods and groues of them, that there Silke wormes may feed thereon. The Mulberry tree is fitly ſet by the ſlip; it may alſo be grafted or inoculated into many trees, being grafted in a white Poplar, it bringeth forth white Mulberies, as *Beritius* in his Geoponickes reporteth. Theſe grow in ſundry gardens in England.

¶ *The Time.*

Of all the trees in the Orchard the Mulberry doth laſt bloome, and not before the cold weather is gone in May (therefore the old Writers were wont to call it the wiſeſt tree) at which time the Silke wormes do ſeeme to reuiue, as hauing then wherewith to feed and nouriſh themſelues, which all the winter before do lie like ſmall graines or ſeeds, or rather like the dunging of a fleſh flie vpon a glaſſe, or ſome ſuch thing, as knowing their proper time both to performe their duties for which they were created, and alſo when they may haue wherewith to maintaine and preſerue their owne bodies, vnto their buſineſſe aforeſaid.

The berries are ripe in Auguſt and September. *Hegeſander* in *Athenæus* affirmeth, that the Mulberie trees in his time did not bring forth fruit in twentie years together, and that ſo great a plague of the gout then raigned and raged ſo generally, as not onely men, but boies, wenches, eunuchs, and women were troubled with that diſeaſe.

¶ *The Names.*

This tree is named in Greeke μορία, and συκάμινος in Latine, *Morus*: in ſhops, *Morus Celſi*: in high Dutch, **Maulberbaum**: in low Dutch, **Moerbeſie boom**: in French, *Meurier*: in Engliſh, Mulberry tree.

The fruit is called μόρον, and συκάμινον: in Latine, *Morum*: in ſhops, *Morum Celſi*: in high Dutch **Moerbeſie**: in Italian, *Moro*: in French, *Meure*: in Spaniſh, *Moras* and *Mores*: in Engliſh, Mulberry.

¶ *The Temperature and Vertues.*

A Mulberries being gathered before they be ripe, are cold and dry almoſt in the third degree, and do mightily binde; being dried they are good for the laske and bloudy flix, the pouder is vſed in meat, and is drunke with wine and water.

B They ſtay bleedings, and alſo the reds; they are good againſt inflammations or hot ſwellings of the mouth and iawes, and for other inflammations newly beginning.

C The ripe and new gathered Mulberries are likewiſe cold and be ful of iuice, which hath the taſte of wine, and is ſomething drying, and not without a binding qualitie: and therefore it is alſo mixed with medicines for the mouth, and ſuch as helpe the hot ſwellings of the mouth, and almonds of the throat; for which infirmities it is ſingular good.

D Of the iuice of the ripe berries is made a confection with ſugar, called *Diamorum*: that is, after the manner of a ſyrrup, which is exceeding good for the vlcers and hot ſwellings of the tongue, throat, and almonds, or Vuula of the throat, or any other malady ariſing in thoſe parts.

E Theſe Mulberries taken in meat, and alſo before meat, do very ſpeedily paſſe through the belly, by reaſon of the moiſture and ſlipperineſſe of their ſubſtance, and make a paſſage for other meats, as *Galen* ſaith.

F They are good to quench thirſt, they ſtir vp an appetite to meat, they are not hurtfull to the ſtomacke, but they nouriſh the body very little, being taken in the ſecond place, or after meat, for although they be leſſe hurtfull than other like fruits, yet are they corrupted and putrified, vnleſſe they ſpeedily deſcend.

G The barke of the root is bitter, hot and drie, and hath a ſcouring facultie: the decoction hereof doth open the ſtoppings of the liuer and ſpleen, it purgeth the belly, and driueth forth wormes.

H The ſame bark being ſteeped in vineger helpeth the tooth ache: of the ſame effect is alſo the decoction of the leaues and barke, ſaith *Dioſcorides*, who ſheweth that about harueſt time there iſſueth out of the root a iuice, which the next day after is found to be hard, and that the ſame is very good againſt the tooth-ache; that it waſteth away *Phyma*, and purgeth the belly.

I *Galen* ſaith, that there is in the leaues and firſt buds of this tree a certaine middle facultie, both to binde and ſcoure.

Chap.

Chap. 132. *Of the Sycomore tree.*

Sycomorus,
The Sycomore tree.

¶ *The Deſcription.*

THe Sycomore tree is of no ſmall height, being very like to the mulberie tree in bigneſſe & ſhew, as alſo in leafe: the fruit is as great as a Fig, and of the ſame faſhion, very like in iuice and taſte to the wilde Fig, but ſweeter, and without any grains or ſeeds within, which groweth not forth of the tender boughes, but out of the body and great old armes very fruitfully: this tree hath in it plenty of milkie iuice, which ſo ſoon as any part is broken or cut, doth iſſue forth.

¶ *The Place.*

It groweth, as *Dioſcorides* writeth, very plentifully in Caria and Rhodes, and in ſundry places of Egypt, as at the great Cayre or Alkaire, and in places that doe not bring forth much wheat, in which it is an helpe, and ſufficeth in ſtead of bread & corne when there is ſcarſitie of victuals. *Galen* writeth, that he ſaw a plant of the Sycomore tree like to the wilde Fig tree, fruit and all.

¶ *The Time.*

It bringeth forth fruit three or foure times in one yeare, and oftner if it be ſcraped with an iron knife, or other like inſtrument.

¶ *The Names.*

This tree is called in Greeke, συκόμορος, of the Fig tree and the Mulbery tree: in Latine, *Sycomorus*: *Cornelius Celſus* nameth it backward *Moroſycos*: the Egyptians of our time do call it *Ficus Pharaonis*, or *Pharao* his Fig tree, as witneſſeth *Bellonius*: and it is likewiſe termed *Ficus Ægyptia*, Egyptian Fig tree, and alſo *Morus Ægyptia*, or Egyptian Mulberrie tree. We cal it Engliſh, Sycomore tree after the Greek and Latine, and alſo Mulberry Fig tree, which is the right Sycomore tree, and not the great Maple, as we haue ſaid in the chapter of the Maple.

The fruit is named in Greeke *Sycomoron*, and in Italian, *Sycomoro* and *Fico d'Egitto*.

¶ *The Temperature and Vertues.*

The fruit of the Sycomore tree hath no ſharpneſſe in it at all, as *Galen* ſaith. It is ſomwhat ſweet in taſte, and is of temperature moiſt after a ſort, and cold as be Mulberries. A

It is good, ſaith *Dioſcorides*, for the belly; but it is ἄτροφος, that is, without any nouriſhment, and troubleſome to the ſtomacke. B

There iſſueth forth of the barke of this tree in the beginning of the Spring, before the fruit appeareth, a liquour, which being taken vp with a ſponge, or a little wooll, is dried, made vp into fine cakes, and kept in gallie pots: this mollifieth, cloſeth wounds together, and diſſolueth groſſe humours. C

It is both inwardly taken and outwardly applied againſt the bitings of ſerpents, hardneſſe of the milt or ſpleene, and paine of the ſtomacke proceeding of a cold cauſe: this liquor doth very quickly putrifie. D

Chap. 133. *Of the Fig tree.*

¶ *The Deſcription.*

1 THe garden Fig tree becommeth a tree of a meane ſtature, hauing many branches full of white pith within, like Elderne pith, and large leaues of a darke greene colour, diuided into ſundry ſections or diuiſions. The fruit commeth out of the branches without any floure at all that euer I could perceiue, which fruit is in ſhape like vnto Peares, of colour either whitiſh, or ſomewhat red or of a deep blew, full of ſmall graines within, of a ſweet and pleaſant taſte; which beeing broken before it be ripe, doth yeeld moſt white milk, like vnto the kindes of Spurge, and the leaues alſo beeing broken doe yeeld the like liquour; but when the Figges be ripe, the iuice thereof is like honie.

1 *Ficus.*
The Fig tree.

‡ 2 *Chamaficus.*
The dwarfe Fig tree.

2 The dwarfe Fig-tree is like vnto the former in leaues and fruit, but it neuer groweth aboue the height of a man, and hath many ſmall ſhoots comming from the roots, whereby it greatly increaſeth.

There is alſo another wilde kinde, whoſe fruit is neuer ripe; *Theophraſtus* nameth it *Erineos*; *Pliny Caprificus*.

¶ *The Place.*

The Fig trees do grow plentifully in Spain and Italy, and many other countries, as in England; where they beare fruit, but it neuer commeth to kindely maturitie, except the tree be planted vnder an hot wall, whereto neither North, nor Northeaſt windes can come.

¶ *The Time.*

The dwarfe Fig tree groweth in my garden, and bringeth forth ripe and very great fruit in the moneth of Auguſt, of which Figs ſundry perſons haue eaten at pleaſure.

In England the Fig trees put not forth their leaues vntill the end of May, where oftentimes the fruit commeth forth before the leaues appeare.

¶ *The*

¶ *The Names.*

The Fig tree is called in Greeke, συκη, and of diuers, for difference ſake betweene it and the wild Fig tree, συκη ἡμερος: in Latine, *Ficus*, and *Ficus ſatiua*, and *Vrbana*: in high-Dutch, **Feygenbaum**: in low-Dutch, **Uijgheboom**: in French, *Figuier*: in Italian, *Fico*: in Spaniſh, *Higuera*: in Engliſh, Fig tree.

The fruit is named in Greeke, σῦκον: in Latine, *Ficus*: and the vnripe fruit, ὄλυνθος: in Latine, *Groſſus*: that which is dried is called in Greeke, ῥαγὰς: in Latine, *Carica*: in high-Dutch, **Feygen**: in low-Dutch, **Uijghen**: in French, *Figues*: in Italian, *Fichi*: in Spaniſh, *Higos*: in Engliſh, Fig: the little ſeeds which are found in them are named by *Galen*, μυρμηκίαι, *Cechramides*.

¶ *The Temperature.*

The greene Figs new gathered are ſomewhat warme and moiſt: the dry and ripe Figs are hot almoſt in the third degree, and withall ſharpe and biting.

The leaues alſo haue ſome ſharpneſſe, with an opening power, but not ſo ſtrong as the iuice.

¶ *The Vertues.*

The dry Figs do nouriſh better than the greene or new Figs; notwithſtanding they ingender not very good bloud, for ſuch people as do feed much thereon doe become lowſie. A

Figs be good for the throat and lungs, they mitigate the cough, and are good for them that be ſhort winded: they ripen flegme, cauſing the ſame to be eaſily ſpet out, eſpecially when they be ſodden with Hyſſop, and the decoction drunke. B

Figges ſtamped with Salt, Rew, and the kernels of Nuts withſtand all poyſon and corruption of the aire. The King of Pontus, called *Mithridates*, vſed this preſeruatiue againſt all venom and poyſon. C

Figs ſtamped and made into the forme of a plaiſter with wheat meale, the pouder of Fenugreek, and Lineſeed, and the roots of mariſh Mallowes, applied warme, do ſoften and ripen impoſtumes, phlegmons, all hot and angry ſwellings and tumors behinde the eares: and if you adde thereto the roots of Lillies, it ripeneth and breaketh Venerious impoſtumes that come in the flanke, which impoſtume is called *Bubo*, by reaſon of his lurking in ſuch ſecret places: in plaine Engliſh termes they are called botches. D

Figs boiled in Wormwood wine with ſome Barly meale are very good to be applied as an implaiſter vpon the bellies of ſuch as haue the dropſie. E

Dry Figges haue power to ſoften, conſume, and make thinne, and may be vſed both outwardly and inwardly, whether it be to ripen or ſoften impoſtumes, or to ſcatter, diſſolue, and conſume them. F

The leaues of the Fig tree do waſte and conſume the Kings Euill, or ſwelling kernells in the throat, and do mollifie, waſte, and conſume all other tumors, being finely pouned and laid thereon: but after my practiſe, being boiled with the roots of mariſh Mallowes vntill they be ſoft, and ſo incorporated together, and applied in forme of a plaiſter. G

The milky iuyce either of the figs or leaues is good againſt all roughneſſe of the skinne, lepries, ſpreading ſores, tetters, ſmall pockes, meaſels, puſhes, wheales, freckles, lentiles, and all other ſpots, ſcuruineſſe, and deformitie of the body and face, being mixed with Barley meale and applied: it doth alſo take away warts and ſuch like excreſcences, if it be mingled with ſome fattie or greaſie thing. H

The milke doth alſo cure the tooth-ache, if a little lint or cotton be wet therein, and put into the hollowneſſe of the tooth. I

It openeth the veines of the hemorrhoids, and looſeneth the belly, being applied to the fundament. K

Figs ſtamped with the pouder of Fenugreeke, and vineger, and applied plaiſterwiſe, doe eaſe the intollerable paine of the hot gout, eſpecially the gout of the feet. L

The milke thereof put into the wound proceeding of the biting of a mad dog, or any other venomous beaſt, preſerueth the parts adioyning, taketh away the paine preſently, and cureth the hurt. M

The greene and ripe Figs are good for thoſe that be troubled with the ſtone of the kidneyes, for they make the conduits ſlipperie, and open them, and do alſo ſomewhat cleanſe: whereupon after the eating of the ſame, it hapneth that much grauell and ſand is conueyed forth. N

Dry or barrell Figs, called in Latine *Carica*, are a remedie for the belly, the cough, and for old infirmities of the cheſt and lungs: they ſcoure the kidnies, and cleanſe forth the ſand, they mitigate the paine of the bladder, and cauſe women with child to haue the eaſier deliuerance, if they feed thereof for certaine dayes together before their time. O

Dioſcorides ſaith, that the white liquor of the Fig tree, and iuice of the leaues, do curdle milke as rennet doth, and diſſolue the milke that is cluttered in the ſtomacke, as doth vineger. P

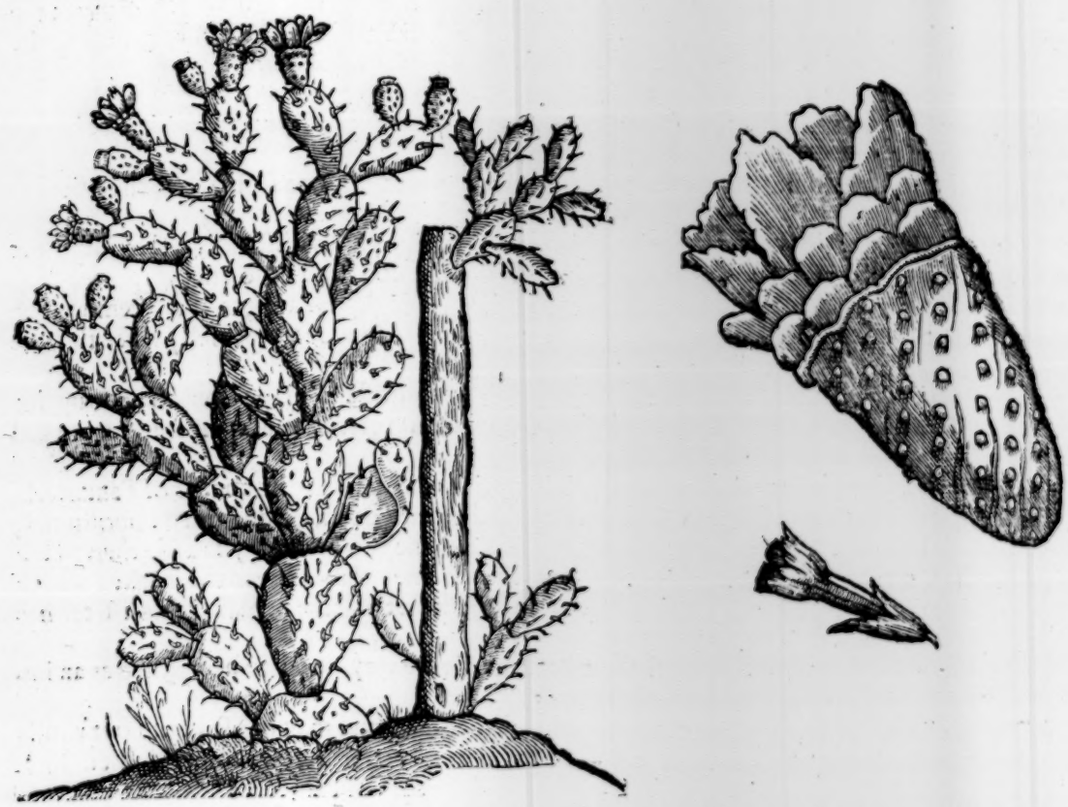
It bringeth downe the menſes, if it be applied with the yolke of an egge, or with yellow wax. Q

CHAP.

Chap. 134. *Of the prickly Indian Fig tree.*

Ficus Indica.
The Indian Fig tree.

Fructus.
The fruit.



¶ *The Deſcription.*

THis ſtrange and admirable plant, called *Ficus Indica*, ſeemes to be no other thing than a multiplication of leaues, that is, a tree made of leaues, without body or boughes; for the leafe ſet in the ground doth in ſhort ſpace take root, and bringeth out of it ſelfe other leaues, from which do grow others one after another, till ſuch time as they come to the height of a tree, hauing alſo in the meane ſeaſon boughes as it were comming from thoſe leaues, ſometimes more, otherwhiles fewer, as Nature liſt to beſtow, adding leafe vnto leafe, whereby it occupieth a great piece of ground: theſe leaues are long and broad, as thicke as a mans thumbe, of a deepe greene colour, ſet full of long, ſlender, ſharpe, and whitiſh prickles: on the tops of which leaues come forth long floures not vnlike to thoſe of the manured Pomegrenat tree, of a yellow colour: after which commeth the fruit like vnto the common Fig, narrow below, and bigger aboue, of a greene colour, and ſtuffed full of a red pulpe and iuice, ſtaining the hands of them that touch it, as do the Mulberries, with a bloudy or ſanguine colour: the top of which Figs are inuironed with certaine ſcaly leaues like a crowne, wherein are alſo contained ſmall graines that are the ſeeds: the which being ſowne, do bring forth plants round bodied, like vnto the trunke of other trees, with leaues placed thereon like the other; which being ſet in the ground bring forth trees of leaues, as we haue ſhewed.

‡ Vpon this plant in ſome parts of the Weſt Indies grow certain excreſcences, which in continuance of time turn into Inſects; and theſe out-growings are that high prized Cochenele wherwith they dye colours in graine. ‡

¶ *The Place.*

This plant groweth in all the tract of the Eaſt and Weſt Indies, and alſo in the countrey Norembega, now called Virginia, from whence it hath beene brought into Italy, Spaine, England, and other countries: in Italy it ſometimes beareth fruit, but more often in Spaine, and neuer as yet in England, although I haue beſtowed great pains and coſt in keeping it from the iniury of our cold clymat.

It groweth

It groweth also at S. Crux and other places of Barbary, and also in an Island of the Mediterranean sea, called Zante, about a day and nights sailing with a meane winde from Petrasse a port in Morea, where my seruant *William Marshall* (before remembred) did see not only great store of those trees made of leaues, but also diuers other round bodied plants of a woody substance: from whence he brought me diuers plants thereof in tubs of earth, very fresh and greene, which flourished in my garden at the impression hereof.

¶ *The Time.*

These plants do grow greene and fresh both Winter and Sommer, by the relation of my foresaid seruant: notwithstanding they must be very carefully kept in these countries from the extremitie of Winter.

¶ *The Names.*

This is thought to be the plant called of *Pliny*, *Opuntium*; whereof he hath written, *lib.* 21. *ca.* 17. in this manner: About Opuns is the herbe *Opuntia*, to mans taste sweet, and it is to be maruelled, that the root should be made of the leaues, and that it should so grow. Opuns is a city neere vnto Phocis in Greece, as *Pausanias*, *Strabo*, and *Pliny* testifie: but it is commonly called in Latine, *Ficus Indica*: of the Indians, *Tune*, and *Tunas*, and also *Anapallus*, as testifieth *Bellonius*: in English, Indian Fig tree.

There is a certaine other described for the Indian Fig tree, by *Theophrastus*, *lib.* 4. which *Pliny*, *lib.* 12. *cap.* 5. doth eloquently expresse almost in the same words, but turned into Latine, whereof we intend to speake in the next chapter.

¶ *The Temperature and Vertues.*

We haue no certaine instruction from the Antients, of the temperature or faculty of this plant, A
or of the fruit thereof: neither haue we any thing whereof to write of our owne knowledge, more than that we haue heard reported of such as haue eaten liberally of the fruit hereof, that it changed their vrine to the colour of bloud; who at the first sight thereof stood in great doubt of their life, thinking it had been bloud, whereas it proued afterwards by experience to be nothing but the tincture or colour the vrine had taken from the iuice of the fruit, and that without all hurt or griefe at all.

It is reported of some, that the iuice of the fruit is excellent good against vlcers of long conti- B
nuance.

‡ Cochenele is giuen alone, and mixed with other things, in maligne diseases, as pestilent fe- C
uers and the like, but with what successe I know not. ‡

Chap. 135. *Of the arched Indian Fig tree.*

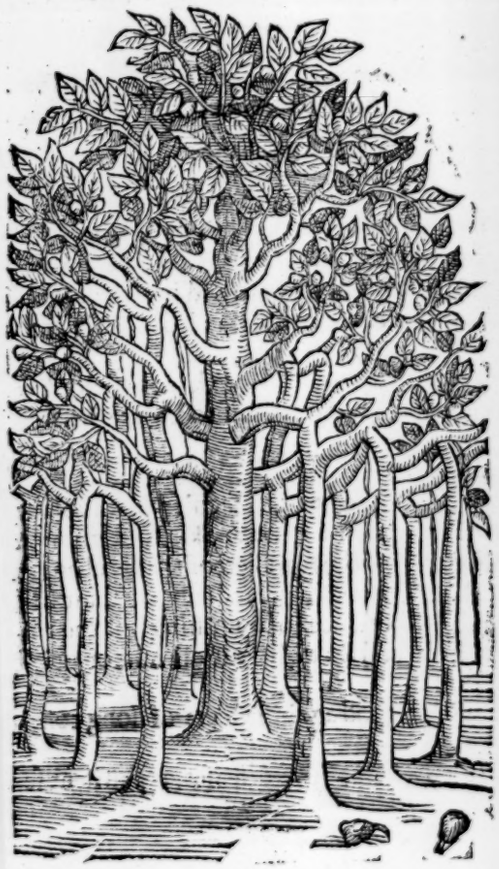
¶ *The Description.*

THis rare and admirable tree is very great, straight, and couered with a yellowish bark tending to tawny: the boughes and branches are many, very long, tough, and flexible, growing very long in short space, as do the twigs of Oziars, and those so long and weake, that the ends thereof hang downe and touch the ground, where they take root and grow in such sort, that those twigs become great trees: and these being growne vp vnto the like greatnesse, doe cast their branches or twiggy tendrels vnto the earth, where they likewise take hold and root; by meanes wherof it commeth to passe, that of one tree is made a great wood or desart of trees, which the Indians do vse for couerture against the extreme heate of the Sun, wherewith they are grieuously vexed: some likewise vse them for pleasure, cutting downe by a direct line a long walke, or as it were a vault, through the thickest part, from which also they cut certaine loope-holes or windowes in some places, to the end to receiue thereby the fresh coole aire that entreth thereat, as also for light, that they may see their cattell that feed thereby, to auoid any danger that might happen vnto them either by the enemie or wilde beasts: from which vault or close walke doth rebound such an admirable echo or answering voice, if one of them speake vnto another aloud, that it doth resound or answer againe foure or fiue times, according to the height of the voice, to which it doth answer, and that so plainly, that it cannot be knowne from the voice it selfe: the first or mother of this wood or desart of trees is hard to be knowne from the children, but by the greatnesse of the body, which three men can scarsely fathom about: vpon the branches whereof grow leaues hard and wrinckled, in shape like those of the Quince tree, greene aboue, and of a whitish hoary colour vnderneath, whereupon the Elephants delight to feed: among which leaues come forth the fruit, of the bignes of a mans thumbe, in shape like a small Fig, but of a sanguine or bloudy colour, and of a sweet tast,

but

but not ſo pleaſant as the Figs of Spaine; notwithſtanding they are good to be eaten, and withall very wholſome.

Arbor ex Goa, ſiue Indica.
The arched Indian Fig tree.



¶ *The Place.*

This wondrous tree groweth in diuers places of the Eaſt Indies, eſpecially neere vnto Goa, and alſo in Malaca: it is a ſtranger in moſt parts of the world.

¶ *The Time.*

This tree keepeth his leaues green winter and Sommer.

¶ *The Names.*

This tree is called of thoſe that haue trauelled, *Ficus Indica*, the Indian Fig; and *Arbor Goa*, of the place where it groweth in greateſt plenty: we may call it in Engliſh, the arched Fig tree.

‡ Such as deſire to ſee more of this Fig tree, may haue recourſe to *Cluſius* his *Exoticks, lib. 1. cap. 1.* where he ſhewes it was mentioned by diuers antient Writers, as *Q. Curtius, lib. 9. Plin. lib. 12. ca. 5. Strabo, lib. 5.* and *Theophr. Hiſt. Plant. lib. 4. cap. 5.* by the name of *Ficus Indica.* ‡

¶ *The Temperature and Vertues.*

We haue nothing to write of the temperature or vertues of this tree, of our owne knowledge: neither haue wee receiued from others more, than that the fruit hereof is generally eaten, and that without any hurt at all, but rather good, and alſo nouriſhing.

Chap. 136.

Of Adams Apple tree, or the Weſt-Indian Plantaine.

¶ *The Deſcription.*

WHether this plant may be reckoned for a tree properly, or for an herby Plant, it is diſputable, conſidering the ſoft and herby ſubſtance whereof it is made; that is to ſay, when it hath attained to the height of ſix or ſeuen cubits, and of the bigneſſe of a mans thigh, notwithſtanding it may be cut downe with one ſtroke of a ſword, or two or three cuts with a knife, euen with as much eaſe as the root of a Radiſh or Carrot of the like bigneſſe: from a thicke fat threddy root riſe immediately diuers great leaues, of the length of three cubits and a halfe, ſometimes more, according to the ſoile where it groweth, and of a cubit and more broad, of bignes ſufficient to wrap a childe in of two yeares old, in ſhape like thoſe of Mandrake, of an ouerworn green colour, hauing a broad rib running thorow the middle thereof: which leaues, whether by reaſon of the extreme hot ſcorching Sun, or of their owne nature, in September are ſo dry and withered, that there is nothing thereof left or to be ſeene but onely the middle rib. From the middeſt of theſe leaues riſeth vp a thicke trunke, whereon doth grow the like leaues, which the people do cut off, as alſo thoſe next the ground, by meanes whereof it riſeth vp to the height of a tree, which otherwiſe would remaine a low and baſe plant. This manner of cutting they vſe from time to time, vntill it come to a certaine height, aboue the reach of the Elephant, which greedily ſeeketh after the fruit. In the middeſt of the top among the leaues commeth forth a ſoft and fungous ſtumpe, whereon do grow diuers apples in forme like a ſmall Cucumber, and of the ſame bigneſſe, couered

with

with a thin rinde like that of the Fig, of a yellow colour when they be ripe: the pulpe or ſubſtance of the meate is like that of the Pompion, without either ſeeds, ſtones, or kernels, in taſt not greatly perceiued at the firſt, but preſently after it pleaſeth, and entiſeth a man to eat liberally thereof, by a certaine entiſing ſweetnes it yeelds: in which fruit, if it be cut according to the length (ſaith myne Author) oblique, tranſuerſe, or any other way whatſoeuer, may be ſeen the ſhape and forme of a croſſe, with a man faſtned thereto. My ſelfe haue ſeene the fruit, and cut it in pieces, which was brought me from Aleppo in pickle; the croſſe I might perceiue, as the forme of a ſpred-Egle in the root of Ferne; but the man I leaue to be ſought for by thoſe that haue better eyes and iudgment than my ſelfe.

Muſa Serapionis.
Adams Apple tree.

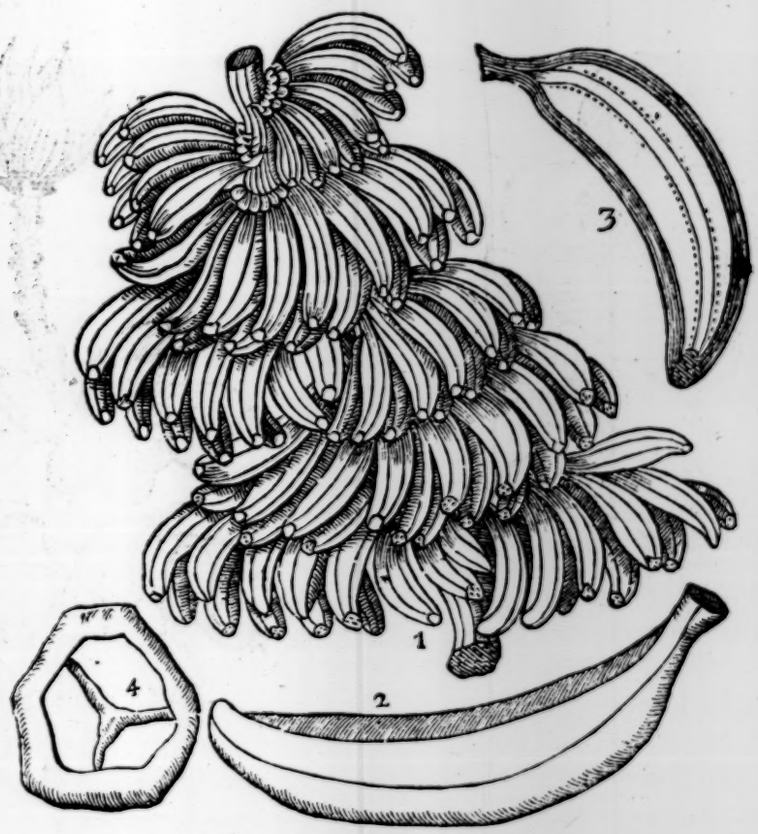
Muſa Fructus.
Adams Apple.

‡ Aprill 10. 1633. my much honored friend Dr. *Argent* (now Preſident of the Colledge of Phyſitions of London) gaue me a plant he receiued from the Bermuda's: the length of the ſtalke was ſome two foot; the thickneſſe thereof ſome ſeuen inches about, being creſted, and full of a ſoft pith, ſo that one might eaſily with a knife cut it aſunder. It was crooked a little, or indented, ſo that each two or three inches ſpace it put forth a knot of ſome halfe inch thickneſſe, and ſome inch in length, which incompaſſed it more than halfe about; and vpon each of theſe ioints or knots, in two rankes one aboue another, grew the fruit, ſome twenty, nineteene, eighteene, &c. more or leſſe, at each knot: for the branch I had, contained nine knots or diuiſions, and vpon the loweſt knot grew twenty, and vpon the vppermoſt fifteene. The fruit which I receiued was not ripe, but greene, each of them was about the bigneſſe of a large Beane; the length of them ſome fiue inches, and the bredth ſome inch and halfe: they all hang their heads downewards, haue rough or vneuen ends, and are fiue cornered; and if you turne the vpper ſide downward, they ſomewhat reſemble a boat, as you may ſee by one of them expreſt by it ſelfe: the huske is as thicke as a Beanes, and will eaſily ſhell off it: the pulpe is white and ſoft: the ſtalke whereby it is faſtned to the knot is verie ſhort, and almoſt as thicke as ones little finger. This ſtalke with the fruit thereon I hanged vp in my ſhop, were it became ripe about the beginning of May, and laſted vntil Iune: the pulp or meat was very ſoft and tender, and it did eate ſomewhat like a Muske-Melon. I haue giuen you the figure of the whole branch, with the fruit thereon, which I drew as ſoone as I receiued it, and it is marked with this figure 1. The figure 2. ſheweth the ſhape of one particular fruit, with the lower

ſide

ſide vpwards. 3. The ſame cut through the middle long wayes. 4. The ſame cut ſide wayes. I haue been told (but how certaine it is I know not) that the floures which precede the fruit are bell-faſhioned, and of a blew colour. I could obſerue no ſeed in the fruit; it may be it was becauſe it had been cut from the ſtocke ſo long before it came to maturitie. This Plant is found in many places of Aſia, Africke, and America, eſpecially in the hot regions: you may find frequent mention of it amongſt the ſea voyages to the Eaſt and Weſt Indies, by the name of Plantaines, or *Platanus, Bananas, Bonnanas, Bouanas, Dauanas, Poco, &c.* ſome (as our Author hath ſaid) haue iudged it the forbidden fruit; other-ſome, the Grapes brought to *Moſes* out of the Holy-land. ‡

Muſa fructus exactior Icon.
An exacter figure of the Plantaine fruit.



¶ *The Place.*

This admirable tree groweth in Egypt, Cyprus, and Syria, neere vnto a chiefe city there called Alep, which we call Aleppo; and alſo by Tripolis, not far from thence: it groweth alſo in Canara, Decan, Guzarate, and Bengala, places of the Eaſt Indies.

¶ *The Time.*

From the root of this tree ſhooteth forth yong ſprings or ſhoots, which the people take vp and plant for the increaſe in the Spring of the yeare. The leaues wither away in September, as is aboue ſaid.

¶ *The Names.*

It is called *Muſa* by ſuch as trauell to Aleppo: by the Arabians, *Muſa Maum:* in Syria, *Moſe:* The Grecians and Chriſtians which inhabit Syria, and the Iewes alſo, ſuppoſe it to be that tree of whoſe fruit *Adam* did taſte; which others thinke to be a ridiculous fable: of *Pliny, Opuntia.*

It is called in the Eaſt Indies (as at Malauar where it alſo groweth) *Palan:* in Malayo, *Pican:* and in that part of Africa which we call Ginny, *Bananas*: in Engliſh, Adams Apple tree.

¶ *The Temperature.*

Dioſcorides and *Serapio* iudge, that it heateth in the end of the firſt degree, and moiſteneth in the end of the ſame.

¶ *The Vertues.*

A The fruit hereof yeeldeth but little nouriſhment: it is good for the heate of the breaſt, lungs, and bladder: it ſtoppeth the liuer, and hurteth the ſtomacke if too much of it be eaten, and procureth

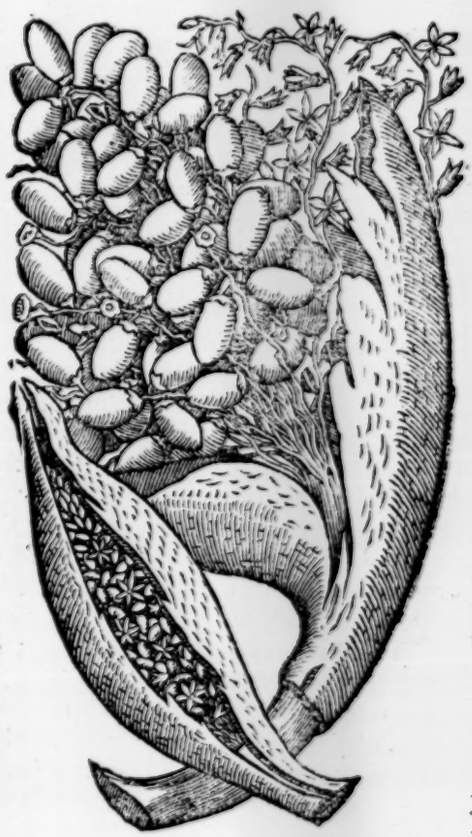
cureth looſeneſſe in the belly: whereupon it is requiſit for ſuch as are of a cold conſtitution, in the eating thereof to put vnto it a little Ginger or other ſpice.

It is alſo good for the reines, or kidnies, and to prouoke vrine: it nouriſheth the childe in the mothers wombe, and ſtirreth to generation. B

Chap. 137. *Of the Date tree.*

Palma.
The Date tree.

Palmarum fructus & flores cum Elate.
The fruit and floures of the Date tree.



¶ *The Deſcription.*

THe Date tree groweth very great and high: the body or trunke thereof is thicke, and couered with a ſcaly rugged barke, cauſed by the falling away of the leaues: the boughes grow onely on the top, conſiſting of leaues ſet vpon a wooddy middle rib like thoſe of Reeds or Flags: the inner part of which rib or ſtalke is ſoft, light, hollow, and ſpongie. Among the leaues come forth the floures included in a long skinny membrane, as it were a ſheath or hoſe, like that which couereth the Floure de-Luce before it be blowne, which being opened of it ſelfe, white floures ſtart forth, ſtanding vpon ſhort and ſlender foot-ſtalkes, which are faſtened with certaine ſmall filaments or threddy ſtrings like vnto little branches: after which ſpring out from the ſame branches the fruit or Dates, which be in faſhion long and round, in taſte ſweet, and many times ſomewhat harſh, of a yellowiſh red colour; wherein is contained a long hard ſtone, which is in ſtead of kernell and ſeed; the which I haue planted many times in my Garden, and haue growne to the height of three foot: but the firſt froſt hath nipped them in ſuch ſort, that ſoone after they periſhed, notwithſtanding my induſtrie by couering them, or what elſe I could doe for their ſuccour.

¶ *The Place.*

The Date trees grow plentifully in Africa and Egypt; but thoſe which are in Paleſtina and

Syria be the beſt: they grow likewiſe in moſt places of the Eaſt and Weſt Indies, where there be diuers ſorts, as well wilde, as tame or manured.

¶ *The Time.*

The Date tree is alwaies green, and floureth in the Spring time: the fruit is ripe in September, and being then gathered they are dried in the Sunne, that they may be the better both tranſported into other countries far diſtant, as alſo preſerued from rotting at home.

¶ *The Names.*

The tree is called in Greeke, φοινιξ: in Latine, *Palma*: in Engliſh, Date tree.

The fruit is named in Greeke, βάλανος φοινίκων: that is to ſay, *Glans Palmarum*, or the fruit of the Date trees: and by one word, φοινικοβάλανος: in Latine, *Palmula*: in ſhops, *Dactylus*: in high-Dutch, **Dattelen**: in low-Dutch, **Dadelen**: in Italian, *Dattoli*: in French, *Dattes*: in Spaniſh, *Tamaras*, and *Dactiles*: in Engliſh, Date.

The cod or ſheath wherein the floures and Dates are wrapped, is called ἐλάτη: and of ſome, βράκτης.

¶ *The Temperature and Vertues.*

A All manner of Dates whatſoeuer are hard of digeſtion, and cauſe head-ache: the worſer ſort be thoſe that be dry and binding, as the Egyptian Dates; but the ſoft, moiſt, and ſweet ones are leſſe hurtfull.

B The bloud which is ingendred of Dates in mans body is altogether groſſe, and ſomewhat clammy: by theſe the liuer is very quickly ſtopped, eſpecially being inflamed and troubled with ſome hard ſwelling: ſo is the ſpleene likewiſe.

C The Dates which grow in colder regions, when they cannot come to perfect ripeneſſe, if they be eaten too plentifully, do fill the body full of raw humors, ingender winde, and oft times cauſe the leproſie.

D The drier ſorts of Dates, as *Dioſcorides* ſaith, be good for thoſe that ſpet bloud, for ſuch as haue bad ſtomacks, and for thoſe alſo that be troubled with the bloudy flix.

E The beſt Dates, called in Latine *Caryotæ*, are good for the roughneſſe of the throat and lungs.

F There is made hereof both by the cunning Confectioners and Cookes, diuers excellent cordiall, comfortable, and nouriſhing medicines, and that procure luſt of the body very mightily.

G They do alſo refreſh and reſtore ſuch vnto ſtrength as are entring into a conſumption, for they ſtrengthen the feebleneſſe of the liuer and ſpleene, being made into conuenient broths, and phyſicall medicines directed by a learned Phyſitian.

H Dry Dates do ſtop the belly, and ſtay vomiting, and the wambling of womens ſtomackes that are with childe, if they be either eaten in meates or otherwiſe, or ſtamped and applied vnto the ſtomacke as a pectorall plaiſter.

I The aſhes of the Date ſtones haue a binding qualitie, and emplaſtick facultie, they heale puſhes in the eyes, *Staphylomata*, and falling away of the haire of the eye lids, being applied together with Spikenard: with wine it keepeth proud fleſh from growing in wounds.

K The boughes and leaues do euidently binde, but eſpecially the hoſe, that is to ſay, the ſheath or caſe of the floures: and therefore it is good to vſe theſe ſo oft as there is need of binding.

L The leaues and branches of the Date tree do heale greene wounds and vlcers, refreſh and coole hot inflammations.

M *Galen* in his booke of Medicines according to the kindes mentioneth a compoſition called *Diapalma*, which is to be ſtirred with the bough of a Date tree in ſtead of a ſpature or a thing to ſtirre with, for no other cauſe than that it may receiue thereby ſome kinde of aſtriction or binding force.

Chap. 138. *Of the wilde Date trees.*

¶ *The Deſcription.*

1 *Theophraſtus* maketh this plant to be a kinde of Date tree, but low and of ſmall growth, ſeldome attaining aboue the height of a cubit: on the top whereof ſhoot forth for the moſt part long leaues like thoſe of the Date tree, but leſſer and ſhorter; from the ſides whereof breakes forth a buſh of threddy ſtrings: among which riſeth vp ſmall branches garniſhed with cluſters of white floures, in which before they be opened are to be ſeene vnperfect ſhapes of leaues, cloſely compaſſed about with an innumerable ſort of thin skinny hulls; which rude ſhapes with the floures are ſerued vp and eaten at the ſecond courſe among other iunkets, with a little ſalt and pepper, being pleaſant to the taſte. ‡ The ſtalke is about the thicknes of ones little

1 *Palmites, ſiue Chamæriphes.*
The little wilde Date tree.

2 *Palmapinus, ſiue Palma conifera.*
The wilde Date tree bearing cones

‡ *Fructus Palmapini.*
The fruit of the Cone-Date.

little finger, here and there ſet with a few crooked pricks: the leaues within ſome handfull or two of the ſtalke are cut vp and made into little beſomes, which are ſold in many glaſſe ſhops here in London. ‡

2 The wilde Date tree that brings forth cones or key-clogs, is of moſt trauellers into the Indies thought to be barren of Dates, except ſometimes it yeeldeth forth ſome ſmall berries like vnto Dates, but dry, and nothing worth. This tree groweth to the height and bigneſſe of a low tree; the trunke or body whereof is ſoft, of a fungous or pithy ſubſtance, vnfit for building, as is the manured Date tree: the branch it ſelfe was brought vnto vs from the Indies, dry & void of leaues, wherefore we muſt deſcribe the leaues by report of the bringer. The branches (ſaith my Author) are couered ouer with long flaggie leaues, hanging downe of a great length like thoſe of the Date tree: the branches are alſo couered with a ſcaly or ſcabbed barke, verie rough, one ſcale or plate lying ouer another, as tiles vpon a houſe: the fruit growes at the end of the branches, not vnlike a great Pine Apple cone, couered ouer with a skinne like the Indian Nut: wherein is contained a ſhel, within which ſhell lieth hid an acorn of long

kernell of an inch long, and ſometimes longer, very hard to be broken, in taſte like the Cheſtnut; which the ſauage people do grate and ſtampe to pouder to make them bread.

¶ *The Place.*

Theophraſtus ſaith the firſt growes in Candy, but much more plentifully in Cilicia, and are now found in certaine places of Italy by the ſea ſide, and alſo in diuers parts of Spaine.

The other hath been found by trauellers into the Weſt Indies, from whence haue bin brought the naked branches with the fruit.

¶ *The Time.*

The time anſwereth that of the manured Date tree.

¶ *The Names.*

The little Date tree or wilde Date tree is named of *Theophraſtus*, χαμαίρωψ: in Naples, *Tephaglione*: in Latine commonly *Palmites*. That which is found in the midſt of the yong ſprings, and is vſed to be eaten in banquets, is called in Greeke, ἐγκεφαλὸς φοίνικος: in Latine, *Palmæ cerebrum*, the brain of the Date tree.

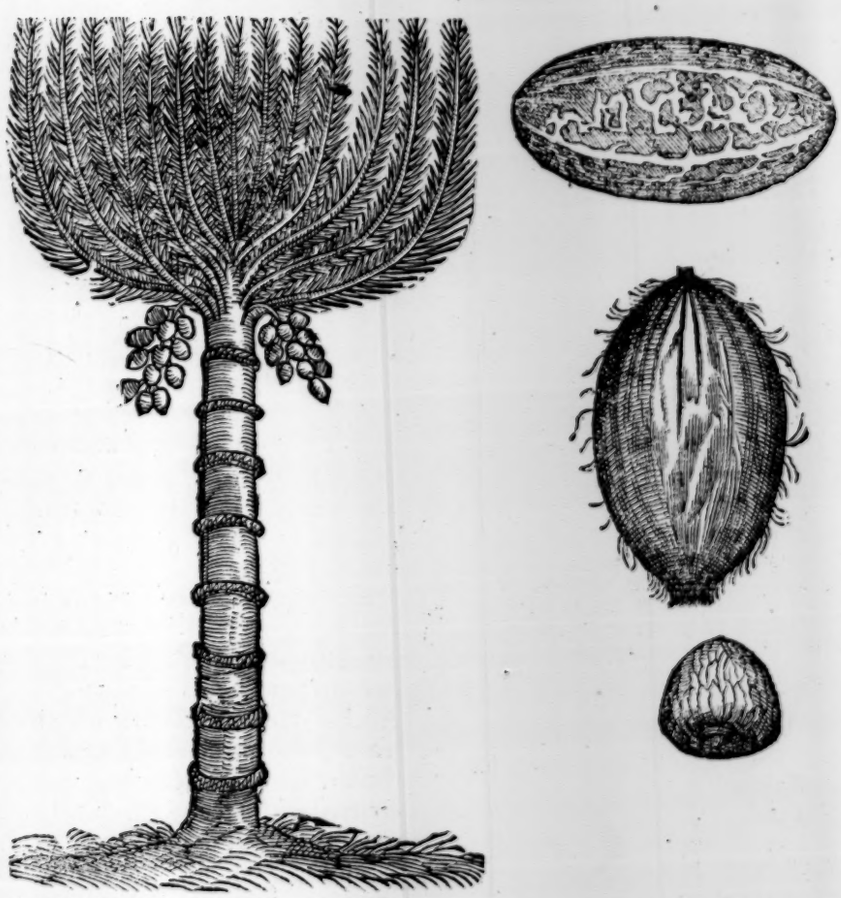
¶ *The Temperature and Vertues.*

A *Galen* ſuppoſeth that the brain of the Date tree conſiſteth of ſundry parts, that is to ſay, of a certaine waterie and warme ſubſtance, and of an earthy and cold; therefore it is moiſt and cold, with a certaine aſtriction or binding qualitie.

B Being taken as a meat it ingendreth raw humors and winde, and therefore it is good to be eaten with pepper and ſalt.

Chap. 139. *Of the drunken Date tree.*

Areca, ſiue Faufel.
The drunken Date tree.



¶ *The Deſcription.*

THe drunken Date tree, which *Carolus Cluſius* calleth *Faufel*, is an Indian tree of a great bignes, the timber whereof is very ſoft and ſpongious, exceeding ſmooth and plaine vnto a great height,

height, not poſſible to be climbed vp; and therefore the Indians for their eaſier aſcending vp, at ſome diſtances do tie round about the tree certaine wyths or ropes made of the barkes of trees, as may be perceiued by the figure, whereby very eaſily they go vp and downe to gather the fruit at their pleaſure. The top of the tree is diuided into ſundry branches, in ſubſtance like to the great cane; whereupon do grow faire flaggie leaues like thoſe of the Palme or Date tree, whereof doubtleſſe this is a wilde kinde: from the bottome of which branches commeth forth fruit in long bunches like traces of Onions, couered with a ſoft pulpe like vnto the Wall-nut, rough, and verie full of haire of a yellowiſh colour, and like the dried Date when it is ripe: within which huske is contained fruit like vnto the Nutmeg, but greater, very hard, and ſtriped ouer with red and white veines, or ſinues.

¶ *The Place, Time, and Names.*

This Date tree, which the Arabians call *Faufel*, that is by interpretation, *Auellana Indica*, the Indian Nut or Filberd, *Auicen* and *Serapio* call *Filfel*, and *Fufel*. It groweth in the Eaſt Indies in diuers and ſundry places, as in Malauar, where vulgarly it is called *Pac*; and of the Nobles and Gentlemen, *Areca*: which name is vſed amongſt the Portugals which dwell in thoſe Indies: in Guzarate and Decan it is called *Cupare*: in Zeilan, *Poaz*: in Malaca, *Pinan*: in Cochin, *Chacani*: in Engliſh, the drunken Date tree, which name we haue coined from his qualitie, becauſe the fruit maketh thoſe drunke that eate thereof.

¶ *The Temperature.*

It is cold and dry in the ſecond degree.

¶ *The Vertues.*

The fruit of *Areca* before it be ripe is reckoned amongſt the ſtupefactiue or aſtoniſhing medicines; for whoſoeuer eateth thereof waxeth drunke, becauſe it doth exceedingly amaſe and aſtoniſh the ſenſes. A

When the Indians are vexed with ſome intolerable ache or paine, or muſt of neceſſitie endure ſome great torment or torture, then do they take of this fruit, whereby the rigor of that pain which otherwiſe they ſhould feele, is very much mitigated. B

The iuice of the fruit of *Areca* doth ſtrengthen the gums, faſten the teeth, comfort the ſtomack, ſtay vomiting and looſeneſſe of the belly: it doth alſo purge the body from congealed or clotted bloud gathered within the ſame. C

Chap. 140. *Of the Indian Nut tree.*

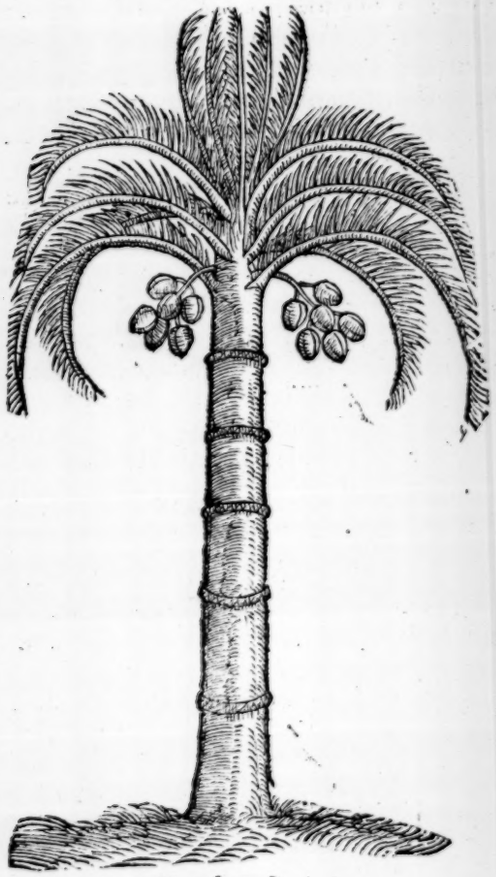
¶ *The Deſcription.*

1 THe Grecians haue not known, but the Arabians haue mentioned this Indian Nut tree, the body whereof is very great, ſmooth and plaine, void of boughes or branches, of a great height; wherefore the Indians do wrap ropes about the body thereof, as they doe vpon the tree laſt deſcribed, for their more eaſe in gathering the fruit: the timber whereof is verie ſpongie within, but hard without, a matter fit to make their Canoos and boats of: on the top of the tree grow the leaues like thoſe of the Date tree, but broad, and ſharpe at the point as thornes, whereof they vſe to make needles, bodkins, and ſuch like inſtruments, wherewith they ſow the ſailes of their ſhips, and do ſuch like buſineſſe: among theſe leaues come forth cluſters of floures like thoſe of the Cheſtnut tree, which turne into great fruit of a round forme, and ſomwhat ſharp at one end; in that end next vnto the tree is one hole, ſomtimes two bored through: this Nut or fruit is wrapped in a couerture, conſiſting of a ſubſtance not vnlike to hempe before it be beaten ſoft: there is alſo a finer and gentler ſtuffe next vnto the ſhell, like vnto Flax before it be made ſoft: in the middle whereof is contained a great Nut couered with a very hard ſhell, of a browne colour before it be poliſhed, afterward of a blacke ſhining colour like burniſhed horne: next vnto the ſhell vpon the inſide there cleaueth a white cornelly ſubſtance firme and ſollid, of the colour and taſte of a blanched Almond: within the cauitie or hollownes thereof is contained a moſt delectable liquor like vnto milke, and of a moſt pleaſant taſte.

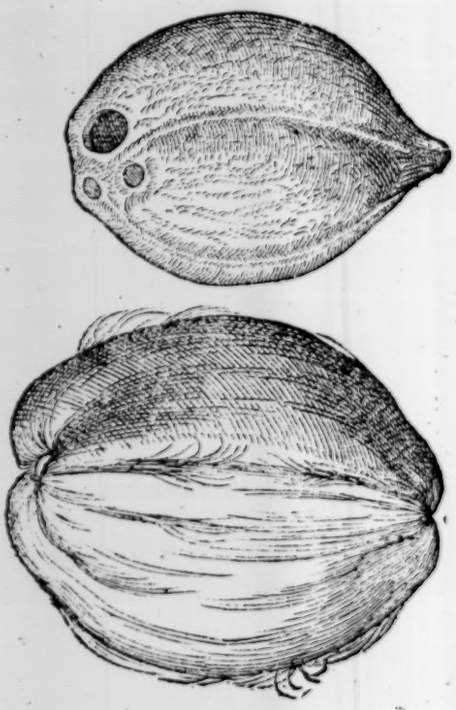
2 We haue no certaine knowledge from thoſe that haue trauelled into the Indies, of the tree which beareth this little Indian Nut; neither haue we any thing of our owne knowledge, more, than that we ſee by experience that the fruit hereof is leſſer, wherein conſiſteth the difference.

‡ The other, expreſſed in the ſame table with the former, by the name of *Mehenbethene*, *Cluſius* receiued it by the ſame name from *Cortuſus* of Padua: yet it doth not (as hee ſaith) well agree with the deſcription; and he rather approues of their opinion who refer it to the *Nux vnguentaria*,

1 *Nux Indica arbor.*
The Indian Nut tree.



Nux Indica.
The Indian Nut.



2 *Nucula Indica.*
The little Indian Nut.

or *Ben*. It is ſome inch long, of a triangular figure, with a hard and wooddy ſhel: which broken, ſhewes three cells or partitions, in each whereof is contained a long kernell white and ſweet. ‡

¶ *The Place.*

This Indian Nut groweth in ſome places of Africa, and in the Eaſt Indies, and in all the Iſlands of the Weſt Indies, eſpecially in Hiſpaniola, Cuba, and Saint Iohns Iſland, and alſo vpon the continent by Carthagena, Nombre de Dios, and Panama, and in Virginia, otherwiſe called Norembega, part of the ſame continent, for the moſt part neere vnto the ſea ſide, and in moiſt places, but it is ſeldome found in the vplandiſh countries.

¶ *The Time.*

It groweth greene Winter and Sommer.

¶ *The Names.*

The fruit is called in Latine, *Nux Indica*: of the Indians, *Cocus*: of the Portugals that dwell in the Eaſt Indies, *Cocco*, taken from the end, wherein are three holes repreſenting the head of a Monkie: *Serapio* and *Rhaſis* do call this tree *Iaralnare*, *id eſt*, *Arborem Nuciferam*, the tree bearing Nuts: of *Auicen*, *Glauci al hend*: of the vulgar people, *Maro*, and the fruit *Narel*; which name *Narel* is common among the Perſians and Arabians: it is called in Malauar, *Tengamaran*: the ripe fruit, *Tenga*; and the greene fruit, *Eleri*: in Goa it is called *Lanhan*: in Malaio, *Triccan*: and the Nut, *Nihor*.

The diſtilled liquor is called *Sula*; and the oile that is made thereof, *Copra*.

¶ *The Temperature.*

It is of a meane temper betwixt hot and cold.

¶ *The*

¶ *The Vertues and vſe.*

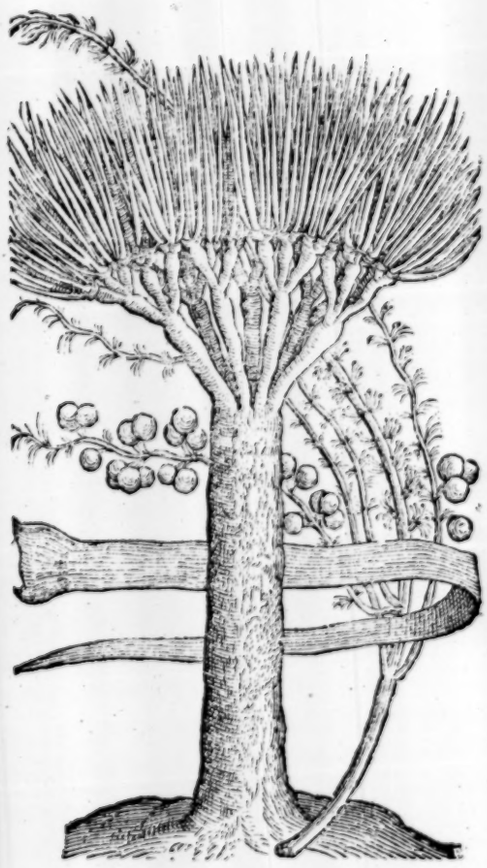
The Indians do vſe to cut the twigs and tender branches toward the euening, at the ends where- A
of they haue bottle gourds, hollow canes, and ſuch like things, fit to receiue the water that drop-
peth from the branches thereof, which pleaſant liquor they drinke in ſtead of wine; from the which
is drawne a ſtrong and comfortable Aqua Vitæ, which they vſe in time of need againſt all manner
of ſickneſſes; of the branches and boughes they make their houſes; of the trunk or body of the tree,
ſhips and boates; of the hempon the outward part of the fruit, they make ropes and cables; and of
the finer ſtuffe, ſailes for their ſhips.

Likewiſe they make of the ſhell of the Nut, cups to drinke in, which we likewiſe vſe in England, B
garniſhed with ſiluer for the ſame purpoſes. The kernell ſerueth them for bread and meat; the
milkie iuice doth ſerue to coole and refreſh their wearied ſpirits: out of the kernel when it is ſtam-
ped, is preſſed a moſt precious oile, not onely good for meat, but alſo for medicine, wherewith they
annoint their feeble lims after their tedious trauell, by meanes whereof the ache and paine is miti-
gated, and other infirmities quite taken away proceeding of other cauſes.

CHAP. 141. *Of the Dragon Tree.*

1 *Draco arbor.*
The Dragon tree.

Draconis fructus.
The Dragon tree fruit.



¶ *The Deſcription.*

THis ſtrange and admirable tree groweth very great, reſembling the Pine tree, by reaſon it doth alwaies flouriſh, and hath his boughes or branches of equal length and bigneſſe, which are bare and naked, of eight or nine cubits long, and of the bigneſſe of a mans arme: from the ends of which do ſhoot out leaues of a cubit and a halfe long, and full two inches broad, ſomewhat thicke, and raiſed vp in the middle, then thinner and thinner like a two edged ſword: among which come forth little moſſie floures, of ſmall moment, and turne into berries, of the bigneſſe of Cherries, of a yel-

lowiſh

lowiſh colour, round, light and bitter, couered with a threefold skin or filme, wherein is to be ſeene, as *Monardus* and diuers other report, the forme of a Dragon, hauing a long necke or gaping mouth; the ridge or backe armed with ſharpe prickles, like the Porcupine; it hath alſo a long taile, & foure feet, very eaſie to be diſcerned: the figure of it we haue ſet forth vnto you according to the greatneſſe thereof, becauſe our words and meaning may be the better vnderſtood, and alſo the leafe of the tree in his full bigneſſe, becauſe it is impoſſible to be expreſſed in the figure: the trunke or body of the tree is couered with a rough barke, very thin, and eaſie to be opened or wounded with any ſmall toole or inſtrument; which being ſo wounded in the Dog daies, bruiſed or bored, doth yeeld forth drops of a thicke red liquour, which of the name of the tree are called Dragons teares, or *Sanguis Draconis*, Dragons bloud: diuers haue doubted whether the liquour or gummie iuice were all one with *Cinnabaris* of *Dioſcorides* (not meaning that *Cinaber* made of Quickſiluer) but the receiued opinion is, they differ not, by reaſon their qualitie and temperature worke the like effect.

¶ *The Place.*

This tree groweth in an Iſland which the Portugals call Madera, and in one of the Canarie Iſlands, called *Inſula Portus Sancti*; and as it ſeemeth it was firſt brought out of Africke, although ſome are of a contrary opinion, and ſay, that it was firſt brought from Carthagena, in America, by the Biſhop of the ſame Prouince.

¶ *The Time.*

The time of his growing we haue touched in the deſcription, where wee ſaid that it flouriſheth and groweth greene all the yeare.

¶ *The Names.*

The names haue beene ſufficiently ſpoken of in the deſcription and in their ſeuerall titles.

¶ *The Temperature and Vertues.*

A ‡ The *Sanguis Draconis* which is thought to proceed from this tree hath an aſtringent faculty, and is with good ſucceſſe vſed in the ouermuch flowing of the courſes, in fluxes, Dyſenteries, ſpitting of bloud, faſtening looſe teeth, and ſuch other affects which require aſtriction.

B Smiths alſo vſe it to varniſh ouer their workes to giue them a ſanguine colour, and keep them from ruſt. ‡

Chap. 142. *Of the Saſſafras, or Ague tree.*

¶ *The Deſcription.*

THe Saſſafras tree grows very great, much like vnto the Pine tree: the trunke or body is ſtraight, ſmooth, and void of boughes, of a great height: it is couered with a two fold groſſe rinde, the vppermoſt of the colour of aſhes, that next the wood of a tawnie colour: on the top come forth many goodly branches, like thoſe of the Palme tree, whereon doe grow greene leaues, ſomewhat like thoſe of the Fig tree, of a ſweet ſmell when they be greene, but much ſweeter when they be dry, declining to the ſmell of Fenell, with much ſweetneſſe in taſte: they are greene Winter and Sommer, neither bearing fruit nor floures, but is altogether barren as it is ſaid: the roots are groſſe, conformable to the greatneſſe of the tree, of a tawnie colour, diſperſing themſelues far abroad vnder the vpper cruſt of the earth, by meanes whereof they are often caſt downe with meane blaſts of winde. ‡ The wood of the tree is very ſtrong, hard and brittle, it hath not ſo ſtrong & a pleaſant ſmell as that of the root, neither is it in ſuch vſe. The leaues are of two ſorts, ſome long and ſmooth, and not ſnipt about the edges: other-ſome, and thoſe chiefely on the ends of the branches, are deeply gaſhed in, as it were diuided into three ſeuerall parts. I haue giuen the figure of a branch taken from a little tree, which grew in the Garden of Maſter *Wilmote* at Bow, who died ſome few yeares agoe. ‡

¶ *The Place.*

This tree groweth in the moſt parts of the Weſt Indies, eſpecially about the cape of Florida Wingandico, and Virginia, otherwiſe named Norembega.

¶ *The Time.*

It flouriſheth and keepeth greene Winter and Sommer.

¶ *The*

Sussafras.
The Sassafras tree.

¶ *The Names.*

The Spaniards and French men haue named this tree, *Sassafras:* the Indians in their tongue, *Pauame:* for want of an English name we are contented to call it the Ague tree, of his vertue in healing the Ague.

¶ *The Temperature.*

The boughes and branches hereof are hot & dry in the second degree; the rinde is hotter, for that it entreth into the third degree of heate and drinesse, as is manifestly perceiued in the decoction.

¶ *The Vertues.*

The best of all the tree is the root, and that worketh the best effect, the which hath the rinde cleauing very fast to the inner part, and is of colour tawnie, and much more sweet of smell than all the tree and his branches. A

The rinde tasteth of a more sweet smell than the tree; and the water being sod with the root is of greater and better effects than any other part of the tree, and is of a more sweet smell, and therefore the Spaniards vse it, for that it worketh better and greater effects. B

It is a tree that groweth neere vnto the sea, and in temperate places that haue not much drouth, nor moisture. There be mountaines growing full of them, and they cast forth a most sweet smell, so that at the beginning when they saw them first, they thought they had been trees of Cinnamon, & in part they were not deceiued: for that the rinde of this tree hath as sweet a smell as Cinamon hath, and doth imitate it in colour and sharpnesse of taste, and pleasantnesse of smell: and so the water that is made of it is of a most sweet smell and taste, as the Cinamon is, and procureth the same works and effects as Cinamon doth. C

The wood hereof cut in smal pieces and boiled in water, to the colour of Claret wine, and drunk for certaine daies together, helpeth the dropsie, remoueth oppilation or stopping of the liuer, cureth quotidian and tertian agues, and long feuers. D

The root of Sassafras hath power to comfort the liuer, and to free from oppilations, to comfort the weake and feeble stomacke, to cause good appetite, to consume windinesse, the chiefest cause of cruditie and indigestion, stay vomiting, and make sweet a stinking breath. E

It prouoketh vrine, remoueth the impediments that doe cause barrennesse, and maketh women apt to conceiue. F

Chap. 143. *Of the Storax tree.*

¶ *The Description.*

The Storax tree groweth to the height and bignesse of the Quince tree: the trunke or bodie is couered with a barke or rinde like vnto the Birch tree: the branches are small and limmer, whereon do grow leaues like those of the Quince tree, greenish aboue, and whitish vnderneath: among which come forth white floures, like those of the Orange tree, of an vnpleasant smell: after commeth the fruit or berries, standing vpon long and slender footstalks, couered ouer with a little woollinesse, of the bignesse of a bladder nut, and of the same colour; wherein is contained small feed,

Styrax arbor.
The Storax tree.

ſeed, whereunto alſo cleaue certaine gummie teares, bearing the name of the tree, and which iſſue from the trunk or body when it is wounded.

¶ *The Place.*

This tree groweth in diuers places of France, Italy and Spaine, where it bringeth forth little or no gum at all: it groweth in Iudæa, Pamphylia, Syria, Piſidia, Sidon, and many other places of Iurie or Paleſtine, as alſo in diuers Iſlands in the Mediterranean ſea, namely Cyprus, Candy, Zant, and other places, where it bringeth forth his gummy liquour in full perfection of ſweetneſſe, and alſo in great plenty, where it is gathered and put into great Canes or Reeds, whereof as ſome deeme it took the name *Calamita*; others deeme of the leaues of Reeds wherein they wrap it: hereof I haue two ſmall trees in my garden, the which I raiſed of ſeed.

¶ *The Time.*

It floureth in May, and the fruit is ripe in September.

¶ *The Names.*

This tree, as may be gathered by ſome, was called *Styrax*, by reaſon of that gum or liquour which droppeth out of the ſame, being like vnto the hollow pipes of Iſe, that hang at the eaues of houſes in Winter, called Styria, or of the Canes or the leaues of Reeds ſpoken of before: in Latine, *Storax Calamitæ*: in Engliſh, Storax, which is kept in Canes or the leaues of Reeds: there floweth from ſome of theſe trees a certain gummie liquor, which neuer groweth naturally hard, but remaineth alwaies thinne, which is called liquid Styrax, or Storax.

¶ *The Temperature.*

The gum of this tree is of an heating, mollifying, and concocting qualitie.

¶ *The Vertues.*

A It helpeth the cough, the falling downe of rheumes and humours into the cheſt, and hoarſneſſe of the voice: it alſo helpeth the noiſe and ſounding of the eares, preuaileth againſt *Strumas*, or the Kings euill, nodes on the nerues, and hard ſwellings proceeding of a cold cauſe: it preuaileth alſo againſt all cold poiſons, as Hemlocks and ſuch like.

B Of this gum there are made ſundry excellent perfumes, pomanders, ſweet waters, ſweet bags, and ſweet waſhing balls, and diuers other ſweet chaines & bracelets, whereof to write were impertinent to this hiſtorie.

Chap. 144. *Of the Sorrowfull tree or Indian Mourner.*

¶ *The Deſcription.*

Arbor triſtis, the ſad or ſorrowfull tree waxeth as big as an Oliue tree, garniſhed with many goodly branches, ſet full of leaues like thoſe of the Plum tree: among which come forth moſt odoriferous and ſweet ſmelling floures, whoſe ſtalkes are of the colour of Saffron, which flouriſh and ſhew themſelues onely in the night time, and in the day time looke withered and with a mourning cheere: the leaues alſo at that time ſhrinke in themſelues together, much like a tender plant that is froſt bitten, very ſadly lumping, lowring, and hanging downe the head, as though it loathed the light, and could not abide the heate of the Sun. I ſhould but in vain loſe labour in repeating a fooliſh fanſie of the Poeticall Indians, who would make fooles beleeue, that this tree was once a faire daughter of a great Lord or King, and that the Sun was in loue with her, with other toies which I omit.

Arbor triſtis.
The ſorrowfull tree.

omit. ‡ The floures are white, ſomewhat like thoſe of Iaſmine, but more double, and they are of a very ſweet ſmell: there ſucceed them many little cods, containing ſome ſix ſeeds a piece ſomewhat like thoſe of *Stramonium*. ‡

¶ *The Place, Time, and Names.*

This tree groweth in the Eaſt Indies, eſpecially in Goa, and Malayo: in Goa it is called *Parizataco*: in Malayo, *Singadi*: in Decan, *Pul*: of the Arabians, *Guart*: and of the Perſians and Turkes, *Gul*: in Engliſh, the Sad or Sorrowfull tree, or the Indian mourner. The time is ſpecified in the deſcription.

¶ *The Temperature and Vertues.*

We haue no ceartaine knowledge of the A
temperature hereof, neuertheleſſe we read that the Indians do colour their brothes and meates with the ſtalkes of the floures hereof in ſtead of Saffron, or whatſoeuer that they deſire to haue of a yellow colour.

It is reported, that if a linnen cloth be ſteeped in the diſtilled water of the floures; and the eyes bathed and waſhed therewith, helpeth the itching and paine therof, and ſtaieth the humours that fall downe to the ſame. B

There is made of the ſplinters of the wood C
certaine tooth-pickes, and many pretty toies for pleaſure.

Chap. 145. *Of the Balſam tree.*

¶ *The Kindes.*

THere be diuers ſorts of trees from which do flow Balſames, very different one from another, not onely in forme, but alſo in fruit, liquour, and place of growing; the which to diſtinguiſh would require more time and trauell than either our ſmall time wil affoord, or riches for our maintenance to diſcouer the ſame in their naturall countries: which otherwiſe by report to ſet downe certaine matter by incertainties, would diſcredit the Author, and no profit ſhall ariſe thereby to the Reader: notwithſtanding we wil ſet downe ſo much as we haue found in the workes of ſome trauellers, which beſt agree with the truth of the hiſtorie.

¶ *The Deſcription.*

1 THere be diuers trees growing in the Indies, whoſe fruits are called by the name of the fruit of the Balſam tree: among the reſt this whoſe figure we haue ſet forth vnto your view, we our ſelues haue ſeene and handled; and therefore the better able to deſcribe it. It is a fruit very crooked, and hollowed like the palme of an hand, two inches long, halfe an inch thicke, couered with a thicke ſmooth tinde, of the colour of a drie Oken leafe; wherein is contained a kernell (of the ſame length and thickneſſe, apt to fil the ſaid ſhell or rinde) of the ſubſtance of an Almond; of the colour of aſhes, fat, and oilie; of a good ſmell, and very vnpleaſant in taſte.

2 The wood we haue dry brought vnto vs from the Indies for our vſe in Phyſicke (a ſmall deſcription may ſerue for a dry ſticke) neuertheleſſe wee haue other fruits brought from the Indies, whoſe figures are not ſet forth, by reaſon they are not ſo well knowne as deſired; whereof one is of the bignes of a Wal-nut, ſomewhat broad on the vpper ſide, with a rough or rugged ſhell, vneuen, blacke of colour, and full of a white kernell, with much iuice in it; of a pleaſant taſte and ſmell, like the oile of Mace: the whole fruit is exceeding light, in reſpect of the quantitie or bigneſſe, euen as

it

it were a piece of Corke; which notwithſtanding ſinketh to the bottome when it falleth into the water, like as doth a ſtone.

1 *Balſami fructus.*
The fruit of the Balſam tree.

‡ 3 *Balſamum Alpini cum Carpobalſamo.*
The Balſam tree with the fruit.

3 This tree, ſaith *Garcias*, that beareth the fruit *Carpobalſamum*, is alſo one of the Balſam trees: it groweth to the height and bigneſſe of the Pomegranate tree, garniſhed with very many branches: whereon do grow leaues like thoſe of Rue, but of colour whiter, alwaies growing greene: amongſt which come forth floures, whereof we haue no certaintie: after which commeth forth fruit like that of the Turpentine tree, which in ſhoppes is called *Carpobalſamum*, of a pleaſant ſmell, but the liquour which floweth from the wounded tree is much ſweeter: which liquour of ſome is called *Opobalſamum*.

‡ *Proſper Alpinus* hath writ a large Dialogue of the Balſam of the Antients, and alſo figured and deliuered the hiſtorie thereof in his booke *De Plant. Ægypti, cap.* 14. whether I refer the curious I haue preſented you with a ſlip from his tree, and the *Carpobalſamum* ſet forth by our Author, which ſeemes to be of the ſame plant. The leaues of this are like to thoſe of *Lentiſcus*, alwaies greene, and winged, growing three, fiue, or ſeuen faſtened to one foot-ſtalke; the wood is gummie, reddiſh, and well ſmelling: the floures are ſmall and white like thoſe of Acatia, growing vſually three nigh together: the fruit is of the ſhape and bigneſſe of that of the Turpentine tree, containing yellow and well ſmelling ſeeds, filled with a yellowiſh moiſture like honey, their taſte is bitteriſh, & ſomwhat biting the tongue. ‡

Of theſe Balſam trees there is yet another ſort: the fruit whereof is as it were a kernell without a ſhell, couered with a thin skin ſtraked with many veines, of a browne colour: the meat is firm and ſolid, like the kernell of the Indian Nut, of a white colour, and without ſmell, but of a grateful taſt; and it is thought to be hot in the firſt degree, or in the beginning of the ſecond.

There be diuers ſorts more, which might be omitted becauſe of tediouſneſſe: neuertheleſſe I wil trouble you with two ſpeciall trees worthy the noting: there is, ſaith my Author, in America a great tree of monſtrous hugeneſſe, beſet with leaues and boughes euen to the ground; the trunke wherof is couered with a twofold bark, the one thick like vnto Corke, & another thin next to the tree: from betweene which barks doth flow (the vpper barke being wounded) a white Balſam like vnto teares

or

or drops, of a most sweet sauour, and singular effects, for one drop of this which thus distilleth out of the tree, is worth a pound of that which is made by decoction: the fruit hereof is small in respect of the others; it seldome exceedeth the bignes of a Pease, of a bitter taste, inclosed in a narrow huske, of the length of a finger, something thin, and of a white colour; which the Indians do vse against head-ache: which fruit of most is that we haue before described, called *Carpobalsamum*.

It is also written, that in the Island called *Hispaniola*; there groweth a small tree, of the height of two men, without the industry of man, hauing stalkes or stems of the colour of ashes; whereon do grow greene leaues, sharpe at both ends, but more greene on the vpper side than on the lower; hauing a middle rib somewhat thicke and standing out; the foot-stalkes whereon they grow are somewhat reddish: among which leaues commeth fruit growing by clusters, as long as a mans hand, fingers and all: the stones or graines in the fruit be few, and greene; but growing to redneſſe more and more as the fruit waxeth ripe. From the which is gathered a juice after this manner: they take the young shootes and buds of the tree, and also the clusters of the fruit, which they bruise, and boile in water to the thickeneſſe of hony, which being strained, they keepe it for their vses.

They vse it against wounds and vlcers; it stoppeth and stancheth the bloud; maketh them cleane; bringeth vp the flesh, and healeth them mightily, and with better succeſſe than true Balsame. The branches of the tree being cut, do cast forth by drops a certaine cleare water, more worth than *Aqua vitæ*, most wholesome against wounds, and all other diseases proceeding from cold causes, if it be drunken some few daies together.

¶ *The Place.*

These trees grow in diuers parts of the world, some in Ægypt, and most of those countries adiacent: there groweth of them in the East and West Indies; as trauellers in those parts report.

¶ *The Time.*

These trees for the most part keepe greene winter and Sommer.

¶ *The Names.*

Balsame is called in Greeke, βάλσαμον: in Latine also *Balsamum*: of the Arabians *Balseni*, *Baleſina*, and *Belsan*: in Italian, *Balsamo*: in French, *Baume*.

The liquor that floweth out of the tree when it is wounded, is called *Opobalsamum*: the wood *Xylobalsamum*: the fruit *Carpobalsamum*: and the liquor which naturally floweth from the tree in Ægypt *Balsamum*.

¶ *The Temperature.*

Balsame is hot and dry in the second degree, with astriction.

¶ *The Vertues.*

Naturall Balsame taken in a morning fasting, with a little Rose water or wine, to the quantitie of fiue or six drops, helpeth those that be asthmatike, or short of winde: it preuaileth against the paines of the bladder, and stomacke, and comforteth the same mightily; and also amendeth a stinking breath; & takes away the shaking fits of the quotidian ague, if it be taken two or three times. A

It helpeth consumptions, clenseth the barren wombe, especially being annointed vpon a pessary, or mother suppositorie, and vsed. B

The stomacke being annointed therewith, digestion is helped thereby; it also preserueth the stomacke from obstructions and windineſſe; it helpeth the hardneſſe of the spleene; easeth the griefes of the reines and belly, proceeding of cold causes. C

It also taketh away all manner of aches, proceeding of cold causes, if they be annointed therewith; but more speedily, if a linnen cloth be wet therein, and laid thereon: vsed in the same manner, it dissolueth hard tumors, called *ædumata*; and strengthneth the weake members. D

The same refresheth the braine, and comforteth the parts adioining, it helpeth the palsie, conuulsions, and all griefes of the sinewes, if they be annoitned therewith. E

The maruellous effects that it worketh in new and greene wound, were heere too long to set downe, and also superfluous; considering the skilfull Chirurgion whom it most concerneth, doth know the vse thereof; and as for the beggerly Quacksaluers, Runnagates, and knauish Mountibanks, we are not willing to instruct them in things so far aboue their reach, capacitie and worthineſſe. F

Chap. 146. *Of a kinde of Balme, or Balsame Tree:*

¶ *The Description.*

THis tree which the people of the Indies do call *Molli*, groweth to the bigneſſe of a great tree, hauing a trunke or body of a darke greene colour, sprinkled ouer with many ash coloured

ſpots: the branches are many, and of very great beautie; whereupon do grow leaues not vnlike to thoſe of the Aſh-tree, conſiſting of many ſmall leaues, ſet vpon a middle rib; growing narrower euer towards the point, euery particular one jagged on the ſides like the teeth of a ſaw; which being plucked from the ſtem, yeeldeth forth a milkie juice, tough and clammie, ſauouring like the bruiſed leaues of Fenell, and as it ſeemeth in taſte ſomewhat aſtringent: the floures grow in cluſters vpon the twiggie branches, like thoſe of the Vine a little before the grapes be formed: after followeth the fruit or berries, ſomewhat greater than Pepper cornes, of an oilie ſubſtance, greene at the firſt, and of a darke reddiſh colour when they be ripe. ‡ The firſt of the figures was taken from a tree, only of three yeeres growth, but the latter from a tree come to his full growth, as it is affirmed in *Cluſius* his *Cur. Poſter.* It differs only in that the leaues of the old trees are not at all ſnipt or diuided on the edges. ‡

1 *Molli, ſiue Molly Cluſij, & Lobelij.*
The Balſame tree of *Cluſius* and *Lobels* deſcription.

‡ 2 *Molle arboris adultæ ramus.*
A branch of the old tree of Molle.

¶ *The Place.*

This tree, ſaith a learned Phyſition called *Ioh. Fragoſus*, doth grow in the King of Spaine his garden at Madryll, which was the firſt that euer he did ſee: ſince which time, *Iohn Ferdinando* Secretary vnto the foreſaid king did ſhew vnto the ſaid *Fragoſus* in his owne garden a tree ſo large, and of ſuch beautie, that he was neuer ſatisfied with looking on it, and meditating vpon the vertues thereof. Which words I haue receiued from the hands of a famous learned man, called M^r. *Lancelot Browne*, D^r. in Phyſicke, and Phyſition to the Queenes Maieſtie, at the impreſſion hereof; faithfully tranſlated out of the Spaniſh tongue, without adding or taking any thing away.

They grow plentifully in the vales and low grounds of Peru, as all affirme that haue trauelled to the VVeſt Indies; as alſo thoſe that haue deſcribed the ſingularities thereof. My ſelfe with diuers others, as namely M^r. *Nicholas Lete*, a worſhipfull Merchant of the Citie of London; and alſo a moſt skilfull Apothecary, M^r. *Iames Garret*, who haue receiued ſeeds hereof from the right Honorable the Lord Hunſdon, Lord high Chamberlaine of England, worthy of triple honour for his care in getting, as alſo for his curious keeping rare and ſtrange things brought from the farthеſt parts of the world; which ſeedes we haue ſowne in our gardens, where they haue brought forth plants of a foot high; and alſo their beautifull leaues: notwithſtanding our care, diligence,

and

and induſtry, they haue periſhed at the firſt approch of winter, as not being able by reaſon of their tenderneſſe to indure the cold of our Winter blaſts.

¶ *The Time.*

As touching the time of his flouriſhing, and bringing his fruit to maturitie, we haue as yet no certaine knowledge, but is thought to be greene both VVinter and Sommer.

¶ *The Names.*

This moſt notable tree is called by the Indian name *Molle*: of ſome, *Molly*, and *Muelle*, taken from his tender ſoftneſſe, as ſome haue deemed: it may be called the Fennell tree, or one of the Balme, or Balſam trees.

¶ *The Temperature.*

This tree is thought to be of an aſtringent or binding qualitie; whereby it appeares beſides the hot temperature it hath, to be compounded of diuers other faculties.

¶ *The Vertues.*

The Indians vſe to ſeeth the fruit or berries hereof in water, and by a ſpeciall skill they haue in the boiling, do make a moſt wholeſome wine or drinke, as alſo a kind of vineger, and ſometimes hony; which are very ſtrange effects, theſe three things being ſo contrary in taſte. A

The leaues boiled, and the decoction drunke, helpeth them of any diſeaſe proceeding of a cold cauſe. B

The gum which iſſueth from the tree, being white like vnto Manna, diſſolued in milke, taketh away the web of the eies, and cleareth the ſight, being wiped ouer with it. C

The barke of this tree boiled, and the legs that be ſwolne and full of paine, bathed and waſhed with the decoction diuers times, taketh away both infirmities in ſhort ſpace. D

This tree is of ſuch eſtimation among the Indians, that they worſhip it as a god, according vnto their ſauage rites and ceremonies: much like as *Pliny* reporteth of *Homers Moly*, the moſt renowned of all plants, which they had in old time in ſuch eſtimation and reuerence, that as it is recorded, the gods gaue it the name of *Moly*, and ſo writeth *Ouid*: E

Pacifer huic dederat florem Cyllenius album,
Moly vocant Superi, nigra radice tenetur.

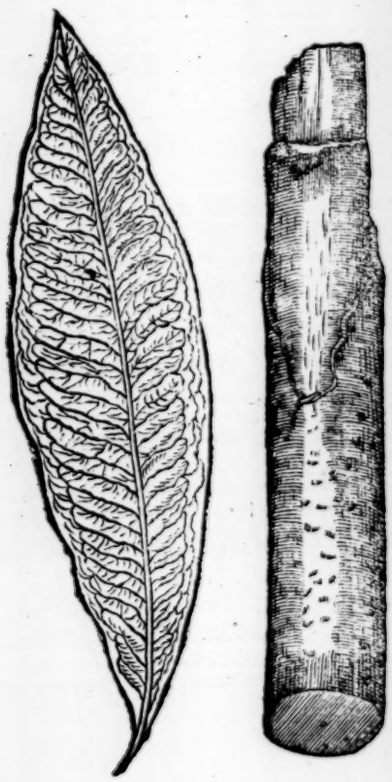
If any be deſirous to ſee more hereof, they may reade a learned diſcourſe of it ſet forth in the Latine tongue, by the learned *Lobel*, who hath at large written the hiſtorie thereof, dedicated vnto the right Honourable, the Lord Chamberlaine, at the Impreſſion hereof, faithfully ouerſeene and examined by the learned Phyſition before remembred, Mr. Doctor *Browne*, and his cenſure vpon the ſame. ‡ Together with *Lobels* reply, who iudged this plant (and not without good reaſon) to be a kinde of the true Balſam of the Antients, and not much different from that ſet forth by *Proſper Alpinus*, whereof I haue made mention in the foregoing chapter. ‡ F

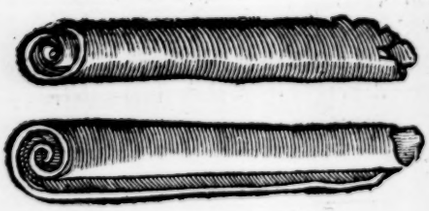
Chap. 147. *Of the Canell, or Cinnamon tree.*

¶ *The Deſcription.*

1 THe tree which hath the Cinnamon for his barke is of the ſtature of an Oliue tree: hauing a body as thick as a mans thigh, from which the Cinnamon is taken; but that taken from the ſmaller branches is much better: which branches or boughes are many, and very ſtraight; whereon do grow beautifull leaues, in ſhape like thoſe of the Orenge tree, and of the colour of the Bay leafe (not as it hath been reported) like vnto the leaues of flags or floure de-Luce: among theſe pleaſant leaues and branches come forth many faire white floures, which turne into round blacke fruit or berries, of the bigneſſe of an Haſell Nut, or the Oliue berry, and of a blacke colour; out of which is preſſed an oile, that hath no ſmell at all vntill it be rubbed and chafed betweene the hands: the trunke or body with the greater armes or boughes of the tree are couered with a double or twofold barke, like that of *Suber*, the Corke tree: the innermoſt whereof is the true and pleaſant Cinnamon, which is taken from the tree, and caſt vpon the ground in the heate of the Sunne, through the heate

Canellæ folium, Bacillus, & Cortex.
The leafe, barke, and trunke of the Cinnamon tree.





thereof it turneth and foldeth it ſelfe round together, as wee daily ſee by viewing the thing it ſelfe: this tree being thus peeled, recouereth a new barke in the ſpace of three yeares, and is then ready to be disbarked as afore. That Cinnamon which is of a pale colour hath not been well dried in the Sunne: that of a faire browne colour is beſt; & that which is blackiſh, hath been too much dried, and alſo hath taken ſome wet in the time of drying.

‡ 2 Beſides the Cinnamon vulgarly knowne and vſed, there is another ſort which alſo is commonly receiued for the *Caſſia* of *Dioſcorides* and the Antients. Now this differs from the former in that it is of a redder colour, of a more hard, ſollid, and compact ſubſtance, commonly alſo thicker, & if you chew it, more clammy and viſcous: the taſte and ſmell are much like Cinnamon, yet not altogether ſo ſtrong as that of the beſt Cinnamon. There is much controuerſie in late Writers concerning both the true Cinnamon, and Caſſia of the Antients: the which I haue not time nor ſpace here to mention, much leſſe to inſiſt vpon: I haue obſerued that both the Cinnamon and Caſſia that we haue are couered ouer with a rough grayiſh barke, like that of an Oke or other ſuch tree, which is cleane ſcraped off, and taken away before it be brought to vs. ‡

¶ *The Place.*

The chiefeſt places where the trees doe grow that beare Cinnamon, are Zeilan, and Malauar: but thoſe of Zeilan are the beſt: they grow in other of the Molucca Ilands, as Iaoa, or Iaua, the greater and the leſſe, and alſo in Mindanoa, for the moſt part vpon mountaines.

¶ *The Time.*

The Cinnamon tree groweth green winter and Sommer, as doall the other trees of the Moluccaes, and Eaſt Indies for the moſt part: the boughes whereof are cut off at ſeaſonable times, by the expreſſe commandement of the King of the Country; and not before he haue appointed the time.

There hath beene ſome controuerſie among writers concerning the tree whoſe bark is *Caſſia*, and that tree that beareth Cinnamon, making them both one tree: but that opinion is not to be receiued: for there is a great difference betweene them, as there is betwixt an Oke, and a Cheſtnut tree; for the tree whoſe barke is *Caſſia*, is doubtleſſe a baſtard kinde of *Canell*, or Cinnamon: in ſhew it is very like, but in ſweetneſſe of ſmell and other circumſtances belonging to Cinnamon, farre inferiour.

¶ *The Names.*

Cinnamon is called in Italian *Canella*: in Spaniſh, *Canola*: in French, *Canelle*: in high Dutch, **Zimmet coeʒlin**: the Grecians, κινναμωμον: the Latines likewiſe *Cinnamomum*: the Arabians, *Darſeni*, and as ſome ſay, *Querfaa*, others, *Querfe*: in Zeilan, *Cuurde*: in the Iſland Iaua they name it *Cameaa*: in Ormus, *Darchini* (i.) *lignum Chinenſe*, the wood of China: in Malauar, *Cais mains*, which in their tongue ſignifieth *Dulce lignum*, Sweet wood: in Engliſh, Cinnamome, Cinnamon, and Canell. The other is called *Caſſia*, and *Caſſia lignea*.

¶ *The Temperature and Vertues.*

Dioſcorides writeth, that Cinnamon hath power to warme, and is of thinne parts: it is alſo drie and

and aſtringent, it prouoketh vrine, cleareth the eies, and maketh ſweet breath.

The decoction bringeth downe the menſes, preuaileth againſt the bitings of venomous beaſts, B
the inflammation of the inteſtines and reines.

The diſtilled water hereof is profitable to many, and for diuers infirmities, it comforteth the C
weake, cold, and feeble ſtomacke, eaſeth the paines and frettings of the guts and intrailes proceeding of cold cauſes, it amendeth the euill colour of the face, maketh ſweet breath, & giueth a moſt pleaſant taſte vnto diuers ſorts of meats, and maketh the ſame not onely more pleaſant, but alſo more wholeſome for any bodies of what conſtitution ſoeuer they be, notwithſtanding the binding qualitie.

The oile drawne chimically preuaileth againſt the paines of the breſt, comforteth the ſtomacke, D
breaketh windineſſe, cauſeth good digeſtion, and being mixed with ſome honie, taketh away ſpots from the face, being annointed therewith.

The diſtilled water of the floures of the tree, as *Garcias* the Luſitanian Phyſition writeth, excel- E
leth far in ſweetneſſe all other waters whatſoeuer, which is profitable for ſuch things as the barke it ſelfe is.

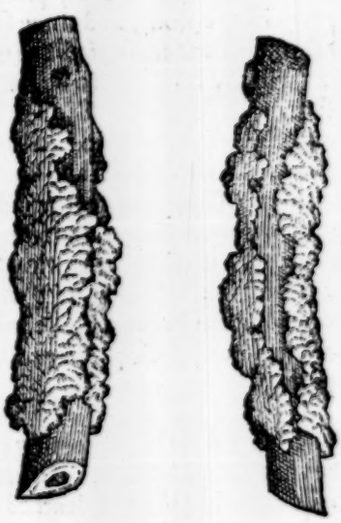
Out of the berries of this tree is drawn by expreſſion, as out of the berries of the Oliue tree, a cer- F
taine oyle, or rather a kinde of fat like butter, without any ſmell at all, except it bee made warme, and then it ſmelleth as the Cinnamon doth, and is much vſed againſt the coldneſſe of the ſinewes all paines of the ioints, and alſo the paines and diſtemperature of the ſtomacke and breaſt.

To write as the worthineſſe of the ſubiect requireth, would aske more time than we haue to be- G
ſtow vpon any one plant; therefore theſe few ſhall ſuffice, knowing that the thing is of great vſe among many, and knowne to moſt.

‡ *Caſſia* vſed in a larger quantitie ſerueth well for the ſame purpoſes which Cinnamon H
doth. ‡

Chap. 142. *Of Gum Lacke and his rotten tree.*

Lacca cum ſuis bacillis.
Gum Lacke with his ſtaffe or ſticke.



¶ *The Deſcription.*

THe tree that bringeth forth that excrementall ſubſtance called *Lacca*, both in the ſhops of Europ and elſewhere, is called of the Arabians, Perſians and Turkes, *Loc Sumutri*, as who ſhould ſay, *Lacca* of Sumutra: ſome which haue ſo termed it, haue thought that the firſt plentie thereof came from Sumutra, but herein they haue erred, for the abundant ſtore thereof came from Pegu, where the inhabitants therof do cal it *Lac*, & others of the ſame Prouince, *Trec*: the hiſtory of which tree, according to that famous Herbariſt *Cluſius* is as followeth. [There is in the countrey of Pegu and Malabar, a great tree, whoſe leaues are like them of the Plum tree, hauing many ſmall twiggie branches; when the trunk or body of the tree waxeth old, it rotteth in ſundry places, wherein do breed certain great Ants or Piſmires, which continually work and labour in the time of Harueſt and Sommer, againſt the penurie of Winter: ſuch is the diligence of thoſe Ants, or ſuch is the nature of the tree wherein they harbour, or both, that they prouide for their winter food, a lumpe or maſſe of ſubſtance, which is of a crimſon colour, ſo beautifull and ſo faire, as in the whole World the like is not ſeene, which ſerueth not onely to phyſicall vſes but is a perfect and coſtly colour for Painters, called by vs, Indian Lack. The Piſmires (as I ſaid) worke out this colour, by ſucking the ſubſtance or matter of Lacca from the tree, as Bees do make honie and wax, by ſucking the matter

thereof from all herbes, trees, and floures, and the inhabitants of that country, do as diligently ſeek for this Lacca, as we in England and other countries ſeeke in the woods for honie; which Lacca after they haue found, they take from the tree, and dry it into a lump; among which ſometimes there come ouer ſome ſticks and pieces of the tree with the wings of the Ants, which haue fallen among it, as we daily ſee.

‡ The Indian Lacke or Lake which is the rich colour vſed by Painters, is none of that which is vſed in ſhops, nor here figured or deſcribed by *Cluſius*, wherefore our Author was much miſtaken in that he here confounds together things ſo different; for this is of a reſinous ſubſtance, and a faint red colour, and wholly vnfit for Painters, but vſed alone and in compoſition to make the beſt hard ſealing wax. The other ſeemes to be an artificiall thing, and is of an exquiſite crimſon colour, but of what it is, or how made, I haue not as yet found any thing that carries any probabilitie of truth. ‡

¶ *The Place.*

The tree which beareth Lacca groweth in Zeilan and Malauar, and in other parts of the Eaſt Indies.

¶ *The Time.*

Of the time we haue no certaine knowledge.

¶ *The Names.*

Indian Lacke is called in ſhops *Lacca*: in Italian, *Lachetta*: *Auicen* calleth it *Luch*: *Paulus* and *Dioſcorides*, as ſome haue thought, *Cancamum*: the other names are expreſſed in the deſcription.

¶ *The Temperature and Vertues.*

A Lack or Lacca is hot in the ſecond degree, it comforteth the heart and liuer, openeth obſtructions, expelleth vrine, and preuaileth againſt the dropſie.

B There is an artificiall Lack made of the ſcrapings of Braſill and Saffron, which is vſed of Painers, and not to be vſed in Phyſicke as the other naturall Lacca.

Chap. 149. *Of the Indian leafe.*

Tamalapatra.
The Indian leafe.

¶ *The Deſcription.*

Tamalapatra, or the Indian leafe grows vpon a great tree like the Orenge tree, with like leaues alſo, but broader, a little ſharp pointed, of a greene gliſtering colour, and three ſmall ribs running through each leafe, after the manner of Ribwort, wherby it is eaſie to be known: it ſmelleth ſomewhat like vnto Cloues, but not ſo ſtrong as Spikenard or Mace (as ſome haue deemed) nor yet of ſo ſubtill and quick a ſent as Cinnamon. There was ſent or added vnto this figure by *Cortuſus* a certaine fruit like vnto a ſmall Acorn, with this inſcription, *Fructus Canellæ*, the fruit of the Canell tree, which may be doubted of, conſidering the deſcription of the forenamed tree holden generally of moſt to be perfect.

¶ *The Place.*

The Indian leafe groweth not fleeting vpon the water like vnto *Lens paluſtris*, as *Dioſcorides* and *Pliny* do ſet downe, (though learned and painfull writers) but is the leafe of a great tree, a branch whereof wee haue ſet forth vnto your view, which groweth in Arabia and Cambaya, far from the water ſide.

¶ *The Time.*

Of the time we haue no certain knowledge, but it is ſuppoſed to be green winter and ſommer.

¶ *The*

¶ *The Names.*

Tamalapatra is called of the Indians in their mother tongue, eſpecially of the Arabians, *Cadegi Indi*, or *La degi Indi*, that is, *Folium Indicum*, or *Indum*, the Indian leafe: but the Mauritanians doe call it *Tembul*. The Latines and Grecians following ſome of the Arabians, haue called it *Malabathrum*.

¶ *The Temperature and Vertues.*

The Indian leafe is hot and dry in the ſecond degree, agreeing with Nardus in temperature, or as others report with Mace: it prouoketh vrine mightily, warmeth and comforteth the ſtomacke, and helpeth digeſtion. A

It preuaileth againſt the pin and web in the eyes, the inflamed and waterie eyes, and all other infirmities of the ſame. B

It is laid among cloathes, as well to keepe them from moths and other vermine, as alſo to giue vnto them a ſweet ſmell. C

CHAP. 150. *Of the Cloue tree.*

Caryophylli veri Cluſij.
The true forme of the Cloue tree.

¶ *The Deſcription.*

THe Cloue tree groweth great in forme like vnto the Bay tree, the trunke or bodie whereof is couered with a ruſſet barke: the branches are many, long, and very brittle, whereupon do grow leaues like thoſe of the Bay tree, but ſomewhat narrower: amongſt which come the floures, white at the firſt, after of a greeniſh colour, waxing of a darke red colour in the end: which floures are the very cloues when they grow hard: after when they be dried in the Sunne they become of that dusky black colour which we dayly ſee, wherein they continue. For thoſe that wee haue in eſtimation are beaten downe to the ground before they be ripe, and are ſuffered there to lie vpon the ground vntill they bee dried throughly, where there is neither graſſe, weeds, nor any other herbes growing to hinder the ſame, by reaſon the tree draweth vnto it ſelfe for his nouriſhment all the moiſture of the earth a great circuit round about, ſo that nothing can there grow for want of moiſture, and therfore the more conuenient for the drying of the Cloues. Contrariwiſe, that groſſe kinde of Cloues which hath beene ſuppoſed to be the male, are nothing elſe than fruit of the ſame tree tarrying there vntill it fall downe of it ſelfe vnto the ground, where by reaſon of his long lying, and meeting with ſome raine in the mean ſeaſon, it loſeth the quick taſte that the others haue. Some haue called theſe *Fuſti*, whereof we may Engliſh them Fuſſes. Some affirme that the floures hereof ſurpaſſe all other floures in ſweetneſſe when they are greene; and hold the opinion, that the hardned floures are not the Cloues themſelues, (as wee haue written) but thinke them rather to be the ſeat or huske wherein the floures doe grow: the greater number hold the former opinion. And further, that the trees are increaſed without labour, graffing, planting, or other induſtrie, but by the falling of the fruit, which beare fruit within eight yeares after they be riſen vp, and ſo continue bearing for an hundred yeares together, as the inhabitants of that countrey do affirme.

¶ *The Place.*

The Cloue tree groweth in ſome few places of the Molucca Iſlands, as in Zeilan, Iaua the greater and the leſſe, and in diuers other places.

¶ *The*

¶ *The Time.*

The Cloues are gathered from the fifteenth of September vnto the end of Februarie, not with hands, as we gather Apples, Cherries, and ſuch like fruit, but by beating the tree, as Wall-nuts are gotten, as we haue written in the deſcription.

¶ *The Names.*

The fruit hereof was vnknowne to the antient Grecians: of the later writers called καρυόφυλλον: in Latine alſo *Caryophyllus*, and *Clavus*: in French, *Clou de Gyroſle*: the Mauritanians, *Charhumfel*: in Italian, *Carofano*: in high-Dutch, **Naegel**: in Spaniſh, *Clauo de eſpecia*: of the Indians, *Calafur*: in the Molucca's, *Changue*: of the Pandets, *Arumfel*, and *Charumfel*: in Engliſh, Cloue tree, & Cloues.

¶ *The Temperature.*

Cloues are hot and dry in the third degree.

¶ *The Vertues.*

A Cloues ſtrengthen the ſtomacke, liuer, and heart, helpe digeſtion, and prouoke vrine.

B The Portugall women that dwell in the Eaſt Indies draw from the Cloues when they bee yet greene, a certaine liquor by diſtillation, of a moſt fragrant ſmell, which comforteth the heart, and is of all cordials the moſt effectuall.

C Cloues ſtop the belly: the oile or water thereof dropped into the eyes, ſharpens the ſight, and clenſeth away the cloud or web in the ſame.

D The weight of foure drams of the pouder of Cloues taken in milke procureth the act of generation.

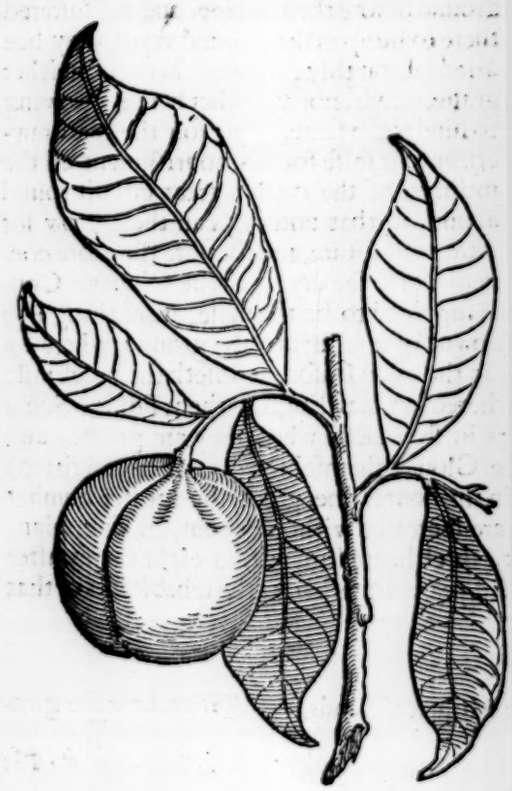
E There is extracted from the Cloues a certaine oile or rather thicke butter of a yellow colour; which being chafed in the hands ſmelleth like the Cloues themſelues, wherewith the Indians do cure their wounds and other hurts, as we do with Balſam.

F The vſe of Cloues, not onely in meat and medicine, but alſo in ſweet pouder and ſuch like, is ſufficiently knowne: therefore this ſhall ſuffice.

† There were formerly three figures in this chapter: wherefore I omitted two as impertinent.

Chap. 151. *Of the Nutmeg tree.*

1 *Nux Muſcata rotunda, ſiue fœmina.*
The round or female Nutmeg.



2 *Nux Myriſtica oblonga, ſiue mas.*
The longiſh or male Nutmeg.

Nux Moſchata cum ſua Maci.
The Nutmeg with his Mace about him.

¶ *The Deſcription.*

1 THe tree that beareth the Nutmeg and the Mace is in forme like to the Peare tree, but the leaues of it are like thoſe of the Bay or Orenge tree, alwaies greene on the vpper ſide, and more whitiſh vnderneath; among which come forth the Nut and Mace as it were the floures. The Nut appeareth firſt, compaſſed about with the Mace, as it were in the middle of a ſingle roſe, which in proceſſe of time doth wrap and incloſe the Nut round on euery ſide: after commeth a huske like that of the Wall-nut, but of an harder ſubſtance, which incloſeth the Nut with his Mace as the Wall-nut husk doth couer the Nut, which in time of ripeneſſe doth cleaue of it ſelfe as the Wall-nut huske doth, and ſheweth his Mace, which then is of a perfect crimſon colour, and maketh a moſt goodly ſhew, eſpecially when the tree is well laden with fruit: after the Nut becommeth dry, the Mace likewiſe gapeth and forſaketh the Nut, euen as the firſt huske or couerture, and leaues it bare and naked, as we all do know; at which time it getteth to it ſelfe a kinde of darke yellow colour, and loſeth that braue crimſon dye which it had at the firſt.

‡ 2 The tree which carrieth the male Nutmeg (according to *Cluſius*) thus differs from the laſt deſcribed: the leaues are like thoſe of the former in ſhape, but much bigger, being ſometimes a foot long, and three or foure inches broad; their common length is ſeuen or eight inches, and bredth two and a halfe: they are of a whitiſh colour vnderneath, and greene and ſhining aboue. The Nuts alſo grow at the very ends of the branches, ſometimes two or three together, and not onely one, as in the common kinde. The Nut it ſelfe is alſo larger and longer: the Mace that incompaſſes it is of a more elegant colour, but not ſo ſtrong as that of the former.

I can ſcarſe beleeue our Authors aſſertion in the foregoing deſcription, that the Nut appeareth firſt, compaſſed about with the Mace as it were in the middeſt of a ſingle Roſe, &c. But I rather thinke they all come forth together, the Nutmeg, Mace, the greene outward huske and all, iuſt as we ſee Wall-nuts do, and onely open themſelues when they come to full maturitie. In the third figure you may ſee expreſt the whole manner of the growing of the Nutmeg, together with both the ſorts of Nutmegs taken forth of their ſhells. ‡

¶ *The Place.*

The Nutmeg tree groweth in the Indies, in an Iſland eſpecially called Banda, and in the Iſlands of Molucca, and in Zeilan, though not ſo good as the firſt.

¶ *The Time.*

The fruit is gathered in September in great aboundance, all things being common in thoſe countries.

¶ *The Names.*

The Nutmeg tree is called of the Grecians, Κάρυον μυριϛικὸν: of the Latines, *Nux Moſchata*, and *Nux Myriſtica*: in Italian, *Noce Moſcada*: in Spaniſh, *Nuez de eſcetie*: in French, *Noix Muſcade*: in high-Dutch, **Moſchat Nuſz**: of the Arabians, *Leuzbane*, or *Gianziban*: of the countrey people where they grow, *Palla*: The Maces, *Bunapalla*. In Decan the Nut is called *Iapatri*, and the Maces, *Iaifol*: of *Auicen*, *Iauſiband*, (i.) *Nux Bandenſis*. The Maces he calleth *Beſbaſe*: in Engliſh, Nutmeg.

¶ *The Temperature.*

The Nutmeg, as the Mauritanians write, is hot and dry in the ſecond degree complete, and ſomwhat aſtringent.

¶ *The Vertues.*

Nutmegs cauſe a ſweet breath, and amend thoſe that do ſtink, if they be much chewed and holden in the mouth. A

The

B The Nutmeg is good againſt freckles in the face, quickneth the ſight, ſtrengthens the belly and feeble liuer; it taketh away the ſwelling in the ſpleene, ſtayeth the laske, breaketh winde, and is good againſt all cold diſeaſes in the body.

C Nutmegs bruiſed and boiled in Aqua vitæ vntill they haue waſted and conſumed the moiſture, adding thereto of *Rhodomel* (that is, honey of Roſes) gently boiling them, being ſtrained to the forme of a ſyrrup, cure all paines proceeding of windie aud cold cauſes, if three ſpoonfulls be giuen faſting for certaine dayes together.

D The ſame bruiſed and boyled in ſtrong white wine vntill three parts be ſodden away, with the roots of Mother-wort added thereto in the boyling, and ſtrained: this liquor drunke with ſome ſugar cureth all gripings of the belly proceeding of windineſſe.

E As touching the choice, there is not any ſo ſimple but knoweth that the heavieſt, fatteſt, and fulleſt of iuice are the beſt, which may eaſily be found out by pricking the ſame with a pinne or ſuch like.

Chap. 152. *Of the Pepper Plant.*

¶ *The Kindes.*

THere be diuers ſorts of Pepper, that is to ſay, white, blacke, and long Pepper, one greater and longer than the other; and alſo a kinde of Ethiopian Pepper.

1 *Piper nigrum.*
Blacke Pepper.

2 *Piper album.*
White Pepper.

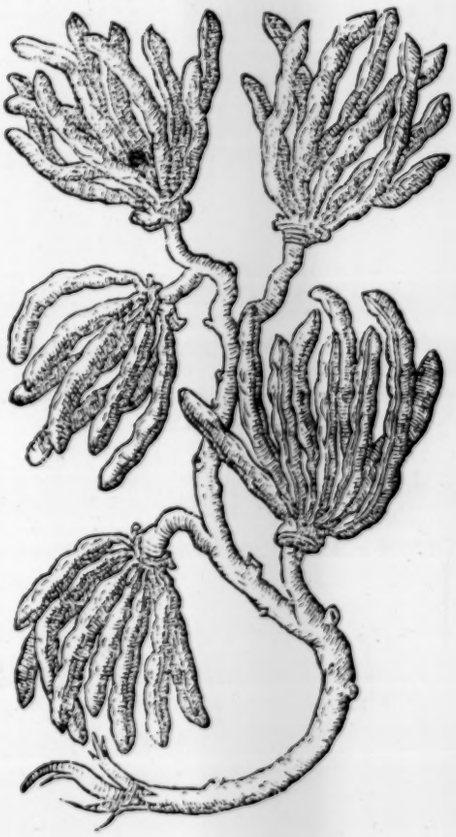
¶ *The Deſcription.*

1 THe Plant that beareth the blacke Pepper groweth vp like a Vine among buſhes and brambles where it naturally groweth; but where it is manured it is ſowne at the bottome of the tree *Faufel* and the Date trees, whereon it taketh hold, and clymbeth vp euen to the top, as doth the Vine, ramping and taking hold with his claſping tendrels of any other thing

thing it meeteth withall. The leaues are few in number, ‡ growing at each ioint one, firſt on one ſide of the ſtalke, then on the other, like in ſhape to the long vndiuided leaues of Iuy, but thinner, ſharpe pointed, and ſometimes ſo broad, that they are foure inches ouer, but moſt commonly two inches broad, and foure long, hauing alwaies fiue pretty large nerues running alongſt them. The fruit grow cluſtering together vpon long ſtalks, which come forth at the ioints againſt the leaues, as you may ſee in the figure: the root (as one may conieƈture) is creeping; for the branches that lie on the ground do at their ioints put forth new fibres or roots. We are beholden to *Cluſius* for this exaƈt figure and deſcription, which he made by certaine branches which were brought home by the Hollanders from the Eaſt Indies. The curious may ſee more hereof in his Exotickes and notes vpon *Garcias*. ‡

† 3 *Piper longum.*
Long Pepper.

4 *Piper Æthiopicum, ſiue Vita longa.*
Pepper of Ethiopia.



2 The Plant that brings white Pepper is not to be diſtinguiſhed from the other plant, but only by the colour of the fruit, no more than a Vine that beareth blacke Grapes, from that which bringeth white: and of ſome it is thought, that the ſelfe ſame plant doth ſometimes change it ſelfe from black to white, as diuers other plants do. ‡ Neither *Cluſius*, nor any other elſe that I haue yet met with, haue deliuered vs any thing of certaine, of the plant whereon white Pepper growes: *Cluſius* only hath giuen vs the manner how it growes vpon the ſtalkes, as you may ſee it here expreſt ‡.

There is alſo another kinde of Pepper, ſeldome brought into theſe parts of Europe, called *Piper Canarium*: it is hollow within, light, and empty, but good to draw flegme from the head, to helpe the tooth-ache and cholericke affeƈts.

3 The tree that beareth long Pepper hath no ſimilitude at all with the plant that brings black and white Pepper: ſome haue deemed them to grow all on one tree, which is not conſonant to truth, for they grow in countries far diſtant one from another, and alſo that countrey where there is blacke Pepper hath not any of the long Pepper; and therefore *Galen* following *Dioſcorides*, were together both ouerſeen in this point. This tree, ſaith *Monardes*, is not great, yet of a wooddy ſubſtance, diſperſing here and there his claſping tendrels, wherewith it taketh hold of other trees and ſuch other things as do grow neere vnto it. The branches are many and twiggie, whereon growes the fruit, conſiſting of many graines growing vpon a ſlender foot-ſtalke, thruſt or compaƈt cloſe

together,

‡ 5 *Piper Caudatum.*
Tailed Pepper.

together, greene at the firſt, and afterward blackiſh; in taſte ſharper and hotter than common blacke Pepper, yet ſweeter, and of better taſte. ‡ For this figure alſo I acknowledge my ſelfe beholden to the learned and diligent *Cluſius*, who cauſed it to be drawne from a branch of ſome foot in length, that he receiued from Dr. *Lambert Hortenſius*, who brought it from the Indies. The order of growing of the leaues, and fruit is like that of the blacke; but the joints ſtand ſomewhat thicker together, the leafe alſo doth little differ from that of the blacke, onely it is thinner, of a lighter greene, and (as *Cluſius* thought) hath a ſhorter foot-ſtalke, the veines or nerues alſo were leſſe imminent, more in number, and run from the middle rib to the ſides, rather than alongſt the leafe. ‡

4 This other kinde of Pepper brought vnto vs from Æthiopia, called of the country where it groweth, *Piper Æthiopicum*: in ſhops, *Amomum*, and alſo *Longa Vita*. It groweth vpon a ſmall tree, in manner of an hedge buſh, whereupon grow long cods in bunches, a finger long, of a browne colour, vneuen, and bunched or puft vp in diuers places, diuided into fiue or ſix lockers or cels, each whereof containeth a round ſeed ſomewhat long, leſſer than the ſeeds of Pæony, in taſte like common Pepper, or *Cardamomum*, whoſe facultie and temperature it is thought to haue, whereof we hold it a kinde.

5 Another kinde of Pepper is ſometimes brought, which the Spaniards do call *Pimenta de rabe*, that is, Pepper with a taile: it is like vnto Cubebes, round, full, ſomewhat rough, blacke of colour, and of a ſharpe quicke taſte, like the common Pepper, of a good ſmell: it groweth by cluſters vpon ſmall ſtems or ſtalkes, which ſome haue vnaduiſedly taken for *Amomum*. The King of Portingal forbad this kinde of Pepper to be brought ouer, for feare leaſt the right Pepper ſhould be the leſſe eſteemed, and ſo himſelfe hindered in the ſale thereof.

¶ *The Place.*

Blacke and white Pepper grow in the kingdome of Malauar, and that very good; in Malaca alſo, but not ſo good; and alſo in the Iſlands Sunde and Cude: there is great ſtore growing in the kingdome of China, and ſome in Cananor, but not much.

Pepper of Æthiopia groweth in America, in all the tract of the country where Nata and Carthago are ſituated. The reſt hath been ſpoken of in their ſeuerall deſcriptions. The white Pepper is not ſo common as the blacke, and is vſed there in ſtead of ſalt.

¶ *The Time.*

The plant riſeth vp in the firſt of the ſpring; the fruit is gathered in Auguſt.

¶ *The Names.*

The Grecians, who had beſt knowledge of Pepper, do call it πέπερι: the Latines, *Piper*: the Arabians, *Fulfel* and *Fulful*: in Italian, *Pepe*: in Spaniſh, *Pimenta*: in French, *Poiure*. in high-Dutch, **Pfeffer**: in Engliſh, Pepper.

That of Ærhiopia is called, *Piper Æthiopicum*, *Amomum*, *Vita longa*, and of ſome, *Cardamomum*, whereof we hold it to be a kinde. I receiued a branch hereof at the hands of a learned Phyſition of London, called Mr. *Steuen Bredwell*, with his fruit alſo.

¶ *The Temperature.*

The Arabians and Perſian Phyſitians iudge, that Pepper is hot in the third degree.

But the Indian Phyſitians which for the moſt part are Empericks, hold that Pepper is cold, as almoſt all other ſpice, which are hot indeed: the long Pepper is hot alſo in the third degree, and as we haue ſaid, is thought to be the beſt of all the kindes.

¶ *The Vertues.*

A *Dioſcorides* and others agreeing with him, affirme, that Pepper reſiſteth poiſon, and is good to be put in medicaments for the eies.

All

All Pepper heateth, prouoketh vrine, digeſteth, draweth, diſperſeth, and cleanſeth the dimneſſe B of the ſight as *Dioſcorides* noteth.

† I haue omitted in this chapter *Matthiolus* his counterfeit figure, which was formerly here. ‡

CHAP. 153. *Of baſtard Pepper, called Betle, or Betre.*

Betle, ſiue Betre.
Baſtard Pepper.

¶ *The Deſcription.*

THis plant climeth and rampeth vpon trees, buſhes, or whatſoeuer elſe it meeteth withall, like vnto the Vine, or the blacke Pepper, whereof ſome hold it for a kinde. The leaues are like thoſe of the greater Bindeweed, but ſomewhat longer, of a duſtie colour, with diuers veines or ribs running through the ſame. The fruit groweth among the leaues, very crookedly writhed, in ſhape like the taile of a Lyzard, of the taſte of Pepper, yet very pleaſant to the palate.

¶ *The Place.*

It groweth among the Date trees, and *Areca*, in moſt of the Molucca Iſlands, eſpecially in the marriſh grounds.

¶ *The Time.*

The time anſwereth that of Pepper.

¶ *The Names.*

This hath been taken for the Indian leafe, but not properly: of moſt it is called *Tembul*, and *Tambul*: in Malauar *Betre*: in Decan, Guzarat, and Canam it is called *Pam*: in Molaio, *Siri*.

¶ *The Vſe and Temperature.*

The leaues chewed in the mouth are of a bitter taſte, whereupon (ſaith *Garcias*) they put thereto ſome Areca and with the lime made of oyſter ſhels, whereunto they alſo adde ſome Amber Griece, *Lignum Aloes*, and ſuch like, which they ſtampe together, making it into a paſte, which they role vp into round balls, keepe dry for their vſe, and carry the ſame in their mouthes vntill by little and little it is conſumed; as when we carry ſugar-Candy in our mouthes, or the iuice of Licorice; which is not onely vnto the ſeely Indians meate, but alſo drinke in their tedious trauels, refreſhing their wearied ſpirits; and helping memory: which is eſteemed among the Empericke Phyſitions, to be hot and dry in the ſecond degree. ‡ *Garcias* doth not affirme that the Indians eate it for meate, or in want of drinke, but that they eate it after meate, and that to giue the breath a pleaſant ſent, which they count a great grace, ſo that if an inferiour perſon that hath not chewed Betre, or ſome ſuch thing, come to ſpeak with any great man, he holds his hand before his mouth leſt his breath ſhould offend him. ‡

CHAP. 154. *Of Graines, or Graines of Paradiſe.*

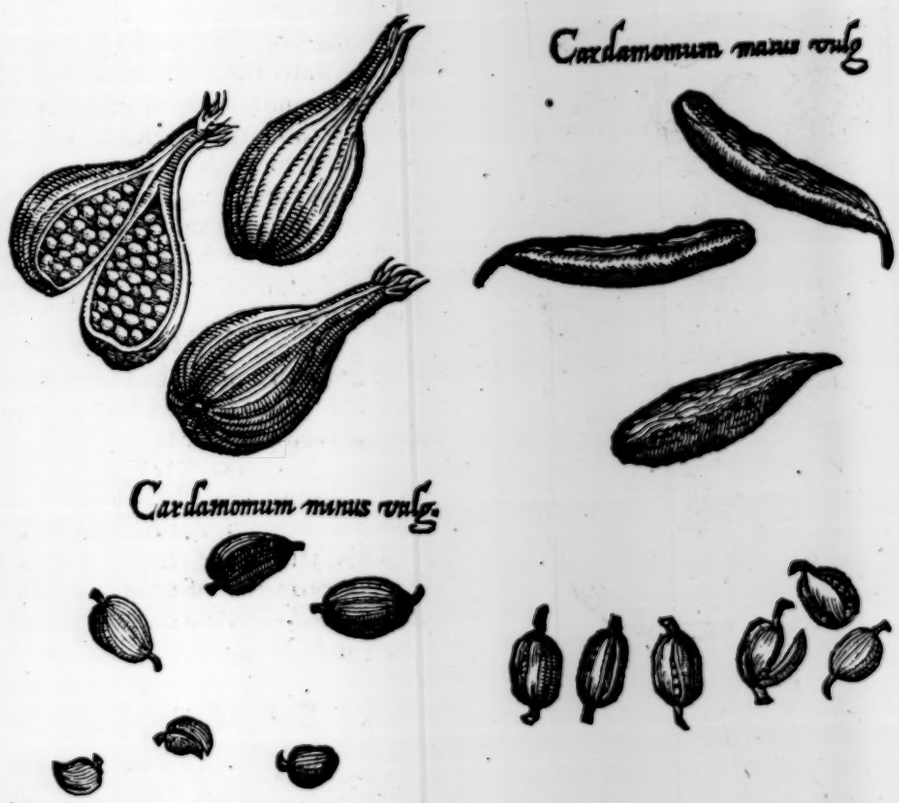
¶ *The Kindes.*

THere be diuers ſorts of Graines, ſome long, others Peare faſhion; ſome greater; and others leſſer.

¶ *The Deſcription.*

† THe firſt figure hereof ſetteth forth vnto your view the cod wherein the hot ſpice lieth, which we call Graines: in ſhops, *Grana Paradiſi:* it groweth, by the report of the Learned, vpon a low herby plant: the leaues are ſome foure inches long, and three broad, with ſomewhat a thicke middle rib, from which run tranſuerſe fibres; they much in ſhape reſemble thoſe of Cloues. The fruit is like a great cod or huske, in ſhape like a Fig when it groweth vpon the tree, but of colour ruſſet, thruſt full of ſmall ſeeds or graines of a darke reddiſh colour (as the Figure ſheweth which is diuided) of an exceeding hot taſte.

Cardamomi genera.
The kindes or ſorts of Graines.



The other ſorts may be diſtinguiſhed by the ſight of the picture, conſidering the onely difference conſiſts in forme.

¶ *The Place.*

Graines grow in Ginny, and the Cardamones in all the Eaſt Indies, from the port of Calecute vnto Cananor; it groweth in Malauar, in Ioa, and in diuers other places.

¶ *The Time.*

They ſpring vp in May, being ſowne of ſeed, and bring their fruit to ripeneſſe in September.

¶ *The Names.*

Graines are called in Greeke, Καρδάμωμον: in Latine, *Cardamomum:* of the Arabians, *Corrumeni*: of diuers Gentiles, *Dore:* of *Auicen*, *Saccolaa quebir* (i.) *magnum:* the other, *Saccolaa ceguer* (i.) *minus.* It is called in Malauar, *Etremelli:* in Zeilan, *Ençal:* in Bengala, Guzarat, and Decan, *Hil*, and *Elychi.* The firſt and largeſt ſort are called of ſome, *Milegueta*, and *Milegetta:* in Engliſh, Grains, and Graines of Paradice.

¶ *The Temperature.*

Auicen writeth, that *Saccolaa*, *Cardamomum*, or *Grana Paradiſi*, are hot and dry in the third degree, with aſtriction.

¶ *The Vertues.*

A The Graines chewed in the mouth draw forth from the head and ſtomacke wateriſh and pituitous humors.

They alſo comfort and warme the weake, cold, and feeble ſtomacke, helpe the ague, and rid the
B ſhaking fits, being drunke with Sacke.

CHAP.

Chap. 155. *Of Yucca or Jucca.*

Yucca, ſiue Iucca Peruana.
The root whereof the bread Caſaua or Cazaua is made.

¶ *The Deſcription.*

THe Plant of whoſe root the Indian bread called Cazaua is made, is a low herbe conſiſting onely of leaues and roots: it hath neither ſtalke, floures, nor fruit, that I can vnderſtand of others, or by experience of the plant it ſelfe, which hath growne in my garden foure yeares together, and yet doth grow and proſper exceedingly; neuertheleſſe without ſtalke, fruit, or floures, as aforeſaid. It hath a very great root, thicke and tuberous, and verie knobby, full of iuice ſomewhat ſweet in taſte, but of a pernicious qualitie, as ſaith my Author: from which root riſeth vp immediately forth of the ground very many leaues ioyned vnto the head of the root in a round circle; the which are long, of the length of a cubit, hollowed like a gutter or trough, verie ſmooth, and of a greene colour, like that of Woade: the edges of the leaues are ſharpe like the edge of a knife, and of a browne colour: the point of the leafe is a prick as ſharp as a needle, which hurteth thoſe that vnaduiſedly paſſe by it: the leafe with aduiſed eye viewed is like vnto a little wherry, or ſuch like boat: they are alſo very tough, hard to break, and not eaſie to cut, except the knife be very ſharpe.

‡ *Lobel* in the ſecond part of his *Aduerſaria* largely deſcribes and figures this plant; and there hee affirmes hee wrot a deſcription (the which he there ſets downe) for our Author; but he did not follow it, and therefore committed theſe errours: Firſt, in that hee ſaith it is the root whereof Cazaua bread was made; when as *Lobel* in his deſcription ſaid he thought it to be *Alia ſpecies à Yucca Indica ex qua panis communis fit.* Secondly, in that he ſet downe the place out of the *Hiſtoria Lugd.* (who tooke it out of *Theuet*) endeauouring by that meanes to confound it with that there mentioned, when as he had his from Mr. *Edwards* his man. And thirdly, (for which indeed he was moſt blame-worthy, and wherein he moſt ſhewed his weakeneſſe) for that hee doth confound it with the *Manihot* or true *Yuicca*, which all affirme to haue a leafe like that of hemp, parted into ſeuen or more diuiſions: and alſo in that he puts it to the *Arachidna* of *Theophraſtus*, when as he denies it both floure and fruit; yet within ſome few yeares after our Author had ſet forth this Worke it floured in his garden.

This ſome yeares puts forth a pretty ſtiffe round ſtalke ſome three cubits high, diuided into diuers vnequall branches carrying many pretty large floures, ſhaped ſomewhat like thoſe of *Fritillaria*, but that they are narrower at their bottomes: the leaues of the floure are ſix: the colour on the inſide white, but on the out ſide of an ouerworne reddiſh colour from the ſtalke to the middeſt of the leafe; ſo that it is a floure of no great beautie, yet to be eſteemed for the raritie. I ſaw it once floure in the garden of Mr. *Wilmot* at Bow, but neuer ſince, though it hath been kept for many yeares in ſundry other gardens, as with Mr. *Parkinſon* and Mr. *Tuggy*. This was firſt written of by our Author; and ſince by *Lobel* and Mr. *Parkinſon*, who keepe the ſame name, as alſo *Bauhine*, who to diſtinguiſh it from the other calls it *Yucca foliis Aloes*. ‡

¶ *The Place.*

This plant groweth in all the tract of the Indies, from the Magellane ſtraights vnto the cape of Florida, and in moſt of the Iſlands of the Canibals, and others adioyning, from whence I had that plant brought me that groweth in my garden, by a ſeruant of a learned and skilfull Apothecary of Exceſter, named Mr. *Tho. Edwards*.

¶ *The Time.*

It keepeth greene both Winter and Sommer in my garden, without any couerture at all, notwithſtanding the iniurie of our cold clymat.

¶ *The Names.*

It is reported vnto me by Trauellers, that the Indians do call it in ſome parts, *Manihot*, but generally *Yucca* and *Iucca*: it is thought to be the plant called of *Theophraſtus*, *Arachidna*; and of *Pliny*, *Aracidna*.

¶ *The Temperature.*

This plant is hot and dry in the firſt degree, which is meant by the feces or droſſe, when the poiſonous iuice is preſſed or ſtrained forth, and is alſo dry in the middle of the ſecond degree.

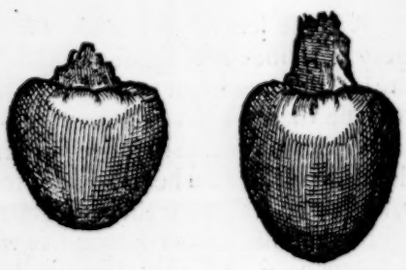
Chap. 156.

Of the fruit Anacardium, and Caious, or Caiocus.

¶ *The Deſcription.*

THe antient writers haue been very briefe in the hiſtorie of *Anacardium*: the Grecians haue touched it by the name of Ανακάρδιον, taking the name from the likeneſſe it hath of an heart both in ſhape and colour; called of the Portugals that inhabit the Eaſt Indies, *Faua de Malaqua*, the bean of Malaca; for being greene, and as it hangeth on the tree, it reſembleth a Beane, ſauing that it is much bigger: but when they be dry they are of a ſhining blackiſh colour, containing between the outward rinde and the kernell (which is like an Almond) a certaine oile of a ſharpe cauſticke or burning qualitie, called *Mel Acardinum*, although the kernell is vſed in meates and ſauces, as we do Oliues and ſuch like, to procure appetite.

Anacardium.
The Beane of Malaca.



Caious.
The kidney Beane of Malaca.

The other fruit groweth vpon a tree of the bigneſſe of a Peare tree: the leaues are much like to thoſe of the Oliue tree, but thicker and fatter, of a feint greene colour: the floures are white, conſiſting of many ſmall leaues much like the floures of the Cherry tree, but much doubled, without ſmell: after commeth the fruit (according to *Cluſius*, of the forme and magnitude of a gooſe egge, full of iuice; in the end whereof is a nut) in ſhape like an Hares kidney, hauing two rindes, betweenwhich is contained a moſt hot and ſharp oile like that of *Anacardium*, whereof it is a kind.

The Beane or kernell it ſelfe is no leſſe pleaſant and wholſome in eating, than the *Piſtacia*, or Fiſticke nut, whereof the Indians do eate with great delight, affirming that it prouoketh Venerie, wherein is their chiefeſt felicitie. The fruit is contained in long cods like thoſe of Beans, but greater: neere vnto which cods commeth forth an excreſcence like vnto an apple, very yellow, of a good ſmell, ſpongious within, and full of iuice, without any ſeeds, ſtones, or graines at all, ſomewhat ſweet in taſte, at the one end narrower than the other, Peare faſhion, or like a little bottle, which hath bin reputed of ſome for the fruit, but not rightly; for it is rather an excreſcence, as is the oke Apple.

¶ *The Place.*

The firſt growes in moſt parts of the Eaſt Indies, eſpecially in Cananor, Calecute, Cambaya, and Decan. The later in Braſile.

¶ *The*

¶ *The Time.*

Theſe trees floure and flouriſh Winter and Sommer.

¶ *The Names.*

Their names haue been touched in their deſcriptions. The firſt is called *Anacardium*, of the likeneſſe it hath with an heart: of the Arabians, *Balador*: of the Indians, *Bibo*.

The ſecond is called *Caious*, and is thus written, *Caiöüs*, and *Caius*: of ſome, *Caiocus*.

¶ *The Temperature and Vertues.*

The oile of the fruit is hot and dry in the fourth degree, it hath alſo a cauſticke or corroſiue qualitie: it taketh away warts, breaketh apoſtumes, preuaileth againſt leprie, *alopecia*, and eaſeth the paine of the teeth, being put into the hollowneſſe thereof. A

The people of Malauar do vſe the ſaid oile mingled with chalke, to marke their cloathes or any other thing they deſire to be coloured or marked, as we do vſe chalke, okar, and red marking ſtones, but their colour will not be taken forth againe by any maaner of art whatſoeuer. B

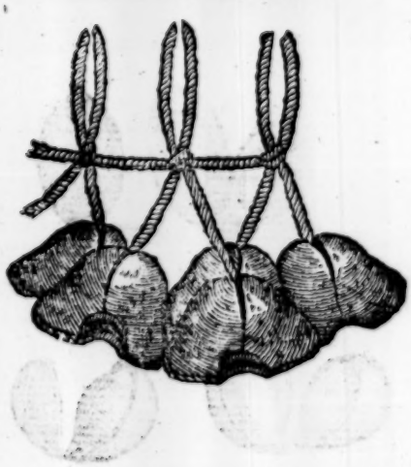
They alſo giue the kernell ſteeped in whay to them that be aſthmaticke or ſhort winded; and when the fruit is yet green they ſticke the ſame ſo ſteeped againſt the wormes. C

The Indians for their pleaſure will giue the fruit vpon a thorne or ſome other ſharpe thing, and hold it in the flame of a candle, or any other flame, which there will burne with ſuch crackings, lightnings, and withall yeeld ſo many ſtrange colours, that it is great pleaſure to the beholders which haue not ſeene the like before. D

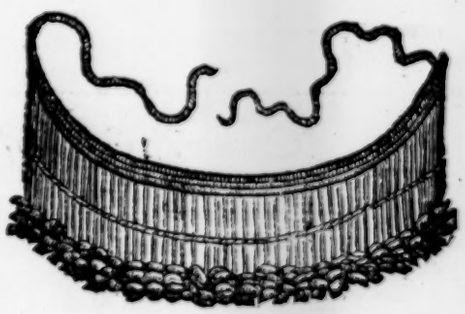
Chap. 157.

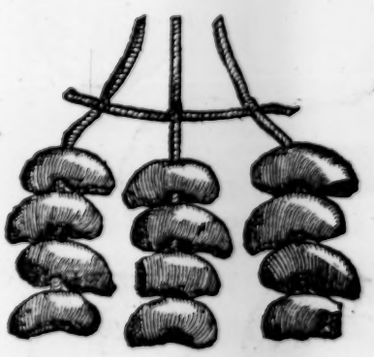
Of Indian Morrice Bells, and diuers other Indian Fruits.

† 1 *Ahouay Theueti.*
Indian Morrice Bels.



† 2 *Fructus Higuero.*
Indian Moroco bels.





¶ *The Deſcription.*

THis fruit groweth vpon a great tree of the bigneſſe of a Peare tree, full of branches, garniſhed with many leaues which are alwaies greene, three or foure fingers long, and in bredth two: when the branches are cut off there iſſueth a milky iuice not inferiour to the fruit in his venomous

qualitie. The trunke or body is couered with a grayiſh barke: the timber is white and ſoft, not fit to make fire of, much leſſe for any other vſe; for being cut and put to the fire to burne, it yeeldeth forth ſuch a loathſome and horrible ſtinke, that neither man nor beaſt are able to endure it: wherefore the Indians haue no vſe thereof, but onely of the fruit, which in ſhape is like the Greeke letter θ, of the bigneſſe of a Cheſtnut, and couered with a moſt hard ſhell, wherein is contained a kernel of a moſt venomous and poyſonſome qualitie, wherewith the men being angry with their wiues, do poyſon them, and likewiſe the women their husbands: they likewiſe vſe to dip or anoint and invenome their arrowes therewith, the more ſpeedily to diſpatch their enemies. Which kernell they take forth with ſome conuenient inſtrument, leauing the ſhell as whole as may be, not touching the kernell with their hands becauſe of its venomous qualitie, which would ſpoile their hands, and ſometimes take away their life alſo. In which ſhells they put ſome little ſtones, and tye them vpon ſtrings (as you may perceiue by the figure) which they dry in the Sunne, and after tye them about their legs, as we do bells, to ſet forth their dances, and Moroſco Matachina's, wherein they take great pleaſure, by reaſon they thinke themſelues to excell in thoſe kindes of dances. Which ratling ſound doth much delight them, becauſe it ſetteth forth the diſtinction of ſounds, for they tune them and mix them with great ones and little ones, in ſuch ſort as we doe chimes or bells.

2 There is alſo another ſort hereof, differing onely in forme; they are of the like venomous qualitie, and vſed for the ſame purpoſe. ‡ The fruit of *Higuerro* is like that of a gourd in pulpe, and it may be eaten: the ſhape of the fruit is round, whereas the former is three cornered. ‡

¶ *The Place.*

Theſe do grow in moſt parts of the Weſt Indies, eſpecially in ſome of the Iſlands of the Canibals, who vſe them in their dances more than any of the other Indians. ‡ You may ſee theſe vpon ſtrings as they are here figured, amongſt many other varieties, with M^r. *Iohn Tradeſcant* at South Lambeth. ‡

¶ *The Time.*

We haue no certaine knowledge of the time of flouring or bringing the fruit to maturitie.

¶ *The Names and Vſe.*

We haue ſufficiently ſpoken of the names and vſe hereof, therefore what hath beene ſaid may ſuffice.

† The figures were tranſpoſed.

Chap. 158. *Of the vomiting and purging Nuts.*

1 *Nuces vomicæ.*
Vomiting Nuts.

1 *Nuces purgantes.*
Purging Nuts.

¶ *The*

¶ *The Deſcription.*

1 *Auicen* and *Serapio* make *Nux vomica*, and *Nux Methel*, to be one, whereabout there hath been much cauelling; yet the caſe is plaine, if the text be true, that the Thorne Apple is *Nux Methel*. Of the tree that beareth the fruit that is called in ſhops *Nux vomica*, and *Nux Methel*, we haue no certaine knowledge: ſome are of opinion, that the fruit is the roote of an herbe, and not the nut of a tree: and therefore ſince the caſe among the learned reſteth doubtfull, we leaue the reſt that might be ſaid to a further conſideration. The fruit is round, flat, like a little cake, of a ruſſet ouerworne colour, fat and firme, in taſte ſweet, and of ſuch an oily ſubſtance, that it is not poſſible to ſtampe it in a mortar to powder; but when it is to be vſed, it muſt be grated or ſcraped with ſome inſtrument for that purpoſe.

2 There be certaine Nuts brought from the Indies, called purging Nuts, of their qualitie in purging groſſe and filthie humors, for want of good inſtruction from thoſe that haue trauelled the Indies, we can write nothing of the tree it ſelfe: the Nut is ſomewhat long, ouall, or in ſhape like an egge, of a browne colour: within the ſhell is contained a kernell, in taſte ſweet, and of a purging faculties.

¶ *The Place and Time.*

Theſe Nuts do grow in the deſarts of Arabia, and in ſome places of the Eaſt Indies: we haue no certaine knowledge of their ſpringing, or time of maturitie.

¶ *The Names.*

Auicen affirmeth the vomiting Nut to be of a poiſonous qualitie, cold in the fourth degree, hauing a ſtupifying nature, and bringeth deadly ſleepe.

¶ *The Vertues.*

Of the Phyſicall vertues of the vomitting Nuts we thinke it not neceſſarie to write, becauſe the danger is great, and not to be giuen inwardly, but mixed with other compoſitions, and that very curiouſly by the hands of a faithfull Apothecarie. A

The pouder of the Nut mixed with ſome fleſh, and caſt vnto crowes and other rauenous fowles, doth kill and ſo dull their ſences at the leaſt, that you may take them with your hands. B

They make alſo an excellent fallet, mixed with ſome meat or butter, and laied in the garden where cats vſe to ſcrape to burie their excrements, ſpoyling both the herbes and alſo ſeeds new ſowne. C

Chap. 159. *Of diuers ſorts of Indian fruits.*

¶ *The Kindes.*

THeſe fruits are of diuers ſorts and kinds, wherof we haue little knowledge, more than the fruits themſelues, with the names of ſome of them: therefore it ſhall ſuffice to ſet forth vnto your view the forme onely, leauing vnto Time, and thoſe that ſhall ſucceed, to write of them at large, which in time may know that, that in this time of infancie is vnknowne.

‡ OVr Authour formerly in this Chapter ſet forth diuers figures of Indian fruits, and amongſt the reſt *Beritinus*, *Cacao*, *Cocci Orientales*, *Buna*, *Fegaras*, *Cububæ*, &c. but he gaue but onely three deſcriptions, and theſe either falſe or to no purpoſe; wherefore I haue omitted them, and in this chapter giuen you moſt of theſe fruits which were formerly figured therein, together with an addition of ſundry other out of *Cluſius* his Exotickes, whoſe figures I haue made vſe of, and here giuen you all thoſe which came to my hands, though nothing ſo many as are ſet forth in his Exotickes; neither, if I ſhould haue had the figures, would the ſhortneſſe of my time nor bigneſſe of the booke (being already growne to ſo large a volume) ſuffer mee to haue inſerted them; therefore take in good part thoſe I here giue, together with the briefe hiſtories of them.

¶ *The Deſcription.*

1 THe firſt and one of the beſt knowne of theſe fruits, are the *Cubibæ*, called of the Arabian Phyſitions *Cubibe* and *Quabeb*; but of the vulgar, *Quabebochini*: in Iaoa where they plentifully grow, *Cumuc*: the other Indians, (the Malayans excepted) call them *Cubas ſini*, not for that they grow in China, but becauſe the Chinois vſe to buy them in Iaoa and Sunda, and ſo carry them to the other ports of India. The plant which carries this fruit hath leaues like

1 *Cubibæ.* Cubibs.
2 *Cocci Orientales. Cocculus Indi.*

Cubibe

Cocci.

3 *Fagara.*

4 *Mungo.*

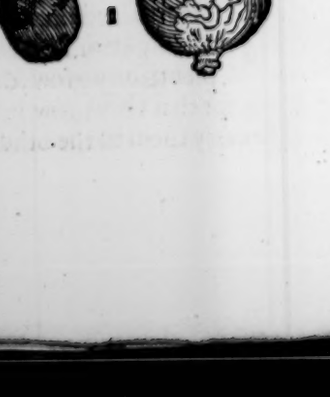
5 *Buna.*

‡ 6 *Amomum verum.*

‡ 7 *Amomum ſpurium.*

‡ 8 *Ymomis.*

9 *Beritinus.*



‡ 10 *Nuces inſanæ.* Mad Nuts.

like thoſe of pepper,but narrower, and it alſo windes about trees like as Iuy or Pepper doth: the fruit hangs in cluſters,like as thoſe we call red Currans, and not cloſe thruſt together in bunches, as grapes: the fruit or berries are of the bigneſſe of Pepper cornes,wrinckled,and of a browniſh colour: they are of a hot and biting aromaticke taſte, and oft times hollow within, but if theybe not hollow,then haue they a pretty reddiſh ſmooth round ſeed vnder their rough vtter huske; each of theſe berries commonly hath a piece of his foot-ſtalke adhering to it. It is reported that the Natiues where it growes firſt gently boile or ſcald theſe berries before they ſell them, that ſo none els may haue them,by ſowing the ſeeds. Some haue thought theſe to haue beene the *Carpeſium* of the Antients; and other-ſome haue iudged them the ſeeds of *Agnus Caſtus*, but both theſe opinions are erronious.

Theſe are hot and dry in the beginning of the third degree; wherefore they are good againſt the A
cold and moiſt affects of the ſtomacke and flatulencies: they helpe to clenſe the breaſt of tough and thicke humours; they are good for the ſpleene, for hoarſneſſe and cold affects of the wombe, chewed with Maſticke,they draw much flegmaticke matter from the head, they heat and comfort the braine. The Indians vſe them macerated in wine to excite venerie.

2 The Plant which carries this fruit is vnknowne, but the berrie is well knowne in ſhoppes by the name of *Cocculus Indicus* ſome call them *Cocci Orientales*: others,*Coccula Orientales*: ſome,as *Cordus* for one, thinke them the fruit of *Solanum furioſum*: others iudge them the fruit of a Tithymale, or of a *Clematis*. Theſe berries are of the bigneſſe of Bay berries,commonly round,and growing but one vpon a ſtalke; yet ſometimes they are a little cornered,and grow two or three cluſtering together: their outer coat or ſhell is hard,rough,and of a browniſh duskie colour: their inner ſubſtance is very oily,of a bitter taſte.

They are vſed with good ſucceſſe to kill lice in childrens heads, being made into pouder and ſo B
ſtrowed amongſt the haire. They haue alſo another faculty which our Author formerly ſet downe in the chapter of *Alaternus* (where he confounded theſe with *Fagaras*) in theſe words,which I haue there omitted,to inſert here;

In England we vſe the fruit called *Cocculus Indi* in pouder mixed with flower,hony,and crummes C
of bread to catch fiſh with,it being a numming,ſoporiferous,or ſleeping medicine, cauſeth the fiſh to turne vp their bellies, as being ſenceleſſe for a time.

3 *Fagara* is a fruit of the bigneſſe of a Chich-peaſe,couered with a thin coat of a blackiſh aſh colour,vnder which outer coat is a ſlender ſhell containing a ſollid kernell, involued in a thin and blacke filme. The whole fruit both in magnitude,forme, and colour is ſo like the *Cocculus Indus* laſt deſcribed,that at the firſt ſight one would take it to be the ſame. *Auicen* mentions this in his 266. Chap. after this manner. What is *Fagara?* It is a fruit like a Chich,hauing the ſeed of *Mahalb*,and in the hollowneſſe is a blacke kernell as in *Schehedenegi*,and it is brought out of Sofale.

He places it amongſt thoſe that heate and dry in the third degree, and commends it againſt the coldneſſe of the ſtomacke and liuer,it helps concoction,and bindes the belly.

4 This which *Cluſius* thinkes to be *Mungo* (which is vſed in the Eaſt Indies about Guzarat and Decan for prouender for horſes) is a ſmall fruit of the bigneſſe of Pepper,creſted, very like Coriander ſeed,but that it is bigger and blacke,it is of a hot taſte.

5 *Buna* is a fruit of the bigneſſe of *Fagara*,or ſomewhat bigger or longer, of a blackiſh aſh colour,couered with a thin skin,furrowed on both ſides longwiſe, whereby it is eaſily diuided into two parts,which containe each a kernell longiſh and flat vpon one ſide,of a yellowiſh colour, and acide taſte. They ſay that in Alexandria they make a certaine very cooling drinke hereof. *Rauwolfius* in his iournal ſeemes to deſcribe this fruit by the name of *Bumus*: and by the appellation, forme, and faculties; he thinkes it may be the *Buncho* of *Auicen*, and *Buncha* of *Rhaſis*, to *Almanſor*. *Cluſius*.

6 This is a kind of Cardamome: and by diuers it is thought to be the true *Amomum* of the Antients,and to this purpoſe *Nicholas Marogna*,a Phyſition of Verona, hath written a treatiſe which is ſet forth at the later end of *Pona's* deſcription of Mount *Baldus*,to which I refer the curious: theſe cods or berries (whether you pleaſe to call them) grow thicke cluſtering together, they are round, and commonly of the bigneſſe of a cherry: the outer skin is tough,ſmoother, whiter, and leſſe creſted than that of the Cardamome: within this filme lye the ſeeds cluſtering together, yet with a thin filme parted into three,the particular ſeeds are cornered, ſomewhat ſmoother and larger than thoſe of Cardamomes,but of the ſame aromaticke taſte,and of a browne colour. Their temperature and faculties may be referred to thoſe of Cardamomes.

7. 8. This with the next enſuing are by *Cluſius* ſet forth by the names I here giue you them, though (as he ſaith) neither of them agree with the *Amomum* of *Dioſcorides*, they were only branches ſet thicke with leaues,hauing neither any obſeruable ſmell or taſte: they were ſent to the learned and diligent Apothecarie *Walarandus Donrez* of Lyons,from Ormuz the famous Mart & port town in the Perſian Bay.

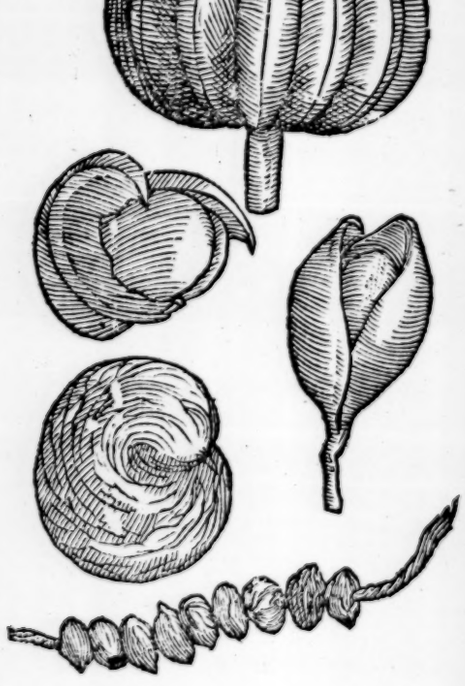
9 Thoſe that accompanied the renowned Sir *Francis Drake* in his voyage about the World,

light

11 *Cacao.* Small Cocoes.

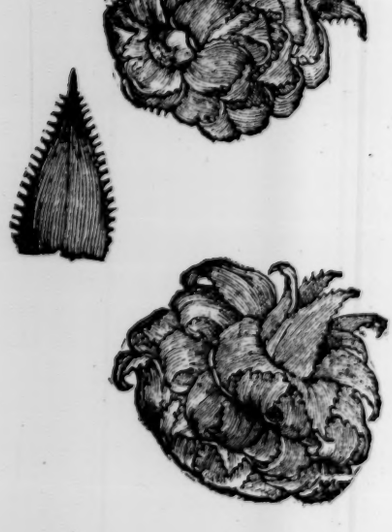
12 *Cucciphora.* Quince Dates.

‡ 13 *Barnce. Arara. Orukoria. Cropiot.*



‡ 14 *Guanobanus.* Tree Melon.

‡ 15 *Ananas:* The Pinia, or Pine Thiſtle.



light vpon a certaine desert Island, wherein grew many very tall trees, and looking for something amongst these to refresh themselues, amongst others they obserued some bigger than Okes, hauing leaues like those of the Bay tree, thicke and shining, not snipt about the edges; their fruit was longish like to the small Acornes of the Ilex or Holme Oke, but without any cup; yet couered with a thin shell of an ash colour, and somtimes blacke, hauing within it a longish white kernell wrapped in a thin peeling, being without any manifest taste; They when they found it, though much oppressed with hunger, yet durst not taste thereof, least it should haue been poisonous: but afterwards comming to the Island Beretina, not far from this, they found it to abound with these trees, & learned that their fruit was not poisonous, but might be eaten. Wherupon afterwards they in want of other victuals, boiled some as they do Peaſe, and ground others into floure, wherewith they made puddings. They found this tree also in the Moluccoes.

10 The first expressed in this table is the mad Plum, or as *Clusius* had rather terme it the Mad Nut; for he calls them Κερυα μανικα, or *Insanæ Nuces*. The Hollanders finding them in their return from the East Indies, and eating the kernels, were for a time distracted, and that variously, according to the particular temperature of each that ate of them; as you may see in *Clusius Exot. lib.* 2. *Cap.* 26. This was round, little more than two inches about, with a shell not thicke, but sufficiently strong, browniſh on the out side, and not smooth, but on the inside of a yellowish colour and smooth, containing a membranous stone or kernell couered with a black pulp, in form and bigneſse not much vnlike a Bullas or Sloe, hauing a large white spot on the lower part whereas it was fastened to the stalke: vnder the pulpe lay the kernell, somewhat hard, and of an ash colour: the foot-stalke was short and commonly carried but one fruit, yet sometimes they obserued two growing together: the tree wheron this fruit grew was of the bigneſse of a Cherry tree, hauing long and narrow leaues like those of the Peach tree: the other fruit figured in the 2. place was of a browniſh yellow colour, somwhat bigger, but not vnlike a small Nut, and inch long, and somwhat more about, smaller below, and bigger aboue, and as it were parted into foure, being very hard and sollid. Of this see more in the fourteenth place.

11 The *Cacoa* is a fruit well knowne in diuers parts of America, for they in some places vse it in stead of money, and to make a drinke, of which, though bitter, they highly esteeme: the trees which beare them are but small, hauing long and narrow leaues, and will onely grow well in places shadowed from the Sun. The fruit is like an Almond taken out of his husk, and it is couered with a thin blacke skin, wherein is contained a kernell obliquely diuided into two or three parts, browniſh, and distinguished with ash coloured veines, of an astringent and vngratefull taste.

12 This which *Clusius* had from *Cortusus*, for the fruit of *Bdellium*, is thought to be the *Cuci* of *Pliny*, and is the *Cuciophera* of *Matthiolus*, and by that name our Author had it in this Chapter. The whole fruit is of the bigneſse of a Quince, and of the same colour, with a sweet and fibrous fleſh, vnder which is a nut of the bigneſse of a large Walnut or somewhat more, almost of a triangular form, bigger below, and smaller aboue, well smelling, of a darke ash colour, with a very hard shell, which broken there is therein contained a hard kernell of the colour and hardneſse of marble, hauing a hollowneſse in the middle, as much as may containe a Hasell Nut.

13 In this table are foure seuerall fruits described by *Clusius Exot. lib.* 2. *c.* 21. The first is called *Baruce*, and is said to grow vpon a high tree in Guyana called Hura: it consisted of many Nuts of some inch long, strongly fastened or knit together, each hauing a hard wooddy shell, falling into two parts, containing a round and smooth kernell couered with an ash coloured filme.

They say the natiues there vse this fruit to purge and vomite. A

The second called Arara growes in Kaiana, but how, it is not knowne: it was some inch long, couered with a skin sufficiently hard and blacke, fastened to a long and rugged stalke that seemed to haue carried more than one fruit: the kernell is blacke, and of the bigneſse of a wilde Oliue.

The natiues vse the decoction hereof to wash maligne vlcers, and they say the kernell will looſe B the belly.

The third named *Orukoria* is the fruit of a tree in Wiapock, called *Iuruwa*, they vse this to cure their wounds, dropping the iuice of the fruit into them. This fruit is flat almost an inch broad, and two long, but writhen like the cod of the true *Cytisus*, but much bigger, very wrinckled, of an ash colour, containing a smooth seed.

The fourth called *Cropiot* is a small and shriuelled fruit, not much vnlike the particular ioints of the Æthiopian pepper.

The sauages vse to take it mixed amongst their Tabaco to asswage head-ache: there were diuers C of them put vpon a string (as you may see in the figure) the better to dry them.

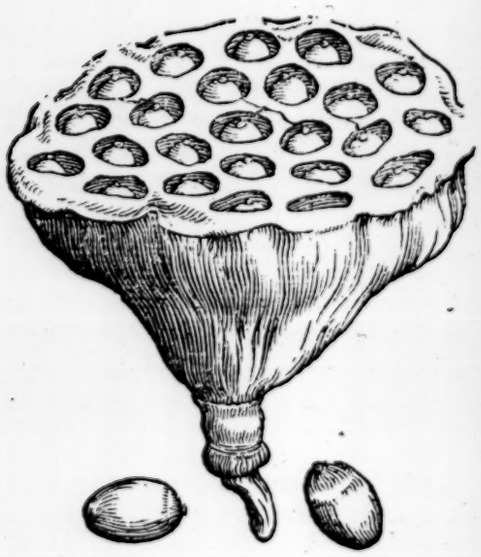
14 This which by *Clusius* & *Lobel* is thought to be the *Guanabanus* mentioned by *Scaliger Exerc.* 281. *part.* 6. is a thicke fruit some foot and halfe long, couered with a thicke and hard rinde, freezed ouer with a soft downineſse, like as a Quince is, but of a greenish colour, with some veines, or rather furrowes running along it, as in Melons: the lower end is somewhat sharp: at the vpper end it is

fastened

faſtened to the boughes, with a firme, hard, and fibrous ſtalke: this fruit containes a whitiſh pulpe, which the Ethiopians vſe in burning feuers to quench the thirſt, for it hath a pleaſant tartneſſe: this dried becomes friable, ſo that it may be brought into pouder with ones fingers, yet retaineth its aciditie: in this pulp lye ſeeds like little Kidneis, or the ſeeds of the true *Anagyris*, of a black ſhining colour, with ſome fibres comming out of their middles: theſe ſowne brought forth a plant hauing leaues like the Bay tree, but it dyed at the approch of Winter. *Cluſ.*

15 *Ananas Pinias*, or Pine Thiſtle is a plant hauing leaues like the *Aizoon aquaticum*, or water

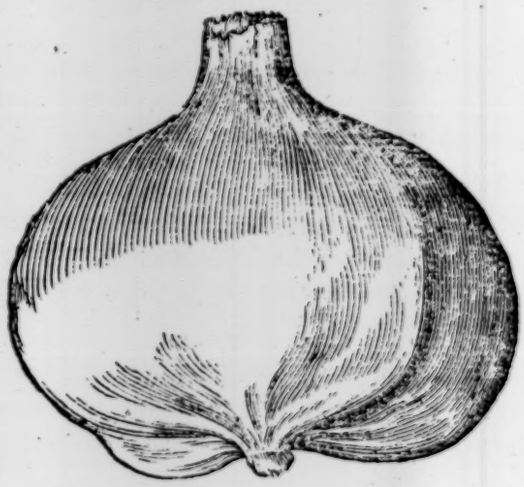
‡ 16 *Faba Ægyptia affinis.*



‡ 17 *Coxco Cypote. Amygdala Peruana:* Almonds of Peru.

‡ 18 *Buenas Noches.*

‡ 19 *Fructus tetragonus.* The ſquare Coco.



‡ 20 *Arboris lanifera ſiliqua.* A cod of the wooll-bearing tree.

Sengreene,

Sengreene, somewhat sharpe and prickly about the edges: the stalke is round, carrying at the top thereof one fruit of a yellowish colour when it is ripe, of the bignes of a Melon, couered with a scale-like rinde: the smell is gratefull, somewhat like that of the Malocotone: at the top of the fruit, and sometimes below it come forth such buds as you see here presented in the figure, which they set in the ground and preserue the kind by in stead of seed: the meat of this fruit is sweet & very pleasant of taste, & yeelds good nourishment; there are certaine small fibres in the meat thereof, which though they do not offend the mouth, yet hurt they the gums of such as too frequently feed thereon.

16 The forme of this is somewhat strange, for it is like a large Poppy head cut off nigh the top: the substance thereof was membranous and wrinckled, of a brownish colour, very smooth: the circumference at the top is about nine inches, and so it growes smaller and smaller euen to the stalke, which seems to haue carried a floure whereto this fruit succeeded: the top of the fruit was euen, and in it were orderly placed 24. cauities, in each whereof was contained a little Nut like an Acorn almost an inch long, and as much thick; the vpper part was of a browniſh colour, & the kernel within was rank and all mouldy. *Clusius* could learne neither whence this came, nor how it grew, but with a great deale of probability thinks it may be that which the Antients described by the name of *Faba Ægyptia*.

17 The former of these two *Clusius* receiued by the name of *Coxco Cypote*, that is the Nut Cypote: It is of a dusky browne colour, smooth, and shining, but on the lower part of an ash colour, rough, which the Painter did not well expresse in drawing the figure. The 2. hee receiued by the name of *Almendras del Peru*, (i.) Almonds of Peru: the shell was like in colour and substance to that of an almond, and the kernell not vnlike neither in substance nor taste: yet the forme of the shell was different, for it was triangular, with a backe standing vp, and two sharp sides, and these very rough.

18 This was the fruit of a large kind of *Conuolvulus* which the Spaniards called *Buenas noches*, or Goodnight, because the floures vse to fade as soone as night came. The seeds were of a sooty colour as big as large Peaſe, being three of them contained in a skinny three cornered head. You may see more hereof in *Clusius*, *Exot. lib. 2. cap.* 18.

19 This is the figure of a square fruit which *Clusius* coniectures to haue been some kind of Indian Nut or Coco: it was couered with a smooth rinde, was seuen inches long, and a foot and halfe about, being foure inches and a halfe from square to square.

20 About Bantam in the East Indies growes a tall tree sending forth many branches, which are set thicke with leaues long and narrow, bigger than those of Rosemary: it carries cods six inches long, and fiue about, couered with a thin skin, wrinckled and sharp pointed, which open themselues from below into fiue parts, and are full of a soft woolly or Cottony matter, wherewith they stuffe cushions, pillowes and the like, and also spin some for certaine vses: amongst the downe lye blacke seeds like those of Cotton, but lesse, and not fastened to the downe.

21 This which *Clus.* calls *Palma Saccifera*, or the Bag Date, because it carries the figure of an Hippocras bag, was found in a desart Island in the Antlantick ocean, by certaine Dutch mariners who obserued whole woods thereof: these bags were some of them 22. or more inches long, and some seuen inches broad in the broadest place, strongly woue with threds crossing one another, of a browniſh yellow colour. These sachels (as they report who cut them from the tree) were filled with fruit of the bignesse of a Walnut huske and all: within these were others, as round as if they had bin torned, and so hard that you could scarce breake them with a hammer: in the midst of these were white kernels, tasting at the first somewhat like pulse, but afterwards bitter like a Lupine.

22. The tree which carries this rough cod is very large, as I haue been told by diuers: some who saw it in Persia, & others that obserued it in Mauritius Island. *Clusius* also notes that they haue bin brought from diuers places: the cod is some three inches long, and some two inches broad, of a duskie red colour, and all rough and prickly: in these cods are contained one, two or more round nuts or seeds of a grayish ash colour, hauing a little spot on one side, where they are fastened to the cod they are exceeding hard, and difficult to breake, but broken they shew a white kernel very bitter and vnpleasant of taste. I haue seen very many and haue some of these, and some haue offered to sel them for East Indian *Beazor*, whereto they haue some small resemblance, though nothing in facultie like them (if I may credit report, which I had rather do than make tryall) for I haue been told by some that they are poisonous; and by others, that they strongly procure vomit.

23. The long cod expressed in this figure is called in the East Indies (as *Clusius* was told) *Kaye baka*, it was round, the thickneſſe of ones little finger, and six inches long: the rinde was thick, black, hard and wrinckled, and it contained a hard pulpe of a sowrish taste, which they affirm was eatable.

The other was a cod of some inch and halfe long, and some inch broad, membranous, rough, and of a browniſh colour, sharp pointed, and opening into two parts, and distinguished with a thin film into foure cels, wherein were contained scarlet Peare fashioned little berries, hauing golden spots especially in the middles. This growes in Brasile, and as *Clusius* was informed was called *Daburi*.

24 In the second place of the tenth figure and description in this chapter you may finde the

‡ 21 *Palma ſaccifera.*
The Sachell Date.

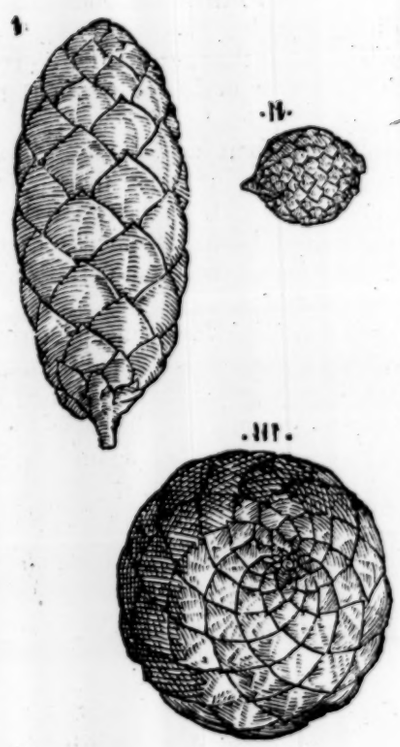
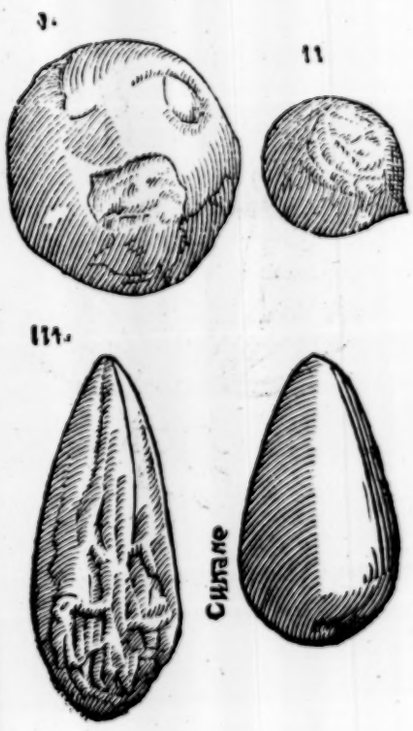
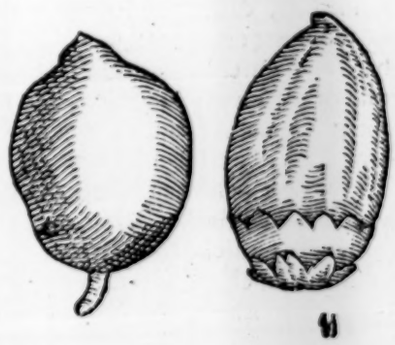
Scalie fruits.



‡ 26 *Fructus alij Exotici.*
Other ſtrange fruits.



‡ 26 *Fructus alij Exotici.*
Other ſtrange fruits.



ſingle Nut here figured, deſcribed, & ſet forth; but this figure better expreſſes the manner of growing therof: for firſt it preſents to the view the nuts in their outer husks growing cloſe together, then the ſingle nuts in and out of their husks, and laſtly their kernell: the ſhell of this nut containes in it a certaine oilie ſubſtance, ſomwhat reſembling the oile of ſweet almonds: the tree whereof this nut is the fruit growes in Ginny, and is much vſed by the people there, for they preſſe a liquour forth of the leaues, or elſe boile them in water, & this ſerues them in ſtead of wine & beare, or at leaſt for a common drink, of the fruit they make bread of a very ſweet and pleaſant taſte.

25 Theſe ſcaily fruits are ſet forth by *Cluſius, Exot. l. 2 c. 3.* The firſt was three inches long and two inches about, and had in it a longiſh hard ſollid kernell, with many veines diſperſed ouer it, and ſuch kernels are ſomtimes poliſhed, whereby they become white, and then their blacke veines make a fine ſhew, which hath giuen occaſion to ſom e impoſtors to put them to ſaile for rare and precious ſtones.

The ſecond was ſmall, round and ſcaily, and the ſcailes turned their points downwards towards the ſtalke.

The third was alſo ſcaily, of the bigneſſe of a Walnut in his huske, with the ſcailes very orderly placed, and of a browniſh colour: it had a kernel which ratled in it when it was ſhaken.

26 The firſt of the two in the former table was brought from Ginny, it was of the bigneſſe and ſhape of a plum, two inches long, and one and halfe broad, of a thicke fungous ſubſtance, ſomewhat wrinckled, and blackiſh on the outſide, and within containing a certaine whitiſh inſiped friable pulpe, wherein lay a few ſmall ſeeds.

The ſecond was ſome inch and halfe long, an inch thicke, couered with an aſh coloured skin, compoſed within of many fibres almoſt like the huske of the Nut Faufell, at the lower end it ſtood in a double cup, and it was ſharp pointed

at the vpper end: in this skin was contained a kernell, or rather nut, blacke, hard, and very wrinckled not much vnlike to that of Faſell, whereto I refer it as a kinde thereof. Theſe two are treated of by *Cluſius*, *Exot. lib. 2. c. 23.*

The firſt of the ſecond table (wherein are contained foure figures) was of a round forme, yet a little flat on one ſide, diſtinguiſhed vnder the blacke and ſhining coat wherewith it was couered, with furrowes running euery way, not vnlike to the Nut Faſell taken forth of his couer: the inner pulpe was hard and whitiſh, firſt of a ſalt, and then of an aſtringent taſte.

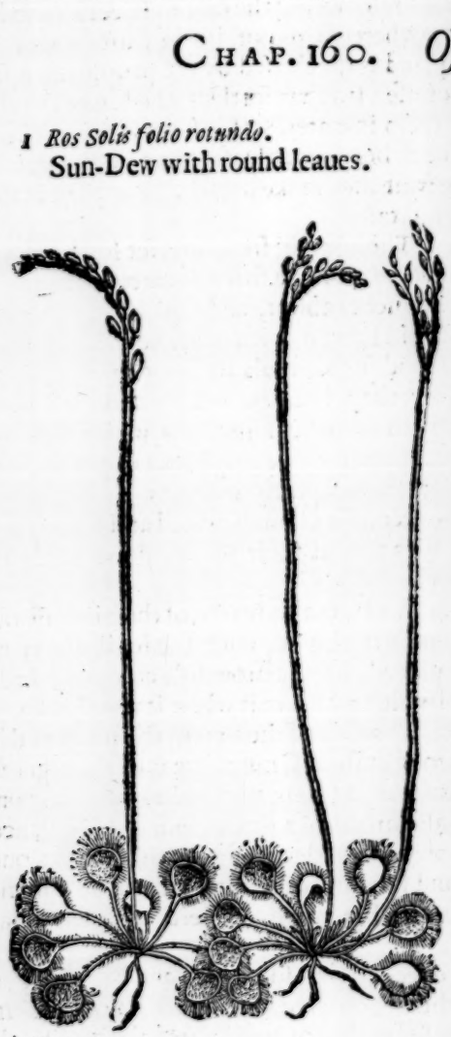
The ſecond of theſe was an inch long, but rather the kernell of a fruit, than a fruit it ſelfe; it was round except at the one end, and all ouer knobby (though the picture expreſſe not ſo much) there was alſo ſome ſhew of a triangular forme at each end.

The third was two inches and a halfe long, and in the broadeſt part ſome inch and more broad: it was ſomewhat crooked, the backe high and riſing, the top narrow, and the lower part ſharp pointed, of an aſh colour, with thicke and eminent nerues running along ſt the back from the top to the lower part, expreſt with ſuch art, as if they had been done by ſome curious hand: it ſeemed to haue bin couered ouer with another rinde, but it was worne off by the beating of the waues of the ſea vpon the ſhore.

The fruit *Cunane* figured in the fourth place of this table, was two inches long, and an inch broad at the head, and ſo ſmaller by little & little, with a back ſtanding out, ſmooth, black, and ſhining, hauing three holes at the top, one aboue, & two below: they ſaid it grew vpon a ſmal tree called Morremor, and was yet vnripe, but when it was ripe it would be as big again, and that the natiues where it grew (which was as I take it about Wiapock) roſt it vpon the coles, and eate it againſt the headache. *Cluſius* ſets forth theſe foure in his *Exot. l. 2. c. 22.* he deſcribes *Cunane cap. 21.* ‡

Chap. 160. *Of Sun-Dew, Youth woort, Ros Solis.*

1 *Ros Solis folio rotundo.*
Sun-Dew with round leaues.



2 *Ros Solis folio oblongo.*
Sun-Dew with longiſh leaues.

¶ *The*

¶ *The Deſcription.*

1 SVn-Dew is a little herb, and groweth very low, it hath a few leaues ſtanding vpon ſlender ſtems, very ſmall, ſomething round, a little hollow, and like an eare picker, hairy and reddiſh as be alſo the ſtems, hauing dew and moiſture vpon them at the drieſt time of the yeare, and when the Sun ſhineth hotteſt euen at high noone; and a moneth after there ſpring vp little ſtalks, a hand breadth high, on which ſtand ſmall whitiſh floures: the roots are very ſlender, and like vnto haires.

2 The ſecond kinde is like vnto the former, in ſtalks and floures, but larger, and the leaues are longer, and not ſo round, wherein conſiſteth the difference.

¶ *The Place.*

They grow in deſart, ſandie and ſunny places, but yet waterie, and ſeldome other-where than among the white mariſh moſſe which groweth on the ground and alſo vpon bogs.

¶ *The Time.*

Sun-Dew flouriſheth in Sommer, it floureth in May or Iune: it is to be gathered when the weather is moſt dry and calme. The diſtilled water hereof that is drawne forth with a glaſſe ſtill, is of a glittering yellow colour like gold, and coloureth ſiluer put therein like gold.

¶ *The Names.*

It is called in Latine, *Ros Solis*: of diuers, *Rorella*: it is named of other, *Salſi Roſa*, of the dew which hangeth vpon it, when the Sun is at the hotteſt: it is called in high Dutch, **Sondaw**, and **Suidaw**: in low Dutch, **Loopichecruit**, which in Engliſh ſignifieth Luſtwoort, becauſe ſheepe and other cattell, if they do but onely taſte of it, are prouoked to luſt. It is called in Engliſh, Sun-Dew, Ros Solis, Youth-woort: in the Northern parts, Red Rot, becauſe it rotteth ſheepe; and in Yorkeſhire, Moore graſſe.

¶ *The Temperature.*

It is a ſearing or cauſticke herbe, and very much biting, being hot and drie in the fourth degree.

¶ *The Vertues.*

The leaues being ſtamped with ſalt do exulcerate and raiſe bliſters, to what part of the body ſoeuer they be applied. A

The later Phyſitions haue thought this herbe to be a rare and ſingular remedie for all thoſe that be in a conſumption of the lungs, and eſpecially the diſtilled water thereof: for as the herbe doth keep and hold faſt the moiſture and dew, and ſo faſt, that the extreme drying heate of the Sun cannot conſume and waſte away the ſame: ſo likewiſe men thought that herewith the naturall and radical humidity in mens bodies is preſerued and cheriſhed. But the vſe therof doth otherwiſe teach, and reaſon ſheweth the contrarie: for ſeeing it is an extreme biting herb, and that the diſtilled water is not altogether without this biting qualitie, it cannot be taken with ſafety: for it hath alſo bin obſerued, that they haue ſooner periſhed that vſed the diſtilled water hereof, than thoſe that abſtained from it, and haue followed the right and ordinarie courſe of diet. B

Cattell of the female kinde are ſtirred vp to luſt by eating euen of a ſmall quantity: which thing hath greatly increaſed their vain opinion, without ſence or reaſon; for it doth not moue nor prouoke cattell to luſt, for that it increaſeth the ſubſtance of the ſeed, but becauſe through his ſharp and biting qualitie it ſtirreth vp a deſire to luſt, which before was dulled, and as it were aſleepe. C

It ſtrengthneth and nouriſheth the body, eſpecially if it be diſtilled with wine, and that liquour made thereof which the common people do call Roſa Solis. D

If any be deſirous to haue the ſaid drinke effectuall for the purpoſes aforeſaid, let them lay the leaues of Roſa Solis in the ſpirit of wine, adding thereto Cinnamon, Cloues, Maces, Ginger, Nutmegs, Sugar, and a few graines of Muske, ſuffering it ſo to ſtand in a glaſſe cloſe ſtopt from the aire, and ſet in the Sun by the ſpace of ten daies, then ſtraine the ſame, and keep it for your vſe. E

Chap. 161. *Of Moſſe of trees.*

¶ *The Deſcription.*

TRee Moſſe hath certaine things like haires, made vp as it were of a multitude of ſlender leaues, now and then all to be iagged, hackt, and finely carued, twiſted and interlaced one in another, which cleaue faſt to the barkes of trees, hanging downe from the bodies: one of this kinde is more

Muſcus quernus.
The Moſſe of the Oke & of other trees.

ſlender and thin, another more thicke, another ſhorter, another longer; all of them for the moſt being of a whitiſh colour, yet oftentimes there is a certaine one alſo which is blacke, but leſſer and thinner: the moſt commendable of them all, as *Pliny* ſaith, be thoſe that are whitiſh, then the reddiſh, and laſtly ſuch as be blacke.

¶ *The Place.*

This Moſſe is found on the Oke tree, the white and blacke Poplar tree, the Oliue tree, the Birch tree, the Apple tree, the Peare tree, the Pine tree, the wilde Pine tree, the Pitch tree, the Firre tree, the Cedar tree, the Larch tree, & on a great ſort of other trees. The beſt, as *Dioſcorides* ſaith, is that of the Cedar tree, the next of the Poplar, in which kinde the white and the ſweet ſmelling Moſſe is the chiefeſt; the blackiſh ſort is of no account. *Matthiolus* writeth, that in Italy that Moſſe is ſweet which groweth on the Pine tree, the Pitch tree, the Fir tree, & the Larch tree, and the ſweeteſt that of the Larch tree.

¶ *The Time.*

Moſſe vpon the trees continueth all the yeare long.

¶ *The Names.*

It is called of the Grecians βρύον of the Latins, *Muſcus*: the Arabians and ſome Apothecaries in other countries call it *Vſnea*: in high Dutch, **Moſz**: in low Dutch, **Moſch**: the French men, *Lu Mouſch*: the Italians, *Muſgo*: in Spaniſh, *Muſco de los arbores*: in Engliſh, Moſſe, tree Moſſe, or Moſſe of trees.

¶ *The Temperature.*

Moſſe is ſomewhat cold and binding, which notwithſtanding is more and leſſe according vnto the nature and facultie of that tree on which it groweth, and eſpecially of his barke: for it taketh vnto it ſelfe and alſo retaineth a certaine propertie of that barke, as of his breeder of which hee is ingendred: therefore the Moſſe which commeth of the Oke doth coole and very much binde, beſides his owne and proper facultie, it receiueth alſo the extreme binding quality of the Oke barke it ſelfe.

The Moſſe which commeth of the Cedar tree, the Pine tree, the Pitch tree, the Fir tree, the Larch tree, and generally all the Roſine trees are binding, and do moreouer digeſt and ſoften.

¶ *The Vertues.*

A *Serapio* ſaith, that the wine in which Moſſe hath been ſteeped certain daies, bringeth ſound ſleep, ſtrengtheneth the ſtomacke, ſtaieth vomiting, and ſtoppeth the belly.

B *Dioſcorides* writeth, that the decoction of Moſſe is good for women to ſit in, that are troubled with the whites; it is mixed with the oile of Ben, and with oiles to thicken them withall.

C It is fit to be vſed in compoſitions which ſerue for ſweet perfumes, and that take away wearieſomneſſe; for which things that is beſt of all which is moſt ſweet of ſmell.

Chap. 162. *Of ground Moſſe.*

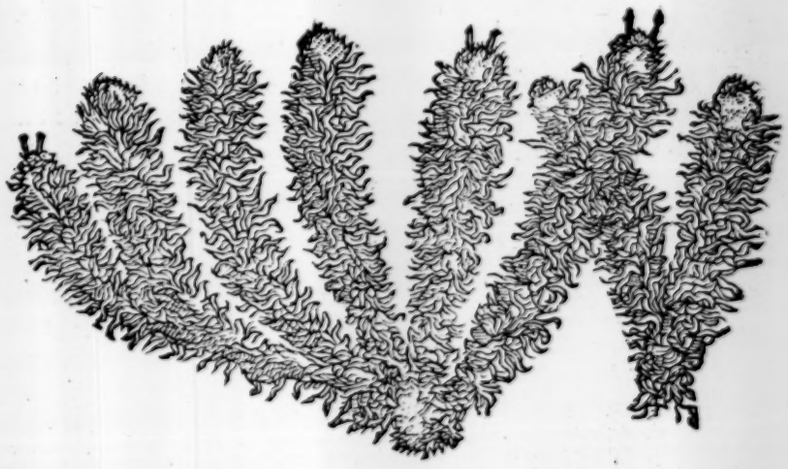
¶ *The Kindes.*

There groweth alſo on the ſuperficiall or vppermoſt part of the earth diuers Moſſes, as alſo vpon rocks and ſtony places, and mariſh grounds, differing in forme not a little.

¶ *The Deſcription.*

1 The common Moſſe groweth vpon the earth, and the bottome of old and antient trees, but ſpecially vpon ſuch as grow in ſhadowie woods, and alſoat the bottom of ſhadowy hedges,

1 *Muſcus terreſtris vulgaris.*
Common ground Moſſe.



2 *Muſcus terreſtris ſcoparius.*
Beeſome ground Moſſe.

3. 4. *Muſcus capillaris, ſiue Adianthum aureum maius & minus.*
Goldilockes or golden Maiden-haire the bigger and leſſe.

hedges and ditches, and ſuch like places: it is very well knowne by the ſoftneſſe and length thereof, being a moſſe moſt common, and therefore needeth not any further deſcription.

2 Beeſome Moſſe, which ſeldome or neuer is found but in bogs and mariſh places, yet ſometimes haue I found it in ſhadowie dry ditches, where the Sun neuer ſheweth his face: it groweth vp halfe a cubit high, euery particular leafe conſiſting of an innumerable ſort of hairy threds ſet vpon a middle rib, of a ſhining blacke colour like that of Maiden-haire, or the Capillare Moſſe *Adianthum aureum*, whereof it is a kinde.

3 This kinde of Moſſe, called *Muſcus capillaris*, is ſeldome found but vpon bogs and mooriſh places, and alſo in ſome ſhadowie dry ditches where the Sun doth not come. I found it in great aboundance in a ſhadowie ditch vpon the left hand neere vnto a gate that leadeth from Hampſted heath,

5 *Muſcus ramoſus floridus.*
Flouring branched Moſſe.

heath toward Highgate; which place I haue ſhewed vnto diuers expert Surgeons of London, in our wandering abroad for our farther knowledge in Simples. This kind of Moſſe, the ſtalkes thereof are not aboue one handfull high, couered with ſhort haires ſtanding very thicke together, of an obſcure yellow green colour; out of which ſtalkes ſpring vp ſometimes very fine naked ſtems, ſomewhat blacke, vpon the tops of which hang as it were little graines like wheat cornes. The roots are very ſlender and maruellous fine.

‡ Of this *Adiantum aureum* there are three kindes, different onely in magnitude, and that the two bigger haue many hairie threds vpon their branches, when as the leaſt hath onely three or foure cloſe to the root; and this is the leaſt of plants that I euer yet ſaw grow. ‡

4 Of this there is alſo another kinde altogether leſſer and lower. This kind of moſſe groweth in moiſt places alſo, commonly in old moſſie and rotten trees, likewiſe vpon rocks, and oftentimes in the chinks and crannies of ſtone walls.

† 5 There is oftentimes found vpon old Okes and Beeches, and ſuch like ouer-grown trees, a kinde of Moſſe hauing many ſlender branches, which diuide themſelues into other leſſer branches; whereon are placed confuſedly very many ſmall threds like haires, of a greeniſh aſh colour: vpon the ends of the tender branches ſometimes there commeth forth a floure in ſhape like vnto a little buckler or hollow Muſhrom, of a whitiſh colour tending to yellownes, and garniſhed with the like leaues of thoſe vpon the lower branches.

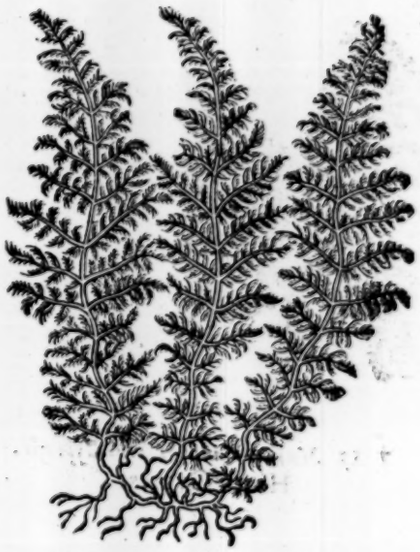
6 *Muſcus Pyxidatus.*
Cup or Chalice Moſſe.

6 Of this Moſſe there is another kinde, which *Lobel* in his Dutch Herbal hath ſet forth vnder the title of *Muſcus Pyxidatus*, which I haue Engliſhed, Cup Moſſe or Chalice Moſſe: it groweth in the moſt barren dry and grauelly ditch bankes, creeping flat vpon the ground like vnto Liuerwort, but of a yellowiſh white colour: among which leaues ſtart vp here and there certaine little things faſhioned like a little cup called a Beaker or Chalice, and of the ſame colour and ſubſtance of the lower leaues, which vndoubtedly may be taken for the floures: the pouder of which Moſſe giuen to children in any liquor for certaine dayes together, is a moſt certaine remedie againſt that perillous malady called the Chin-cough.

7 There is likewiſe found in the ſhadowie places of high mountaines, and at the foot of old and

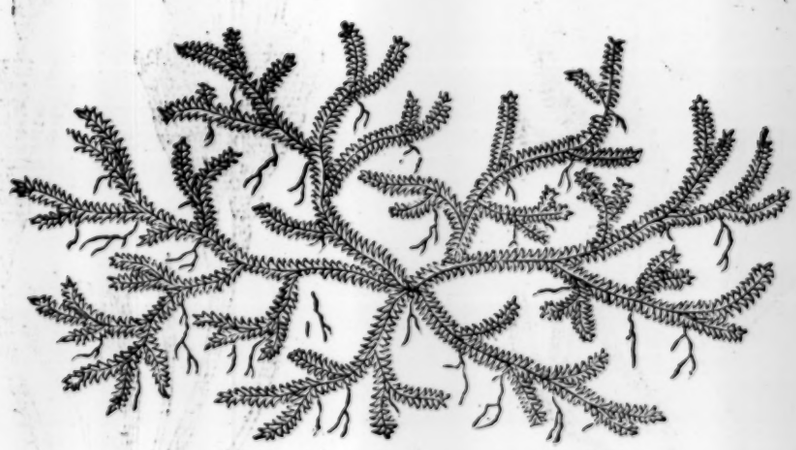
and rotten trees, a certaine kinde of Moſſe in face and ſhew not vnlike to that kinde of Oke Ferne called *Dryopteris*. It creepeth vpon the ground, hauing diuers long branches, conſiſting of many ſmall leaues, euery particular leafe made vp of ſundry little leaues, ſet vpon a middle rib one oppoſite to another.

7 *Muſcus Filicinus.*
Moſſe Ferne.



8 *Muſcus corniculatus.*
Horned or knagged Moſſe.

9 *Muſcus denticulatus.*
Toothed Moſſe.



8 There is found vpon the tops of our moſt barren mountaines, but eſpecially were ſea Coles are accuſtomed to be digged, ſtone to make iron of, and alſo where ore is gotten for tinne and lead, a certaine ſmall plant: it riſeth forth of the ground with many bare and naked branches, diuiding themſelues at the top into ſundry knags like the forked hornes of a Deere, euery part whereof is of an ouerworne whitiſh colour.

‡ Our Author formerly gaue another figure and deſcription of this plant, by the name of *Holoſteum petræum*, which I haue omitted, thinking this the better. *Tragus*, *Lonicerus*, and *Bauhine* referre this to the Fernes; and the laſt of them calleth it *Filix ſaxatilis corniculata*: *Pena* and *Lobel* made it their *Holoſtium alterum*: *Thalius* calls it *Adianthum acroſchiſton, ſeu furcatum*, ‡

9 There is found creeping vpon the ground a certaine kinde of Moſſe at the bottom of Heath and Ling, and ſuch like buſhes growing vpon barren mountaines, conſiſting as it were of ſcales made vp into a long rope or cord, diſperſing it ſelfe far abroad into ſundry branches, thruſting out

here

here and there certain roots like threds, which take hold vpon the vpper cruſt of the earth, whereby it is ſent and diſperſed far abroad: the whole plant is of a yellowiſh greene colour.

10 This other kinde of Moſſe is found in the like places: it alſo diſperſeth it ſelfe far abroad, and is altogether leſſer than the precedent, wherein conſiſts the difference.

10 *Muſcus minor denticulatus.*
Little toothed Moſſe.

11 *Muſcus clauatus, ſiue Lycopodium.*
Club Moſſe, or Wolfe claw Moſſe.

† 12 *Muſcus clauatus foliis Cypreſſi.*
Heath Cypres.

11 There is likewiſe another kinde of Moſſe, which I haue not elſewhere found than vpon Hampſted heath, neere vnto a little cottage, growing cloſe vpon the ground amongſt buſhes and brakes, which I haue ſhewed vnto diuers Surgeons of London, that haue walked thither with me for their further knowledge in Simples, who haue gathered this kinde of Moſſe, wherof ſome haue made

13 *Muſcus ex cranio humano.*
Moſſe growing vpon the skull of a man.

made them hat-bands, girdles, and alſo bands to tye ſuch things as they had before gathered, for the which purpoſe it moſt fitly ſerued; ſome pieces whereof are ſix or eight foot long, conſiſting as it were of many hairie leaues ſet vpon a tough ſtring, very cloſe couched and compact together, from which is alſo ſent forth certaine other branches like the firſt: in ſundry places there be ſent down fine little ſtrings, which ſerue in ſtead of roots, wherewith it is faſtened to the vpper part of the earth, and taketh hold likewiſe vpon ſuch things as grow next vnto it. There ſpring alſo from the branches bare and naked ſtalkes, on which grow certaine eares as it were like the catkins or blowings of the Haſell tree, in ſhape like a little club or the reede Mace, ſauing that it is much leſſer, and of a yellowiſh white colour, very well reſembling the claw of a Wolfe, whereof it tooke his name; which knobby katkins are altogether barren, and bring forth neither ſeed nor floure.

‡ 14 *Muſcus parvus ſtellaris.*
Small Heath Moſſe.

‡ 12 This, whoſe figure in the former edition was by our Author vnfitly put for Lauander Cotton (hauing more regard to the title of the figure in *Tabernamontanus*, than to ſee whether it were that which he there deſcribed) is no other than a kinde of *Muſcus clauatus*, or Club-Moſſe. It is thought to be the *Selago* mentioned by *Pliny, lib. 25. cap. 11. Tragus* and ſome others call it *Sauina ſylueſtris: Turner* and *Tabernamontanus, Chamæcypariſſus:* but *Bauhine* the moſt fitly nameth it *Muſcus clauatus foliis Cypreſſi:* and *Turner* not vnfitly in Engliſh, Heath Cypreſſe. This is a low plant, and keepes greene Winter and Sommer: the leaues are like thoſe of Cypreſſe, bitter in taſte, but without ſmell: it carries ſuch eares or catkins as the former, and thoſe of a yellowiſh colour: it is found growing in diuers wooddy mountainous places of Germanie, where they call it **Wald Seuenbaum**, or wilde Sauine. ‡

13 This kinde of Moſſe is found vpon the skulls or bare ſcalps of men and women, lying long in charnell houſes or other places, where the bones of men and women are kept together: it groweth very thicke, white, like vnto the ſhort moſſe vpon the trunkes of old Okes: it is thought to be a ſingular remedie againſt the falling Euill and the Chin-cough in children, if it be poudered, and then giuen in ſweet wine for certaine daies together.

‡ 14 Vpon diuers heathy places in the moneth of May is to be found growing a little ſhort Moſſe not much in ſhape different from the firſt deſcribed, but much leſſe, and parted at the top into ſtar-faſhioned heads. *Lobel* calls this, *Muſcus in Ericetis proueniens.* ‡

¶ *The*

¶ *The Place.*

Their ſeuerall deſcriptions ſet forth their naturall places of growing.

¶ *The Time.*

They flouriſh eſpecially in the Sommer moneths.

¶ *The Names.*

Goldilocke is called in high-Dutch, **Veldertodt, golden Vederdodt, Jung Vrauwen har:** in low-Dutch, **Gulden Vederdoot:** *Fuchſius* nameth it *Polytrichon Apuleij*, or *Apuleius* his Maiden-haire, neuertheleſſe *Apuleius* Maiden-haire is nothing elſe but *Dioſcorides* his *Trichomanes*, called Engliſh Maiden-haire; and for that cauſe wee had rather it ſhould be termed *Muſcus capillaris*, or hairy Moſſe. This is called in Engliſh, Goldilockes: it might alſo be termed Golden Moſſe, or Hairy Moſſe.

Wolfes claw is called of diuers Herbariſts in our age, *Muſcus terreſtris*: in high-Dutch, **Beerlay, Hurtelkraut, Hellkraut:** in low-Dutch, **Volfs clauwen**; whereupon wee firſt named it *Lycopodium*, and *Pes Lupi*: in Engliſh, Wolfes foot, or Wolfes claw, and likewiſe Club-Moſſe. Moſt ſhops of Germanie in former times did falſly terme it *Spica celtica*: but they did worſe, and were very much too blame, that vſed it in compound medicines in ſtead of *Spica celtica*, or French Spikenard: as touching the reſt, they are ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

The Moſſes of the earth are dry and aſtringent, of a binding qualitie, without any heate or cold.

Goldilocks and the Wolfes clawes are temperate in heate and cold.

¶ *The Vertues.*

A The Arabian Phyſitians do put Moſſe amongſt their cordiall medicines, as fortifying the ſtomacke, to ſtay vomit, and to ſtop the laske.

B Moſſe boiled in Wine and drunke ſtoppeth the ſpitting of bloud, piſſing of bloud, the termes, and bloudy flix.

C Moſſe made into pouder is good to ſtanch the bleeding of greene and freſh wounds, and is a great helpe vnto the cure of the ſame.

D Wolfes claw prouoketh vrine, and as *Hieronymus Tragus* reporteth, waſteth the ſtone, and driueth it forth.

E Being ſtamped and boyled in wine and applied, it mitigateth the paine of the gout.

F Floting wine, which is now become ſlimie, is reſtored to his former goodneſſe, if it be hanged in the veſſell, as the ſame Author teſtifieth.

† The figure formerly in the firſt place was of the *Muſcus Montanus* of *Tabern.* being a ſmall kinde of *Muſcus denticulatus*. The fifth and ſixth were both of one; and ſo of the two deſcriptions I haue made one more accurate, and reſerued the better figure.

Chap. 163. *Of Liuerwort.*

¶ *The Deſcription.*

1 Liuerwort is alſo a kinde of Moſſe which ſpreadeth it ſelfe abroad vpon the ground, hauing many vneuen or crumpled leaues lying one ouer another, as the ſcales of Fiſhes do, greene aboue, and browne vnderneath: amongſt theſe grow vp ſmall ſhort ſtalkes, ſpred at the top like a blaſing ſtarre, and certaine fine little threds are ſent downe, by which it cleaueth and ſticketh faſt vpon ſtones, and vpon the ground, by which it liueth and flouriſheth.

2 The ſecond kinde of Liuerwort differeth not but in ſtature, being altogether leſſe, and more ſmooth or euen: the floures on the tops of the ſlender ſtems are not ſo much laid open like a ſtar; but the eſpeciall difference conſiſteth in one chiefe point, that is to ſay, this kinde being planted in a pot, and ſet in a garden aboue the ground, notwithſtanding it ſpitteth or caſteth round about the place great ſtore of the ſame fruit, where neuer any did grow before.

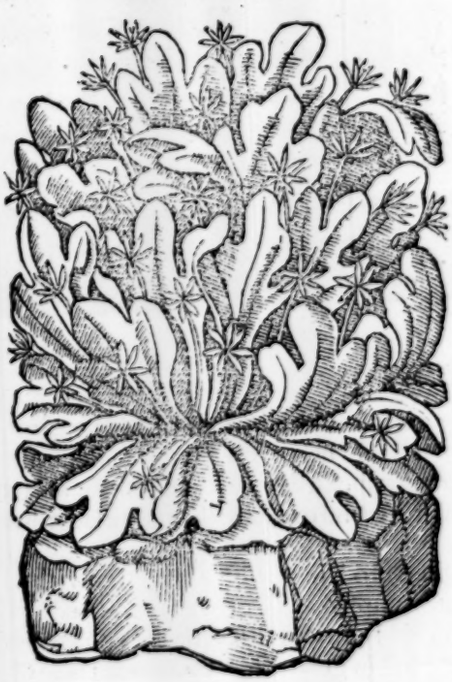
‡ Of this ſort which is ſmall, and oftentimes found growing in moiſt gardens among Beares-eares, and ſuch plants, when they are kept in pots, there are two varieties, one hauing little ſtalkes ſome inch long, with a ſtarre-faſhioned head at the top: the other hath the like tender ſtalke, and a round head at the top thereof. ‡

3 This is found vpon rockes and ſtony places, as well neere vnto the ſea, as further into the land: it groweth flat vpon the ſtones, and creepeth not far abroad as the ground Liuerwort doth, it only reſteth it ſelfe in ſpots and tufts ſet here and there, of a duſty ruſſet colour aboue, and blackiſh vnderneath: among the crumpled leaues riſe vp diuers ſmall ſtems, whereupon do grow little ſtar-like floures of the colour of the leaues: it is often found at the bottom of high trees growing vpon high

1 *Hepatica terreſtris.*
Ground Liuer-wort.

2 *Hepatica ſtellata & vmbellata.*
Small Liuer-wort with ſtarry and round heads.

3 *Hepatica petræa.*
Stone Liuerwort.



high mountaines, eſpeciall in ſhadowie places.

¶ *The Place.*

This is often found in ſhadowy and moiſt places, on rocks and great ſtones layd by the highway, and in other common paths where the Sun beams do ſeldome come, and where no traueller frequenteth.

¶ *The Time.*

It brings forth his blaſing ſtars and leaues oftentimes in Iune and Iuly.

¶ *The Names.*

It is called of the Grecians, Ἀνάγαλλις: of the Latines, *Lichen*: and of ſome, Βρύον, that is to ſay, *Muſcus*, or Moſſe, as *Dioſcorides* witneſſeth: it is named in ſhops *Hepatica*, yet there are alſo many other herbes named *Hepaticæ*, or Liuer-worts, for difference whereof this may fitly be called *Hepatica petræa*, or Stone Liuer-wort, hauing taken that name from the Germanes, who call this Liuerwort, **Steyn Leberkraut**: and in low-Dutch, **Steen Leuercrupt**: in Engliſh, Liuerwort.

¶ *The Temperature.*

This Stone Liuerwort is of temperature cold and dry, and ſomewhat binding.

¶ *The Vertues.*

It is ſingular good againſt the inflammations of the liuer, hot and ſharpe agues, and tertians which proceed of choler.

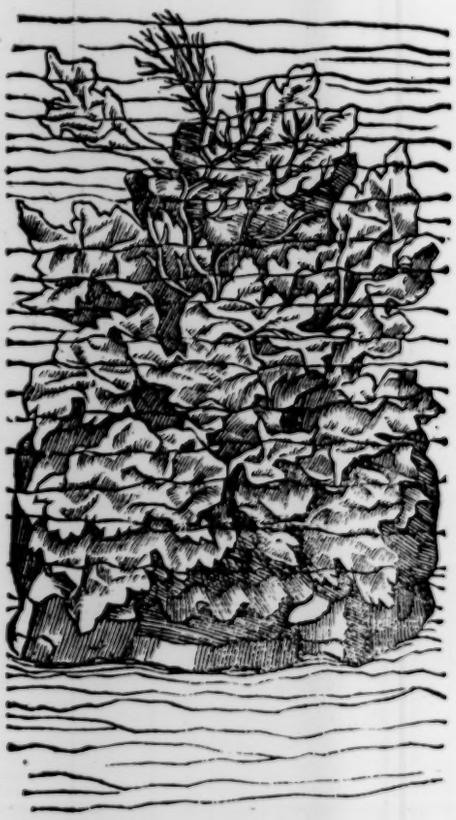
Dioſcorides teacheth, that Liuer-wort being applied to the place ſtancheth bleeding, takes away all inflammations, and that it is good for a tetter or ring-worme, called in Greeke, Λειχην: and that it is a remedie for them that haue the yellow iaundice, euen that which commeth by the inflammation of the liuer; and that furthermore it quencheth the inflammations of the tongue.

Chap. 164.

Of Lung-wort, or wood Liuer-wort, and Oiſter-greene.

1 *Lichen arborum.*
Tree Lung-wort.

2 *Lichen marinus.*
Sea Lung-wort, or Oiſter-greene.



¶ *The Deſcription.*

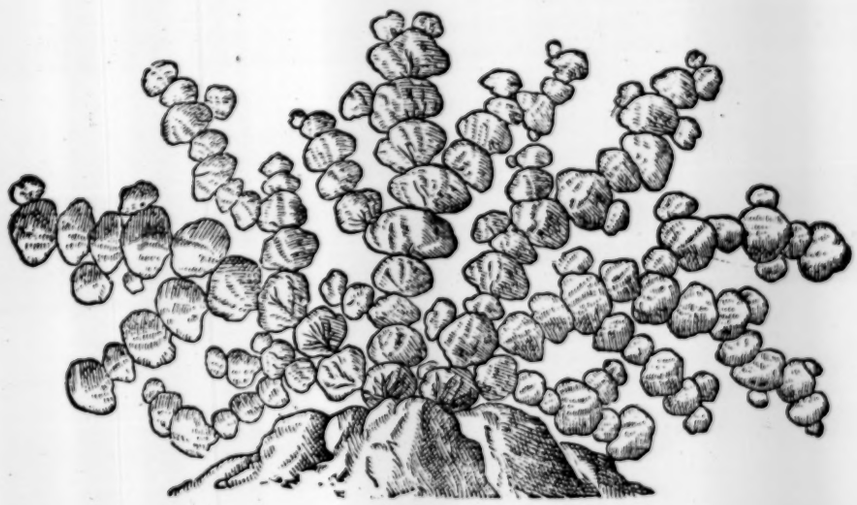
1 TO Liuerwort there is ioyned Lung-wort, which is alſo another kinde of Moſſe, drier, broader, of a larger ſize, and ſet with ſcales: the leaues hereof are greater, and diuerſly folded one in another, not ſo ſmooth, but more wrinckled, rough and thicke almoſt like a Fell or hide, and tough withall: on the vpper ſide whitiſh, and on the nether ſide blackiſh or duſty, it ſeemeth to be after a ſort like to lungs or lights.

2 This kinde of ſea Moſſe is an herby matter much like vnto Liuer-wort, altogether without ſtalke or ſtem, bearing many greene leaues, very vneuen or crumpled, and full of wrinkles, and ſomwhat broad, not much differing from leaues of criſpe or curled Lettuce: this groweth vpon rockes within the bowels of the ſea, but eſpecially among oiſters, and in greater plenty among thoſe Oiſters which are called Wall-fleet Oiſters: it is very well knowne euen to the poore Oiſter-women which carry Oiſters to ſell vp and downe, who are greatly deſirous of the ſaid moſſe for the decking and beautifying of their Oiſters, to make them ſell the better. This moſſe they doe call Oiſter-greene.

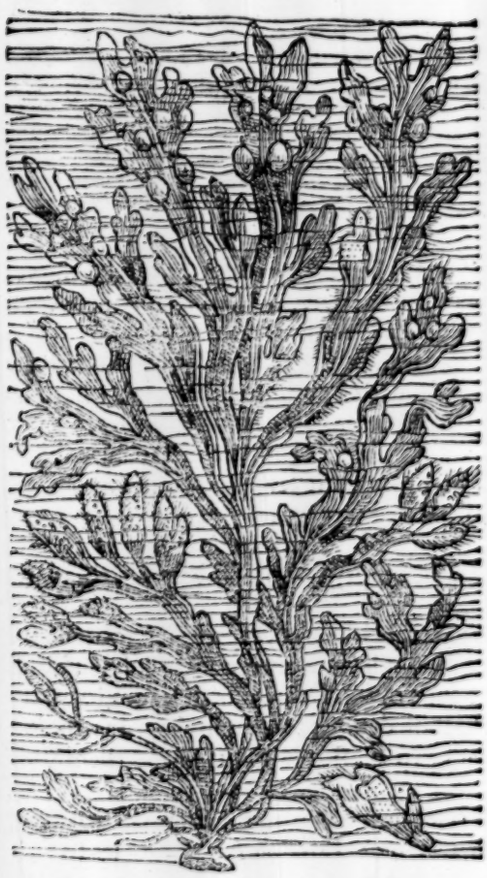
‡ 3 The branches of this elegant plant are ſome handfull or better high, ſpred abroad on euerie ſide, and only conſiſting of ſundry ſingle roundiſh leaues, whereto are faſtned ſomtimes one, ſometimes

ſometimes two or more ſuch leaues, ſo that the whole plant conſiſts of branches made vp of ſuch round leaues, faſtned together by diuers little & very ſmal threds: the lower leaues which ſtick faſt to the rockes are of a browniſh colour, the other of a whitiſh or a light greene colour, ſmooth and ſhining. This growes vpon rockes in diuers parts of the Mediterranean. *Cluſius* ſetteth it forth by the name of *Lichen Marinus*; and he receiued it from *Imperato* by the name of *Sertuloria*: and *Cortuſus* had it from *Corſica*, by the title of *Corallina latifolia*; and he called it *Opuntia marina*, hauing reference to that mentioned by *Theophraſt. lib. 1. cap. 12. Hiſt. Plant.* ‡

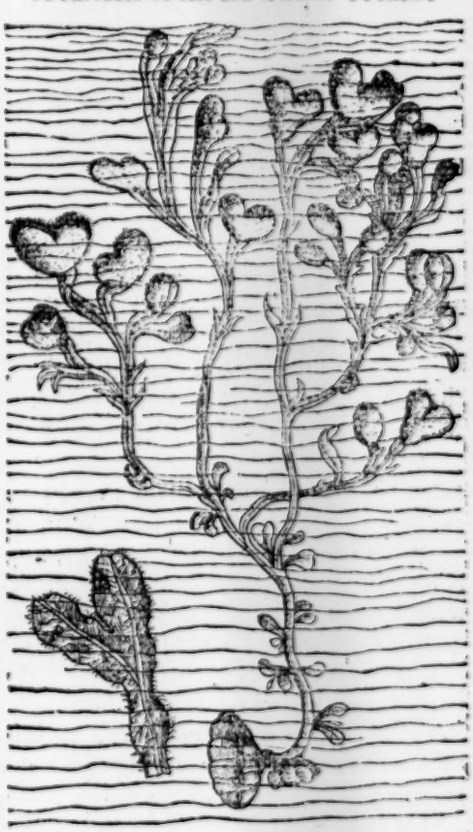
‡ 3 *Lichen marinus rotundifolius.* Round leaued Oiſter-weed.



4 *Quercus marina.*
Sea Oke or Wracke.



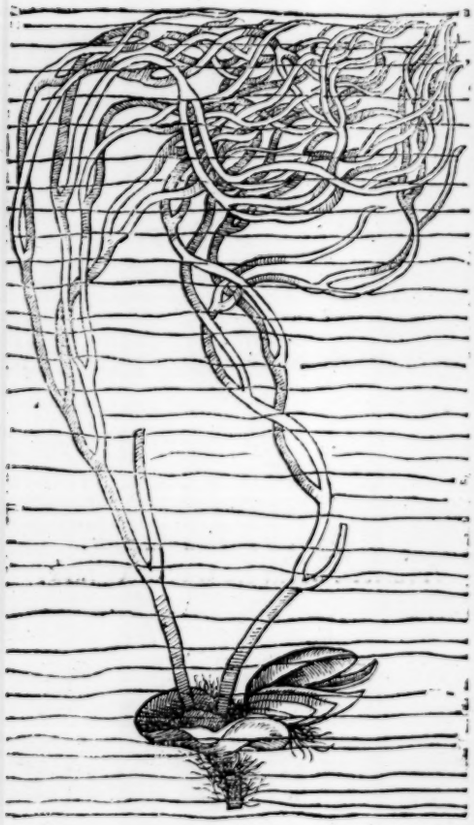
‡ 4 *Quercus marina varietas.*
A varietie of the ſea Oke or Wrack.



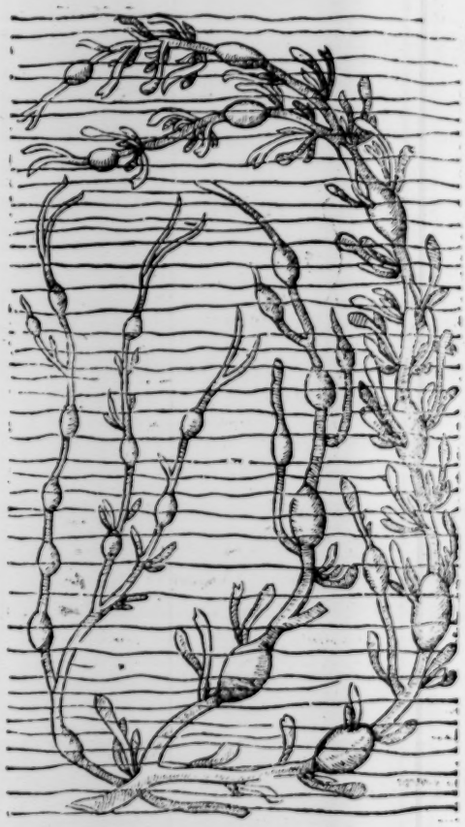
4 There is alſo another ſort of ſea Weed found vpon the drowned rockes, which are naked and bare of water at euery tyde. This ſea Weed groweth vnto the rocke, faſtned vnto the ſame at one

end, being a ſoft herby plant, very ſlipperie, inſomuch that it is a hard matter to ſtand vpon it without falling: it rampeth far abroad, and here and there is ſet with certaine puft vp tubercles or bladders, full of winde, which giueth a cracke when it is broken: the leafe it ſelfe doth ſomewhat reſemble the Oken leafe, whereof it tooke his name *Quercus marina*, the ſea Oke: of ſome, Wracke, and Crow Gall. His vſe in phyſicke hath not beene ſet forth, and therefore this bare deſcription may ſuffice.

‡ 5 *Quercus marina ſecunda.*
Sea Thongs.



‡ 6 *Quercus marina tertia.*
The third ſea Wracke.



‡ Of this *Quercus marina*, or *Fucus*, there are diuers ſorts, whereof I will giue you the figures and a briefe hiſtorie: the firſt of theſe is onely a varietie of the laſt deſcribed, differing there-from in the narrowneſſe of the leaues, and largeneſſe of the ſwolne bladders.

5 This growes to the length of fiue or ſix foot, is ſmooth and membranous, being ſome halfe fingers bredth, and variouſly diuided, like wet parchment or leather cut into thongs: this hath no ſwolne knots or bladders like as the former; and is the *Fucus marinus ſecundus* of *Dodonæus*.

6 This Wracke or ſea weed hath long and flat ſtalkes like the former, but the ſtalks are thicke ſet with ſwolne knots or bladders, out of which ſometimes grow little leaues, in other reſpects it is not vnlike the former kindes. *Dodonæus* makes this his *Fucus marinus* 3.

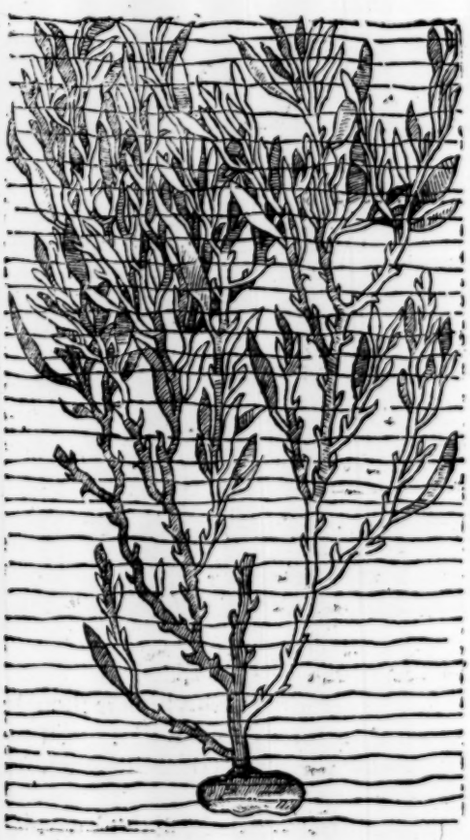
7 The leaues of this other Wracke, which *Dodonæus* makes his *Fucus marinus quartus*, are narrower, ſmaller, and much diuided; and this hath either none or very few of thoſe ſwollen bladders which ſome of the former kindes haue.

8 This, which *Lobel* calleth *Alga marina*, hath iointed blacke branched creeping roots of the thickneſſe of ones finger, which end as it were in diuers eares, or hairy awnes, compoſed of whitiſh hairy threds ſomewhat reſembling Spikenard: from the tops of thoſe eares forth leaues, long, narrow, ſoft, and graſſe-like, firſt greene, but white when they are dry. It growes in the ſea as the former. They vſe it in Italy and other hot countries to packe vp glaſſes with, to keepe them from breaking.

9 Of this Tribe are diuers other plants; but I will onely giue you the hiſtory of two more, which I firſt obſerued the laſt yeare, going in company with diuers London Apothecaries to finde Simples, as farre as Margate in the Iſland of Tenet; and whoſe figures (not before extant that I know of) I firſt gaue in my Iournall or enumeration of ſuch plants as we there and in other places found. The firſt of theſe by reaſon of his various growth is by *Bauhine* in his *Prodromus* diſtinguiſhed

guiſhed into two, and deſcribed in the ſecond and third places. The third he calls *Fucus longiſſimo, latiſſimo, craſſoque folio*, and this is marked with the figure 1. The ſecond he calls *Fucus arboreus polyſchides*; and this you may ſee marked with the figure 2. This ſea Weed (as I haue ſaid) hath a various face, for ſometimes from a fibrous root, which commonly groweth to a pibble ſtone, or faſtened to a rocke, it ſendeth forth a round ſtalke ſeldome ſo thicke as ones little finger, and about ſome halfe foot in length, at the top whereof growes out a ſingle leafe, ſometimes an ell long, and then it is about the bredth of ones hand, and it ends in a ſharpe point, ſo that it very well reſembles a two edged ſword. Sometimes from the ſame root come forth two ſuch faſhioned leaues, but then commonly they are leſſer. Otherwhiles at the top of the ſtalke it diuides it ſelfe into eight, nine, ten, twelue, more or fewer parts, and that iuſt at the top of the ſtalke, and theſe neuer come to that length that the ſingle leaues do. Now this I iudge to be the *Fucus polyſchides* of *Bauhine*. That theſe two are not ſeuerall kindes I am certaine; for I haue marked both theſe varieties from one and the ſame root, as you may ſee them here expreſt in the figure. At Margate where they grow they call them ſea Girdles, and that name well befits the ſingle one; and the diuided one they may call Sea Hangers, for if you do hang the tops downewards, they doe reaſonable well reſemble the old faſhioned ſword-hangers. Thus much for their ſhape: now for their colour, which is not the ſame in all; for ſome are more greene, and theſe can ſcarce be dried; other-ſome are whitiſh, and theſe do quickly dry, and then both in colour and ſubſtance are ſo like parchment, that ſuch as know them not would at the firſt view take them to be nothing elſe. This is of a glutinous ſubſtance, and a little ſaltiſh taſte, and diuers haue told me they are good meate, being boiled tender, and ſo eaten with butter, vineger, and pepper.

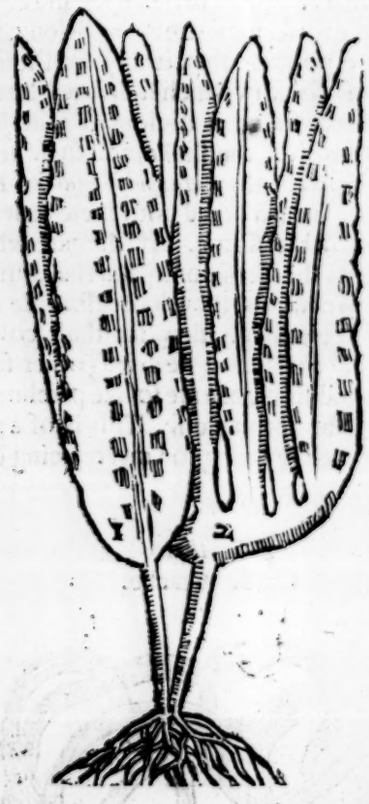
‡ 7 *Quercus marina quarta.*
Iagged Sea Wracke.



‡ 8 *Alga.*
Graſſe Wracke.

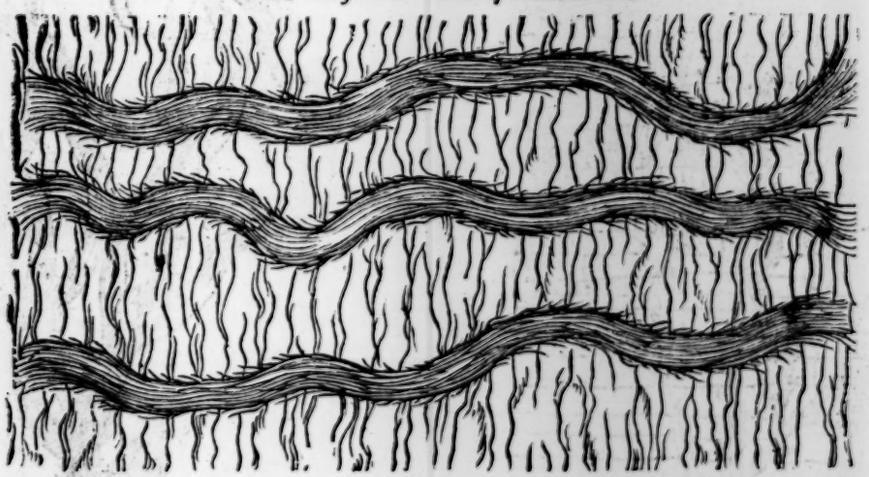
10 This which I giue you in the tenth place is not figured or deſcribed by any that as yet I haue met with; wherefore I gaue the figure and deſcription in the forementioned Iournall, which I will here repeate. This is a very ſucculent and fungous plant, of the thickneſſe of ones thumbe; it is of a darke yellowiſh colour, and buncheth forth on euerie ſide with many vnequall tuberoſities or knots: whereupon Mr. *Thomas Hickes* being in our companie did fitly name it Sea ragged Staffe. We did not obſerue it growing, but found one or two plants thereof ſome foot long apiece.

‡ 9 *Fucus phaſganoides & polyſchides.*
Sea Girdle and Hangers.



‡ 10 *Fucus ſpongioſus nodoſus.*
Sea ragged Staffe.

‡ 11 *Conferua.* Hairy Riuerweed.



11 In ſome ſlow running waters is to be found this long greene hairy weed, which is thought to be the *Conferua* of *Pliny*: it is made vp onely of long hairy greene threds, thicke thrummed together without any particular ſhape or faſhion, but only following the current of the ſtreame. ‡

¶ *The Place.*

It groweth vpon the bodies of old Okes, Beech, and other wilde trees, in darke & thick woods: it is oftentimes found growing vpon rocks, and alſo in other ſhadowie places.

¶ *The Time and Names.*

It flouriſheth eſpecially in the Sommer moneths.

It taketh his name *Pulmonaria* of the likeneſſe of the forme which it hath with lungs or lights, called in Latine *Pulmones*, of ſome, *Lichen*: it is called in high-Dutch, **Lungenkraut**: in low-Dutch **Longhencruyt**: in French, *Herbe à Poulmon*: in Engliſh, Lung-wort, and wood Liuerwort.

¶ *The Temperature.*

This ſeemeth to be cold and dry.

¶ *The*

¶ *The Vertues:*

It is reported that ſhepheards and certaine horſeleeches do with good ſucceſſe giue the pouder hereof with ſalt vnto their ſheepe and other cattell which be troubled with the cough, and be broken winded. A

Lungwoort is much commended of the learned Phyſitions of our time againſt the diſeaſes of the lungs, eſpecially for the inflammations and vlcers of the ſame, being brought into pouder, and drunke with water. B

It is likewiſe commended for bloudy and greene wounds, and for vlcers in the ſecret parts, and alſo to ſtay the reds. C

Moreouer, it ſtoppeth the bloudy flix, and other flixes and ſcourings, either vpwards or downewards, eſpecially if they proceed of choler: it ſtayeth vomiting, as men ſay, and it alſo ſtoppeth the belly.

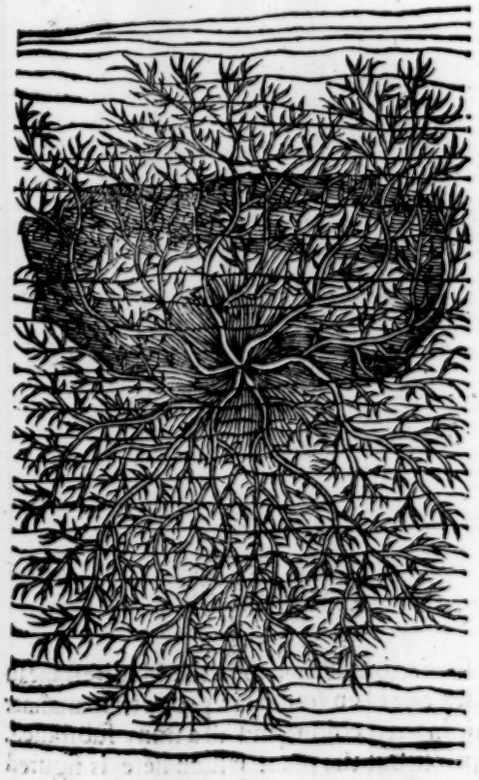
Oiſter greene fried with egges and made into a tanſie & eaten, is a ſingular remedy for to ſtreng then the weakneſſe of the backe. D

CHAP. 165. *Of Sea Moſſe, or Coralline.*

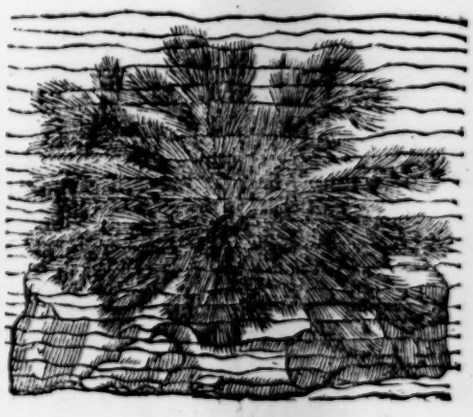
¶ *The Kindes.*

THere be diuers ſorts of Moſſe, growing as well within the bowels of the ſea, as vpon the rocks, diſtinguiſhed vnder ſundry titles.

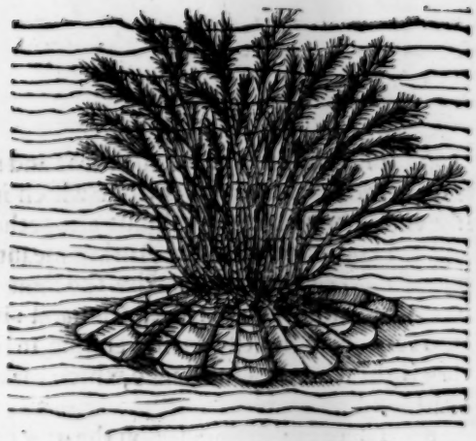
1 *Muſcus marinus, ſiue Corallina alba.*
White Coralline, or ſea Moſſe.



† 2 *Muſcus marinus albidus.*
White ſea Moſſe.



3 *Corallina Anglica.*
Engliſh Coralline.



¶ *The*

¶ *The Deſcription.*

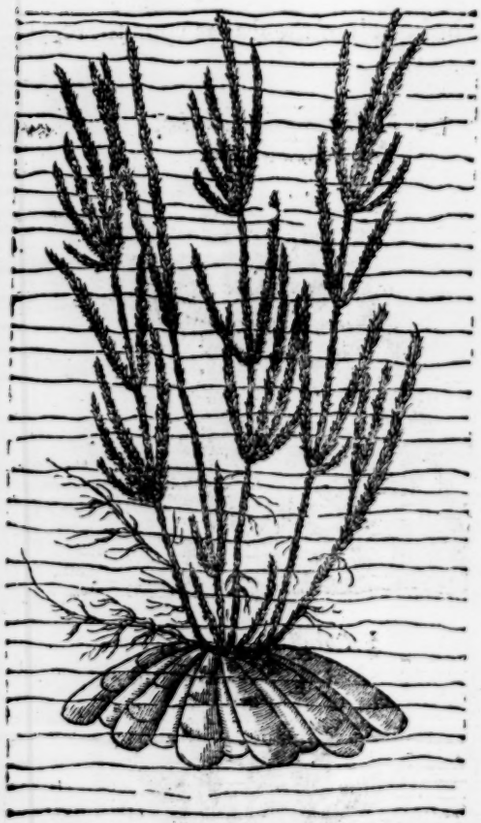
1 THis kinde of Sea Moſſe hath many ſmall ſtalkes finely couered or ſet ouer with ſmall leaues, very much cut or iagged, euen like the leaues of Dill, but hard, and of a ſtonie ſubſtance.

2 The ſecond is much like vnto the former, yet not ſtony, but more finely cut, and growing more vpright, branching it ſelfe into many diuiſions at the top, growing very thicke together, and in great quantitie, out of a piece of ſtone, which is faſhioned like an hat or ſmall ſtonie head, wherby it is faſtened vnto the rocks.

3 This third kinde of ſea moſſe is very well knowne in ſhops by the name *Corallina*; it yeeldeth forth a great number of ſhoots, in ſhap much like vnto Corall; being full of ſmall branches diſperſed here and there, diuerſly varying his colour, according to the place where it is found, beeing in ſome places red, in otherſome yellow, and of an herby colour; in ſome gray, or of an aſh colour, and in otherſome very white.

4 The fourth kinde of Sea Moſſe is ſomewhat like the former, but ſmaller, and not ſo plentiful where it groweth, proſpering alwaies vpon ſhels, as of Oyſters, Muſcles, and Scallops, as alſo vpon rolling ſtones, in the bottome of the water, which haue tumbled downe from the high cliffes and rocks, notwithſtanding the old prouerbe, that rolling ſtones neuer gather Moſſe.

4 *Corallina minima.*
The ſmalleſt Coralline.



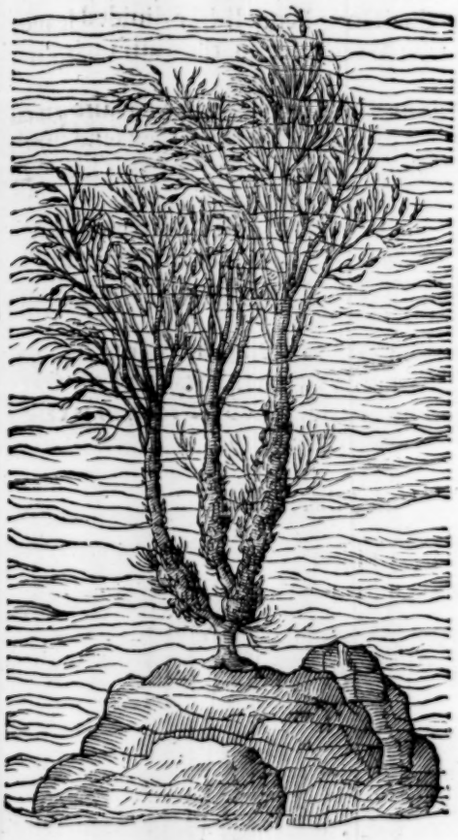
5 *Muſcus Corallinus, ſive Corallina montana.*
Corall Moſſe, or mountaine Coralline.

5 There is found vpon the rocks and mountaines of France, bordering vpon the Mediterranean ſea, a certaine kinde of Coralline, which in theſe parts hath not been found: it groweth in manner like vnto a branch of Corall, but altogether leſſer, of a ſhining red colour, and of a ſtony ſubſtance.

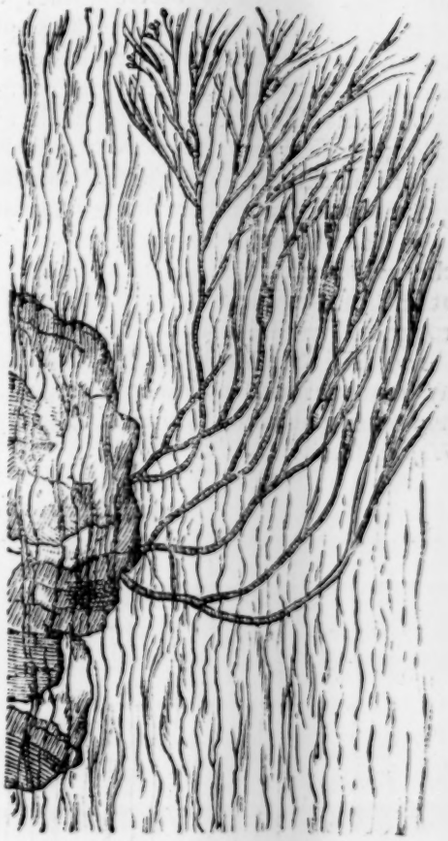
‡ I know not what our Author meant by this deſcription, but the plant which here is figured out of *Tabernamontanus* (and by the ſame title he hath it) is of a Moſſe growing vpon Hampſtead heath, and moſt ſuch places in England: it growes vp ſome two or three inches high, and is diuided into very many little branches ending in little threddy chiues: all the branches are hollow, and of a very light whitedry ſubſtance, which makes it ſomewhat to reſemble Coralline, yet is it not ſtony at all. ‡

6 There is alſo found vpon the rocks neere vnto Narbone in France, and not far from the ſea, a kinde

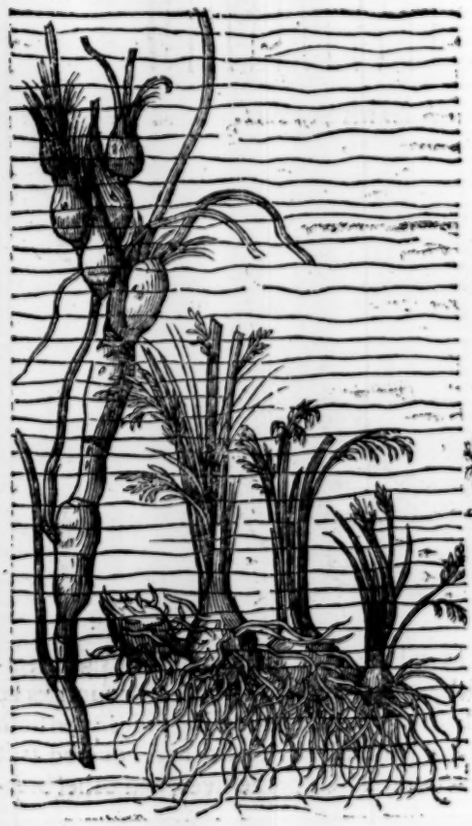
6 *Fucus marinus tenuifolius.*
Fenell Coralline, or Fenell Moſſe.



‡ 7 *Fucus ferulaceus.*
Sea Fenell.



‡ 8 *Fucus tenuifolius alter.*
Bulbous ſea Fennell.



‡ 9 *Muſcus marinus Clusius.*
Branched Sea Moſſe.

kinde of Coralline. it groweth vp to the forme of a ſmall ſhrub, branched diuerſly; whereon doe grow ſmall graſſe-like leaues, very finely cut or iagged, like vnto Fennel; yet are they of a ſtony ſubſtance, as are the reſt of the Corallines; of a darke ruſſet colour.

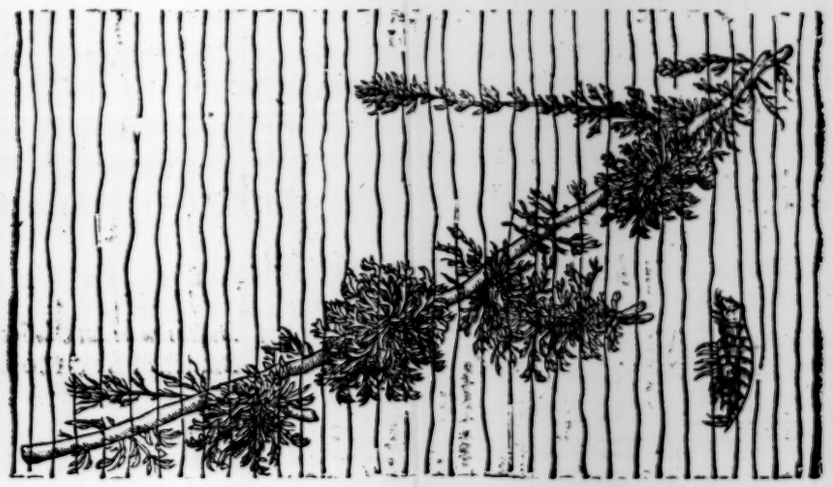
‡ 7 This growes alſo in the like places, hauing many ſmall long Fennell-like diuided leaues vpon ſtalks ſome foot long, with ſome ſwelling eminences here & there ſet in the diuiſions of the leaues: this is by *Lobel* called by the name I here giue you it.

8 This alſo hath fine cut leaues like thoſe of Fennell, but much leſſe & ſhorter, of a faire green colour: theſe grow vp from round tuberous roots, which together with the fibres they ſend forth are of a blackiſh colour: the ſtalks alſo are tuberous and ſwolne, as in other plants of this kind. It growes in the ſea with the former. *Dodonæus* calls this *Fucus marinus virens tenuifolius.*

9 This kinde of ſea Moſſe growes ſome foure or more inches long, diuided into many branches, which are ſubdiuided into ſmaller, ſet with leaues finely iagged, like thoſe of Cammomill; at firſt ſoft, flexible, and tranſparent, greene below, and purpliſh aboue; being dried, it becommeth rough and fragile, like as Coralline. It growes in the Mediterranean ſea.

10 This Sea Moſſe is a low little excreſcence, hauing ſomewhat broad cut leaues growing many from one root: in the whole face it reſembles the moſſe that grows vpon the branches of Okes and other trees, and is alſo white and very like it, but much more brittle. This by *Dodonæus* is called *Muſcus Marinus tertius.*

‡ 10 *Muſcus marinus* 3. *Dod.* Broad leafed Sea moſſe.



‡ 11 *Abies marina Belgica, Cluſ.* *Cluſius* his Sea Firr.

11 Vpon the rocks and ſhels of ſea fiſhes are to be found diuers ſmall plants, hauing reſemblance to others that grow vpon the land; and *Cluſius* ſaith, vpon the coaſt of the Low countries he obſerued one which very much reſembled the Fir-tree, hauing branches growing orderly on both ſides, but thoſe very brittle and ſmall, ſeldome exceeding a handfull in height, and couered as it were with many ſmall ſcales. He obſerued others that reſembled Cypreſſe trees, and other branches that reſembled Tameriske or heath. ‡

¶ *The*

¶ *The Place.*

Theſe Moſſes grow in the ſea vpon the rocks, and are oftentimes found vpon Oiſter ſhels, Muſkell ſhells, and vpon ſtones: I found very great plenty thereof vnder Reculuers and Margate, in the Ile of Thanet; and in other places alongſt the ſands from thence vnto Douer.

¶ *The Time.*

The time anſwereth the other Moſſes, and are found at all times of the yeare.

¶ *The Names.*

Sea Moſſe is called in Greeke βρύον θαλάσσιον: in Latine, *Muſcus marinus*: of the Apothecaries, Italians, and French men, *Corallina*: in Spaniſh, *Malharquiana yerua*: in high Dutch, Meermoſz: in low Dutch, Zee Moſch: in Engliſh, Sea Moſſe, and of many Corallina, after the Apothecaries word, and it may be called Corall Moſſe. The titles diſtinguiſh the other kindes.

¶ *The Temperature.*

Corallina conſiſteth, as *Galen* ſaith, of an earthie and wateriſh eſſence, both of them cold: for by his taſte it bindeth, and being applied to any hot infirmitie, it alſo euidently cooleth: the earthie eſſence of this Moſſe hath in it alſo a certaine ſaltneſſe, by reaſon whereof likewiſe it drieth mightily.

¶ *The Vertues.*

Dioſcorides commendeth it to be good for the gout which hath need to be cooled. A

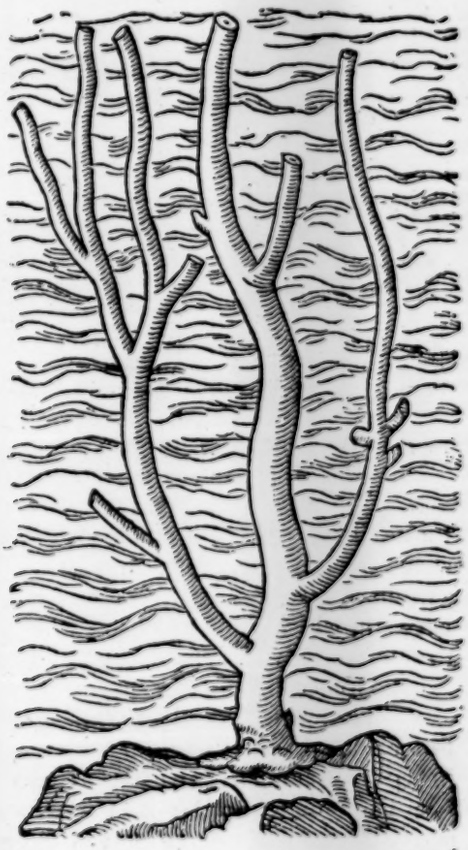
The later Phyſitions haue found by experience, that it killeth wormes in the belly; it is giuen to this purpoſe to children in the weight of a dram or thereabouts. B

That which cleaueth to Corall, and is of a reddiſh colour, is of ſome preferred and taken for the beſt: they count that which is whitiſh, to be the worſer. Notwithſtanding in the French Ocean, the Britain, the low countrey, or elſe in the Germane ocean ſea, there is ſcarce found any other than the whitiſh Coralline, which the nations neere adioyning do effectually vſe. C

Chap. 166. *Of Corall.*

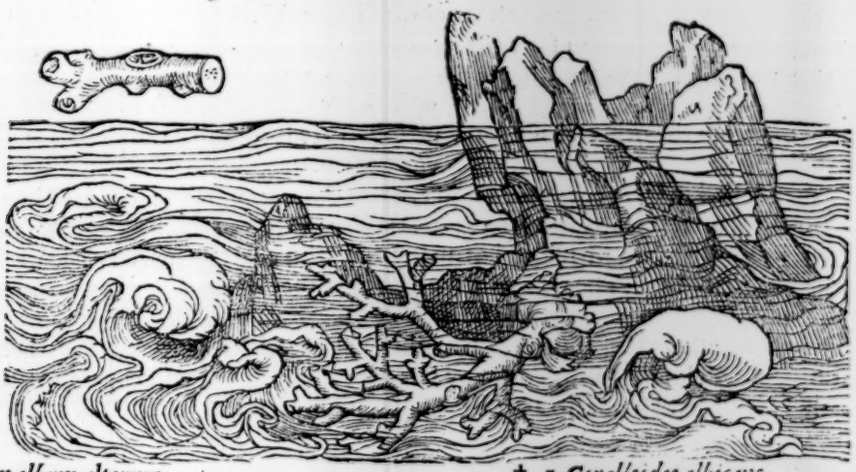
1 *Corallium rubrum.*
Red Corall.

2 *Corallium nigrum, ſive Antipathes.*
Blacke Corall.



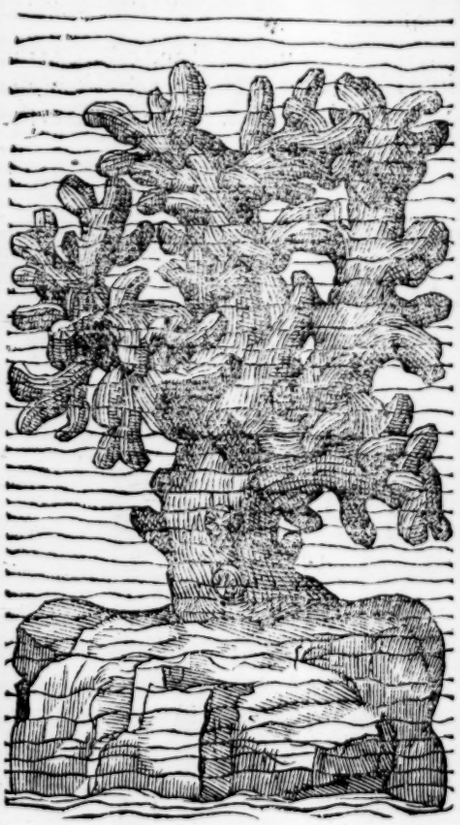
¶ *The*

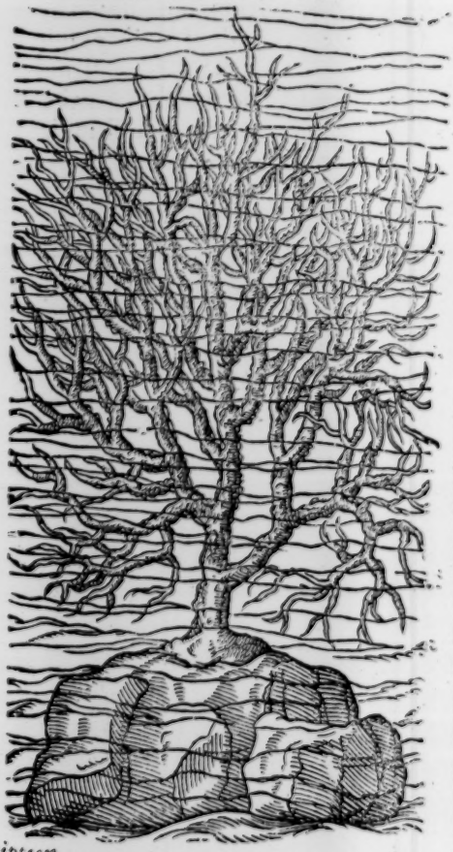
3 *Corallium album.* White Corrall.



4 *Corallium album alterum.*
The other white or yellow Corrall.

‡ 5 *Coralloides albicans.*
Whitiſh baſtard Corall.





¶ *The Deſcription.*

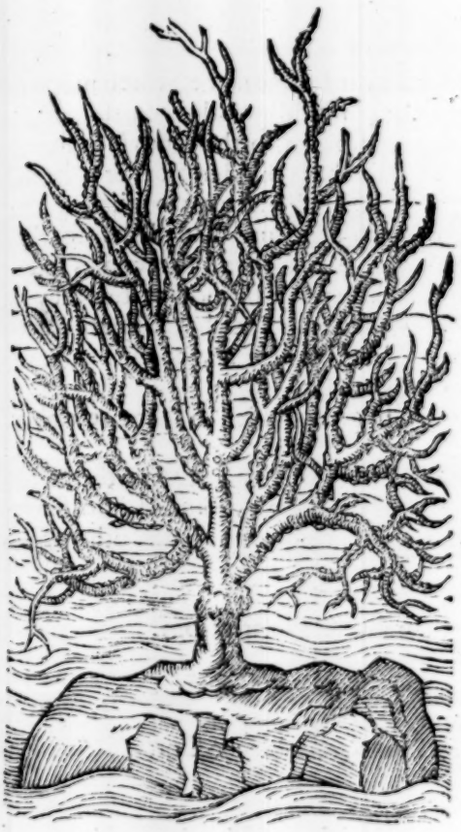
1 ALthough Corrall be a matter or ſubſtance, euen as hard as ſtones, yet I thinke it not amiſſe to place and inſert it here next vnto the moſſes, and the rather for that the kindes thereof do ſhew themſelues, as well in the maner of their growing, as in their place and forme, like vnto the Moſſes. This later age wherein we liue, hath found moe kindes hereof than euer were knowne or mentioned among the old writers. Some of theſe Corrals grow in the likeneſſe of a ſhrub, or ſtony matter; others in a ſtraight forme, with crags and ioints, ſuch as we ſee by experience: the which for that they are ſo well knowne, and in ſuch requeſt for Phyſicke, I will not ſtand to deſcribe; only this remember, that there is ſome Corrall of a pale yellow colour, as there be ſome red, and ſome white.

2 The blacke Corrall groweth vpon the rocks neere to the ſea about Maſſilia, in manner of the former; herein differing from it, in that this is of a ſhining blacke colour, and very ſmooth, growing vp rather like a tree, than like a ſhrub

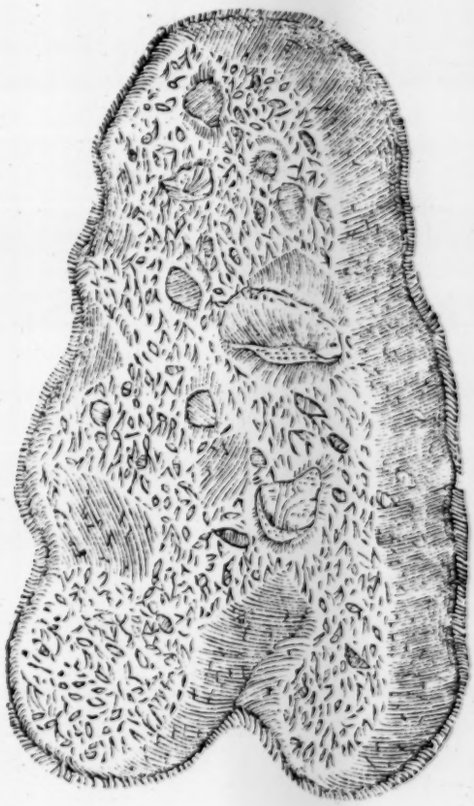
3 The white Corrall is like to the former, growing vpon the rocks neere the ſea, and in the Weſt parts of England, about Saint Michaels mount; but the branches hereof are ſmaller, and more brittle, finelier diſperſed into a number of branches, of a white colour.

4 The

‡ 6 *Coralloides rubens.*
Reddiſh baſtard Corall.



7 *Spongia marina alba.*
White Spunge.



‡ 8 *Spongia infundibuli forma.*
Funnell faſhioned Spunge.

‡ 9 *Spongia ramoſa.*
Branched Spunge.

4 The fourth and laſt groweth alſo vpon the Weſterne rocks of the ſea, and in the place aforenamed, and varieth his colour, ſometimes waxing white, ſometimes yellow, and ſometimes red.

‡ 5 This growes vp with many branches ſome two or three handfulls high; the inner part is a hard wooddy ſubſtance, which is couered ouer with a white and hard ſtony matter, ſo that it much reſembleth white Corall, but that it is neither ſo thicke, hard, nor ſmooth, but is rough

and bends eaſily without breaking, which Corall will not do. *Lobel* calls this *Corallina alba*, it growes in the Mediteranian ſea, and vpon the Coaſts of Spaine.

6 This in all reſpects is like the laſt deſcribed, the colour excepted, which is a darke red, and therefore better reſembles the red Corall. *Cluſius* refers both theſe to the *Quercus marina* mentioned by *Theophraſtus*, *Hiſt. plant. lib. 7. cap. 4.* ‡

7 There is found growing vpon the rockes neere vnto the ſea, a certaine matter wrought together, of the ſome or froth of the ſea, which we call ſpunges, after the Latine name, which may very fitly be inſerted among the ſea Moſſes, whereof to write at large would greatly increaſe our volume, and little profit the reader, conſidering we haſten to an end, and alſo that the vſe is ſo well knowne vnto all: therefore theſe few lines may ſerue vntill a further conſideration, or a ſecond Edition. ‡ Spunges are not like the *Alcyonium*, that is, an accidentall matter wrought together of the froth of the ſea, as our Author affirmes, but rather of a nobler nature than plants, for they are ſaid to haue ſence, and to contract themſelues at the approach of ones hand that comes to cut them vp, or for feare of any other harme-threatning obiect, and therefore by moſt writers they are referred to the ζωόφυτα which ſome render *Plantanimalia*, that is, ſuch as are neither abſolute plants, nor liuing creatures, but participate of both: they grow of diuers ſhapes and colours vpon the Rockes in the Mediterranian, as alſo in the Archipelago, or Ægean ſea.

8 *Cluſius* obſerued one yet adhering to the ſtone whereon it grew, which in ſhape reſembled a funnell, but in ſubſtance was like another Spunge.

9 There is alſo to be found vpon our Engliſh coaſt a ſmall kinde of ſpunge caſt vp by the ſea, and this is alſo of different ſhapes and colour, for the ſhape it is alwaies diuided into ſundry branches, but that after a different manner; and the colour is oft times browniſh, and otherwhiles gray or white. *Lobel* makes it *Conferuæ marinæ genus*. ‡

¶ *The Place.*

The place of their growing is ſufficiently ſpoken of in their ſeuerall deſcriptions.

¶ *The Time.*

The time anſwereth the other kindes of ſea Moſſes.

¶ *The Names.*

Corallium rubrum is called in Engliſh, red Corrall. *Corallium nigrum*, blacke Corrall. *Corallium album*, white Corrall.

¶ *The Temperature.*

Corrall bindeth, and meanely cooleth: it clenſeth the ſcars and ſpots of the eies, and is very effectuall againſt the iſſues of bloud, and eaſeth the difficultie of making water.

¶ *The Vertues.*

A Corrall drunke in wine or water, preſerueth from the ſpleene; and ſome hang it about the neckes of ſuch as haue the falling ſickeneſſe, and it is giuen in drinke for the ſame purpoſe.

B It is a ſoueraigne remedy to drie, to ſtop, and ſtay all iſſues of bloud whatſoeuer in man or woman, and the dyſentery.

C Burned Corrall drieth more than when it is vnburned, and being giuen to drinke in water, it helpeth the gripings of the belly, and the grieſes of the ſtone in the bladder.

D Corrall drunke in wine prouoketh ſleepe: but if the patient haue an ague, then it is with better ſucceſſe miniſtred in water, for the Corrall cooleth, and the water moiſtneth the body, by reaſon whereof it reſtraineth the burning heate in agues, and repreſſeth the vapours that hinder ſleepe.

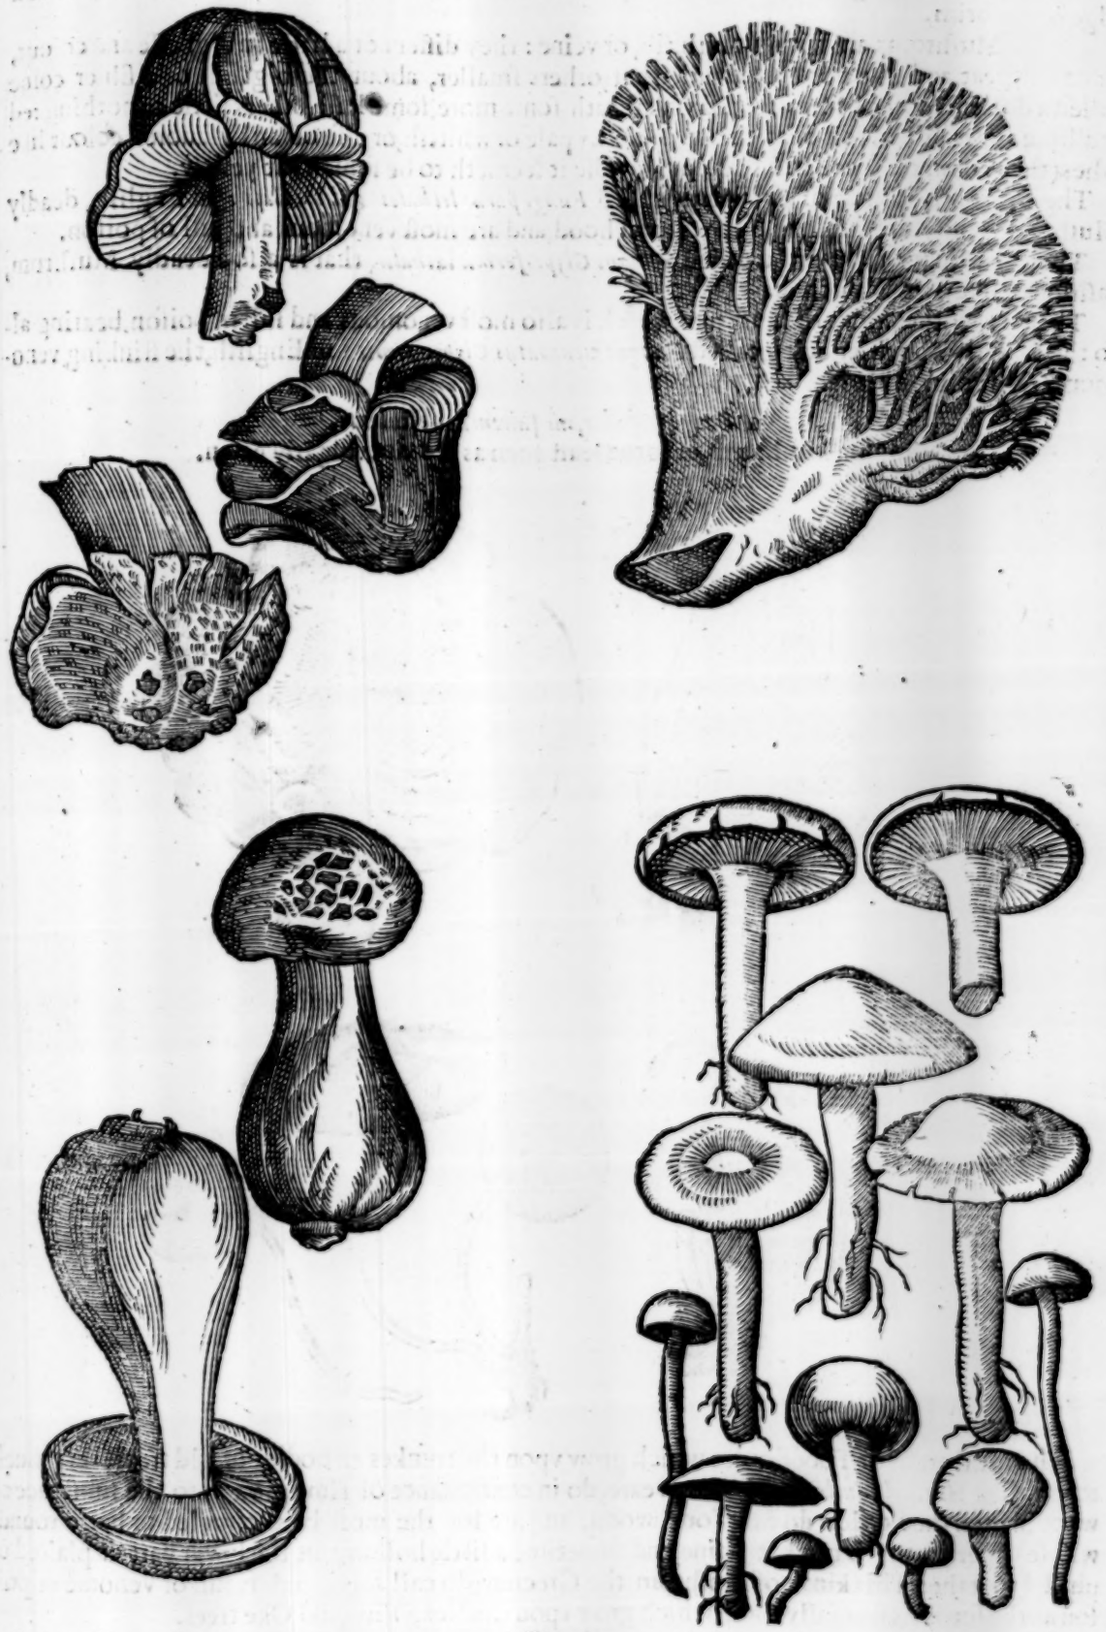
Chap. 167. *Of Muſhrumes, or Toadſtooles.*

¶ *The Kindes.*

Some Muſhrumes grow forth of the earth; other vpon the bodies of old trees, which differ altogether in kindes. Many wantons that dwell neere the ſea, and haue fiſh at will, are very deſirous for change of diet to feed vpon the birds of the mountaines; and ſuch as dwell vpon the hills or champion grounds, do longe after ſea fiſh; many that haue plenty of both, do hunger after the earthie excreſcences, called Muſhrumes: whereof ſome are very venomous and full of poiſon, others not ſo noiſome; and neither of them very wholeſome meate; wherefore for the auoiding of the venomous qualitie of the one, and that the other which is leſſe venomous may be diſcerned from it, I haue thought good to ſet forth their pictures with their names and places of growth. ‡ Becauſe the booke is already grown too voluminous, I will only giue you the figures of ſuch as my Author hath here mentioned, with ſome few others, but not trouble you with any more hiſtory, yet diſtinguiſh betweene ſuch as are eatable, and thoſe that be poyſonous, or at leaſt not to be eaten; for the firſt figured amongſt the poyſonous ones, is that we call Iewes-eare, which hath no poyſonous facultie in it. *Cluſius* (all whoſe figures I could haue here giuen you) hath written a peculiar tract of theſe baſtard plants, or excreſcences, where ſuch as deſire it may finde them ſufficiently diſcourſed of. ‡

¶ *The*

1 *Fungi vulgatiſſimi eſculenti.* Common Muſhrums to be eaten.



¶ *The Deſcription.*

1 GRound Muſhrums grow vp in one night, ſtanding vpon a thicke and round ſtalke, like vnto a broad hat or buckler, of a very white colour vntil it begin to wither, at what time it loſeth his faire white, declining to yellowneſſe: the lower ſide is ſomewhat hollow, ſet or decked with fine gutters, drawne along from the middle centre to the circumference or round edge of the brim.

2 All Muſhroms are without pith, rib, or veine: they differ not a little in bigneſſe and colour, ſome are great, and like a broad brimmed hat; others ſmaller, about the bigneſſe of a ſiluer coine called a doller: moſt of them are red vnderneath; ſome more, ſome leſſe; others little or nothing red at all: the vpper ſide which beareth out, is either pale or whitiſh, or elſe of an ill fauored colour like aſhes (they commonly call it Aſh colour) or elſe it ſeemeth to be ſomewhat yellow.

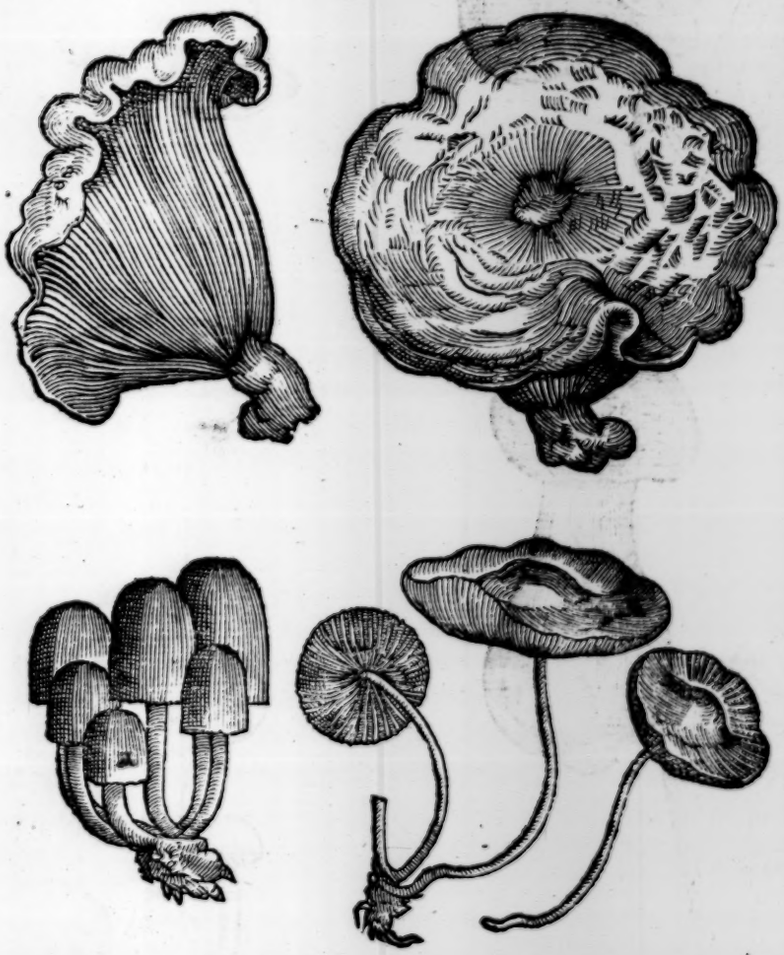
There is another kinde of Muſhrums called *Fungi parui lethales galericulati:* in Engliſh, deadly Muſhrums, which are faſhioned like vnto an hood, and are moſt venomous and full of poiſon.

There is a kinde of Muſhrum called *Fungus Clypeiformis lathalis*, that is alſo a deadly Muſhrum, faſhioned like a little buckler.

There is another kinde of Muſhrum, which is alſo moſt venomous and full of poiſon, bearing alſo the ſhape of a buckler, being called *Fungus venenatus Clypeiformis:* in Engliſh, the ſtinking venomous Muſhrom.

2 *Fungi lethales, aut ſaltem non eſculenti.*

Poyſon Muſhrums, or at the leaſt ſuch as are not vulgarly eaten.



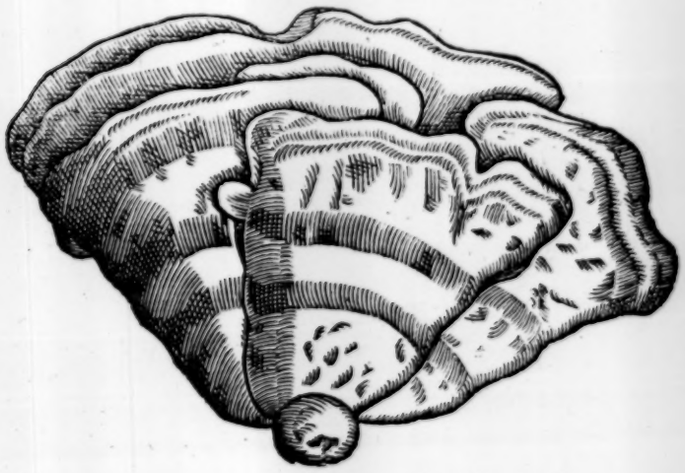
The Muſhrums or Toodſtooles which grow vpon the trunkes or bodies of old trees, very much reſembling *Auricula Iudæ*, that is Iewes eare, do in continuance of time grow vnto the ſubſtance of wood, which the Foulers do call Touchwood, and are for the moſt halfe circuled or halfe round, whoſe vpper part is ſomewhat plaine, and ſometime a little hollow, but the lower part is plaited or purſed together. This kinde of Muſhrum the Grecians do call ἀγαρικὸν, and is full of venome or poiſon as the former, eſpecially thoſe which grow vpon the Ilex, Oliue, and Oke trees.

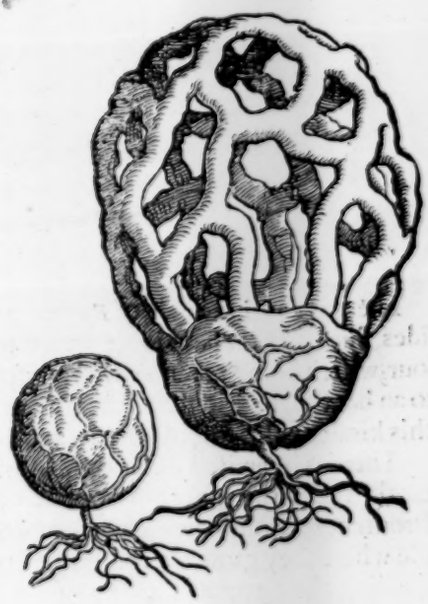
There is likewiſe a kinde of Muſhrum called *Fungus Fanaginoſus*, growing vp in moiſt and ſhadowie woods, which is alſo venomous, hauing a thicke and tuberous ſtalke, an handfull high, of a duskiſh colour, the top whereof is compact of many ſmall diuiſions, like vnto the hony combe.

There

Fungus ſambucinus, ſive Auricula Iudæ. Iewes eares.

Fungi lethales, ſiue non eſculenti. Poyſonous Muſhrums.

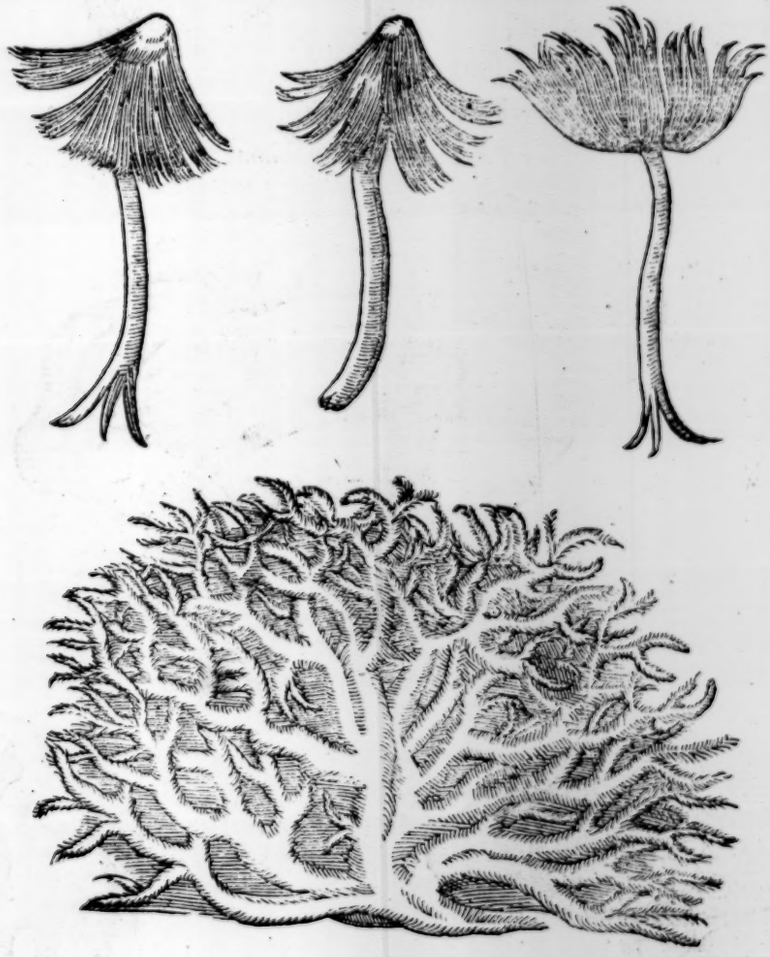




There is alſo found another, ſet forth vnder the title *Fungus virilis penis arecti forma*, which wee Engliſh, Pricke Muſhrum, taken from his forme.

3 *Fungus orbicularis*, or *Lupi crepitus*, ſome do call it *Lucernarum fungus*: in Engliſh, Fuſſe balls, Pucke Fuſſe, and Bulfiſts, with which in ſome places of England they vſe to kill or ſmolder their Bees, when they would driue the Hiues, and bereaue the poore Bees of their meat, houſes, and liues: theſe are alſo vſed in ſome places where neighbours dwell far aſunder, to carry and reſerue fire from place to place, whereof it tooke the name, *Lucernarum Fungus*: in forme they are very round, ſticking and cleauing vnto the ground, without any ſtalks or ſtems; at the firſt white, but afterward of a duskiſh colour, hauing no hole or breach in them, whereby a man may ſee into them, which being troden vpon do breath forth a moſt thin and fine pouder, like vnto ſmoke, very noiſome and hurtfull vnto the eies, cauſing a kinde of blindneſſe, which is called Poor-blinde, or Sand-blinde.

Fungi lethales, ſive non eſculenti. Poiſonous Muſhrums.



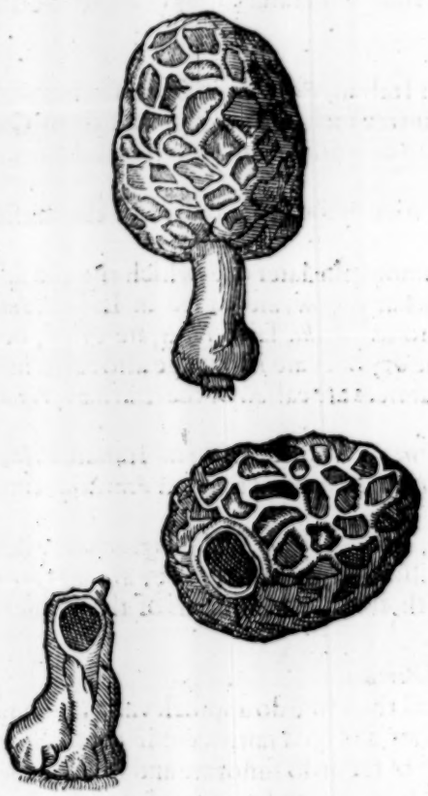
There is another kinde of *Fungus*, or Muſhrum, which groweth in moiſt medowes, and by ditch ſides, fiue or ſix inches high, couered ouer with a skin like a piece of ſheepes leather, of a ruſſet colour; which being taken away there appeareth a long and white ſtumpe, in forme not much vnlike to an handle, mentioned in the title, or like vnto the white and tender ſtalke of Aron, but greater: this kinde is alſo full of venome and poiſon.

There is likewiſe a kinde of Muſhrum, with a certaine round excreſcence, growing within the earth, vnder the vpper cruſt or face of the ſame, in dry and grauelly grounds in Pannonia and the Prouinces adioining which do cauſe the ground to ſwel, and be full of hils like Mole-hils. The people where they grow, are conſtrained to dig them vp and caſt them abroad like as we do Mole-hils. ſpoiling their grounds, as Mole-hils are hurtfull vnto our ſoile: theſe haue neither ſtalks, leaues, fibres nor ſtrings annexed or faſtened vnto them, and for the moſt part are of a reddiſh colour, but within of a whitiſh yellow: the Grecians haue called this tuberous excreſcence, *Idna*, and the Latines *Tubera*: the Spaniards do call them *Turmas de tierra*: in Engliſh wee may call them Spaniſh Fuſſe bals.

¶ *The Place.*

Muſhrums come vp about the roots of trees, in graſſie places of medowes, and Ley Land newly turned

Fungus fauiginoſus.
Hony-comb'd Muſhrome.



Fungus Virilis Penis effigie.
Pricke Muſhrom.

Tubera terræ.
Fuſſe-balls, or Puckfiſts.

turned; in woods alſo where the ground is ſandy, but yet dankiſh: they grow likewiſe out of wood, forth of the rotten bodies of trees, but they are vnprofitable and nothing worth. Poiſonſome Muſhroms, as *Dioſcorides* ſaith, groweth where old ruſty iron lieth, or rotten clouts, or neere to ſerpents dens, or roots of trees that bring forth venomous fruit. Diuers eſteeme thoſe for the beſt which grow in medowes, and vpon mountaines and hilly places, as *Horace* ſaith, *lib. ſer. 2. ſatyr. 4.*

——— *pratenſibus optima fungis*
Natura eſt, alijs malè creditur.

The medow Muſhroms are in kinde the beſt,
It is ill truſting any of the reſt.

¶ *The*

¶ *The Time.*

Diuers come vp in Aprill, and laſt not till May, for they flouriſh but whileſt Aprill continues: others grow later, about Auguſt; yet all of them after raine, and therefore they are found one yere ſooner, and another later. Muſhroms, ſaith *Pliny*, grow in ſhoures of raine: they come of the ſlime of trees, as the ſame Author affirmeth.

¶ *The Names.*

They are called in Latine, *Fungi*: in Greeke, μύκητες: in Italian, *Fonghi*: in Spaniſh, *Hungos*, *Cugumenos*: in French, *Campinion*, which word the low-Countrey men alſo vſe, and call them **Campernoellen**: in high-Dutch, **Schwemme**, **Pfifferling**: in Engliſh, Muſhroms, Toad-ſtooles, and Paddock-ſtooles.

The Muſhroms that come vp in Aprill are called in Latine of ſome, *Spongiolæ*: of the Italians, *Prignoli*: and in high-Dutch, **Morchel.**

They that are of a light red are called of ſome *Boleti*, among the later ones which riſe and fall away in ſeuen dayes. The white, or thoſe which be ſomewhat yellow, are called in Latine, *Suilli*: which the later Phyſitions name *Porcini*, or Swine Muſhroms. *Suilli*, ſaith *Pliny*, are dried, being hanged vpon ruſhes, which are thruſt through them. The dry ones are in our age alſo eaten in Bohemia and Auſtria: they that grow by the roots of Poplar trees are called of the Latines, *Populnei*, Poplar Muſhroms.

Puffes-fiſts are commonly called in Latine, *Lupi crepitus*, or **Wolfes fiſts**: in Italian, *Veſcie de Lupo*: in Engliſh, Puffes-fiſts, and Fuſſe-balls in the North. *Pliny* nameth them *Pezicæ*, as though he ſhould ſay, flat.

Tree Muſhroms be called in Greeke, μυκήτες: in Latine, *Fungi arborum*, and *Fungi arborei*: in Engliſh, tree Muſhroms, or Touch-wood: in high-Dutch alſo **Schwemme.** They are all thought to be poiſonſome, being inwardly taken. *Nicander* writeth, that the Muſhroms of the Oliue tree, the Ilex tree, and of the Oke tree bring death.

¶ *The Temperature and Vertues.*

A *Galen* affirmes, that they are all very cold and moiſt, and therefore do approch vnto a venomous and murthering facultie, and ingender a clammy, pituitous, and cold nutriment if they be eaten. To conclude, few of them are good to be eaten, and moſt of them do ſuffocate and ſtrangle the eater. Therefore I giue my aduice vnto thoſe that loue ſuch ſtrange and new fangled meates, to beware of licking honey among thornes, leſt the ſweetneſſe of the one do not counteruaile the ſharpneſſe and pricking of the other.

B Fuſſe-balls are no way eaten: the pouder of them doth dry without biting: it is fitly applied to merigalls, kibed heeles, and ſuch like.

C In diuers parts of England where people dwell farre from neighbours, they carry them kindled with fire, which laſteth long: whereupon they were called *Lucernarum Fungi*.

D The duſt or pouder hereof is very dangerous for the eyes, for it hath been often ſeen, that diuers haue been pore-blinde euer after, when ſome ſmall quantitie thereof hath been blowne into their eyes.

E The countrey people do vſe to kill or ſmother Bees with theſe Fuſſe-balls, being ſet on fire, for the which purpoſe it fitly ſerueth.

F ‡ The fungous excreſcence of the Elder, commonly called a Iewes eare, is much vſed againſt the inflammations and all other ſoreneſſes of the throat, being boiled in milke, ſteeped in beere, vineger, or any other conuenient liquor. ‡

Chap. 168.

Of great Tooth-wort, or Clownes Lung-wort.

¶ *The Deſcription.*

1 THere is often found among the Muſhroms a certaine kinde of excreſcence conſiſting of a jelly or ſoft ſubſtance, like that of the Muſhroms, and therefore it may the more fitly be here inſerted: it riſeth forth of the ground in forme like vnto *Orobanche*, or the Broome-Rape, and alſo in ſubſtance, hauing a tender, thicke, tuberous, or miſ-ſhapen body, conſiſting as it were of ſcales like teeth (whereof it tooke his name) of a duſty ſhining colour tending to purple. The ſtalke riſeth vp in the middle, garniſhed with little gaping hollow floures like thoſe of Satyrion; on the outſide of an ouerworne whitiſh colour: the whole plant reſembleth a rude forme of that jelly,

gellie, or ſlimie matter, found in the fields, which we call the falling of ſtars: the root is ſmall and tender.

2 There is alſo another ſort hereof found, not differing from the precedent: the chiefe difference conſiſteth in that, that this plant is altogether leſſer; ‡ and hath a root diuerſly diuaricated like Corall, white of colour, full of juice, and without any fibres annexed thereto ‡; in other reſpects like.

1 *Dentaria maior Mathioli.*
Great Toothwoort, or Lungwoort.

2 *Dentaria minor.*
Little Lungwoort.

¶ *The Place.*

Theſe plants do grow at the bottome of Elme trees, and ſuch like, in ſhadowie places: I found it growing in a lane called Eaſt-lane, vpon the right hand as ye go from Maidſtone in Kent vnto Cockes Heath, halfe a mile from the towne; and in other places thereabout: it doth alſo grow in the fields about Croidon, eſpecially about a place called Groutes, being the land of a worſhipfull Gentleman called M^r. *Garth*: and alſo in a wood in Kent neere Crayfoot, called Rowe, or Rough-hill: it groweth likewiſe neere Harwood in Lancaſhire, a mile from Whanley, in a wood called Talbot banke.

¶ *The Time.*

They flouriſh in May and Iune.

¶ *The Names.*

There is not any other name extant, more than is ſet forth in the deſcription.

¶ *The Temperature and Vertues.*

There is nothing extant of the faculties hereof, either of the ancient or later writers: neither haue we any thing of our owne experience; onely our countrie women do call it Lungwoort, and do vſe it againſt the cough, and all other imperfections of the lungs: but what benefit they reape thereby I know not; neither can any of iudgement giue me further inſtruction thereof.

Chap. 166. *Of Saunders.*

¶ *The Kindes.*

THe ancient Greekes haue not knowne the ſorts of Saunders: *Garcias* and others deſcribe three, *Album*, *Rubrum*, and *Pallidum*: which in ſhops is called *Citrinum*.

¶ *The*

¶ *The Deſcription.*

1 THe Saunders tree groweth to the bigneſſe of the Walnut-tree, garniſhed with many goodly branches; whereon are ſet leaues like thoſe of the Lentiske tree, alwaies greene; among which come forth very faire floures, of a blew colour tending to blacknesſe; after commeth the fruit of the bigneſſe of a Cherry, greene at the firſt, and blacke when it is ripe; without taſte, and ready to fall downe with euery little blaſt of winde: the timber or wood is of a white colour, and a very pleaſant ſmell.

2 There is likewiſe another which groweth very great, the floures and fruit agree with the other of his kinde: the wood is of a yellowiſh colour, wherein conſiſteth the difference.

‡ 3 The third ſort which wee call Red-Saunders is a very hard and ſollid wood, hauing little or no ſmell, the colour thereof is very red, it groweth not in thoſe places where the other grow, neither is the forme of the tree deſcribed by any that I know of, it is frequently vſed to colour ſauces, and for ſuch like vſes. ‡

¶ *The Place.*

The white and yellow Saunders grow naturally, and that in great aboundance, in an Iſland called Timor, and alſo in the Eaſt-Indies beyond the riuer Sanges or rather Ganges, which the Indians call *Hanga*, and alſo about Iaua, where it is of better odour than any that groweth elſewhere.

The red Saunders growes within the riuer Ganges, eſpecially about Tanaſarim, and in the marriſh grounds about Charamandell: *Auicen*, *Serapio*, and moſt of the Mauritanians call it by a corrupt name, *Sandal*: in Timor, Malaca, and in places neere adioyning, *Chandama*: in Decan and Guzarate, *Sercanda*: in Latine, *Sandalum* and *Santalum*, adding thereto for the colour *album*, *flauum*, or *Citrinum*, and *rubrum*, that is, white, yellow, and red Saunders.

¶ *The Time.*

Theſe trees which are the white and yellow Saunders grow greene Winter and Sommer, and are not one knowne from another, but by the Indians themſelues, who haue taken very certaine notes and markes of them, becauſe they may the more ſpeedily diſtinguiſh them when the Mart commeth.

¶ *The Names.*

Their names haue been ſufficiently ſpoken of in their deſcriptions.

¶ *The Temperature.*

† Yellow and white Saunders are hot in the third degree, and dry in the ſecond. The redde Saunders are not ſo hot. †

¶ *The Vertues.*

A The Indians do vſe the decoction made in water, againſt hot burning agues, and the ouermuch flowing of the menſes, *Eriſipelas*, the gout, and all inflammations, eſpecially if it be mixed with the iuice of Nightſhade, Houſleeke, or Purſlane.

B The white Saunders mixed with Roſe water, and the temples bathed therewith, ceaſeth the paine of the megrim, and keepeth backe the flowing of humours to the eies.

C *Auicen* affirmeth it to be good for all paſſions of the hart, and maketh it glad and merry, and therefore good to be put in colliſes, iellies, and all delicate meates which are made to ſtrengthen and reuiue the ſpirits.

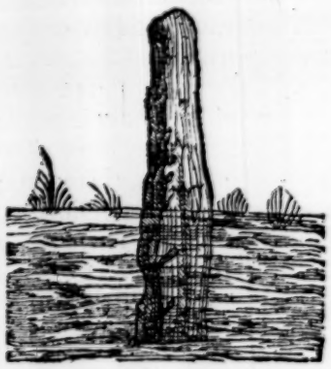
D ‡ Red Saunders haue an aſtrictiue and ſtrengthning facultie, but are not cordiall as the other two, they are vſed in diuers medicines and meates both for their facultie and pleaſing red colour which they giue to them. ‡

Chap. 170. *Of Stony wood, or wood made Stones.*

¶ *The Deſcription.*

AMong the wonders of England this is one of great admiration, and contrarie vnto mans reaſon and capacitie, that there ſhould be a kinde of wood alterable into the hardneſſe of a ſtone called Stonie wood, or rather a kinde of water, which hardneth wood and other things, into the nature and matter of ſtones. But we know that the workes of God are wonderfull,

Lignum Lapideum, ſiue in Lapides conuerſum.
Stonie wood, or wood made ſtones.



wonderfull, if we doe but narrowly ſearch the leaſt of them, which we dayly behold; much more if we turne our eyes vpon thoſe that are ſeldome ſeene, and knowne but of a few, and that of ſuch as haue painfully trauelled in the ſecrets of Nature. This ſtrange alteration of nature is to be ſeene in ſundry parts of England & Wales, through the qualities of ſome waters and earth, which change ſuch things into ſtone as do fall therein, or which are of purpoſe for triall put into them. In the North part of England there is a Well neere vnto Knaesborough, which will change any thing into ſtone, whether it be wood, timber, leaues of trees, moſſe, leather gloues, or ſuch like. There be diuers places in Bedfordſhire, Warwickſhire, and Wales, where there is ground of that qualitie, that if a ſtake be driuen into it, that part of the ſtake which is within the ground will be a firme and hard ſtone, and all that which is aboue the ground retaineth his former ſubſtance and nature. Alſo my ſelfe being at Rougby (about ſuch time as our fantaſticke people did with great concourſe and multitudes repaire and run headlong vnto the ſacred Wells of *Newnam Regis*, in the edge of Warwickſhire, as vnto the water of life, which could cure all diſeaſes) I went from thence vnto theſe Wells, where I found growing ouer the ſame a faire Aſh tree, whoſe boughes did hang ouer the ſpring of water, whereof ſome that were ſeare and rotten, and ſome that of purpoſe were broken off, fell into the water, and were all turned into ſtones. Of theſe boughes or parts of the tree I brought into London, which when I had broken in pieces, therein might be ſeene, that the pith and all the reſt was turned into ſtones; yea many buds and flourings of the tree falling into the ſaid water, were alſo turned into hard ſtones, ſtill retaining the ſame ſhape and faſhion that they were of before they were in the water. I doubt not but if this water were proued about the hardning of ſome Confections Phyſicall, for the preſeruation of them, or other ſpecial ends, it would offer greater occaſion of admiration for the health and benefit of mankinde, than it doth about ſuch things as already haue been experimented, tending to very little purpoſe.

Chap. 171.

Of the Gooſe tree, Barnacle tree, or the tree bearing Geeſe.

Britannica Conchæ anatiferæ.
The breed of Barnacles.

¶ The

¶ *The Deſcription.*

HAuing trauelled from the Graſſes growing in the bottome of the fenny waters, the Woods, and mountaines, euen vnto Libanus it ſelfe; and alſo the ſea, and bowels of the ſame, wee are arriued at the end of our Hiſtorie; thinking it not impertinent to the concluſion of the ſame, to end with one of the maruells of this land (we may ſay of the world.) The hiſtorie whereof to ſet forth according to the worthineſſe and raritie thereof, would not only require a large and peculiar volume, but alſo a deeper ſearch into the bowels of nature, than my intended purpoſe wil ſuffer me to wade into, my ſufficiencie alſo conſidered; leauing the hiſtorie thereof rough hewen, vnto ſome excellent men, learned in the ſecrets of nature, to be both fined and refined: in the mean ſpace take it as it falleth out, the naked and bare truth, though vnpoliſhed. There are found in the North parts of Scotland and the Iſlands adiacent, called Orchades, certain trees whereon do grow certaine ſhells of a white colour tending to ruſſet, wherein are contained little liuing creatures: which ſhells in time of maturitie do open, and out of them grow thoſe little liuing things, which falling into the water do become fowles, which we call Barnakles; in the North of England, brant Geeſe; and in Lancaſhire, tree Geeſe: but the other that do fall vpon the land periſh and come to nothing. Thus much by the writings of others, and alſo from the mouths of people of thoſe parts, which may very well accord with truth.

But what our eyes haue ſeene, and hands haue touched we ſhall declare. There is a ſmall Iſland in Lancaſhire called the Pile of Foulders, wherein are found the broken pieces of old and bruiſed ſhips, ſome whereof haue been caſt thither by ſhipwracke, and alſo the trunks and bodies with the branches of old and rotten trees, caſt vp there likewiſe; whereon is found a certaine ſpume or froth that in time breedeth vnto certaine ſhels, in ſhape like thoſe of the Muskle, but ſharper pointed, and of a whitiſh colour: wherein is contained a thing in forme like a lace of ſilke finely wouen as it were together, of a whitiſh colour, one end whereof is faſtned vnto the inſide of the ſhell, euen as the fiſh of Oiſters and Muskles are: the other end is made faſt vnto the belly of a rude maſſe or lumpe, which in time commeth to the ſhape and forme of a Bird: when it is perfectly formed the ſhell gapeth open, and the firſt thing that appeareth is the foreſaid lace or ſtring; next come the legs of the bird hanging out, and as it groweth greater it openeth the ſhell by degrees, til at length it is all come forth, and hangeth onely by the bill: in ſhort ſpace after it commeth to full maturitie, and falleth into the ſea, where it gathereth feathers, and groweth to a fowle bigger than a Mallard, and leſſer than a Gooſe, hauing blacke legs and bill or beake, and feathers blacke and white, ſpotted in ſuch manner as is our Mag-Pie, called in ſome places a Pie-Annet, which the people of Lancaſhire call by no other name than a tree Gooſe: which place aforeſaid, and all thoſe parts adioyning do ſo much abound therewith, that one of the beſt is bought for three pence. For the truth hereof, if any doubt, may it pleaſe them to repaire vnto me, and I ſhall ſatisfie them by the teſtimonie of good witneſſes.

Moreouer, it ſhould ſeeme that there is another ſort hereof; the hiſtorie of which is true, and of mine owne knowledge: for trauelling vpon the ſhore of our Engliſh coaſt betweene Douer and Rumney, I found the trunke of an old rotten tree, which (with ſome helpe that I procured by Fiſhermens wiues that were there attending their husbands returne from the ſea) we drew out of the water vpon dry land: vpon this rotten tree I found growing many thouſands of long crimſon bladders, in ſhape like vnto puddings newly filled, before they be ſodden, which were very cleere and ſhining; at the nether end whereof did grow a ſhell fiſh, faſhioned ſomewhat like a ſmall Muskle, but much whiter, reſembling a ſhell fiſh that groweth vpon the rockes about Garnſey and Garſey, called a Lympit: many of theſe ſhells I brought with me to London, which after I had opened I found in them liuing things without forme or ſhape; in others which were neerer come to ripenes I found liuing things that were very naked, in ſhape like a Bird: in others, the Birds couered with ſoft downe, the ſhell halfe open, and the Bird ready to fall out, which no doubt were the Fowles called Barnakles. I dare not abſolutely auouch euery circumſtance of the firſt part of this hiſtory, concerning the tree that beareth thoſe buds aforeſaid, but will leaue it to a further conſideration; howbeit that which I haue ſeene with mine eyes, and handled with mine hands, I dare confidently auouch, and boldly put downe for veritie. Now if any will obiect, that this tree which I ſaw might be one of thoſe before mentioned, which either by the waues of the ſea or ſome violent wind had been ouerturned, as many other trees are; or that any trees falling into thoſe ſeas about the Orchades, will of themſelues beare the like fowles, by reaſon of thoſe ſeas and waters, theſe being ſo probable coniectures, and likely to be true, I may not without preiudice gaineſay, or indeauour to confute.

‡ The Barnakle, whoſe fabulous breed my Author here ſets downe, and diuers others haue alſo

alſo deliuered, were found by ſome Hollanders to haue another originall, and that by egges, as other Birds haue: for they in their third voyage to finde out the North-Eaſt paſſage to China, and the Molucco's, about the eightieth degree and eleuen minutes of Northerly latitude, found two little Iſlands, in the one of which they found aboundance of theſe Geeſe ſitting vpon their egges, of which they got one Gooſe, and tooke away ſixty egges, &c. *Vide Pontani, Rerum & vrb. Amſteldam. Hiſt. lib. 2. cap. 22.* Now the ſhells out of which theſe birds were thought to fly, are a kinde of *Balanus marinus*; and thus *Fabius Columna*, in the end of his *Phytobaſanos*, writing *piſcium aliquot hiſtoria*, iudiciouſly proues: to whoſe opinion I wholly ſubſcribe, and to it I refer the Curious. His aſſeueration is this: *Conchas vulgò Anatiferas, non eſſe fructus terreſtres, neque ex ijs Anates oriri; ſed Balani marinæ ſpeciem.* I could haue ſaid ſomthing more hereof, but thus much I thinke may ſerue, together with that which *Fabius Columna* hath written vpon this point. ‡

¶ *The Place.*

The borders and rotten plankes whereon are found theſe ſhels wherein is bred the Barnakle, are taken vp in a ſmall Iſland adioyning to Lancaſhire, halfe a mile from the maine land, called the Pile of Foulders.

¶ *The Time.*

They ſpawne as it were in March and Aprill; the Geeſe are formed in May and Iune, and come to fulneſſe of feathers in the moneth after.

And thus hauing through Gods aſſiſtance diſcourſed ſomewhat at large of Graſſes, Herbes, Shrubs, Trees, and Moſſes, and certaine Excreſcences of the earth, with other things moe, incident to the hiſtorie thereof, we conclude and end our preſent Volume, with this wonder of England. For the which Gods name be euer honored and praiſed.

FINIS.

AN APPENDIX OR ADDITION OF certaine Plants omitted in the former Hiſtorie.

The Preface.

HAuing run through the Hiſtorie of Plants gathered by Mr. *Gerrard*, and much enlarged the ſame both by the addition of many Figures and hiſtories of Plants not formerly contained in it, and by the amending and encreaſing the hiſtorie of ſundry of thoſe which before were therein treated of; I finde that I haue forgotten diuers which I intended to haue added in their fitting places: the occaſion hereof hath beene, my many buſineſſes, the troubleſomeneſſe, and aboue all, the great expectation and haſt of the Worke, whereby I was forced to performe this task within the compaſſe of a yeare. Now being conſtant to my firſt reſolution, I here haue, as time would giue me leaue, and my memorie ſerue, made a briefe collection and addition (though without method) of ſuch as offered themſelues vnto me; and without doubt there are ſundrie others which are as fitting to be added as thoſe; and I ſhould not haue been wanting, if time would haue permitted me to haue entred into further conſideration of them. In the meane time take in good part thoſe that I haue here preſented to your view.

CHAP. I. *Of the Maracoc or Paſſion-floure.*

¶ *The Deſcription.*

THis Plant, which the Spaniards in the Weſt Indies call *Granadilla*, becauſe the fruit ſomewhat reſembles a Pomegranat, which in their tongue they term *Granadas*, is the ſame which the Virginians call *Maracoc*. The Spaniſh Friers for ſome imaginarie reſemblances in the floure, firſt called it *Flos Paſſionis*, the Paſſion floure, and in a counterfeit figure, by adding what was wanting, they made it as it were an Epitome of our Sauiours Paſſion: thus ſuperſtitious perſons *ſemper ſibi ſomnium fingunt*. *Bauhine* deſirous to refer it to ſome ſtock or kindred of formerly knowne plants, giues it the name of *Clematis trifolia*: yet the floures and fruit pronounce it not properly belonging to their Tribe; but *Clematis* being a certaine generick name to all wooddy winding plants, this as a ſpecies may come vnder the denomination, though little in other reſpects participating with them. The roots of this are long, ſomewhat like, yet thicker than thoſe of *Sarſaparilla*, running vp and downe, and putting vp their heads in ſeuerall places: from theſe roots riſe vp many long winding round ſtalkes, which grow two, three, foure, or more yards high, according to the heate and ſeaſonableneſſe of the yeare and ſoile whereas they are planted: vpon theſe ſtalkes grow many leaues diuided into three parts, ſharpe pointed, and ſnipt about the edges: commonly out of the boſomes of each of the vppermoſt leaues there groweth a claſping tendrell and a floure: the floure growes vpon a little foot-ſtalke ſome two inches long, and is of a longiſh cornered forme, with fiue little crooked hornes at the top, before ſuch time as it open it ſelfe, but opened, this longiſh head diuides it ſelfe into ten parts, and ſuſtaines the leaues of the floure, which are very many, long, ſharpe pointed, narrow, and orderly ſpred open one by another, ſome lying ſtraight, others crooked: theſe leaues are of colour whitiſh, but thicke ſpotted with a Peach colour, and towards the bottome it hath a ring of a perfect Peach colour, and aboue and beneath it a white circle, which giue a great grace to the floure; in the middeſt whereof riſes an vmbrane, which parts it ſelfe into foure or fiue crooked ſpotted hornes, with broadiſh heads: from

the midſt of theſe riſes another roundiſh head which carries three nailes or hornes, biggeſt aboue, and ſmalleſt at their lower end: this floure with vs is neuer ſucceeded by any fruit, but in the Weſt Indies, whereas it naturally growes, it beares a fruit, when it is ripe of the bigneſſe and colour of Pomegranats, but it wants ſuch a ring or crown about the top as they haue; the rinde alſo is much thinner and tenderer, the pulpe is whitiſh, and without taſte, but the liquor is ſomwhat tart: they open them as they do egges, and the liquor is ſupped off with great delight, both by the Indians and Spaniards, (as *Monardus* witneſſeth) neither if they ſup off many of them ſhall they find their ſtomack oppreſt, but rather their bellies are gently looſned. In this fruit are contained many ſeeds ſomwhat like Peare kernells, but more cornered and rough.

Clematis trifolia, ſiue Flos Paſſionis.
The Maracoc or Paſſion-floure.

This growes wilde in moſt of the hot countries of America, from whence it hath been brought into our Engliſh gardens, where it growes very well, but floures only in ſome few places, and in hot and ſeaſonable yeares: it is in good plenty growing with Miſtreſſe *Tuggy* at Weſtminſter, where I haue ſome yeares ſeene it beare a great many floures.

CHAP. 2. *Of Ribes or red Currans.*

¶ *The Deſcription.*

1 THe plant which carries the fruit which we commonly terme red Currans, is a ſhrubbie buſh of the bigneſſe of a Gooſeberry buſh, but without prickles: the wood is ſoft and white, with a pretty large pith in the middle: it is couered with a double barke, the vndermoſt, being the thicker, is greene, and the vppermoſt, which ſometimes chaps and pills off, is of a browniſh colour,

colour,and ſmooth: the barke of the yongeſt ſhoots is whitiſh and rough: the leaues,which grow vpon footſtalkes ſome two inches long, are ſomewhat like Vine leaues, but ſmaller by much, and leſſe cornered, being cut into three, and ſometimes,but ſeldomer,into fiue parts, ſomwhat thicke, with many veines running ouer them, greener aboue than they are below: out of the branches in Spring time grow ſtalkes hanging downe ſome ſix inches in length, carrying many little greeniſh floures, which are ſucceeded by little red berries, cleare and ſmooth,of the bigneſſe of the Whortle berries, of a pleaſant tart taſte. Of this kinde there is another, onely different from this in the fruit,which is twice ſo big as that of the common kind.

2 The buſh which beares the white Currans is commonly ſtraighter and bigger than the former: the leaues are leſſer, the floures whiter, and ſo alſo is the fruit, being cleare and tranſparent, with a little blackiſh rough end.

1 *Ribes vulgaris fructu rubro.*
Red Currans.

2 *Ribes fructu albo.*
White Currans.

3 Beſides theſe there is another,which differs little from the former in ſhape,yet grows ſomwhat higher,and hath leſſer leaues: the floures are of a purpliſh green colour, and are ſucceeded by fruit as big againe as the ordinary red,but of a ſtinking and ſomewhat loathing ſauour: the leaues alſo are not without this ſtinking ſmell.

¶ *The Place, Time, and Names.*

None of theſe grow wild with vs, but they are to be found plentifully growing in many gardens, eſpecially the two former, the red and the white.

The leaues and floures come forth in the Spring, and the fruit is ripe about Midſommer.

This plant is thought to haue been vnknowne to the antient Greekes: ſome thinke it the *Ribes* of the Arabian *Serapio* · *Fuchſius*, *Matthiolus*, and ſome other deny it; notwithſtanding *Dodonæus* affirmes it: neither is the controuerſie eaſily to be decided, becauſe the Author is briefe in the deſcription thereof, neither haue we his words but by the hand of a barbarous Tranſlator. Howeuer the ſhops of late time take it (the faculties conſenting thereto) for the true Ribes, and of the fruit hereof prepare their *Rob de Ribes*. *Dodonæus* calls it *Ribeſium*, *groſſularia rubra*,& *Groſſularia tranſmarina*; and they are diſtinguiſhed into three ſorts, *Rubra*, *Alba*, *Nigra Ribeſia*, red, white, and blacke Currans: the Germans call them **S. Johans traubell**, or **traublin**, and **S. Johans Beerlin**: the Dutch, **Beſſkins ouer Zee**: the Italians, *Vuetta roſſa*: the French, *Groiſſeles*, *Groiſelles d'outre mer*: the Bohemians, **Jahodi S. Jana**: the Engliſh, Red Currans: yet muſt they not be confounded

with those Currans which are brought from Zant, and the continent adioyning thereto, and which are vulgarly sold by our Grocers; for they are the fruit of a small Vine, and differ much from these.

The Temperature and Vertues.

A The berries of red Currans, as also of the white, are cold and dry in the end of the second degree, and haue some astriction, together with tenuitie of parts.

B They extinguish and mitigate feuerish heates, represse choler, temper the ouer-hot bloud, resist putrefaction, quench thirst, helpe the deiection of the appetite, stay cholericke vomitings and scourings, and helpe the Dysenterie proceeding of an hot cause.

C The iuice of these boiled to the height of honey, either with or without sugar (which is called *Rob de Ribes*) hath the same qualities, and conduces to the same purposes.

CHAP. 3. *Of Parsley Breake-stone, and bastard Rupturewort.*

1 *Percepier Anglorum Lob.*
Parsley Breake-stone.

2 *Polygonũ Herniariæ facie.*
Bastard Rupture-wort.

D

E

¶ *The Description.*

1 I Thought it was not altogether inconuenient to couple these two Plants together in one Chapter; first, because they are of one stature; and secondly, taken out of one and the same History of Plants, to wit, the *Aduersaria* of *Pena* and *Lobel*.

The first of these, which the Authors of the *Aduersaria* set forth by the name of *Percepier*, (and rather assert, than affirme to be the *Scandix* of the Antients) is by *Tabernamontanus* called *Scandix minor*: and by *Fabius Columna*, *Alchimilla montana minima*: it hath a small wooddy yellowish fibrous root, from which rise vp one, two, or more little stalks, seldome exceeding the height of an handfull, and these are round and hairy, and vpon them grow little roundish leaues, like the tender leaues of Cheruill, but hairy, and of a whitish green colour, fastned to the stalkes with short foot-stalkes, and hauing little eares at their setting on: the floures are small, greene, and fiue cornered, many clustering together at the setting on of the leaues: the seed is small, smooth, and yellowish: the stalks of this plant grow sometimes vpright, and otherwhiles they lean on the ground: it is to be found vpon diuers dry and barren grounds, as in Hide Parke, Tuthill fields, &c. It floures in May, and ripens the seed in Iune and Iuly. It seemes by the Authors of the *Aduersaria*, that in the West countrey about Bristow they call this Herbe Percepier; but our herbe women in Cheapside know it by the name of Parsley Breake-stone.

This is hot and dry, and of subtil parts: it vehemently and speedily moues vrine, and by some is kept in pickle, and eaten as a sallad.

The distilled water is also commended to be effectuall to moue vrine, and clense the kidnies of grauell.

2 The historie of this, by the forementioned Authors, *Aduers. pag.* 404. is thus set forth vnder this title, *Polygonium Herniariæ foliis & facie, peramplo radice Astragalitidi*: Neither (say they) ought this to be despised by such as are studious of the knowledge of Plants; for it is very little knowne, being a very small herbe lying along vpon the ground, and almost ouerwhelmed or couered with the grasse, hauing little branches very full of ioints: the little leaues and seeds are whitish, and very like those of *Herniaria* or Rupture-wort: the whole plant is white, hauing a very small and mossie floure: the root is larger than the smalnesse of the plant seemeth to require, hard, branched, diuersly turning and winding, and therefore hard to be plucked vp: the taste is dry and hottish. It growes vpon a large Plaine in Prouince, betweene the cities Arles and Selon. Thus much *Pena* and *Lobel*. I am deceiued, if some few yeares agone I was not shewed this plant, gathered in some part of this kingdome, but where, I am not able to affirme.

CHAP.

Chap. 4. *Of Heath Spurge and Rocke Roſe*

¶ *The Deſcription.*

1 THeſe Plants by right ſhould haue followed the hiſtorie of *Thymelæa*, for in ſhape and facultie they are not much vnlike it. The firſt is a low ſhrub, ſending from one root many branches of ſome cubit long, and theſe bending, flexible, and couered with an outer blackiſh barke, which comprehends another within, tough, and which may be diuided into fine threds: the leaues are like thoſe of *Chamælea*, yet leſſer, ſhorter and thicker, a little rough alſo, and growing about the branches in a certaine order: if you chew them they are gummie, bitter at the firſt, and afterwards hot and biting: the floures grow amongſt the leaues, longiſh, yellowiſh, and diuided at the end into foure little leaues: the fruit is ſaid to be like that of *Thymælea*, but of a blackiſh colour, the root is thicke and wooddie. It growes frequently in the kingdome of Granado and Valentia in Spaine, it floures in March and Aprill. The Herbariſts there terme it *Sanamunda*, and the common people, *Mierda-cruz*, by reaſon of the purging facultie.

1 *Sanamunda* 1. *Cluſ.*
Heath Spurge.

2 *Sanamunda* 2. *Cluſ.*
The ſecond Heath Spurge.

2 The other is a ſhrub ſome cubit high, hauing tough flexible branches couered with a denſe and thick barke, which, the outward rinde being taken away, ouer all the plant, but chiefely next the root, may be drawn into threds like Flax or Hemp: the vpper branches are ſet with thick, ſhort, fat, rough ſharp pointed leaues, of ſomwhat a ſaltiſh taſte at the firſt, afterwards of a hot & biting taſte: the floures are many, little and yellow: the root is thicke and wooddie like as that of the former: this growes vpon the ſea coaſt of Spaine, and on the mountaines nigh Granado, where they call it *Sanamunda*, and the common people about Gibraltar call it Burhalaga, and they only vſe it to heat their ouens with. It floures in Februarie. *Anguillara* called this, *Empetron: Cæſalpinus, Cneoron*, and in the *Hiſtoria Lugd.* it is the *Cneoron nigrum Myconi: Seſamoides minus: Dalechampij*, and *Phacoides, Oribaſij quibuſdam.*

3 This

3 This is bigger than either of the two former, hauing whiter and more flexible branches, whoſe barke is vnmeaſurably tough and hard to breake: the vpper branches are many, and thoſe very downie, and hanging downe their heads, ſet thicke with little leaues like Stone-crop, and of the like hot or burning facultie: the floures are like thoſe of the former; ſometimes greeniſh, otherwhiles yellow: *Cluſius* did not obſerue the fruit, but ſaith, it floured at the ſame time with the former, and grew in all the ſea coaſt, from the Straits of Gibralter, to the Pyrenæan mountaines. *Alfonſus Pantius* called this *Cneoron*: *Lobel* and *Tabernamontanus* call it *Erica Alexandrina*.

3 *Sanamunda 3. Cluſ.*
The third Heath Spurge.

4 *Cneoron Matthioli.*
Rocke Roſe.

4 This alſo may not vnfitly bee ioined to the former, for it hath many tender flexible tough branches commonly leaning or lying along vpon the ground, vponwhich without order grow leaues greeene, skinny, and like thoſe of the true *Thymelæa*; at firſt of an vngrate full, and afterwards of a bitter taſte, yet hauing none or very little acrimony (as far as may be perceiued by their taſte:) the floures grow vpon the tops of the branches ſix ſeuen or more together, conſiſting of foure little leaues of a reddiſh purple colour, very beautifull and well ſmelling, yet offending the head if they be long ſmelt vnto: theſe are ſucceeded by ſmall berries, of colour white, containing a round ſeed, couered with an aſh coloured skin. The root is long, of the thickeneſſe of ones little finger, ſometimes blackiſh, yet moſt commonly yellowiſh, tough, and ſmalleſt at the top where the branches come forth. It floures in Aprill and May, and ripens the fruit in Iune: it floures ſometimes thrice in the yeare, and ripens the fruit twiſe; for *Cluſius* affirmes that twiſe in one yeare he gathered ripe berries from one and the ſame plant. It growes plentifully vpon the mountainous places of Auſtria about Vienna; whither the countrey women bring the floures to the market in great plenty to ſell them to deck vp houſes: it grows alſo in the dry medowes by Frankford on the Mœne, where there is obſerued a variety with white floures. *Matthiolus* would haue this to be the *Cneoron album* of *Theophraſtus*: *Cordus* calls it *Thymelæa minor*: it is the *Cneoron alterum Matthioli*, and *Oleander ſyl. Auicennæ Myconi*, in the *Hiſt. Lugd.* The Germans call it **Stein Roſelin**: and wee may call it Rocke Roſe, or dwarfe Oleander.

5 This plant by *Bauhine* is called *Cneorum album folio oleæ argenteo molli*: and by *Dalechampius*, *Cneorum album*, which hath been the reaſon I haue put it here, although *Caſalpinus*, *Imperatus*, and *Plateau*,

5 *Cneorum album foliis argenteis.*
White Rocke Roſe.

Chamæbuxus flore Coluteæ.
Baſtard dwarfe box.

tean, who ſent it to *Cluſius*, would haue it to be and cal it *Dorycnium*: It is a ſhrubby herb ſending from one root many ſingle ſtalkes ſome halfe cubit or better high: the leaues which grow vpon the ſtalkes without order, are like thoſe of the Oliue, but ſomewhat narrower, and couered ouer with a ſoft ſiluer-like downineſſe: at the top of the ſtalks grow many flours cluſtering together, of the ſhape of thoſe of the leſſer Bindeweed, but white of colour. This growes wilde in ſome parts of Sicily, whence *Cæſalpinus* calls it *Dorychnium ex Sicilia.*

¶ *The Temperature and Vertues.*

The three firſt are very hot, and two firſt haue a ſtrong purging facultie, for taken in the weight of a dram with the decoction of Cicers they mightily purge by ſtoole, both flegme, choller, and alſo wateriſh humours, and they are often vſed for this purpoſe by the Countrey people in ſome parts of Spaine. A

The faculties of the reſt are not knowne, nor written of by any as yet.

Chap. 5. *Of Baſtard dwarfe Box.*

¶ *The Deſcription.*

THis which *Cluſius* for want of a name calls *Anonymos flore Coluteæ*: *Geſner* called *Chamæbuxus*: to which *Bauhine* addes *flore Coluteæ*; and *Beſler* in his *hortus Eyſtettenſis*, agreeable to the name I haue giuen it in Engliſh, calls it *Pſeudochamæbuxus*. It is a ſmall plant hauing many creping wooddy tough roots, here and there ſending forth ſmall fibers; from theſe ariſe many tough bending branches ſome ſpan long, hauing thicke ſharpe pointed greene leaues, almoſt like thoſe of Boxe, and theſe grow vpon the ſtalks without any order, and when you firſt chew them they are of an vngratefull taſte, afterwards bitter and hot; at the tops of the branches, do come forth amongſt the leaues three or foure longiſh floures, for the moſt part without ſmell; yet in ſome places they ſmell ſweet, like as ſome of the Narciſſes; they conſiſt of three leaues apiece; two whereof are white, and ſpread abroad as wings, a whitiſh little hood couering their lower ends: the third is wrapt vp in forme of a pipe, with the end hollow & crooked, and this

this is of a yellow colour, which by age oft times becomes wholly red: after those floures succeed cods, broad and flat, little lesse than those of the broad leaued *Thlaspi*, and greene of colour, rough, and in each of these cods are commonly contained a couple of seeds, of the bignes of little Chichlings, of a blackish ash colour, rough, and resembling a little dug.

This is sometimes found to vary, hauing the two winged leaues yellow or red, and the middle one yellow.

¶ *The Place.*

It floures in Aprill and May, and ripens the seed in Iune; it growes vpon most of the Austrian and Stirian Alpes, and in diuers places of Hungarie. It is neither vsed in Physicke, nor the faculties thereof in medicine knowne.

CHAP. 6. *Of Winged Bind weed, or Quamoclit*

Quamoclit, sive Conuoluulus Pennatus.
Winged Windeweed.

¶ *The Description.*

THe first that writ of and described this plant was *Caesalpinus*, & that by the name of *Gelsiminum rubrum alterum*: after him *Camerarius* gaue a description and figure therof in his *Hortus Medicus*, by the name of *Quamoclit*: and after him *Fabius Columna* both figured and described it more accurately, whose description is put to the figure of it (we here giue) in *Clus.* his *Curæ posteriores*. It is so tender a plant that it will not come to any perfection with vs, vnlesse in extraordinary hot yeres, and by other artificiall helps, wherefore I will borrow the description thereof out of *Fabius Columna*. This exoticke plant, saith he, cannot more fitly be referred to any kinde, than to the family of the *Conuoluuli*, or Bindweeds, for in the nature and whole habit it is almost like them, excepting the shape of the winged leaues: it is stored with lesse milk: the flours are long, hollow, but parted into fiue at the top, of a pleasing red colour, with streaked lines or folds, standing vpon long stalkes one or two together comming out of the bosomes of the leaues at each ioint of the branches, and they haue in them fiue yellowish pointalls; then succeeds a longish fruit standing in a scaly cup, ending in a sharp pointall, and couered with a tough skin, as that of the common *Convoluulus*, but lesser, hauing within it foure longish blacke hard seedes, of a biting taste. The leaues grow alternately out of the ioints of the purple winding branches, being winged and finely diuided, twise as small as the common *Rheseda*, of a darke greene colour, but the young ones are yellowish, first hauing a few diuisions, but afterwards more, till they come to haue thirteen on a side, and one at the top: but the lower ones are oft times forked: by reason of the great plenty of leaues and flouring stalks or branches, winding themselues about artificiall hoops, crossings, or other fashioned workes of Reeds, or the like, set for winding herbs to clime vpon, it much delights the eie of the beholder, and is therefore kept in pots in gardens of pleasure. The seed sowne in the beginning of the Spring growes vp in Iune, and the first leaues resemble the winged fruit of the Maple: it floures in the end of August, and ripens the seed in the end of September.

CHAP.

Chap. 7. *Of the ſenſitiue Herbe.*

Herba mimoſa.
The ſenſitiue berbe.

Eius exactior icon.
A perfect figure thereof.

¶ *The Deſcription.*

THis which I here call the ſenſitiue herbe, is that which *Chriſtopher a Coſta* ſets forth by the name of *Herba mimoſa*, or the Mocking herbe, becauſe when one puts his hand thereto it forthwith ſeemes to wither and hang downe the leaues; but when you take it away againe it recouers the priſtine greeneſſe and vigor. I wil here giue you that which *Acoſta* writes thereof, & the figure & hiſtorie which *Cluſius* giues in his notes vpon him; and alſo another figure better expreſſing the leaues and manner of growing. There is found (ſaith *Acoſta*) in ſome Gardens another plant ſome fiue handfuls long, reſting vpon the neighbouring ſhrubs or walls, hauing a ſlender ſtalke of a freſh greene colour, not very round, ſet at certaine ſpaces with ſmall and pricking thornes: the leaues are not vnlike the former, [That is, the *Herba viua*, which in condition is little different from this] being ſomewhat leſſer than thoſe of the female Ferne. It loues to grow in moiſt and ſtony places, and is called *Herba mimoſa*, for the reaſon formerly giuen. The nature hereof is much different from that of *Arbor triſtis* for euery night at Sun-ſet it as it were withers and dries, ſo that one would thinke it were dead, but at Sun-riſe it recouers the former vigor, and by how much the Sun growes hotter, by ſo much it becomes the greener, and all the day it turnes the leaues to the Sun.

This plant hath the ſmell and taſte of Liquorice, and the leaues are commonly eaten by the Indians againſt the cough, to cleanſe the cheſt, & cleare the voice: it is alſo thought good againſt the paines of the kidneies, and to heale greene wounds. Thus much *Acoſta*. A

Now, ſaith *Cluſius*, the leaues of many plants, eſpecially pulſes, vſe to contract or ſhrinke vp their leaues in the night time. Now I receiued a dry plant, which was ſent to me by the name of *Herba mimoſa*, by *Iames Garret* in the end of October, 1599, which he writ he had of the right Honourable the Earle of Cumberland, who returning from Saint *Iohn de Puerto rico* in the Weſt Indies, brought it put in a pot with ſome earth, but could not preſerue it aliue. But I cauſed the figure of that dried plant to be expreſſed as well as it might, ſo to fit it to the deſcription following, made alſo by the dried plant. This plant which was wholly drie and without leaues had a ſingle root, and that not thick, but hard and wooddy, with few fibres, from whence aroſe three or foure ſhort ſtalks, which ſtraight diuided themſelues into ſlender branches, which ſpread themſelues round about vpon the ground, at each ioint putting forth many long and ſlender fibres, like as in the branches of the common Woodbinde, which lye vpon the ground: theſe branches were a cubit long, and ſometimes more, round, tough, with ſome prickles, broader at their ſetting on, as you may ſee in the common bramble, yet leſſer, fewer, & leſſe firme; theſe againe were diuided into other more ſlender branches ſet with many little prickles, out of whoſe ioints betwixt two little leaues grew forth foot-ſtalks, bedeckt with their little leaues, which were many, ſet in order, with other to anſwer to them on the other ſide, but hauing no ſingle leafe at the end: they were tender & green, not vnlike the little leaues of *Acacia*, & theſe (at their firſt comming out) couered with a thin whitiſh hairines, as I gathered by a little branch retaining the foot-ſtalke and leaues thereon (which he ſent with the former) and it had alſo ſome fibres comming forth thereof. He alſo added to the former two little heads, which growing vpon the ſame plant, he writ he receiued of the

forementioned right Honorable Earle, with ſome branches yet retaining the leaues. Theſe little heads conſiſted of many ſlender, narrow, and as it were prickly little leaues; amongſt which lay hid round ſeeds, ſmooth, blacke, and ſomewhat ſwoln in the middle: the floures I ſaw not, neither know I whether they were brought with the reſt: but whether the leaues of this plant being green, & yet growing on the ground, do wither at the approch of ones hand, as *Chriſtopher A Coſta* writes, and for that cauſe impoſes the name thereon, they beſt know who haue ſeene the greene and yet growing plant: for the faculties you may haue recourſe to that which *A Coſta* hath ſet downe. Thus much out of *Cluſius*.

Novemb. 7. 1632. I being with M^r. *Iob Beſt* at the Trinity houſe in Ratcliffe; among other varieties, he ſhewed me a dry plant hereof, which I heedfully obſerued, and carefully opening out ſome of the faireſt leaues, which (as alſo the whole plant beſides) were careleſly dried, I found the leaues grew vſually ſome dozen or more on a foot-ſtalke, iuſt as many on one ſide as on the other; & they were couered ouer with a little downines, which ſtanding out on their edges made them look as if they had bin ſnipt about the edges, which they were not: alſo I found at euery ioint two little hooked prickles, & not two little leaues or appendices at the ſetting on of the foot-ſtalks, but three or foure little leaues, as the rudiment of a yong branch, comming forth at the boſom of each foot-ſtalk: the longeſt branch (as far as I remember) was not aboue a ſpan long; I then drew as perfect a figure as I could of the perfecteſt branch therof, drawing as neere as I could the leaues to their ful bigneſſe, the which I here preſent you withall. There are two figures formerly extant, the one this of *Cluſius*, which I here giue you, and the other in the 18. booke, & 144. chap. of the *Hiſt. Lug.* which is out of *A Coſta*, and this ſeeems to be ſo far different from that of *Cluſius*, that *Bauhine* in his *Pinax* ſaith, *Cluſius notis ſuis in Acoſtam diuerſam plane figuram propoſuit, herbam minoſam nominans*: but he did not wel conſider it, for if he had, he might haue found theſe ſo much different, thus far to agree, they both make the branches prickly & weak: the leaues many on one rib, one oppoſite to another without an odde one at the end: but *Cluſius* figures the leaues ſo cloſe together, that they ſeem but one leafe, and *Acoſta* makes them too far a ſunder, and both of them make them too ſharp pointed; *Cluſ.* made his be taken from a dried plant, and *Acoſta* I iudg made his by the Idæa thereof which he had in his memorie, and after this manner, if my iudgement faile me not, are moſt of the figures in him expreſt: but of this enough, if not too much.

CHAP. 8. *Of the Staffe tree, and euer-greene Priuet.*

1 *Celaſtrus Theophraſti.*
The ſtaffe tree.

2 *Phillyrea* 1. *Cluſ.*
Cluſius his 1. Mocke-Priuet.

¶ *The Deſcription.*

1 THe hiſtory and figure of this tree are ſet forth in *Cluſius* his *Curæ poſter.* and there it is aſſerted to be the κέλαστρος, or κέλαστρον of *Theophraſtus*; for by diuers places in *Theophraſtus* there collected, it is euident, that his *Celaſtus* was euer greene, grew vpon very high and cold mountaines, yet might be tranſplanted into plaine and milder places, that it floured exceeding late and could not perfect the fruit by reaſon of the nigh approch of winter, and that it was fit for no other vſe but to make ſtaues on for old men.

Now this tree growes but to a ſmall height, hauing a firme and hard body, diuiding it ſelfe at the top into ſundry branches, which being yonge are couered with a greene barke, but waxing old with a browniſh one; it hath many leaues, growing alwaies one againſt another, and thicke together, of a deepe ſhining greene aboue, and lighter vnderneath, keeping their verdure both Winter and Sommer: they are of the bigneſſe of thoſe of *Alaternus*, not ſnipt about the edges, but onely a little nickt, when they are yet yong; at the top of the tendereſt branches among the leaues, vpon footſtalkes of ſome inch long, grow fiue or ſix little floures conſiſting commonly of fiue little leaues of a yellowiſh greene colour, and theſe ſhew themſelues in the end of Autumne, or the beginning of Winter, and alſo in the beginning of the Spring; but if the Sommer be cold and moiſt it ſhewes the buds of the floures in October; the fruit growes on a ſhort ſtalke and is a berry of the bigneſſe of the Myrtle, firſt green, then red, of the colour of that of *Aſparagus*, and laſtly blacke when it is withered: the ſtone within the berry is little, and as it were three cornered, conteining a kernell couered with a yellow filme. Where this growes wilde I know not, but it was firſt taken notice of in the publike Garden at the Vniuerſitie of Leyden, from whence it was brought into ſome few gardens of this Kingdome.

2 The firſt *Phyllyria* of *Cluſius*, may fitly be refer'd to the reſt of the ſame tribe and name deſcribed formerly in the 59. chapter of the the third booke. It growes ſomewhat taller than the Scarlet Oke, and hath branches of the thickneſſe of ones thumbe or ſomewhat more, and thoſe couered with a greene barke marked with whitiſh ſpots; the leaues ſomewhat reſemble thoſe of the Scarlet Oke, but greater, greener, thicker, ſomewhat prickley about the edges, of an aſtringent taſte, but not vngratefull. The floure thereof *Cluſius* did not ſee, the fruit is a little blacke berry, hanging downe out from the boſome of the leaues, and conteining a kernell or ſtone therein. It growes wilde in many wilde places of Portugale, where they call it Azebo.

The temperature and vertues are refer'd to thoſe ſet downe in the formerly mentioned chapter.

CHAP. 9. *Of Mocke-Willow.*

Speiræa Theophraſti, Cluſ.
Mocke-Willow.

¶ *The Deſcription.*

THis Willow leaued ſhrub, which *Cluſius* conieCtures may be refer'd to the *Speiræa* mentioned by *Theophraſtus*, *lib.* 1. *cap.* 23. *hiſt. plant.* I haue named in Engliſh, Mocke-Willow, how fitly I know not, but if any will impoſe a fitter name I ſhall be well pleaſed therewith; but to the thing it ſelfe. It is a ſhrub, (ſaith *Cluſius*) ſome two cubits high, hauing ſlender branches or twigs couered ouer with a reddiſh barke, whereon grow many leaues without order, long, narrow, like thoſe of the Willow, ſnipt about the edges, of a light green aboue, and of a blewiſh greene vnderneath, of a drying taſte conjoyned with ſome bitternes. The tops of the branches for ſome fingers length carry thicke ſpikes of ſmall floures cluſtering together, and conſiſting of fiue leaues apiece, out of whoſe middle come forth many little threds of a whitiſh red or fleſh colour, together with the floure, hauing no peculiar

ſmell, but ſuch as is in the floure of the Oliue tree; theſe floures fading there ſucceed ſmall fiue cornered heads, which comming to full maturitie containe a ſmall and yellowiſh duſty ſeed: it floures in Iuly, and ripens the ſeed in the end of Auguſt. *Cluſius* had this plant from *Fredericke Sebizius* Phyſition to the Duke of Briga, and that from Briga in Sileſia, and he (as I ſaid) refers it to the Στυφὰξ of *Theophraſtus*, which he reckons amongſt the ſhrubs that carry ſpike faſhioned floures.

This is not vſed in medicine, nor the Temperature and faculties thereof as yet knowne.

CHAP. 10. *Of the Strawberry-Bay.*

Adrachne Theophraſti.
The Strawberry-Bay.

¶ *The Deſcription.*

THe figure and hiſtory of this were ſent by *Honorius Bellus* out of Candy to *Cluſius*, from whom I haue it. It is that which *Theophraſtus* calls *Adrachne* or (as moſt of the printed bookes haue it) *Andrachne*, but the former ſeemes the righter, and is the better liked by *Plinie*, *lib.* 1. *cap.* 22. At this day in Candy where it plentifully growes, it is called *Adracla*. It is rather a ſhrub than a tree, delighting in rockie and mountanous places, and keeping greene VVinter and Sommer, hauing leaues ſo like thoſe of Bayes, that they are diſtinguiſhable only by the ſmell, which theſe are deſtitute of. The barke of the bole and all the branches is ſo ſmooth, red and ſhining, that they ſhew like branches of Corall, this barke crackes or breakes off in Sommer, and pills off in thinne ſleakes, at which time it is neither red nor ſhining but in a meane betweene yellow and aſh-colour. It hath floures twice in a yeere like as the *Arbutus*, or Strawberry tree, and that ſo like it, that you can ſcarſe know the one from the other; yet this differs from it in that it growes onely in the mountaines, hath not the leaues jagged, neither a rough barke; the wood hereof is very hard, and ſo brittle that it will not bend, and they vſe it to burne and to make whorles for their womens ſpindles. *Theophraſtus* reckons vp this tree amongſt thoſe which die not when their barkes are taken off, and are alwaies greene, and retaine their leaues at their tops all winter long: which to be ſo *Honorius Bellus* obſerued. *Bellonius* alſo obſerued this tree in many places of Syria.

The fruit in Temperature, as in ſhape, is like that of the Stawberry-tree.

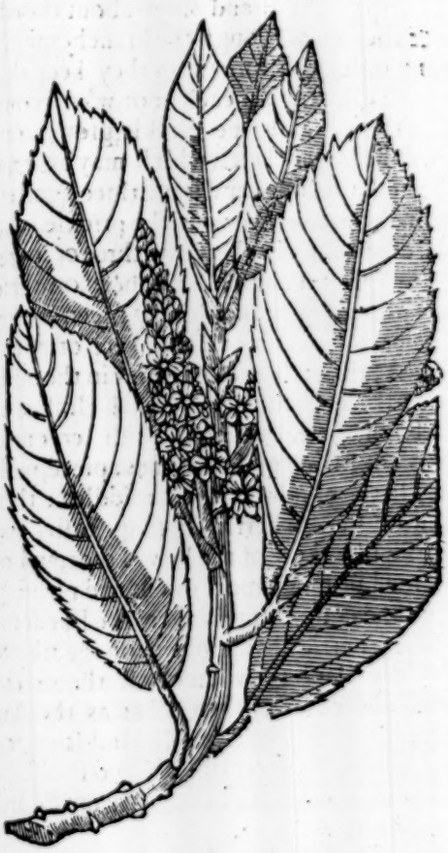
CHAP. 11. *Of the Cherry-Bay.*

¶ *The Deſcription.*

THe Cherry-bay is one of the euergreen trees: it riſes vp to an indifferent height, and is diuided into ſundry branches, couered ouer with a ſwart green barke: that of the yonger ſhoots is wholly greene.

green, the leaues alternately ingirt the branches, & they are long, ſmooth, thick, green and ſhining, ſnipt alſo lightly about the edges: when the tree is growne to ſome height, at the tops of the branches amongſt the leaues of the former yeares growth, vpon a ſprig of ſome fingers length, it puts forth a great many little white floures, conſiſting of fiue leaues a piece, with many little chiues in them: theſe floures quickly fall away, and the fruit that ſucceeds them is a berry of an ovall figure, of the bigneſſe of a large Cherry or Damſon, and of the ſame colour, and of a ſweet and pleaſant

Laurocerаſi flos.
The Cherry-bay in floure.



Laurocerаſi fructus.
The Cherry-bay with the fruit.

taſte, with a ſtone in it like to a Cherry ſtone. This floures in May, and ripens the fruit in Auguſt or September: it was firſt ſent to *Cluſius* from Conſtantinople, and that by the name of *Trabiſon curmaſi. 1. Trapezuntina dactylus*, the Date of Trapeſon; but it hath no affinitie with the Date. *Dalechampius* refers it to the ſecond *Lotus* mentioned by *Theophraſtus, hiſt. plant. lib. 4. cap. 4.* but therewith it doth not agree. *Cluſius* and moſt ſince, cal it fitly *Laurocerаſus*, or *Ceraſus folio Laurino*. It is now got into many of our choiſe Engliſh gardens, where it is well reſpected for the beauty of the leaues and their laſting or continuall greeneneſſe.

The fruit hereof is good to be eaten, but what phyſicall vertues the tree or leaues thereof haue, it is not yet knowne.

Chap. 12. *Of the Euer-greene Thorne.*

THis plant which *Lobel* and ſome other late writers haue called by the name of *Pyracantha*, is the *Oxyacantha* mentioned by *Theophraſtus, lib. 1. cap. 15. lib. 3. cap. 4. hiſt. plant.* among the euer-green trees, and I thinke rather this than our white Thorn to be the *Oxyacantha* of *Dioſcorides, lib. 1. c. 123.* and certainely it was no other than this Thorne which *Virgil* makes mention of by the name of *Acanthus, lib. 2. Georg.* in theſe words, *Et baccas ſemper frondentis Acanthi.* That is, And the berries of the Eue-greene Thorn.

Oxyacantha Theophrasti.
The Euer-greene Thorne.

¶ *The Description.*

THis growes vp like a bush, vnlesse you keepe it with pruning, and then it will in time grow to the height of a smal tree, as the Hawthorne, whereto it is of affinitie, for the wood is white and hard, like it, and couered ouer with the like barke; but the leaues are somwhat like those of the Damson tree, longish, sharp pointed, and snipt about the edges: & they grow alongst the branches, without any order, yet sometimes they keep this maner of growing: at each knot, where commonly there is a sharpe prickle, growes out one of the larger leaues, which may be some inch and halfe long, and some three quarters of an inch broad: then vpon the prickle, and at the comming out therof are three or foure, more or lesse, much smaller leaues: now these leaues are of a faire and shining green aboue, but paler vnderneath, and they keep on al the yeare: At the ends, and oft times in the middles of the branches come forth clusters or vmbels of little whitish blush coloured floures, consisting of fiue leaues apiece, with some little chiues in their middles: then follow clusters of berries, in shape, taste, and bigneſse like those of the Hawthorne, and of the same, but much more orient and pleasing colour, and containing in them the like seed: now these berries hang long vpon the tree, & make a gallant shew amongst the greene leaues, and chiefely then, when as the Autumne blasts haue depriued other trees of their wonted verdure. This floures in May and Iune, and ripens the fruit in September and October: it growes wilde in sundry places of Italy, and Prouince in France, but is kept in gardens with vs, where it is held in good esteeme for his euer greeneſse and pliableneſse to any worke or forme you desire to impose vpon him.

The fruit haue the same faculties that are formerly attributed to Hawes, in the foregoing booke, *pag.* 1328. and therefore I will not here repeat them.

CHAP. 13. *Of the Ægyptian Nap, or great Iuiubes tree.*

¶ *The Description.*

THis tree, which for his leaues and manner of growing I thinke may fitly be referred to the Iuiubes tree, is of two sorts; that is, the one prickly, and the other not prickly, in other respects they are both alike, so that one figure and historie may serue for them both; which I will giue you out of *Clusius*, who receiued this figure together with a description thereof from *Honorius Bellus*, and also added therto that which *Prosper Alpin.* hath written of it in his 5. chap. *de Plant. Ægypt.* It grows to the height of an indifferent Peare-tree, and the bodie and branches thereof are couered with a whitish ash coloured barke: the leaues are like those of the Iuiubes tree, two inches long, and one broad, with three nerues running alongst them; of a deepe shining greene aboue, and more whitish vnderneath: and they grow alternately vpon the branches: and at their comming forth grow tufts of little white floures hanging vpon single long foot-stalks: after these followes the fruit like vnto a small Apple, of the bigneſse for the most part of a large Cherry, and sometimes as big as a VValnut, of a sweet taste, containing therein a kernell or stone like that of an Oliue. It beares fruit twise a yeare, for it hath ripe fruit both in the Spring and fall; yet the vernall fruit seldom comes to good,

by

Oenoplia non ſpinoſa.
The great Iuiubes tree.

by reaſon of the too much moiſture of the ſeaſon, which cauſes it to become worme-eaten. The Thorny kinde is deſcribed by *Alpinus*, who rightly iudges it the *Connarus* of *Athenæus*, but the figure he giues is not very accurate. That which wants prickles growes (as well as the prickly one) in Ægypt and Syria, as alſo in the city Rhetimo in Candy, whither it was brought out of Syria.

The hiſtorie of both theſe trees is in *Serapio* by the name of *Sadar*: but he, according to his cuſtome confounds it with the *Lotus* of *Dioſcorides*, from which it very much differs. *Belonius* in his ſecond booke, and 79. chap. of his Obſeruations, reckons vp *Napeca* amongſt the trees that are alwaies greene: which is true, in thoſe that grow in Egypt and Syria; but falſe in ſuch as grow in Candy. That tree in Ægypt and Syria is called *Nep*, or *Nap*. *Alpinus* calls it *Paliurus Athenæi*, or *Nabca Ægyptiorum*, thinking it (as I formerly ſaid) the *Connarus* mentioned in the 14. booke of *Athenæus* his Deipnoſophiſts. A

¶ *The Vertues out of Alpinus.*

The fruit is of a cold and dry facultie, and the vnripe ones are frequently vſed to ſtrengthen the ſtomacke, and ſtop lasks: the iuice of them being for this purpoſe either taken by the mouth, or injected by clyſter: of the ſame fruit dried and macerated in water, is made an infuſion profitable againſt the relaxation and vlceration of the guts. B

The decoction or infuſion of the ripe dried fruit, is of a very frequent vſe againſt all peſtilent feuers: for they affirme that this fruit hath a wonderfull efficacie againſt venenate qualities, and putrifaction, and that it powerfully ſtrengthens the heart. C

Alſo the iuice of the perfectly ripe fruit is very good to purge choler forth of the ſtomacke and firſt veines: and they willingly vſe an infuſion made of them in all putride feuers to mitigate their heate or burning.

Chap. 14. *Of the Perſian Plum.*

¶ *The Deſcription.*

1 THis tree is thought by *Cluſius* (to whom I am beholden for the hiſtorie and figure) to be the *Perſea arbor* mentioned by *Pliny* and *Plutarch*, but he ſomewhat doubts whither it be that which is mentioned by *Theophraſtus*. *Dioſcorides* alſo, *Galen* and *Strabo* make mention of the *Perſea arbor*, and they all make it a tree alwaies greene, hauing a longiſh fruit ſhut vp in the ſhell and coat of an Almond: with which how this agrees you may ſee by this deſcription of *Cluſius*.

This tree (ſaith he) is like to a Peare tree, ſpreading it ſelfe far abroad, and being alwaies green, hauing branches of a yellowiſh green colour. The leaues are like thoſe of the broadeſt leaued Bay-tree, greene aboue, and of a grayiſh colour vnderneath, firm, hauing ſome nerues running obliquely, of a good taſte and ſmell, yet biting the tongue with a little aſtriction. The floures are like thoſe of the Bay, growing many thicke together, and conſiſt of ſix ſmall whitiſh yellow leaues. The fruit at the firſt is like a Plum, and afterwards it becomes Peare faſhioned, of a blacke colour, and pleaſant taſte: it hath in it a heart faſhioned kernell, in taſte not vnlike a Cheſnut, or ſweet Almond. I found it flouring in the Spring, and I vnderſtood the fruit was ripe in Autumne, by the relation of Sig. *Iohn*

Perſea arbor.
The Perſian Plum.

Cotonaſter Geſneri.
Geſners wilde Quince

Iohn Placa, Phyſition and Profeſſor of Valentia, who ſhewed me the tree growing in the garden of a Monaſterie a mile from Valentia, brought thither, as they ſay, out of America, and he ſaid they called it *Mamay*: but the Spaniards who haue deſcribed America giue this name to another tree. But diuers yeares after, I vnderſtood by the moſt learned *Simon de Tovar*, a Phyſition of Ciuil, who hath the ſame tree in his garden, with other exoticke plants, that it is not called *Mamay*, but *Aguacate*. Thus much out of *Cluſius*; where ſuch as are deſirous, may finde more largely handled the queſtion, whither this be the *Perſea* of the Antients or no? *Rariorum plan. Hiſt. l. 1. c. 2.*

CHAP. 15. *Of Geſners wilde Quince.*

¶ *The Deſcription.*

THe ſhrub which I here figure out of *Cluſius*, is thought both by him and others, to be the *Cotonaſtrum* or *Cidonago*, mentioned by *Geſner* in his Epiſtles, *lib.* 3. *pag.* 88. It hath branches ſome cubit long, tough, and bare of leaues in their lower parts, couered with a blacke barke: and towards the tops of the branches grow leaues ſomewhat like thoſe of Quinces: of a darke greene aboue, and whitiſh vnderneath, ſnipt about the edges: at the tops of the branches grow vſually many floures, conſiſting of fiue purpliſh coloured leaues a piece, with ſome threddes in their middles: theſe decaying, vnder them grow vp red dry berries without any pulp or iuice, each of them containing foure triangular ſeeds. *Cluſius* found this flouring in Iune vpon the tops of the Auſtrian Alpes, and he queſtions whether it were not this which *Bellonius* found in the mountains of Candy, and called *Agriomælea*, *lib.* 1. *cap.* 17. This is not vſed in Phyſicke, nor the faculties thereof knowne.

CHAP.

CHAP. 16. *Of Tamarindes.*

Tamarindus.
The Tamarinde.

Tamarindi ſiliqua.
The cod of the Tamarinde.

¶ *The Deſcription.*

TAmarinds, which at this day are a medicine frequently vſed, and vulgarly knowne in ſhops, were not knowne to the antient Greekes, but to ſome of the later, as *Actuarius*, and that by the name of *Oxyphœnicæ*, that is, ſoure Dates, drawne as it may ſeeme from the Arabicke appellation, *Tamarindi*, that is, Indian Date: but this name is vnproper, neither tree nor fruit being of any affinitie with the Date, vnleſſe the Arabicke *Tamar* be a word vſed in compoſition for fruits of many kindes, as the Greeke μῆλον, the Latine *Malum*, and Apple with vs in Engliſh; for we call the Cone of the Pine, and excreſcence of the Oke leafe, by the name of Pine Apple, and Oke Apple. But howſoeuer it be, it is no matter for the name, whether it be proper or no, if ſo be that it ſerue to diſtinguiſh the thing from others, and we know what is denoted by it. In Malauar they call it *Puti*: in Guzarat, *Ambili*, by which name it is knowne in moſt parts of the Eaſt Indies. This tree is thus deſcribed by *Proſper Alpinus, de Plant. Ægypti, cap.* 10. The Tamarind (ſaith he) is a tree of the bigneſſe of a Plum tree, with many boughes and leaues like thoſe of the Myrtle, many ſtanding vpon one rib [one againſt another, with a ſingle one at the end:] it carrieth white floures very like thoſe of the Orange tree: out of whoſe middle comes forth foure white and very ſlender threds: after theſe come thicke and large cods, at firſt greene, but when they are ripe of an aſh colour; and within theſe are contained thicke, hard, browniſh, cornered ſeeds, and a blacke acide pulpe. Theſe trees grow in ſome few gardens of Egypt, whither they haue bin brought out of Arabia and Ethiopia. This plant hath this ſtrange qualitie that the leaues alwaies follow the Sun, and when it ſets they all contract themſelues, and open out themſelues againe at the riſing thereof; and there is obſerued to be ſuch force in this motion, that they cloſely ſhut vp and hold their cods (if any be on the tree) and then at the riſing of the Sun they forgoe them againe. But I haue obſerued this folding vp of the leaues to be common to diuers other Egyptian plants, as *Acatia*, *Abrus*, *Abſus*, and *Sesban*. Thus much out of *Alpinus*.

The

The figure I here giue in the first place, out of *Lobel*, is of a plant some six moneths old, arisen of a seed: and such by sowing of seeds I haue seene growing in the garden of my deceased friend Mr. *Tuggy*, but they still died at the first approch of Winter. The other figure expresses the cods, and some of the seeds apart, taken forth of the cods: now the cods are neuer brought whole to vs, but the vtter rindes are taken off, and the strings or nerues that runne alongst the cods: the pulpe and seeds in it are close thrust together, and so are brought to vs in pots and such like vessels.

¶ *The Temperature and Vertues.*

A The fruit or pulpe of Tamarindes is cold and dry in the third degree: it is of good vse in cholericke diseases, as burning Feuers, Tertians, and the like: it is a lenitiue and very gently purging medicine and therefore vsed to be put into medicines seruing to that purpose.

B They vse (saith *Alpinus*) the leaues of Tamarindes to kill wormes in young children; and also their infusion or decoction to loosen the belly: the leaues are acide, and not vnpleasant vnto the taste.

C The Arabians preserue the small and yet greene cods of this tree, as also the ripe ones, either with sugar, or the honey boiled out of the fruit of the Carob tree: they also mix the pulpe with sugar, which trauellers carry with them in their iournies through the desart places of Africk, wherewith they being dry or ouerheated, may quench their thirst, coole and refresh themselues, and also euacuate many hot humors by stoole.

D In pestilent and all other burning putrid feuers they drinke the water with sugar, wherein a good quantitie of Tamarinds haue been infused; for it is a drinke very pleasant to such as are thirsty by reason of too much heate, for it powerfully cooles and quenches thirst.

E They are also vsed in all putrid feuers caused by cholericke and adust humors, and also against the hot distempers and inflammations of the liuer and reines, and withall against the Gonorrhæa.

F Some also commend them against obstructions, the dropsie, iaundice, and the hot distempers of the Spleene: they conduce also to the cure of the itch, scab, leprosie, tetters, and all such vlcerations of the skin which proceed of adust humors.

G They are not good for such as haue cold stomacks, vnlesse their coldnesse be corrected by putting to them Mace, Anise seeds, Squinanth, or such like.

Chap. 17.

Of the Mamoera, the Male and Female.

¶ *The Description.*

THe historie of these two trees, together with the figures I here giue you, are in the *Cura Posteriores* of *Clusius*, from whence I will take as much as concernes their history, and briefely here giue it you.

That of the Poet (saith he) is most true, *Non omnis fert omnia tellus*: for I thinke there is no prouince to be found, which produces not some peculiar plant not growing in other regions, as they can testifie who haue trauelled ouer forrein countries, especially if they haue applied themselues to the obseruation of plants. Amongst such I thinke I may reckon that honest and courteous man *Iohn Van Vsele*, who returning out of that part of America called Brasile, shewed me in the yeare 1607. a booke, wherein he in liuely colours had expresst some plants and liuing creatures: for as he told me, when he purposed to trauell he learned to paint, that so he might expresse in colours, for his memorie and delight after he was returned home, such singularities as he should obserue abroad. Now amongst those which hee in that booke had expressed, I obserued two very singular, and of a strange nature, whose figures without any difficultie he bestowed vpon me, as also the following historie.

These two trees, whose figures you see here expresst, are of the same kinde, and differ only in sex; for the one of them, to wit the male, is barren, and only carries floures, without any fruit; but the female onely fruit, and that without floure: yet they say they are so louing, and of such a nature, that if they be set far asunder, and the female haue not a male neere her, shee becomes barren, and beares no fruit: of which nature they also say the Palme is.

Now the bole or trunke of that tree which beares the fruit is about two foot thicke, and it groweth some nine foot high before it begin to beare fruit; but when it hath acquired a iust magnitude, then shall you see the vpper part of the tree laden with fruit, and that it will be as it were thicke

girt

girt about therewith for ſome nine foot high more: the fruit is round and globe-faſhioned, of the ſhape and magnitude of a ſmall gourd, hauing when it is ripe a yellowiſh pulpe, which the inhabitants vſe to eate to looſen their bellies: this fruit contains many kernels of the bignes of a ſmal peaſe, blacke and ſhining, of no vſe that he could learne, but which were caſt away as vnneceſſary: the leaues come forth amongſt the fruit, growing vpon long foot-ſtalkes, and they in ſhape much reſemble the Plane tree or great Maple.

Mamoera mas.
The male Dug tree.

Mamoera famina.
The female Dug tree.

What name the Braſilians giue it he could not tell, but of the Portugals that dwelt there it was called *Mamoera*, and the fruit *Mamaon*, of the ſimilitude I thinke they haue with dugs, which by the Spaniards are called *Mamas* and *Tetas*.

There is no difference in the forme of the trunke or leaues of the male and female, but the male only carries floures hanging downe, cluſtering together vpon long ſtalks like to the floures of Elder, but of a whitiſh yellow colour, and theſe vnprofitable, as they affirme.

Both theſe trees grow in that part of America wherein is ſcituate the famous Bay called by the Portugals, *Baya de todos los ſanctos*, lying about thirteene degrees diſtant from the Equator towards the Antarticke pole.

Chap. 18.

Of the Cloue-Berry Tree.

¶ *The Deſcription.*

I Muſt alſo abſtract the hiſtorie of this out of the Works of the learned and diligent *Cluſius*, who ſets it forth in his Exoticks, *lib.* 1. *cap.* 17. in the next chapter after Cloues.

I put (ſaith he) the deſcription of this fruit next after the hiſtorie of Cloues, both for the affinitie

Amomum quorundam, fortè Garyophyllon Plinij.
The Cloue-berry tree.

affinitie of ſmell it hath with Cloues, as alſo for another cauſe, which I will ſhew hereafter. *Iames Garret* in the yeare 1601 ſent me from London this round fruit, commonly bigger than Pepper cornes, yet ſome leſſe, wrinkled, of a browniſh colour, ſufficiently fragile; which opened, I found contained a ſeed round, black, which might be diuided into two parts, of no leſſe aromaticke taſte and ſmell than the fruit it ſelfe, and in ſome ſort reſembling that of Cloues: it growes in bunches or cluſters, as I coniectured by many berries which yet kept their ſtalks, & two or three which ſtucke to one little ſtalke: to theſe were added leaues of one form, but of much different bignes, for ſome of them were ſeuen inches long, and three broad; ſome onely fiue inches long, and two and a half broad; others did not exceed 3 inches in length, and theſe were not two inches broad; and ſome alſo were much leſſe and narrower than theſe, eſpecially thoſe that were found mixed with the berries, differing according to the place in the boughes or branches which they poſſeſt. I obſerued none among them which had ſnipt leaues, but ſmooth, with many ſmall veines running obliquely from the middle rib to the ſides, with their points now narrower, otherwhiles broader, and roundiſh: they were of a browniſh aſh colour, of a ſufficient acride taſte: the branches which were added to the reſt were ſlender, quadrangular, couered with a barke of an aſh colour, and thoſe were they of a yeares growth; for thoſe that were of an after growth were browniſh, and they had yet remaining the prints where the leaues had growne, which for the moſt part were one againſt another, and theſe alſo were of an acride taſte, as well as the leaues, and of no vngratefull ſmell.

I receiued the ſame fruit ſome yeares before, but without the ſtalks, and with this queſtion propounded by him which ſent it, *An Amomum?* And certainly the faculties of this fruit are not very much vnlike thoſe which *Dioſcorides* attributes to his *Amomum*; for it hath an heating aſtrictiue and drying faculty, and I thinke it may performe thoſe things whereto *Dioſcorides*, *Lib.* 1. *Cap.* 14. ſaith his is good; yet this wanteth ſome notes which he giues vnto his, as the leaues of Bryonie, &c.

But I more diligently conſidering this Exoticke fruit, finde ſome prime notes which do much moue me (for I will ingenuouſly profeſſe what I thinke) to iudge it the *Garyophyllon* of *Pliny*; for he, *Hiſt. Nat. lib.* 12. *cap.* 7. after he hath treated of Pepper addes theſe words: [There is beſides in the Indies a thing like to the Pepper corne, which is called *Garyophyllon*, but more great and fragil: they affirme it growes in an Indian groue; it is brought ouer for the ſmels ſake.] Though this deſcription be briefe and ſuccinct, neither containes any faculties of the fruit it ſelfe, yet it hath manifeſt notes, which, compared with thoſe which the fruit I here giue you poſſeſſe, you ſhal find them very like; as comparing them to Pepper cornes, yet bigger and more fragile, as for the moſt part theſe berries are: their ſmell is alſo very pleaſing, and comming very neere to that of Cloues, and for the ſmells ſake only they were brought ouer in *Plinies* time. I found, this fruit being chewed made the breath to ſmell well: and it is credible, that it would be good for many other purpoſes, if triall were made.

CHAP.

CHAP. 19. *Of Guaiacum, or Indian Pock-wood.*

Guaiaci arboris ramulus.
A branch of the Guaiacum tree.

¶ *The Deſcription.*

GVaiacum, which ſome call *Lignum Sanctum*: others, *Lignum vitæ*, is a well kown wood, though of a tree vnknown, or at leaſt not certainly knowne; for this figure which I here giue you out of *Cluſius*, was gotten, and the hiſtorie framed as you ſhall heare by his own words, taken out of his *Scholia* vpon the 21 Chapter of *Monardus*. About the beginning (ſaith he) of the yeare 1601. I receiued from *Peter Garret* a branch of a foot long, which he writ was giuen him by a certaine Surgeon lately returned from America, for a branch of the tree Guaiacum: which if it be a branch of the true *Guaiacum*, then hath *Nicolas Monardus* ſleightly enough ſet downe the hiſtorie of this tree. I thus deſcribed this branch which was ſent me.

This branch was a foot long, very writhen, and diſtinguiſhed with many knots, ſcarſe at the lower end equalling the thickneſſe of a writing pen or gooſe quil, hauing an hard and yellowiſh wood, and a wrinkled barke o an aſh colour: at the vpper end it was diuided into ſlender branches, whereof ſome yet retained their leaues, and other ſome the floures and the rudiment of the fruit: the leaues, or more truly the wings or foot-ſtalkes of the leaues grew vpon ſlender branches one againſt another, each winged leafe hauing foure or ſixe little leaues, alwaies growing by couples one againſt other, as in the Maſticke tree; and theſe were thickiſh, round, and diſtinguiſhed with many veines, which by reaſon of their drineſſe (as I obſerued) would eaſily fall off, leauing the footſtalks naked, and onely retaining the markes whereas the leaues had beene. In the knots of the vpper branches there grew as it were ſwellings, out of which together grew ſix, eight, ten, or more ſlender foot-ſtalkes, ſome inch long, each carrying a floure not great, conſiſting of ſix little leaues (but whether white, yellow, or blew, I could not by reaſon of the drineſſe iudge:) out of the middle of the floure grew many little threds, and in ſome the rudiment of the fruit began to appeare, hauing two cels, almoſt ſhaped like the ſeed-veſſell of the common Shepheards purſe.

Thus much *Cluſius*, who afterwards receiued the fruit from two or three, but the moſt perfect from the learned Apothecarie *Iohn Pona* of Verona: they are commonly parted into two parts or cels, yet he obſerued one with three: he found longiſh ſtones in them almoſt like thoſe of *Euonymus*, and they conſiſted of a very hard and hairy ſubſtance like to that of the Date ſtones, containing a ſmooth kernel of a yellowiſh colour.

Now will I giue you the deſcriptions of *Monardus*: then, what I haue obſerued my ſelfe of this wood, which I muſt confeſſe is very little, yet which may giue ſome light to the ignorant. Of this wood (ſaith *Monardus*) many haue written many waies, ſaying that it is either Ebonie, or a kinde of Box, or calling it by ſome other names. But as it is a new kinde of tree, not found in theſe regions, or any other of the whole world deſcribed by the Antients, but only thoſe of late diſcouered; ſo this ſhall be a new tree to vs: howeuer it be, it is a large tree of the bignes of the Ilex, full of branches, hauing a great matrix or blackiſh pith, the ſubſtance of the wood being harder than Ebonie: the barke is thicke, gummie or fat, and when the wood is dry falleth eaſily off: the leaues are ſmal and hard: the floure yellow: the which is followed by a round ſollid fruit, containing in it ſeeds like thoſe of the Medlar.

It growes plentifully in the Iſles of *Sancto Domingo*.

Another

Another kinde of this was afterwards found in the Iſland of S. Iohn de Puerto rico, neere to the former: it is alſo like the laſt deſcribed, but altogether leſſe, and almoſt without matrix or pith, ſmelling ſtronger, and being bitterer than the former; which being left, this is now in vſe, and of the wondrous effects it is called *Lignum ſanctum*; neither without deſert, being (experience giuing teſtimonie) it excells the other: yet both their faculties are admirable in curing the French diſeaſe, and therefore the water or decoction of both of them are drunke, either mixed together, or ſeuerally, both for the cure of the forementioned diſeaſe, as alſo againſt diuers other affects. Thus much for *Monardus* his deſcription.

The wood which is now in vſe with vs is of a large tree, whoſe wood is very heauy, ſollid, and fit to turne into bowles or the like, and all that I haue yet ſeene hath been wholly without matrix or pith, and commonly it is of a darke browniſh colour, ſomewhat inclining to yellow, hauing a ring of white ingirting it next to the barke; I haue obſerued a tree whoſe diametre hath been two foot and a quarter, to haue had as little or leſſe of this white wood as one whoſe diameter was thirteene inches; and this which was thirteene inches had only a white circle about it of one inch in bredth: I thinke the yonger the tree is, the bigger the white circle is: the beſt wood is denſe, heauy, browniſh, leauing a quicke and biting taſte in the decoction, as alſo his ſmell and colour. The barke of this wood is alſo denſe and heauy, of a hard ſubſtance and yellowiſh colour within, but rough and greeniſh, or elſe grayiſh without, and of ſomewhat a bitteriſh taſte. Thus much for the deſcription of the wood and his barke. Now let me ſay ſomewhat briefely of the temperature and qualities.

The Temperature and Vertues.

A It is iudged to be hot and dry in the ſecond degree: it hath a drying, attenuating, diſſoluing, and clenſing facultie, as alſo to moue ſweat, and reſiſt contagion and putrefaction.

B The decoction of the barke or wood of Guajacum, made either alone or with other ingredients, as ſhall be thought moſt fit for the temper and age of the Patient, is of ſingular vſe in the cure of the French Poxes, and it is the moſt antient and powerfull antidote that is yet known againſt that diſeaſe. I forbeare to ſpecifie any particular medicine made thereof, becauſe they are wel enough knowne to all to whom this knowledge belongs, and they are aboundantly ſet downe by all thoſe that haue treated of that diſeaſe.

C It alſo conduceth to the cure of the dropſie, Aſthma, Epilepſie, the diſeaſes of the bladder and reines, paines of the ioints, flatulences, crudities, and laſtly all chronicall diſeaſes proceeding from cold and moiſt cauſes: for it oftentimes workes ſingular effects whereas other medicines little preuaile.

D It doth alſo open the obſtructions of the liuer and ſpleene, warmes and comforts the ſtomacke and all the intrals, and helps to free them of any groſſe viſcous matter which may be apt to breed diſeaſes in them.

Chap. 20.

Of the Guayaua, or Orange-Bay.

¶ *The Deſcription.*

Simon de Touar ſent *Cluſius* a branch of the tree which the Spaniards call *Guayauas*, from which he drew this figure, and thus deſcribes it. This branch (ſaith *Cluſius*) whoſe vpper part together with the fruit I cauſed to be drawne, was ſome foot long, foure ſquare, alternately ſet with leaues growing by couples, being foure inches long, and one and a halfe or two broad, of the forme of Bay leaues, very firme, hauing a ſwelling rib running alongſt the lower ſide, with veins running obliquely from thence to the ſides, of an aſh or grayiſh colour beneath, but ſmooth aboue, with the veines leſſe appearing; which broken, though old, yet retained the ſmell of Bay leaues, and alſo after ſome ſort the taſte: the fruit was ſmooth, yet ſhriueled, becauſe peraduenture it was vnripe, of the bigneſſe of a ſmall apple, longiſh, blackiſh on the out ſide like a ripe plum, but within full of a reddiſh pulpe, of an acide taſte; and in the middle were many whitiſh ſeeds of the bigneſſe of Miller, or thoſe that are in Figs.

Nicolas Monardus (as he is turned into Latine by *Cluſius*) thus giues vs the hiſtorie of *Guayauas*, in his ſixty fourth Chapter. It is a tree, ſaith he, of an indifferent bigneſſe, and hath ſpreading branches, the leafe of the Bay, and a white floure, like that of the Orange, yet ſomewhat bigger, and

Guayavæ arboris ramus.
The Orange-Bay.

and well ſmelling; it eaſily growes, whereſoeuer it be ſowne, and ſo ſpreds and creepes that it is accounted as a weed, for it ſpoiles the graſſe of many paſtures, with the too much ſpreading as brambles do; the fruit is like to our apples, of the bigneſſe of thoſe the Spaniards call *Camueſas*, green at the firſt, and of a golden colour when they be ripe, with their inner pulpe white, and ſometimes red; diuided: it hath foure cells, wherein lie the ſeeds, like thoſe of the Medlers, very hard, of a browniſh colour, wholly ſtony, without kernell and taſte.

The fruit is vſually eaten, the rinde being A
firſt taken off; it is pleaſing to the palate, wholeſome and eaſie of concoction; being greene it is good in fluxes of the belly, for it powerfully bindes; and ouer, or throughly ripe it looſeth the belly; but betweene both, that it is neither too greene, nor ouer-ripe, if roſted, it is good both for ſound and ſicke; for ſo handled it is wholeſommer, and of a more pleaſing taſte; that alſo is the better which is gathered from domeſticke and huſbanded trees. The Indians profitably bathe their ſwolne legges in the decoction of the leaues; and by the ſame they free the ſpleene from obſtruction. The fruit ſeemes to be cold, wherefore they giue it roſted to ſuch as are in feuers. It growes commonly in all the VVeſt Indies. Thus much *Monardus*.

CHA. 21. *Of the Corall tree.*

¶ *The Deſcription.*

THe ſame laſt mentioned *Simon de Touar* a learned and prime Phyſition of Ciuill ſent *Cluſius* three or foure branches of this tree, from whence he framed this hiſtory and figure. He writ (ſaith *Cluſ.*) that this tree grew in his garden, ſprung vp of ſeeds ſent from America, which had the name of Corall impoſed on them, by reaſon the floures were like Corall, but he did not ſet downe there ſhape; writing onely this in his letter: That he had two little ſhrubs, which had borne floures, and that the greater of them bore alſo cods full of large beanes, but in the extreme Winter, which they had the yeere before, he loſt not onely that tree, and others ſprung vp of Indian ſeed, but alſo many other plants. Now ſeeing that this tree carries coddes, I conieƈture the floures were in forme not vnlike to thoſe of Peaſe, or of the tree called *Arbor Iudæ*, but of another colour, to wit, red like Corall, eſpecially ſeeing that in the catalogue of his garden which hee ſent me the yeere before, he had writ thus [*Arbor Indica dicta Coral, ob eius florem ſimilem Corallo, &c.* that is, An Indian tree called Corrall, by reaſon of the floure like to Corrall, whoſe leaues are very like thoſe of the *Arbor Iudæ*, but this hath thornes, which that wants.] And verily the branches which he ſent (for he writ he ſent the branches with the leaues, but the tree brought out ſome twice or thrice as bigge) had leaues not much vnlike thoſe of *Arbor Iudæ*, but faſtened to a ſhorter footſtalke and growing one againſt another, with a ſingle one at the end of the branch, which was here and there ſet with ſharpe and crooked prickles; but whether theſe branches are onely the ſtalkes of the leaues, or perfeƈt branches, I doubt, becauſe all that hee ſent had three leaues apiece; I could eaſily perſuade my ſelfe, that they were onely leaues, ſeeing the vpper part ended in one leafe; and the lower end of one among the reſt, yet ſhewed the place where it ſeemed it grew to the bough. But I affirme nothing, ſeeing there was none whereof I could inquire, by

Coral arboris ramus.
A branch of the Corall tree.

reaſon of his death who ſent them m e, which hapned ſhortly after; yet I haue made the forme of the leaues with the manner as I conieCtured they grow, to be delineated in the figure which I here giue you. Whether *Matthiolus* in his laſt edition of his Commentaries vpon *Dioſcorides* would haue expreſt this, by the Icon of his firſt *Acacia*, which is prickly, and hath leaues reſembling thoſe of *Arbor Iuda*, I know not; but if he would haue expreſſed this tree, the painter did not well play his part.

After that *Cluſius* had ſet forth thus much of this tree in his *Hiſt. rariorum plant.* the learned Dr. *Caſtaneda* a Phyſition alſo of Ciuill certified me, ſaith he, that the floures of this tree grow thicke together at the tops of the branches, ten, twelue, or more hanging vpon ſhort foot-ſtalkes, growing out of the ſame place: whoſe figure he alſo ſent, but ſo rudely drawne, that I could not thereby haue come to any knowledge of the floures, but that he therewith ſent me two dried floures, by which I partly gathered their form. Now theſe flours were very narrow, 2. inches long or more, conſiſting of three leaues, the vppermoſt of which much exceeded the 2. narrow ones on the ſides both in length and breadth, and it was doubled; but before the floure was opened it better reſembled a horne or cod, than a floure, and the lower end of it ſtood in a ſhort green cup, in the middeſt of the floure vnder the vpper leafe that was folded, but open at the top; there came forth a ſmooth pointall, diuided at the top into nine parts or threds, whoſe ends of what colour they were, as alſo the threds, I know not, becauſe I could not gather by the dry floure, whoſe colour was quite decayed, and the picture it ſelf expreſſed no ſeparation of the leaues in the floure, no forme of threds, but onely the floures ſhut, and reſembling rather cods than floure, and thoſe of a deepe red colour. But if I could haue ſeen them freſher, I ſhould haue been able to haue giuen a more exact deſcription: wherefore let the reader take in good part that which I haue here performed. Thus much *Cluſius*.

CHAP. 22. *Of the ſea Lentill.*

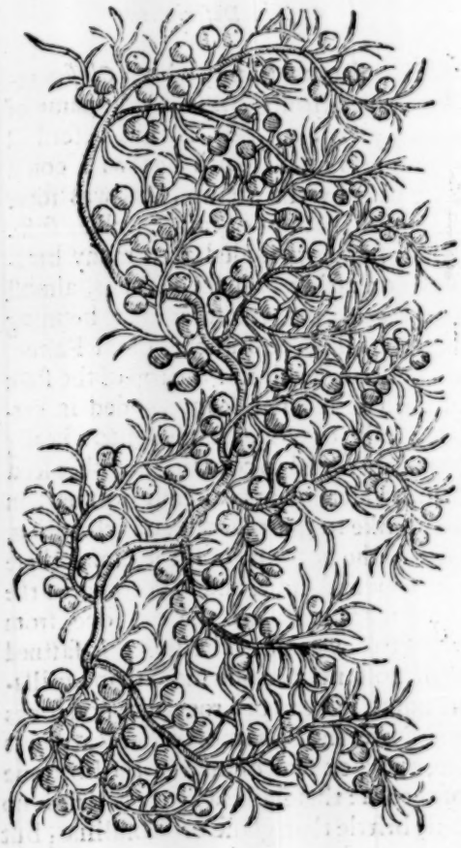
¶ *The Deſcription.*

SOme call this *Vua marina*, and others haue thought it the *Lenticula marina* of *Serapio*, but they are deceiued, for his *Lenticula marina* deſcribed in his 245. chapter, is nothing elſe than the *Muſcus marinus* or *Bryon thalaſſion*, deſcribed by *Dioſcorides*, *lib.* 4. *cap.* 99. as any that compares theſe two places together may plainely ſee.

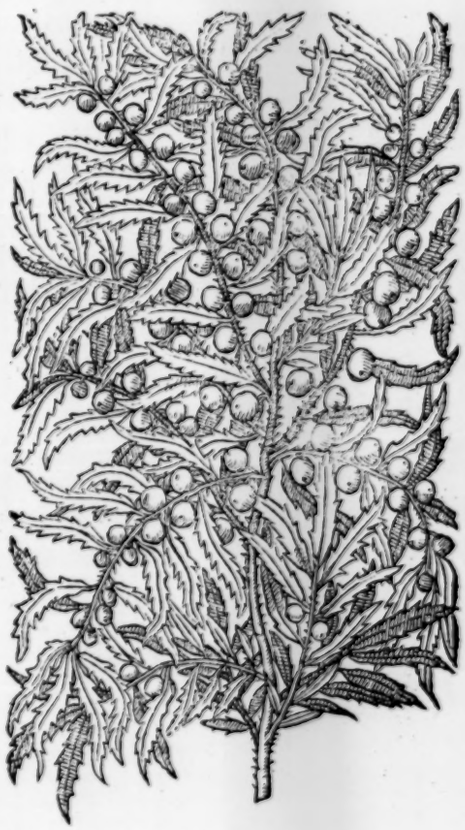
1 The former of theſe hath many winding ſtalkes, whereon grow ſhort branches ſet thick with narrow leaues like thoſe of Beluidere, or Beſome flax, and among theſe grow many skinny, hollow, empty round berries of the bigneſſe and ſhape of Lentills, whence it takes the name: this growes in diuers places of the Mediterranian and Adriaticke ſeas.

2 This differs little from the former, but that the leaues are broader, ſhorter, and ſnipt about the edges. But this being in probabilitie the Sargazo of *Acoſta*, you ſhall here what he ſaies thereof. In that famous and no leſſe to be feared nauigation del Sergazo (for ſo they which ſaile into the Indies call all that ſpace of the Ocean from the 18. to the 34. degree of Northerly latitude) is ſeen a deepe and ſpatious ſea couered with an herbe called Sarguazo, being a ſpan long, wrapped with the tender branches as it were into balls, hauing narrow and tender leaues ſome halfe inch long, much

1 *Lenticula marina anguſtifolia.*
Narrow leaued Sea Lentill.



2 *Lenticula marina ſerratis foliis.*
Cut leaued Sea Lentill.



much ſnipt about the edges, of colour reddiſh, of taſte inſipide, or without any ſenſible biting, but what is rather drawne from the ſalt water, than naturally inherent in the plant. At the ſetting on of each leafe growes a ſeed round like a pepper corne, of a whitiſh colour, and ſometimes of white and red mixed, very tender when as it is firſt drawne forth of the water, but hard when it is dried, but by reaſon of the thinneſſe very fragile, and full of ſalt water: there is no root to be obſerued in this plant, but only the marks of the breaking off appeares; and it is likely it growes in the deepe and ſandy bottome of the ſea, and hath ſmall roots; yet ſome are of opinion that this herb is plucked vp and carried away by the rapide courſe of waters that fall out of many Iſlands into the Ocean. Now the Maſter of the ſhip wherein I was did ſtiffely maintaine this opinion; and in the ſailing here we were becalmed; but as far as euer wee could ſee wee ſaw the ſea wholly couered with this plant, and ſending down ſome yong Sailers which ſhould driue the weeds from the ſhip, and clenſe the water, we plainly ſaw round heapes thereof riſe vp from the bottom of the ſea where by ſounding we could finde no bottome.

This plant pickled with ſalt and vineger hath the ſame taſt as Sampier, and may be vſed in ſtead thereof, and alſo eaten by ſuch as ſaile, in place of Capers. I willed it ſhould be giuen newly taken forth of the ſea, to Goats which we carried in the ſhip, and they fed vpon it greedily. A

I found no faculties thereof; but one of the Sailers troubled with a difficultie of making water, caſting out ſand and groſſe humors, ate thereof by chance both raw and boiled, onely for that the taſte thereof pleaſed him: after a few dayes hee told to me that he found great good by the eating thereof, and he tooke ſome of it with him, that ſo he might vſe it when he came aſhore. Hitherto B

A Coſta.

Chap. 23. *Of the Sea Feather.*

Myriophyllum marinum.
The Sea Feather.

¶ *The Deſcription.*

THis elegant plant, which *Cluſius* receiued from *Cortuſus* by the name of *Myriophyllum Pelagicum*, is thus deſcribed by him: As much (ſaith hee) as I could conie&ture by the pi&ture, this was ſome cubit high, hauing a ſtraight ſtalke, ſufficiently ſlender, diuided into many branches, or rather branched leaues, almoſt like thoſe of Ferne, but far finer, bending their tops like the branches of the Palme, of a yellowiſh colour: the top of the ſtalk adorned with leſſer leaues, ended in certaine ſcales or cloues framed into a head; which are found to containe no other ſeed than tender plants already formed, in ſhape like to the old one: which falling, ſinke to the bottome of the ſea, and there take root and grow, and ſo become of the ſame magnitude as the old one from whence they came. The ſtalke is faſtned with moſt ſlender and more than capillarie fibres, in ſtead of a root, not vpon rocks and Oiſter ſhells, as moſt other ſea plants are, but vpon ſand or mud in the bottome of the ſea: this ſtalke when it is drie is no leſſe brittle than glaſſe or Coralline; but greene and yet growing it is as tough and flexible as *Spartum* or Matweed.

¶ *The Place.*

It groweth in the deepeſt ſtreames of the Illyrian ſea, whence the Fiſhermen draw it forth with hooks and other inſtruments which they call Sperne. The whole plant, though dried, retains the faculties.

¶ *The Names.*

The Italian Fiſhermen call it *Penachio delle Ninfe*, and *Palma de Nettuno*: ſome alſo, *Scettro di Nettuno*.

¶ *The Vertues.*

A They ſay it is good againſt the virulent bites of the Sea ſerpents, and the venomous ſtings or prickes of Fiſhes.

B Applied to ſmall greene wounds it cures them in the ſpace of 24 houres.

C *Cortuſus* writ, that he had made triall thereof for the killing and voiding of wormes, and that he found it to be of no leſſe efficacie than any Coralline, and that giuen in leſſe quantitie.

Chap. 24. *Of the Sea Fan.*

¶ *The Deſcription.*

THis elegant ſhrub groweth vpon the rockes of the ſea (where it is ſometimes couered with the water) in diuers places; for it hath been brought both from the Eaſt and Weſt Indies, and as I haue been informed it is to be found in great plenty vpon the rocks at the Burmuda Iſles. *Cluſius* calls

Frutex marinus reticulatus.
Sea Fan.

calls it *Frutex Marinus elegantiſsimus*, and thinkes it may be referred to the *Palma Marina* of *Theophraſtus*. *Bauhine* hath referred it to the *Corallina's*, calling it *Corallina cortice reticulato maculoſo purpuraſcente*. It growes vp ſomtimes to the height of three foot, hauing a ſtalke ſome handfull or two high before it part into branches: then is it diuided into three, foure, or more branches, which are ſubdiuided into infinite other leſſer ſtrings, which are finely interwouen and ioyned together as if they were netted, yet leauing ſometimes bigger, otherwhiles leſſer holes: and theſe twiggy branches become ſmaller and ſmaller, the farther they are from the root, and end as it were in ſmal threds: theſe branches grow not vp on euerie ſide, as in other plants, but flat one beſides another, ſo that the whole plant reſembles a fan, or a cabbage leafe eaten full of holes; yet ſomtimes vpon the ſides come forth other ſuch fanne-like branches, ſome bigger, ſome leſſe, ſometimes one or two, otherwhiles more. The inner ſubſtance of this Sea-Fan is a blackiſh tough, and hard wood, and it is all couered ouer with a rough Coral-like ſtony matter, of a reddiſh or purpliſh colour, and this you may with your naile or a knife ſcrape off from the ſmooth and blacke wood.

I know no vſe of this, but it is kept for the beauty and raritie thereof, by many louers of ſuch curioſities, amongſt which for the rareneſſe of the ſtructure this may hold a prime place.

Chap. 25.

Of China, and Baſtard China.

¶ *The Deſcription.*

THis root which is brought from the remoteſt parts of the world, and is in frequent vſe with vs, hath not been knowne in Europe little aboue foureſcore and ten yeares: for *Garcias ab Orta* the Portugall Phyſition writes, That he came to the firſt knowledge thereof in the Eaſt Indies, in the yeare 1535, and that by this meanes, as he relates it: It hapned (ſaith he) that about that time a merchant in the Iſle *Diu* told the noble gentleman S^r. *Mart. Alfonſo de Souſa* my Patron, by what meanes he was cured of the French Poxes, which was by a certaine root brought from China; whoſe faculties he much extolled, becauſe ſuch as vſed it needed not obſerue ſo ſtrict a diet as was requiſit in the vſe of Guajacum, but ſhould onely abſtaine from Beefe, Porke, Fiſh, and crude fruits; but in China they do not abſtaine from fiſh, for they are there great gluttons. When the report of this root was divulged abroad, euery man wonderfully deſired to ſee and vſe it, becauſe they did not well like of the ſtrict dyet they were forced to obſerue in the vſe of Guajacum. Beſides, the inhabitants of theſe countries, by reaſon of their idle life are much giuen to gluttony. About this time the China ſhips arriue at Malaca, bringing a ſmall quantitie of this root for their owne vſe. But this little was ſought for with ſuch earneſtneſſe, that they gaue an exceſſiue rate for it; but afterwards the Chinois bringing a greater quantitie, the price fell, and it was ſold verie cheape. From this time Guajacum began to be out of vſe, and baniſhed the Indies, as a Spaniard that would famiſh the Natiues. Thus much *Garcias* concerning the firſt vſe thereof in the Eaſt Indies.

1 The China now in vſe is a root of the largeneſſe of that of the ordinarie Flag, or *Iris paluſtris*, and not much in ſhape vnlike thereto, but that it wants the rings or circles that are imprinted in the other: the outer coat or skin of this root is thin, ſometimes ſmooth, otherwhile rugged, of a browniſh red colour, and not to be ſeparated from the ſubſtance of the root, which is of an indifferent firmeneſſe, being not ſo hard as wood, but more ſollid than moſt roots which are not of ſhrubs or trees: the colour is ſometimes white, with ſome very ſmall mixture of redneſſe; otherwhiles it hath a greater mixture of red, and ſome are more red than white: it is almoſt without taſt, yet that it hath is dry, without any bitterneſſe or acrimonie at all. The beſt is that which is indifferently ponderous, new, firme, not worme-eaten, nor rotten, and which hath a good and freſh colour, and that either white, or much inclining thereto. The plant whoſe root this is (if we may beleeue *Chriſtopher A Coſta*) hath many ſmall prickly and flexible branches, not vnlike the *Smilax aſpera*, or the prickly Binde-weed: the biggeſt of theſe exceedeth not the thickeneſſe of ones little finger. The leaues are of the bigneſſe of thoſe of the broad leaued Plantaine: the roots are as large as ones hand, ſometimes leſſe, ſollid, heauy, white, and alſo ſometimes red, and many oft times growing together.

1 *China vulgaris Officinarum.*
True China.

2 *Pſeudo-China.*
Baſtard China.

It groweth aboundantly in the territorie of China, and is alſo found in Malabar, Cochin, Cranganor, Coulan, Tanor, and other places.

The Chinois call it *Lampatan:* in Decan they call it *Lampatos:* in Canarin, *Bouti:* the Arabians, Perſians, and Turks terme it *Choph-China.*

2 This other root, whoſe figure you ſee here expreſt, was ſent from London to *Cluſius* in the yeare 1591, by *Iames Garret*, being brought out of Wingandecaow, or Virginia, with this inſcription, *Chinæ ſpecies*, A kinde of China. *Cluſius* cauſed this figure thereof to be drawne, and thus deſcribeth it. This root (ſaith hee) was very knotty, and formed with out-growings, or bunches ſtanding out, of a reddiſh colour, and it yet retained at the top ſome part of the ſtalke, being ſomwhat like vnto that of *Smilax aſpera*, or common rough Binde-weed, hard, wooddy, and full of veines, as the ſtalks of *Smilax aſpera:* the ſubſtance of the root was alſo reddiſh, as the root of the common Flagge, at the firſt of a ſaltiſh taſte, it being old, (for ſo it was when I receiued it)

and

and then drying. Now I iudge this the ſame that the writer of the Virginian Hiſtorie mentions in his chapter of roots, and ſaith, it was brought into England for China, though the Natiues knew no vſe thereof: but they vſe another root very like China, which they call *Tſinaw*, of which beeing cut, beaten, and preſſed out with water, they draw a iuice wherewith they make their bread. Thus much *Cluſius*, to whoſe words I thinke it not amiſſe to adde that which Mr. *Thomas Hariot* (who was the writer of the Virginian hiſtorie, here mentioned by *Cluſius*) hath ſet downe concerning this thing.

Tſinaw (ſaith he) is a kinde of root much like vnto that which in England is called the China root, brought from the Eaſt Indies. And we know not any thing to the contrarie but that it may be of the ſame kinde. Theſe roots grow many together in great cluſters, and doe bring forth a Brier ſtalk, but the leafe in ſhape is far vnlike: which being ſupported by the trees it groweth neereſt vnto, will reach or clime to the top of the higheſt. From theſe roots whileſt they be new or freſh, being chopt into ſmall pieces and ſtampt, is ſtrained with water a iuice that maketh bread, and alſo beeing boiled, a very good ſpoonemeat in manner of a gelly, and is much better in taſte, if it be tempered with oyle. This *Tſinaw* is not of that ſort which by ſome was cauſed to be brought into England for the China root; for it was diſcouered ſince, and is in vſe as is aforeſaid; but that which was brought hither is not yet knowne, neither by vs, nor by the inhabitants, to ſerue for any vſe or purpoſe, although the roots in ſhape are very like. Thus much *Hariot*.

¶ *The Temperature and Vertues.*

China is thought to be moderately hot and drie: the decoction thereof made alone or with other things, as the diſeaſe and Symptomes ſhal require, is much commended by *Garcias*, for to cure the French pox, but chiefely that diſeaſe which is of ſome ſtanding: yet by moſt it is iudged leſſe powerfull than *Guajacum*, or *Sarſaparilla*. A

It attenuates, moues ſweat, and dries, and therefore reſiſts putrifaction: it ſtrengthens the liuer, helpes the dropſie, cures maligne vlcers, ſcabbes, and lepry. It is alſo commended in Conſumptions. B

The decoction of this root, ſaith *Garcias*, beſides the diſeaſes which haue communitie with the Poxe, conduces to the cure of the Palſie, Gout, Sciatica, ſchirrous and œdematous tumours. It alſo helps the Kings-euill. It cureth the weakeneſſe of the ſtomacke, the inueterate head-ache, the ſtone and vlceration of the bladder; for many by the vſe of the decoction hereof haue beene cured which formerly receiued help by no medicine. C

Chap. 26. *Of Coſtus.*

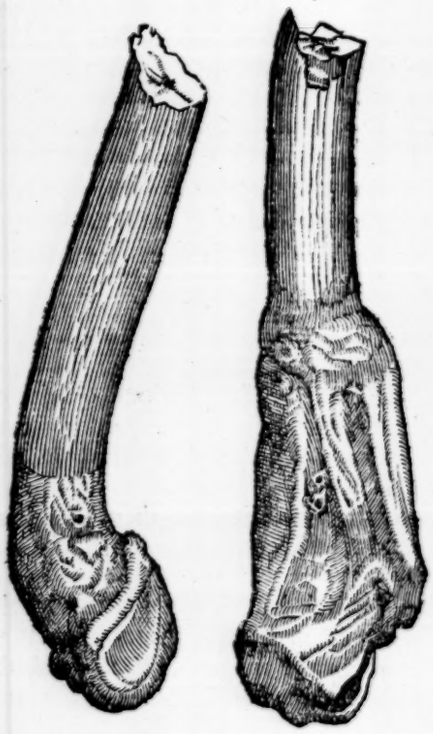
¶ *The Deſcription.*

THis ſimple medicine was briefely deſcribed by *Dioſcorides*, who mentions three kindes thereof, but what part of a plant, whether root, wood, or fruit, he hath not expreſt: but one may probablely coniecture it is a root, for that he writes toward the end of the Chapter where he treats thereof, *lib.* 1. *cap.* 15. that it is adulterated by mixing therewith the roots of *Helenium commagenum*; now a root cannot well be adulterated but with another. Alſo *Pliny*, *lib.* 12. *cap.* 12. calls it a root; but neither any of the antient or moderne Writers haue deliniated the plant, whoſe root ſhould be this *Coſtus*. *Dioſcorides* makes three ſorts, as I haue ſaid: the Arabian being the beſt; which was white, light, ſtrong, and well ſmelling: the Indian, which was large, light, and blacke: the Syrian, which was heauie, of the colour of Box, and ſtrong ſmelling. Now *Pliny* makes two kindes, the blacke, and the white, which he ſaith is the better; ſo I iudge his blacke to be the Indian of *Dioſcorides*, and his white, the Arabian. Much agreeable to theſe (but whether the ſame or no, I do not determine) are the two roots whoſe figures I here preſent to your view, and they are called by the names of *Coſtus dulcis* (I thinke they ſhould haue ſaid *odoratus*) and *Coſtus amarus*.

1 The firſt of theſe, which rather from the ſmall, than taſte, is called ſweet, is a pretty large root, light, white, and well ſmelling, hauing the ſmell of Orris, or a violet, but ſomewhat more quick and piercing, eſpecially if the root be freſh, and not too old: it is oft times diuided at the top into two, three, or more parts, from whence ſeuerall ſtalks haue growne, and you ſhall ſomtimes obſerue vpon ſome of them pieces of theſe ſtalks ſome two or three inches long, of the thickeneſſe of ones little

little finger, crested, and filled with a soft pith, like as the stalks of Elder, or more like those of the Bur-docke: the taste of the root is bitter, with some acrimonie, which also *Dioscorides* requires in his, for he saith, the taste should be biting and hot; thus much for the first, being *Costus dulcis* of the shoppes.

1 *Costus Indicus sive odoratus.*
Indian or sweet smelling Costus.



2 *Costus Officinarum Lobelij.*
Bitter Costus.

2 The second, which is the *Costus amarus*, and it may be the Indian of *Dioscorides*, and *Niger* of *Pliny*, hath a root blacke both within and without, light, yet very dense. It seemes to be of some large root, for that it is brought ouer cut into large pieces, of the bignesse of ones finger, sometimes bigger sometimes lesse, which it seemes is for the more conuenient drying thereof, for a large root, vnlesse it be cut into pieces can scarcely be wel dried: the taste of this is bitter, somewhat clammy and ingrate: the smell is little or none.

There are some other roots which haue been set forth by late writers for *Costus*, but because they are neither in vse, knowne here with vs, nor more agreeable to the descriptions of the Antients, I hastening to an end, am willing to passe them ouer in silence.

¶ *The Temperature and Vertues out of the Antients.*

A It hath a heating and attenuating facultie, and therefore was vsed in oile to annoint the bodie against the cold fits of Agues, the Sciatica, and when it was needfull to draw any thing to the superficies of the body.

B It is also conuenient to moue vrine, to procure the termes, to help strains, convulsions, or cramps and paines in the sides; and by reason of the bitternesse it kills wormes.

C It is good to be drunke against the bite of the viper: against paines of the chest, and windinesse of the stomacke taken in Wine with Worme-wood: and it is vsed to be put into sundrie Antidotes.

CHAP.

CHAP. 27. *Of Drakes root, or Contra-yerua.*

¶ *The Deſcription.*

THat root which of late is knowne in ſome ſhops by the Spaniſh name *Contra-yerua*, is the ſame which *Cluſius* hath ſet forth by the title of *Drakena radix*: wherefore I will giue you the hiſtorie of *Cluſius*, and thereto adde that which *Monardus* writes of the *Contra-yerua*. For though *Bauhine*, and the Author of the *Hiſtoria Lugdunenſis* ſeeme to make theſe different, yet I finde that both *Cluſius* his figure and hiſtorie exactly agree with the roots ſent vs from Spaine by that title, wherefore I ſhall make them one, till ſome ſhall ſhew me how they differ: and *Cluſius* ſeemes to be of this minde alſo, who deſired but the degree of heate which *Monardus* giues theſe, and that is but the ſecond degree: now theſe haue no taſte at the firſt, vntill you haue chewed them a pretty while, and then you ſhall finde a manifeſt heate and acrimonie in them, which *Cluſius* did alſo obſerue in his.

In the yeare (ſaith *Cluſius*) 1581. the generous Knight Sir *Francis Drake* gaue me at London certain roots, with three or foure Peruvian Beazor ſtones, which in the Autumne before (hauing finiſhed his voyage, wherein paſſing the Straights of Magellan, he had encompaſſed the World) he had broug ht with him, affirming them to be of high eſteeme amongſt the Peruvians: now for his ſake that beſtowed theſe roots vpon me, I haue giuen them the title *Drakena radix*, or *Drakes* root, and haue made them to be expreſſed in a table, as you may here ſee them.

1 *Drakena radix.*
Contra-yerua.

2 *Radix Drakenæ affinis.*
Another ſort of Contra-yerua.

Theſe roots were for the moſt part ſome halfe inch thick, longiſh, now and then bunching out into knots and vnequall heads, and their tops looked as if they were compoſed of thicke ſcales, almoſt like thoſe of the *Dentaria enneaphyllos*; blackiſh without, wrinckled, and hard, becauſe dried: their inner part was white; they had ſlender fibres here and there growing out of them, and ſome more thicke and large, hard alſo and tough, at which hung other knots: I obſerued no manifeſt ſmel they had, but found them to haue a taſte ſomewhat aſtringent, & drying the tongue at the firſt; but being long chewed, they left a quicke and pleaſing acrimonie in the mouth.

It ſeemed to haue great affinitie with the *Radix S. Helenæ*, whereof *Nic. Monardus* ſpeakes in his booke of the Simple Medicines brought from the Weſt Indies: but ſeeing *N. Eliot* (who accompanied

nied S^r. *Fran. Drake* in that voyage, ſaid, that the Spaniards in Peru had them in great requeſt; and they could not eaſily be got of them, and that he had learned by them, that the leaues were preſent poiſon, but the root an antidote, and that not only againſt the ſame poiſon, but alſo againſt other; and that it ſtrengthned the heart and vitall faculties, if it were beaten to pouder, and taken in the morning in a little wine; and giuen in water, it mitigated the heat of Feuers. By reaſon of theſe faculties it ſhould much agree with the *Radix Contra-yerua*, whereof *Monardus* writes in the ſame booke: yet in theſe I required the aromaticke taſte and degree of heate, which he attributes vnto theſe roots. Thus much *Cluſ.*

A From Charcis a Prouince of Peru, ſaith *Monard.* are brought certaine roots very like the roots of *Iris*, but leſſe, and hauing the ſmell of Fig leaues. The Spaniards that liue in the Indies call them *Contra-yerua*, as if you ſhould ſay an Antidote againſt poiſon; becauſe the pouder of them taken in white Wine is a moſt preſent remedy againſt all poiſon of what kinde ſoeuer it be (only ſublimate excepted, whoſe malignitie is onely extinguiſhed by the drinking of milke) it cauſes them to bee caſt vp by vomite, or euacuated by ſweat. They alſo ſay that Philtres or amorous potions are caſt forth by drinking this pouder. It alſo killeth wormes in the belly. The root chewed hath a certain aromaticke taſte ioined with acrimony; wherefore it ſeemes hot in the ſecond degree. Thus farre *Monardus*.

2 *Cluſius Exot. l. 4. c. 11.* being the next after *Drakena radix*, deſcribes this root, whoſe figure I giue you in the 2. place, & that by the ſame title as it is here ſet forth. Theſe roots, ſaith he, ſeemed ſomwhat like the *Drakena radix* which were found in the great ſhip which brought backe the Viceroy from the Eaſt Indies, and was taken by the Engliſh: for they were tuberous, and as much as one may gather by their forme, crept vpon the ſurface of the earth, hauing vpon them many haires and fibres, and being of a ſooty colour, yet ſomewhat inclining to yellow, dying the ſpittle in chewing them, and being bitter: they as yet retained foot-ſtalks of the leaues, but of what faſhion they were no man can eaſily gueſſe. But it was likely they were of great vſe among the Indians, ſeeing that the Vice-roy brought them together with other precious medicines growing in the Eaſt Indies. *Iames Garret* ſent this to *Cluſius* with the little plant dryed, whoſe figure you ſee expreſt by it.

CHAP. 28. *Of* Lignum Aloes.

Lignum Aloes vulgare.

¶ *The Deſcription.*

IT is a queſtion whether the *Agallochum* deſcribed in the 21. *c. l.* 1 of *Dioſcorides* be the ſame which the later Greeks and ſhops at this time call *Xyloaloe*, or *Lignum Aloes*, many make them the ſame: others, to whoſe opinion I adhere, make them differerent, yet haue, not the later, ſhew what *Agallochum* ſhould bee, which I notwithſtanding will do; and though I doe not now giue you my arguments, yet I will point at the things, & ſhew poſitiuely my opinions of them.

The firſt and beſt of theſe is that which ſome call *Calumbart*: others, *Calumba*, or *Calambec*: this is of high eſteem in the Indies, & ſeldom found but among ſt the Princes, and perſons of great qualitie; for it is ſold oft times for the weight in gold; I haue not ſeen any therof but in beads; it ſeemes to be a whiter wood than the ordinary, of a finer graine, not ſo ſubiect to rot, and of a more fragrant ſmell, and but light.

The ſecond ſort, which is vſually brought ouer, and called in ſhops by the name of *Lignum Aloes*, is alſo a precious and odoriferous wood, eſpecially burnt: the ſtickes of this are commonly knotty & vnſightly: ſome parts of them being white, ſoft, and doted: otherſome, denſe, blackiſh,

blackiſh, or rather intermixt with blacke and white veines, but much more blacke than white, and this put to the fire will ſweat out an oily moiſture, and burnt, yeeld a moſt fragrant odour. This I take to be the true *Xyloaloe* of the late Greekes; and the *Agalugen* of *Auicen*; and that they call *Palo d' Agula* in the Indies.

The third is a wood of much leſſe price than the former: and I conjecture it might well be ſubſtituted for *Thus*: and this I take to be the *Agallochum* of *Dioſcorides*; the *Lignum Aloes ſylueſtre* of *Garcias*; and *Agula braua* of *Linſcoten*. It is a firme and ſollid wood, ſomewhat like that of the Cedar, not ſubiect to rot or decay: the colour thereof is blackiſh, eſpecially on the out-ſide; but on the in-ſide it is oft times browniſh and ſpeckled, containing alſo in it an oilie ſubſtance, and yeelding a ſweet and pleaſing ſmell when it is burnt, but not like that of the two former: the taſte alſo of this is bitterer than that of the former: and the wood (though denſe and ſollid) may be eaſily cleft long-waies; it is alſo a farre handſomer and more ſightly wood than the former, hauing not many knots in it.

Garcias ab Orta thus deſcribes the tree that is the *Lignum Aloes* (I iudge it's that I haue ſet forth in the ſecond place:) it is (ſaith he) like an Oliue tree, ſometimes larger: the fruit or floure I could not yet ſee, by reaſon of the difficulties and dangers which a re to be vndergone in the accurate obſeruation of this tree (Tigers frequently there ſeeking their prey.) I had the branches with the leaues brought me from Malaca. Now they ſay that the wood new cut downe hath no fragrant odour, nor till it be dried: neither the ſmell to be diffuſed ouer the whole matter of the wood, but in the heart of the tree; for the barke is thicke, and the matter of the wood without ſmell. Yet may I not denie, but the barke and wood putrifying that oilie and fat moiſture, may betake it ſelfe to the heart of the tree, and make it the more odoriferous: but there is no need of putrifaction to get a ſmell to the *Lignum Aloes*: for there are ſundry ſo expert and skilfull in the knowledge thereof, that they will iudge of that which is new cut downe, whither it will be odoriferous or no. For in all ſorts of wood ſome are better than other ſome: thus much out of *Garcias*; where ſuch as are deſirous may ſee more vpon this ſubiect.

¶ *The Temperature and Vertues.*

It is of temperature moderate ly hot and dry, and alſo of ſomewhat ſubtill parts. Chewed it makes the breath ſmell ſweet, and burnt it is a rich perfume. A

Taken inwardly it is good to helpe the ſtomack that is too cold and moiſt, as alſo the weak liuer. B

It is commended likewiſe in dyſenteries and pleuriſies: and put alſo into diuers Cordiall medicines and Antidotes as a prime ingredient. C

CHAP. 29. *Of Gedwar.*

1 *Gedwar aut, Geiduar.*

2 *Zedoaria exactior icon.* A better figure of Zedoary:

¶ *The Deſcription.*

IN the Chapter of Zedoarie (which I made the 28. of the firſt booke) I might fitly haue giuen you this hiſtorie of Gedwar, which is thought to be that deſcribed by *Auicen, lib. 2. c. 734.* and a kinde of Zedoarie: *Garcias* ſaith, Gedwar is at a high rate, and not eaſily to be found, vnleſſe with the Indian Mountibanks and juglers, which they call *Iogues*, which goe vp and downe the countrey like Rogues, and of theſe the Kings and Noblemen buy *Geidnar*: it is good for many things, but chiefely againſt poiſons, and the bites and ſtings of venomous creatures. Now *Cluſius* in his *Auctarium* at the end thereof giues this figure, with the following hiſtorie.

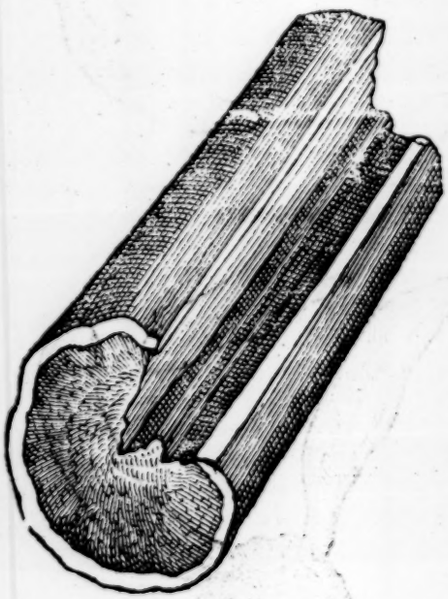
1 Becauſe *Garcias*, ſaith he, *cap. 42. l. 1. Aromatum hiſt.* treating of Zedoarie writes, that *Auicen* calls it Gedwar; and ſaith that it is of the magnitude of an Acorne, and almoſt of the ſame ſhape, I in my notes at the end of that chapter affirmed that it was not knowne in Europe, and hard to be knowne. But in the yeare 1605, *Iohn Pona* ſent me from Verona together with other things two roots written on by the name of *Gedwar verum*. They were not much vnlike a longiſh Acorne, or (that I may more truly compare them) the ſmaller bulbs of an Aſphodil, or *Anthora*: the one of them was whole and not periſhed: the other rotten and broken, yet both of them very hard and ſollid, of an aſh colour without, but yellowiſh within, which taſted, ſeemed to poſſeſſe a heating facultie and acrimonie.

But although I can affirm nothing of certaintie of this root, yet I made the figure of the wholler of them to be expreſt in a table, that ſo the forme might be conceiued in ones minde more eaſily, than by a naked deſcription. Let the Studious thanke *Pona* for the knowledge hereof. Thus much *Cluſius*.

2 In the 28 chapter of the firſt booke I gaue the figure of Zodoarie out of *Cluſius*, hauing not at that time this figure of *Lobel*, which preſents to your view both the long and the round, with the manner how they grow together, being not ſeuerall roots, but parts of one and the ſame.

CHAP. 30. *Of Roſe-wood.*

Aſpalathus albicans torulo citreo.
White Roſe-wood.



Aſpalathus rubens.
Reddiſh Roſe-wood.

¶ *The*

¶ *The Deſcription.*

BOth theſe as alſo ſome other woods are referred to the *Aſpalathus* deſcribed by *Dioſcorides, l.* 1. *c.* 19. But the later of theſe I take to be the better of the two ſorts there mentioned. The firſt of them is whitiſh without, hauing a yellowiſh or citrine coloured round in the middle: the taſte is hottiſh, and ſmell ſomewhat like that of a white-Roſe.

The other hath alſo a ſmall ring of white, next the thicke and rugged barke, and the inner wood is of a reddiſh colour, very denſe, ſollid and firme, as alſo indifferent heauy: the ſmell of this is alſo like that of a Roſe, whence they vulgarly call it *Lignum Rhodium*, Roſe-wood, rather than from Rhodes the place where the later of them is ſaid to grow.

¶ *The Faculties out of* Dioſcorides.

It hath a heating facultie with aſtriction, whence the decoction thereof made in wine is conue- A
nient to waſh the vlcers of the mouth, and the eating vlcers of the priuities and ſuch vnclean ſores as the *Ozæna* (a ſtinking vlcer in the noſe ſo called.)

Put vp in a peſſarie it drawes forth the childe, the decoction thereof ſtayes the looſeneſſe of the B
belly, and drunke it helpes the caſting vp of bloud, the difficultie of making water, and windineſſe.

AT the end of this Appendix I haue thought good to giue you diuers deſcriptions of Plants, which I receiued from my often mentioned friend M^r. *Goodyer*, which alſo were omitted in their fitting places, partly through haſte, and partly for that I receiued ſome of them after the printing of thoſe chapters wherein of right they ſhould haue been inſerted. They are moſt of them of rare and not written of plants, wherefore more gratefull to the curious.

Hieracium ſtellatum Boelij.

THis plant is in round, hairy, ſtraked, branched ſtalks, and long, rough, blunt indented leaues like to *Hieracium falcatum*, but ſcarce a foot high: the floures are alſo yellow three times ſmaller: which paſt, there ſucceed long crooked ſlender ſharpe pointed cods or huskes, neere an inch long, ſpreading abroad, ſtar-faſhion, wherein a long ſeed is contained: this hath no heads or woolly down like any of the reſt, but onely the ſaid crooked coddes which doe at the firſt ſpread abroad. The root is ſmall, threddie, full of milkie iuice, as is alſo the whole plant and it periſheth when the ſeed is ripe.

Hieracium medio nigrum flore maiore Boelij.

This hath at the firſt ſpreading vpon the ground many long, narrow, green, ſmooth leaues bluntly indented about the edges, like thoſe of *Hieracium falcatum*, but ſmaller: amongſt which riſe vp three, foure, or more, ſmall, ſmooth, ſtraked round ſtalks, diuided into other branches, which grow longer than the ſtalks themſelues leaning or trayling neere the ground: the floures grow on the tops of the ſtalks, but one together, compoſed of many pale yellow leaues, the middle of each floure being of a blackiſh purple colour.

Hieracium medio nigrum flore minore Boelij.

This is altogether like the laſt before deſcribed in ſtalkes and leaues: the floures are alſo of a blackiſh purple in the middle, but they are three times ſmaller.

Hieracium lanoſum

There groweth from one root three, foure or more round vpright ſoft cottonie ſtalks, of a reaſonable bigneſſe, two foot high, diuided into many branches, eſpecially neere the top, whereon groweth at each diuiſion one broad ſharpe pointed leafe, diuided into corners, and very much crumpled, and alſo very ſoft cottonie and woolly, as is the whole plant: the floures are ſmall, double, of a pale yellow colour, very like thoſe of *Piloſella repens*, growing cluſtering very many together at the tops of the ſtalkes and branches, forth of ſmall round ſoft cottonie heads: theſe foure plants grew from

ſeed which I receiued from Mr. *Coys*, 1620. and I made theſe deſcriptions by the Plants the 22. of Auguſt, 1621.

Blitum ſpinoſum: eſt Beta Cretica ſemine aculeato Bauhini & Matth. pag. 371.

This ſendeth forth from one root many round greene ſtrailing, ioynted, ſmall branches, about a foot long: the leaues are of a light greene colour, and grow at euery ioint one, ſomewhat like the leaues of great Sorrell, but they are round topped without barbes or eares below, or any manifeſt taſte or ſmell, very like the leaues of Beets, but much ſmaller: the floures grow cluſtering together about the ioints, and at the tops of the branches ſmall and greeniſh, each floure containing fiue or ſix very ſmall blunt topped leaues, and a few duſtie chiues in the middle: which paſt, there commeth great prickly ſhriuelled ſeed, growing euen cloſe to the root, and vpwards on the ioints, each ſeed hauing three ſharpe prickes at the top growing ſide-waies, which indeed may be more properly called the huske; which huske in the in-ſide is of a darke reddiſh colour, and containeth one ſeed in forme like the ſeed of *Flos Adonis*, round at the lower end, and cornered towards the top, and ſharp pointed, couered ouer with a darke yellowiſh skin; which skin pulled away, the kernell appeareth yellow on the out ſide, and exceeding white within, and will with a light touch fall into very ſmall pouder like meale.

Geranij Bæticæ ſpecies Boelij.

This hath at the beginning many broad leaues, indented about the edges, ſomwhat diuided, like thoſe of *Geranium Creticum*, but of a lighter greene colour, and ſmaller: amongſt which grow vp many round hairy kneed trailing branches, diuided into many other branches, bearing leaues like the former, but ſmaller, and no more diuided. The floures are ſmal like thoſe of *Geranium Moſchatum*, but of a deeper reddiſh colour, each floure hauing fiue ſmall round topped leaues: after followeth ſmall long hairie ſeed, growing at the lower end of a ſharpe pointed beak like that of *Geranium Moſchatum*: the whole plant periſheth when the ſeed is ripe.

Boelius a Low-countrey-man gathered the ſeeds hereof in Bætica a part of Spaine, and imparted them to Mr. *William Coys*, a man very skilfull in the knowledge of Simples, who hath gotten plants thereof, and of infinite other ſtrange herbes, and friendly gaue me ſeeds hereof, and of many other, *Anno*, 1620.

Antirrhinum minus flore Linariæ luteum inſcriptum.

This hath at the firſt many very ſmall, round, ſmooth branches from one root, trayling on the ground, about foure or fiue inches long, ſet with many ſmall greene ſhort ſharp pointed leaues, like thoſe of *Serpillum*, but that theſe are longer, ſmooth, and three or foure growing oppoſite one againſt another: amongſt which riſe vp fiue or ſix, ſometimes ten or twelue vpright round ſmooth little ſtalks a cubit high, diuided into branches bearing ſmall long ſmooth greene leaues, growing without order, as narrow as the vpper leaues of *Oenanthe Anguſtifolia*: at the toppes of the ſtalks and branches grow cluſtering together fiue ſix or more ſmall yellow floures, flouring vpwards, leauing a long ſpike of very ſmall huskes, each huske hauing a ſmall line or chinke as though two huskes were ioined together, the one ſide of the huske being a little longer than the other, wherein is contained exceeding ſmall blackiſh ſeed. The root is very ſhort, ſmall, and white, with a few threds, and periſheth at winter.

This plant is not written of that I can finde. I receiued ſeed thereof from Mr. *William Coys* often remembred.

Linaria minor æſtiua.

The ſtalkes are round, ſmooth, of a whitiſh greene colour, a foot high, weake, not able to ſtand vpright: whereon grow long narrow ſharpe pointed leaues, moſt commonly bending or turning downewards. The floures grow in ſpikes at the toppes of the branches, yet not very neere together, and are verie ſmall and yellow, with a ſmall tayle: the ſeed of this plant is ſmall, flat, and of a blackiſh gray colour, incloſed in ſmall round huskes, and you ſhall commonly haue at one time floures and ripe ſeed all on a ſtalke. The whole plant is like to the common *Linaria*, but that it is a great deale leſſer, and the floures are ſix times as ſmall, and periſh at Winter. I alſo receiued ſeeds thereof from Mr. *William Coys*.

Scorpioides multiflorus Boëlij.

This Plant is in creeping branches and leaues like the common *Scorpioides buplcuri folio :* the floures are alſo alike, but a little bigger, and grow foure or fiue together on one foot-ſtalke : the cods are rougher, and very much turned round, or folded one within another : in all things elſe alike.

Scorpioides ſiliqua craſſa Boelij.

This is alſo like the other in creeping branches and leaues : the floures are ſomething bigger than any of the reſt, and grow not aboue one or two together on a foot-ſtalk : the cods are crooked, without any rough haire, yet finely checkquered, and ſeuen times bigger than any of the reſt, fully as big as a great Palmer-worme, wherein is the difference : the ſeed is almoſt round, yet extending ſomewhat in length, almoſt as big as ſmall field Peaſon, of a browne or yellowiſh colour. This alſo periſheth when the ſeed is ripe. *Sept.* 1. 1621.

Silibum minus flore nutante Boelij.

This Thiſtle is in ſtalkes and leaues much ſmaller than our Ladies Thiſtle, that is to ſay, The ſtalkes are round, ſtraked, ſo newhat woolly, with narrow skinny prickly edges three or foure foot high, diuided into many branches, whereon grow long leaues, deeply diuided, full of white milke-like ſtreakes and ſharpe prickles by the edges : the floures grow on the tops of the ſtalks and branches, forth of ſmall heads, commonly turning downwards, of the bigneſſe of an Oliue, ſet with very ſmall ſlender ſharpe pricks, containing nothing but ſmall purple chiues, ſpreading abroad like thoſe of *Iacea*, with ſome blewiſh chiues in the middle : the ſeed followeth, incloſed in downe, and is ſmall and grayiſh like the ſeed of other Thiſtles, but it is as clammy as Bird-lime. The whole plant periſheth at Winter, and reneweth it ſelfe by the falling of his ſeed. I finde not this written of. It was firſt gathered by *Boelius* in Spaine, and imparted vnto M^r. *William Coys*, who friendly gaue me ſeeds thereof.

Aracus maior Bæticus Boelij.

It hath ſmall weake foure ſquare ſtreaked trailing branches, two foot high, leſſer, but like thoſe of Fetches, whereon grow many leaues without order, and euery ſeuerall leafe is compoſed of ſix, ſeuen, or more ſmall ſharpe pointed leaues, like thoſe of Lentils, ſet on each ſide of a middle rib, which middle rib endeth with claſping tendrels : the floures grow forth of the boſomes of the leaues, but one in a place, almoſt without any foot-ſtalkes at all, like thoſe of Vetches, but of a whitiſh colour, with purple ſtreakes, and of a deeper colour tending to purple towards the nailes of the vpper couering leaues : after which follow the cods, which are little aboue an inch long, not fully ſo big as thoſe of the wilde beane, almoſt round, and very hairy : wherein is contained about 4 peaſon, ſeldom round, moſt commonly ſomewhat flat, and ſometimes cornered, of a blackiſh colour, neere as big as field peaſon, and of the taſte of Fetches : the whole herbe periſheth when the ſeed is ripe. This plant *Boelius* ſent to M^r. *William Coys*, who hath carefully preſerued the ſame kind euer ſince, and friendly imparted ſeeds thereof to me in *Anno* 1620.

Legumen pallidum Vliſiponenſe, Nonij Brandonij.

This plant is very like, both in ſtalks, leaues, and cods, to *Aracus maior Bæticus*, but the floures of this are of a pale yellow or Primroſe colour, and the whole herbe ſmaller, and nothing ſo hairy. It periſheth alſo when the ſeed is ripe. I receiued the ſeeds likewiſe from M^r. *Coys*.

Vicia Indica fructu albo. Piſum Indicum Gerardo.

This Vetch differeth not in any thing at all, either in ſtalkes, leaues, cods, faſhion of the floures, or colour thereof, from our common manured Vetch, but that it groweth higher, and the fruit is bigger and rounder, and of a very cleare white colour, more like to peaſon than Vetches. M^r. *Gerard* was wont to call this Vetch by the name of *Piſum Indicum*, or Indian Peaſe, gotten by him after the publiſhing of his Herball, as M^r. *Coys* reported to me. But the ſaid M^r. *Coys* hath in my iudgment more properly named it *Vicia fructu albo* : which name I thought moſt fit to call it by, onely adding *Indica* to it, from whence it is reported to haue been gotten. *Iul.* 30. 1621.

Aſtragalus marinus Luſitanicus Boelij.

This hath fiue, ſix, or more round ſtraked reddiſh hairy ſtalks or branches, of a reaſonable bigneſſe, proceeding from one root, ſometimes creeping or leaning neere the ground, and ſometimes ſtanding vpright, a cubit high, with many greene leaues, ſet by certaine diſtances, out of order like thoſe of *Glaux vulgaris*, but leſſer, euery leafe being compoſed of fourteen or more round top-

ped leaues, a little hairy by the edges, ſet on each ſide of a long middle rib, which is about nine or ten inches in length, without tendrels: the floures grow forth of the boſomes of the leaues, neere the tops of the ſtalkes, on long round ſtreaked hairy foot-ſtalkes, of a very pale yellow colour, like thoſe of *Securidaca minor*, but bigger, growing cloſe together in ſhort ſpikes, which turne into ſpikes of the length of two or three inches, containing many ſmall three cornered cods about an inch long, growing cloſe together like thoſe of *Glaux vulgaris*, each cod containing two rowes of ſmall flat foure cornered ſeeds, three or foure in each row, of a darke yellowiſh or leadiſh colour, like to thoſe of *Securidaca minor*, but three or foure times as big, of little taſte: the root is ſmall, ſlender, white, with a few threds, and groweth downe right, and periſheth when the ſeed is ripe. I firſt gathered ſeeds of this plant in the garden of my good friend M^r. *Ioh. Parkinſon* an Apothecary of London, *Anno* 1616.

Faba veterum ſerratis foliis Boelij.

This is like the other wilde Beane in ſtalks, floures, cods, fruit, and claſping tendrels, but it differeth from it in that the leaues hereof (eſpecially thoſe that grow neere the tops of the ſtalks) are notched or indented about the edges like the teeth of a ſaw. The root alſo periſheth when the ſeed is ripe. The ſeeds of this wilde Beane were gathered by *Boelius* a Low-country man, in Bætica a part of Spaine, and by him ſent to M^r. *William Coys*, who carefully preſerued them, and alſo imparted ſeeds thereof to me, in *Anno* 1620. *Iul.* 31. 1621.

Piſum maculatum Boelij.

They are like to the ſmall common field Peaſon in ſtalkes, leaues, and cods; the difference is, the floures are commonly ſmaller, and of a whitiſh greene colour: the Peaſon are of a darke gray colour, ſpotted with blacke ſpots in ſhew like to blacke Veluet; in taſte they are alſo like, but ſomewhat harſher. Theſe peaſon I gathered in the garden of M^r. *Iohn Parkinſon*, a skilfull Apothecarie of London; and they were firſt brought out of Spaine by *Boelius* a low-Countrey man.

Lathyrus æſtivus flore luteo. Iuly. 28. 1621.

This is like *Lathyris latiore folio Lobelij*, in ſtalks, leaues, and branches, but ſmaller: the ſtalks are two or three foot long, made flat with two skins, with two exceeding ſmall leaues growing on the ſtalks, one oppoſite againſt another: betweene which ſpring vp flat foot-ſtalks, an inch long, bearing two exceeding narrow ſharpe pointed leaues, three inches long: betweene which grow the tendrels, diuided into many parts at the top, and taking hold therwith: the floures are ſmal, and grow forth of the boſomes of the leaues, on each foot-ſtalk one floure, wholly yellow, with purple ſtrakes. After each floure followeth a ſmooth cod, almoſt round, two inches long, wherein is contained ſeuen round Peaſon, ſomewhat rough, but after a curious manner, of the bigneſſe and taſte of field Peaſon, and of a darke ſand colour.

Lathyrus æſtivus Bæticus flore cæruleo Boelij.

This is alſo like *Lathyris latiore folio Lobelij*, but ſmaller, yet greater than that with yellow flours, hauing alſo adioining to the flat ſtalkes, two eared ſharpe pointed leaues, and alſo two other ſlender ſharpe pointed leaues, about foure inches long, growing on a flat foot-ſtalke; beetweene them, an inch and a halfe long, and one tendrel between them diuided into two or three parts: the floures are large, and grow on long ſlender foure-ſquare foot-ſtalkes, from the boſomes of the leaues, on each foot-ſtalk one: the vpper great couering leafe being of a light blew, & the lower ſmaller leaues of a deeper blew: which paſt there come vp ſhort flat cods, with two filmes, edges, or skins on the vpper ſide, like thoſe of *Eruilia Lobelij*, containing within foure or fiue great flat cornered Peaſon, bigger than field Peaſon, of a darke ſand colour.

Lathyrus æſtivus edulis Bæticus flore albo Boelij.

This is in flat skinny ſtalks, leaues, foot-ſtalks, and cods, with two skins on the vpper ſide, and in all things elſe like the ſaid *Lathyrus* with blew floures; only the floures of this are milk white: the fruit is alſo like.

Lathyrus æſtivus flore miniato.

This is alſo in skinnie flat ſtalks and leaues like the ſaid *Lathyris latiore folio*, but far ſmaller, not three foot high: it hath alſo ſmall ſharp pointed leaues growing by couples on the ſtalke, between which grow two leaues, about three inches long, on a flat foot-ſtalk half an inch long: alſo between thoſe leaues grow the tendrels: the floures are coloured like red lead, but not ſo bright, growing on

ſmoorh

ſmooth ſhort foot-ſtalks,one on a foot-ſtalke: after which follow cods very like thoſe of the common field peaſon, but leſſer,an inch and a halfe long,containing foure,fiue,or ſixe cornered Peaſon, of a ſand colour, or darke obſcure yellow,as big as common field peaſon,and of the ſame taſte.

Lathyrus paluſtris Luſitanicus Boelij

Hath alſo flat skinnie ſtalks like the ſaid *Lathyrus latiore folio*,but the paire of leaues which grow on the ſtalke are exceeding ſmall as are thoſe of *Lathyrus flore luteo*,and are indeed ſcarce worthie to be called leaues: the other paire of leaues are about two inches long, aboue halfe an inch broad,and grow from betweene thoſe ſmall leaues,on flat foot-ſtalks,an inch long: betweene which leaues alſo grow the tendrels: the floures grow on foot-ſtalks which are fiue inches long, commonly two on a foot-ſtalke,the great vpper couering leaues being of a bright red colour,and the vnder leaues are ſomewhat paler: after commeth flat cods,containing ſeuen or eight ſmall round peaſon,no bigger than a Pepper corne,gray and blacke,ſpotted before they are ripe, and when they are fully ripe of a blacke colour,in taſte like common Peaſon: the ſtalks,leaues,foot-ſtalkes and coddes are ſomwhat hairy and rough.

Lathyrus æſtivus dumetorum Bæticus Boelij

Hath alſo flat skinnie ſtalks like the ſaid *Lathyrus latiore folio*,but ſmaller,and in the manner of the growing of the leaues altogether contrarie. This hath alſo two ſmall ſharp pointed leaues,adioyning to the ſtalke: betweene which groweth forth a flat middle rib with tendrels at the top, hauing on each ſide(not one againſt another)commonly rhree blunt topped leaues, ſometimes three on the one ſide,and two on the other,and ſometimes but foure in all,about an inch and a halfe long: the floures grow on foot-ſtalks, about two or three inches long,each foot-ſtalk vſually bearing two floures, the great couering leafe being of a bright red colour; and the two vnder leaues of a blewiſh purple colour: afterwhich follow ſmooth cods, aboue two inches long,containing,fiue, ſixe,or ſeuen ſmooth Peaſon,of a browne Cheſtnut colour,not round,but ſomewhat flat, more long than broad,eſpecially thoſe next both the ends of the cod,of the bigneſſe and taſte of common field peaſon.

Iuniperus ſterilis.

This ſhrub is in the manner of growing altogether like the Iuniper tree that beareth berries,only the vpper part of the leaues of the youngeſt and tendereſt bowes and branches are of a more reddiſh greene colour: the floures grow forth of the boſoms of the leaues,of a yellowiſh colour,which neuer exceed three in one row,the number alſo of each row of leaues: each floure is like to a ſmall bud,more long than round,neuer growing to the length of a quarter of an inch, being nothing elſe but very ſmall ſhort crudely chiues,very thicke and cloſe thruſt together, faſtened to a very ſmall middle ſtem,in the end turning into ſmall duſt,which flieth away with the winde, not much vnlike that of *Taxus ſterilis*: on this ſhrub is neuer found any fruit. 15. *Maij*. 1621.

WHen the laſt ſheets of this worke were on the Preſſe,I receiued a Letter from from M^r. *Roger Bradſhaghe*,wherein he ſent me incloſed a note concerning ſome plants mentioned by our Author which I haue thought fitting here to impart to the Reader: he writes not who it was that writ them,wherefore I cannot acquaint you with his name,but thanke him,though vnknowne,for his deſire to manifeſt the truth,and ſatisfie our doubts in theſe particulars.

BEcauſe you write that *Gerards* Herbal is vpon a review,I haue thought good to put you in mind what I haue obſerued touching ſome plants which by him are affirmed to grow in our Northern parts: firſt the plant called *Pirola*,which he ſaith groweth in Lanſdale,I haue made ſearch for it the ſpace of twentie yeares, but no ſuch is to be heard of.

Sea Campion with a red floure was told him groweth in Lancaſhire: no ſuch hath euer bin ſeen by ſuch as dwell neere where they ſhould grow.

White Fox-gloues grow naturally in Lanſdale,ſaith he,it is very rare to ſee one in Lanſdale.

Garden Roſe he writes groweth about Leiland in Glouers field wilde: I haue learned the truth from thoſe towhom this Glouers field did belong,and I finde no ſuch thing, only aboundance of red wilde poppie,which the people call Corne-roſe is there ſeene.

White Whortles,as he ſaith,grow at Crosby in Weſtmerland,and vpon Wendle hill in Lancaſhire: I haue ſought Crosbie very diligently for this plant and others which are ſaid to grow there,but none could I finde,nor can I heare of any of the countrey people in theſe parts, who dayly are labouring vpon the mountains where the VVortle berries abound, that any white ones haue

beene

been seene, sauing that those which *Gerard* calls red Whortles, and they are of a very pale white green till they be full ripe, so as when the ripe ones looke red, the vnripe ones looke white.

Cloud-berrie assuredly is no other than Knout berrie.

Heskets Prim-rose groweth in Clap-dale. If Mr. *Hesket* found it there it was some extraordinary luxurious floure, for now I am well assured no such is there to be seene, but it is onely cherished in our gardens.

Gerard saith many of these Northerne plants do grow in Cragge close. In the North euery town and village neere any craggie ground both with vs & in Westmerland haue closes so called, whereby *Gerards* Cragge close is kept close from our knowledge.

Chamæmorus, seu Vaccinia nubis. Knot, or Knout-berrie, or Cloud-berrie.

THis Knot, Knout or Cloud-berrie (for by all these names it is knowne to vs in the North, and taketh these names from the high mountaines whereon it groweth, and is perhaps, as *Gerard* saith, one of the brambles, though without any prickles) hath roots as small as packe thred, which creepe far abroad vnder the ground, of an ouerworne red colour, here and there thrusting more fastly into the mossie hillockes tufts of small threddie strings, and at certaine ioints putting vp small stalks rather tough than wooddy, halfe a foot high, somthing reddish below: on which do grow two or three leaues of a reasonable sad green colour, with foot-stalkes an inch long, one aboue another without order: the highest is but little, and seldome well spread open; they are something rugged, crispie, full of nerues in euery part, notched about the edges, and with some foure gashes a little deeper than the rest, whereby the whole leafe is lightly diuided into fiue portions. On the top of the stalk commeth one floure consisting of foure, sometimes of fiue leaues apiece, very white and tender, and rather crumpled than plaine, with some few short yellow threds in the midst: it standeth in a little greene husk of fiue leaues, out of which when the floure fades, commeth the fruit, composed of diuers graines like that of the bramble, as of eight, ten or twelue, sometimes of fewer, and perhaps through some mischance but of three or two, so ioined, as they make some resemblance of a heart, from whence (it may be) hath grown that errour in *Gerard* of diuiding this plant into 2 kinds: the fruit is first whitish greene, after becommeth yellow, and reddish on that side next the Sun.

It groweth naturally in a blacke moist earth or mosse, whereof the countrie maketh a fewel we call Turfe, and that vpon the tops of wet fells and mountains among the Heath, mosse, and brake: as about Ingleborow in the West part of York-shire, on Graygreth a high fell on the edge of Lancashire, on Stainmor such a like place in Westmerland, and other such like high places.

The leaues come forth in May, and in the beginning of Iune the floures: the fruit is not ripe till late in Iuly.

The berries haue a harsh and something vnpleasant taste.

THis worke was begun to be printed before such time as we receiued all the figures from beyond the Seas, which was the occasion I omitted these following in their fitting places: but thinking it not fit to omit them wholly, hauing them by me, I wil giue you them with their titles, and the reference to the places where to they belong.

* In August last whiles this worke was in the Presse, and drawing to an end, I and Mr. *William Broad* were at Chissel-hurst with my oft mentioned friend Mr. *George Bowles*, and going ouer the heath there I obserued this small *Spartum* whose figure I here giue, and whereof you shall find mention, in the place noted vnder the title of the figure; but it is not there described, for that I had not seen it, nor could finde the description therof in any Author, but in Dutch, which I neither had nor vnderstood. Now this little Matweed hath some small creeping stringy roots: on which grow somwhat thick heads, consisting of three or foure leaues, as it were wrapt together in one skin, biggest below, and so growing smaller vpwards, as in *Schœnanth*, vntill they grow vp to the height of halfe an inch, then these rushie greene leaues (whereof the longest scarce exceeds two inches) breake out of these whitish skins wherein they were wrapped, and lye along vpon the ground, and amongst these growes vp a small grassie stalke, some handfull or better high, bending backe the top, which carries two rowes of small chaffie seeds. It is in the perfection about the beginning of August.

Chrysomela Athenæi, i. Malus Medica.
Citrago, i. Melissa.
Clavum Veneris, i. Nymphæa.
Clavicula, i. Hedera Helix.
Clematis Peregrina, i. Flammula Iouis,
Clematis Daphnoides, id est Vinca pervinca.
Clematis altera Matthiol. i. Viorna.
Cleome Horatij, i. Erysimum.
Colabrina, i. Arum Ægyptium.
Cocior, i. Fœniculus.
Colocasia, i. Faba Ægyptia.
Columnaris, i. Campana Lactescens.
Columbina Actuarij, i. Verbena.
Combul, i. Nardus.
Condisi, i. Saponaria.
Condurdum Plinii, i. Vaccaria.
Consolida media Fuchsij, id est, Bellis maior.
Consolida media, i. Bugula.
Consolida minor Matthioli, i. Prunella.
Consolida minor Ruellij, id est Bellis minor.
Conzambuch Turcor. i. Hemerocallis Valentina.
Connarus Athenæi, i. Iniubæ species maior.
Concordia, i. Agrimonia.
Conila, i. Myrrhis.
Consecratrix, i. Iris nostras.
Coralloides Cordi, i. Dentaria Matthioli.
Corcorus Melochia, id est Olus Indaicum.
Corcorus Marcelli vet. id est Anagallis mas.
Corydalis, i. Radix Cava.
Cor Indum, i. Pisum Cordatum.
Corizsola Rhasis, i. Stamonea.
Corona fratrum, i. Cardnus Eriocephalus.
Corion, i. Coriandrum.
Coronopus, i. Cornu Cervi.
Corigiola, i. Centumnodia.
Corona monachi, i. Dens Leonis.
Corona Regia, i. Pomum spinosum.
Coroneola, i. Lysimachia.
Corydalium, i. Fumaria.
Corylus, i. Avellana.
Costus spurius, Matth. i. Panax Chironium.
Costus Hortorum, i. Balsamita maior.
Costa Canina, i. Quinquenervia.
Corydalopodium, i. Consol. Regalis.
Cotinus Dodo. i. Coccygria Plinij.
Cot Auicennæ, i. Medica.
Crepanella, id est Dentillaria Rondeletij.
Creta Marina, i. Crithmum.
Crinita, i. Capillus Veneris.
Cucullata, i. Pinguicula.
Cucurida, i. Dentillaria Rondeletij.
Cuminum Æthiopicum, i. Ammi.
Cunilago, i. Conyza.
Cunegundis, herba, i. Eupatorium Auicennæ.
Cunila Columellæ, i. Satureia.
Cunophoron, i. Nux Indica.
Cunder Auicennæ, i. Saponaria.
Curcuma, i. Cyperus Indus.
Curcas Clusij, i. Ricinus.
Cusbar, i. Coriandrum.
Cyanus Hierosolymitana, i. Ptarmica Austriaca.

Cyso, id est, Hyssopus.
Cyminalis, id est, Gentiana.
Cynanthemis, i. Cotula fœtida.
Cynospastus, i. Paonia.
Cynosorchis, i. Satyrium.
Cynocephalus Apulei, i. d est, Antirrhinum.
Cynocephalus, i. Anetum.
Cynosbatos Dioſc. id est Roſa ſylueſtris.
Cynosbatos Tragi, i. Oxyacanthus.
Cynosbatos Ruellij, i. Rubus.
Cynosbatos Daleſc. i. Capparis.
Cyprus, i. Ligustrum. Lobelij.
Cyprus Dod. i. Phillyrea.

D

Damedries, i. Chamedrys.
Danebalchil, i. Equiſetum.
Darach, i. Palma.
Daracht mous, i. Muſa.
Datura, i. Stramonia perigrina.
Debonigi, i. Chamomilla.
Decta, id est Beta.
Delphinium, i. Conſolida Regalis.
Diapensia, i. Sanicula.
Didar Arab. i. Vlmus.
Digitus Veneris, i. Nymphea.
Dili, id est Iſatis.
Diocallia Apulei, i. Chamomelum.
Dioſpiros, i. Milium ſolis.
Dioſpiros Plinij, i. Lacryma Iob.
Dieſanthos Theop. i. Superba Fuchſij.
Dochon, id est Panicum.
Dolichus Theophr. id est Phaſeolus Lobelii.
Draco herba, i. Tarcon,
Draco ſylueſtris, i. Ptarmica.
Drofutum, i. Haliabbi Aniſum.
Droſion Cordi, i. Alchimilla.
Drypis Guillandini, i. Tragon. Mat.
Drypis Theop. i. Eryngium Marinum
Dryopteris Tragi, id est Pteridion Cordi.
Dryopteris, i. Adianthum nigrum.
Dryophonon Plinii, id est Arabis Dodon.
Dulb Arab. i. Platanus.
Dulcamara, i. Amara Dulcis.
Dulciſida, i. Paonia.
Dulcichinum Guillandini, i. Cyperus dulcis Tragi.
Dumbebe, i. Endivia.

E

Echium Paluſtre Cordi, i. Scorpioides Dodon.
Eghelo, Dodon. id est Laburnum Lobelij.
Eleagnus Mat. i. Ziziphus alb. Lobel.
Eleoſelinum, i. Paludapium.
Elliſiphacos, i. Salvia.
Elkiageber, i. Roſmarinus.
Empetron Dod. i. Kali.
Empetron Rondeletii, i. Crithmum.
Empetron Tragi, i. herba Turca.
Empetron, i. Herniaria.
Encephalus, i. Chamærrhiphes.
Enephyllum, Lobelii, i. Dentaria.
Eneaphyllum, i. Lingua Serpentina.
Enneadynamen Geſneri, i. Gramen Parnaſſi.
Ephetium, i. Ranunculus.
Euphroſynum Plinii, i. Borago.
Epilobion Geſn. i. Chamænerium Lobel
Epimetron, i. Epimedium.
Epipetron, i. Epimedium.
Epipactis Recentiorum, i. Helleborine.
Epipactis Rondeletii, i. Herniaria.
Eranthemum, i. Flos Adonis.
Ericoides, i. Euphraſia lutea, Dod.
Eringium Vegetii, i. Acarna Theop.
Eringium Guillan, i. Carduus Stellatus
Erinus, i. Corcoros Plinii
Erucum ſylueſtre, i. Catanance.
Eryphion Apulei, i. Ruta.
Eryſimum Theop. i. Camelina.
Erythrodanum, i. Rubia tinctorum.
Exupera, i. Verbena.

F

Farfara, i. Tuſſilago.
Farfugium, i. Tuſſilago.
Farſum Auicennæ, id est Thora Valdenſis.
Farfrugum, i. Caltha paluſtris.
Faranum, i. Tuſſilago.
Fandegeni, i. Origanum
Fel Terra, i. Centaureum minus.
Fœniculus Porcinus, i. Peucedanum.
Ferulacoli, i. Thapſia.
Ferraria, i. Agrimonia.
Ferraria Lobelii, i. Scrophularia.
Feſtuca Plinii, i. Auena Sterilis.
Flammula Ionis, id est Clematis Peregrina.
Filicaſtrum, i. Oſmunda Regalis.
Filix paluſtris, i. Oſmunda Regalis.
Filix Florida, i. Oſmunda Regalis.
Filix Latifolia Cordi, i. Oſmunda Regalis.
Ficaria, i. Chelidonium minus.
Flos Regius, i. Conſolida Regalis.
Flos Ambarualis, i. Polygala.
Fontalis, i. Potamogeiton.
Folium Indum, id est, Malabathrum Garciæ.
Fuga Dæmonis, i. Hypericum.
Fuſus, i. Atractylis.
Fumaria Corydalis, i. Radix Cava.

G

Galedragon Plinii, i. Dipſacus:
Garoſmus, i. Atriplex Olida.
Gallitricum, i. Horminum.
Gelſeminum Indicum, i. Mirabilis Peruviana.
Genitura, id est, Anetum.
Genicularis, i. Phu magnum.
Genecanthe, i. Bryonia nigra.
Geum, i. Caryophyllata.
Giezar, i. Daucus.
Giezar Aridras, i. Belbunen.
Gith, i. Nigella.
Githago Plinii, i. Lolium.
Gladiolus Aquatilis, i. Iuncus Floridus
Globularia, i. Aphyllanthes.
Gloſſographe, Auicennæ, i. Fumaria.
Goſſypium, i. Xylon.
Granum Regium Meſuæ, i. Ricinus.
Gromphena Plinii, i. Calendula.
Groſſularia, i. Ribes.
Groſſularia, i. Vua criſpa.

H

Habenog Auer. i. Chamamela.
Habal Nil Serapionis, i. Convolvulus cæruleus.
Halcaſmeg Auerroi, i. Fœniculus.
Halgazar Auerroi, i. Paſtinaca.
Halicacabum Veſicarium, id est Alkekengi.
Halicacabum Peregrinum, i. Piſum Cordatum.
Hameſiteos, i. Chamæpitys.
Hanab. Althaleb, i. Solanum.
Haraba, i. Cucurbita.
Harbatum, i. Peucedanum.
Harenaria, i. Cornu Cerui.
Haronigi, id est Doronicum.
Haſmiſen Syriacum, id est Convolvulus Cæruleus.
Haſtula Regia, i. Aſphodelus albus.
Haſce, i. Thymus.
Handacocha Plinii, i. Trifolium bituminoſum.
Haur Arab. i. Populus alba.
Hebene, i. Xylaloe officinarum.
Herculania, i. Verbena.
Hederalis Ruellii, i. Aſclepias.
Hedera ſpinoſa, i. Smilax Aſpera.
Hedera Cilicia, i. Smilax Aſpera.
Helxine, i. Parietaria.
Helice, i. Hedera Helix.
Hemen, i. Serpillum.
Hepatica alba Cordi, i. Gramen Parnaſſi.
Herba Scythica, i. Glycyrrhiza vulg.
Herba Caſta, i. Paonia.
Herba Leonis, i. Palma.
Herba Lucis, i. Chelidonium maius.
Herba Impetiginaria i. Chelidonium maius.
Herba Vulcani, i. Ranunculus.
Herba Sceleratæ, i. Ranunculus.
Herba Vlceraria, i. Ranunculus.
Herba Cauſtica, i. Ranunculus.
Herba Dinocilia, i. Conſolida Regalis.
Herba Stellæ, i. Cornu Cerui.
Herba Cancri, i. Helsotropium.
Herba Radicis Apulei, id est Polypodium.
Herba Leonis Dodon. id est, Aquilegia.
Herba S. Anthonij, i. Dentillaria Rondeletij.
Herba Coxendicum, i. Cotyledon.
Herba Benedicta, i. Caryophyllata.
Herba Fortis, id est Solidago Saracenica.
Herba Paralyſis, i. Primula veris.
Herba Clauellata, i. Violatricolor.

Herba

Herba Lassulata, id est Balsamita maior.
Herba Pinnula, id est, Hyoscyamus.
Herba Turca, i. Herniaria.
Herba Hungarica Dodon. i. Alcea.
Herba Simeonis Dodon. id est, Alcea.
Herba Vrbana, i. Acanthus.
Herba Tunica Gordonij, id est Ocymastrum.
Herba Tunica Dodon. id est, Caryophyllata.
Herba Gallica Fracastorij, i. Galega.
Herba Rutinalis, i. Sphondylium.
Herba Sardoa, id est Ranunculus aquaticus,
Herba Sacra, i. Tabaco.
Herba Sacra Agrippæ, i. Melissa.
Hermodactylus Dodon. id est Colchicum.
Hermodact. Italorum, i. Iris tuberosa Lobel.
Hesperis Clusij, i. Leucoium marinum Lobelij.
Hippia, i. Alsine.
Hirundinaria, i. Asclepias.
Hortus Veneris, i. Cotyledon.
Horminum Tridentinum, id est Colus Iouis.
Humadh, i. Lapathum.
Hunen, i. Iuiube.
Huniure, i. Vrtica.
Hydroselinum, i. Paludapium.
Hydroselinum Camerarij, id est Lauer maius.
Hyoscyamus Peruvianus, i. Tabaco.
Hippoglossum, Bonifacia, id est Laurus Alex.
Hyosyris Plinij, i. Iacea nigra.
Hyophthalmon, i. Aster Atticus.
Hypecoon Dodon, id est Cuminum sylvestre.
Hypecoon Clusij, i. Alcea Veneta.
Hipposelinon, i. Olus atrum.

I

Iarus, id est, Arum.
Iackaiak, i. Anemone.
Iasione, i. Campanula.
Iasin, i. Ennla.
Ianatri, i. Nux Moscata.
Ibiga, i. Chamæpitys.
Iezar Serapionis, i. Pastinaca.
Imperatrix, i. Meum.
Inula Rustica Scribonij Largi, i. Consolida maior.
Inguinalis, i. Aster atticus.
Intybum, i. Cichorium.
Iouis Faba, i. Hyoscyamus.
Iouis Glans, i. Castanea.
Iouis Flos, i. Lychnis.
Iouis Arbor, i. Quercus.
Iorgir, i. Eruca.
Irio, i. Erysimum.
Iuncus quadratus Celsi, i. Cyperus.
Iua Muscata, i. Chamæpitys.
Iusacti, i. Sambucus.
Iusquiamus, i. Hyoscyamus.
Ixopus Cordi, i. Chondrilla.

K

Kanturion, i. Centaureum.
Kanz, i. Amygdalus.
Kaper, i. Capparis.
Kauroch, i. Chelidonium maius.
Kebikengi, i. Ranunculus.
Keiri, i. Leucoium.
Kemetri, i. Pyrus.
Kemum, i. Cuminum.
Kenne, i. Ligustrum.
Keruagh, i. Ricinus.
Kerugha, i. Ricinus.
Kermes, i. Coccus infectoria.
Kulb, i. Milium solis.
Kusbera Auerroij, id est Coriandrum.
Kusbor, i. Coriandrum.

L

Labrusca, i. Bryonia nigra.
Labrum Veneris, i. Dipsacus.
Laburnum, i. Anagyris.
Lactaria, i. Tithymalus.
Lactuca leporina, i. Sonchus.
Lactucella, i. Sonchus.
Lanata Cordi, i. Aria Theoph.
Lancea Christi, id est, Lingua Serpentina.
Lantana, i. Viburnum.
Lanaria, i. Radicula.
Lanceola, i. Quinqueneruia.
Laudata Nobilium, i. Veronica.
Lathyris, i. Catapuntia.
Lathyrus, i. Pisum sylvestre.
Lauer Lauacrum, i. Dipsacus.
Laurus Alexandrina, id est, Hippoglossum.
Laurus rosea, i. Oleander.
Laurus sylvestris, id est, Laurus Tinus.
Laurentina Mathioli, i. Bugula.
Leo Columellæ, i. Aquilegia.
Leontostomium Gesneri, id est, Aquilegia.
Leo Herba Dodon. i. Aquilegia.
Lepidium Plinij, i. Piperitis.
Lesen Arthaur, i. Buglossum.
Leucacantha, i. Carlina.
Leucanthemum, i. Chamæmelum.
Libadion Plinij, i. Centaurem.
Libanium Apulei, i. Borago.
Limodoron Dodon, i. Orobanche.
Lingua anis, i. Fraxini semen.
Lingua Pagana, i. Hippoglossum.
Liliago Cordi, i. Phalangium Lobel.
Lisen, i. Plantago.
Lotus Vrbana, i. Trifolium odoratum Lobelij.
Longina, i. Lonchitis.
Lichen, i. Hepatica officinarum.
Lunaria Arthritica Gesneri, i. Auricula Vrsi.
Luciola, i. Lingua serpentina.
Lunaria Græca, i. Bolbonac.
Lunaria maior Dioscor. id est, Alysson.
Luph Cordi, i. dracunculus.
Luula, i. Trifolium Acetosum.

Lycostaphylos Cordi, id est, Sambucus aquatica,
Lycopsis, i. Buglossum sylvestre.
Lycoperficum, i. Poma Amoris.

M

Machla, id est, Palma.
Madon Plinij, id est, Bryonia alba.
Mahaleb Auicennæ, id est. Pseudoligustrum.
Mahaleb, i. species Phillyreæ.
Magydaris Theoph. i. Laserpitium.
Malacoccissos, id est, Hedera Terrestris.
Malinathalla Theop, i. Mala insana vel potius, Cyperus Esculentus.
Malaccissus Cassani Bassi, i. Caltha palustris.
Malnauiscus, i. Ibiscus.
Manus Martis, i. Quinquefolium.
Marana, i. Stramonia.
Marathrum, i. Fœniculum.
Maru herba Dodon. id est, Cerinthe Plinij.
Marinella, i. Phu magnum.
Marmarites, i. Fumaria.
Marmorella, i. Agrimonia.
Mastastes, i. Laserpitium.
Maston Plinij, i. Scabiosa.
Mater Herbarum, i. Artemisia.
Matersilon, i. Iacea nigra.
Matrisaluia, i. Horminum.
Matrisylua, i. Periclymenum.
Maurohebræ Caput, id est, Antirrhinum.
Medium Dioscor. id est, Viola Martiana.
Medium Lobelij, i. Iris maritima Narbonensis.
Melochia, i. Corcorus.
Melampodium, i. Helleborus niger.
Mel frugum Dioclis, i. Panicum.
Melampyrum, id est, Triticum Vaccinum.
Melaspermum, i. Nigella.
Melich Arab. id est, Trifolium fruticans.
Meleagris Flos, i. Fritillaria.
Melanthium, i. Nigella.
Melospinum, i. Pomum Spinosum.
Memiran Andr. Bellunensis, i. Chelidonium maius.
Memiresin Auicen. idem.
Mend Heudi Arabibus, id est, Scamonea.
Memitha Arabibus, id est, Papaver Cornutum.
Memacylum, i. Arbutus.
Menogenion, i. Paonia.
Mentha Saracenica, id est Balsamita maior.
Men, id est Meum.
Memiren Serapionis, i. Chelidonium minus.
Methel, i. Stramonia.
Merzenius, i. Maiorana.
Mescatremsir, id est, Dictamnum.

Mille grana, i. Herniaria.
Menianthe Theop. id est Trifolium palustre.
Militaris, i. Millefolium.
Miha, i. Styrax.
Millemorbia, i. Scrophularia.
Mixa, i. Sebesten.
Molochia Serapionis, id est, Corcoros Matthioli.
Molybdena, id est, Dentillaria Rondeletij.
Momordica, i. Balsamita mas.
Morghani Syriaca, id est, Fabago Belgarum.
Mochus Dodon. id est, Orobus Lobel.
Morella, i. Solanum Hortense.
Mula Herba Gazæ, i. Ceterach.
Multibona, i. Petroselinum.
Mumeiz, i. Sycomorus.
Muralia Plin. i. Helxine.
Myophononon, i. Doronicum.
Myrtus sylvestris, i. Ruscus.
Myrica, i. Tamariscus.
Myriophyllum, i. Viola aquatilis.

N

Nabatnaho, id est, Mentha.
Nanochach, i. Ammi.
Nard & Naron Arab, i. Rosa.
Nardus Cretica, i. Phu magnum.
Nardus Rustica Plinij, i. id est, Conyza vel potius Asarum.
Narf. i. Nasturtium.
Nargol, i. Palma.
Nasturtium hibernum, i. Barbarea.
Nenuphar, i. Nymphæa.
Neottia, i. Nidus auis.
Nepa Gazæ, i. Genista spinosa.
Nerium, i. Oleander.
Nicophoron Plinij, i. Smilax aspera.
Nicotiana, i. Tabaco.
Nigellastrum, i. Pseudomelanthium.
Nilofer, i. Nymphæa.
Nil Auicennæ, id est, Convolvulus Cæruleus.
Nola Culinaria, i. Anemone.
Noli me tangere, i. Impatiens herba.
Noli me tangere, i. Cucumis sylvestris.
Nux Metel, i. Stramonia Fuchsij.
Nux Vesicaria, id est, Staphylodendron.
Nymphea minima, i. Morsus Rana.

O

Oculus Christi, id est, Horminum syl.
Odontis, id est. Dentillaria Rondeletij.
Olualidia, i. Chamamælum.
Olea Bohemica, i. Ziziphus alba.
Oleagnos, i. Chamelæa.
Oleastellum, i. Chamelæa.
Olus Indiacum, i. Corcoros.
Olus album Dodon. i. Valeriana Campestris, vel Lactuca agnina.
Onagra Veterum, i. Chamænerium.
Onitis Plinij, i. Origanum.
Ononis, i. Resta Bouis.
Onobrychis, id est, Caput Gallinaceum.
Onobrychis Belgarum, i. Campanula Aruensis.
Onosma, id est, Buglossum sylvestre.
Onopordon, id est, Acanthium Illyricum.
Ordelion Nicandri, i. Tordylion.
Ophris, i. Bifolium.
Ophioglossum, id est, Lingua serpentis.
Opuntia Plinii, i. Ficus Indica.
Opsago, i. Solanum somniferum.
Orbicularis, i. Cyclamen.
Orvala, i. Horminum.
Oreoselinum, i. Petroselinum.
Ornus, i. Fraxinus Bubula.
Orontium, i. antirrhinum.
Ostria Cordi, i. Ornus Tragi.
Osteocollon, i. Consolida maior.
Ostrutium, i. Imperatoria.
Osyris, i. Linaria.
Othonna, i. Flos Africanus.
Oxyacantha, i. Berberis.
Oxyacanthus i. Spina appendix, vel pyracantha.
Oxys, i. Trifolium Acetosum.
Oxymyrsine, i. Ruscus.
Oxycoccus Cordi, id est, Vaccinia palustris.

P

Palma Christi, id est, Ricinus.
Palalia, i. Cyclamen.
Paderota, i. Acanthus.
Panis Cuculi, id est, Trifolium Acetosum.
Pancratium, i. Squilla.
Panis porcinus, i. Cyclamen.
Papaver Spumeum, i. Ben album.
Paronychia Dioscor. id est. Ruta Muraria.
Passerina, Ruellii, id est, Morsus Gallina.
Pedicularis herba, i. Staphisagria.
Pedunculata Marcelli, id est, Staphisagria.
Peganon, i. Ruta sylvestris.
Pentadactylon, i. Ricinus.
Peponella Gesneri, id est, Pimpinella.
Perlaro, i. Lotus arbor.
Perforata, i. Hypericon.
Perdicion, i. Helxine.
Peristerion, i. Scabiosa minima.
Personata, i. Bardana.
Pezizæ Plinii, sunt fungi species.
Pes auis, i. Ornithopodium.
Pes Leonis, i. Alchimilla.
Pes vituli, i. Arum.
Pes Leporinus, i. Lagopus.
Petrum America, i. Tabaco.
Petilius Flos, i. Flos africanus.
Pharnaceum, i. Costus Spurius.
Phasganon Theop. i. Gladiolus.
Phalangitis, i. Phalanginm.
Phellos, i. Suber.
Phellandrium, i. Cicutaria palustris.
Phellandrium Guillandini, i. Angelica.
Phœnix, i. Lolium.
Philomedium, i. Chelidonium maius.
Phileterium, i. Ben album.
Phleos, i. Sagittaria.
Phthirion, i. Pedicularis.
Phylateria, i. Polemonium.
Phillyrea Dodon. i. Ligustrum.
Phyllon Theophrasti, i. Mercurialis.
Philanthropos, i. Aparine.
Picnacomon Anguill. i. Rheseda.
Pimpinella spinosa Camerarii, i. Poterion Lobel.
Pinastella, i. Peucedanum.
Piper aquaticum, i. Hydropiper.
Piper Calecuthium, Indum, Brasilianum, i. Capsicum.
Piper agreste, i. Vitex.
Pistatia sylvestris, id est Nux Vesicaria.
Pistana, i. Sagittaria.
Planta leonis, i. Alchimilla.
Pneumonanthe Lobelii, i. Viola Calathiana Dodonæi.
Podagraria Germanica, id est Herba Gerardi.
Polytricum, i. Capillus Veneris.
Polytricum Fuchsij, id est Muscus capillaris.
Polygonatum, id est, Sigillum Salomonis.
Polygonoides Dioscoridis, id est, Vinca pervinca.
Polyanthemum, i. Ranunculus aquaticus.
Pologonum, i. Centumnodia.
Populago, i. Tussilago, vel Caltha palustris,
Potentilla maior, i. Ulmaria.
Pothos Costei, i. Aquilegia.
Pothos Theophrasti, i. Aquilegia.
Proserpina herba, i. Chamomelum.
Protomedia, i. Pimpinella.
Pseudorchis, i. Bifolium.
Pseudobunium, i. Barbarea.
Pseudocapsicum, i. Strichnodendron.
Pyrethrum sylvestre, i. Ptarmica.
Pteri[illegible] Pteropteris Tragi.
P[illegible]
R[illegible]
Ral[illegible]bi, id est, Fumaria.
Rigina prati, i. Vlmaria.
Rosa fatuina, i. Paonia.
Rosa Iunonis, i. Lilium.
Rorastrum, i. Bryonia.
Rorella, i. Ros solis.
Rotula solis, i. Chamæleum.
Rhododaphne, i. Oleander.
Rhododendron, i. Oleander.
Rhuselinum Apulei, i. Ranunculus.

Rima Maria, i. Alliaria.
Rincus Marinus, i. Crithmum.
Rubus cerninus, i. Smilax aspera.
Rumex, id est Lapathum.
Ruta capraria, id est Galega.
Ruta palustris, id est Thalictrum.

S

Sabeteregi, id est Fumaria.
Sabaler, i. Satureia.
Sadeb, id est Ruta.
Sacra herba Agrippæ, i. Salvia.
Saffargel, i. Malus Cydonia.
Safarheramon, i. Sparganium.
Salicaria, i. Lysimachia.
Saliunca Gesneri, i. Nardus Celtica.
Salsirora, i. Ros solis.
Salicastrum Plin. i. Amara dulcis.
Salix Amerina, i. Salix humilis.
Salinaris, i. Pyrethrum.
Saluia vitæ, i. Ruta muraria.
Saluia agrestis, id est Scordium alterum.
Salvia Romana, i. Balsamita maior.
Salusandria, i. Nigella.
Samalum Plin. i. Pulsatilla.
Samolum Plin. i. Anagallis Aquatica.
Sampsuchum, i. Amaracus.
Sanguis Herculis, id est Helleborus albus.
Sanguinaria, i. Cornus cerus.
Sanamunda. i. Caryophyllata quibusdã.
Sarax, i. Filix.
Sardinia glans, i. Castanea.
Sauch, i. Malus Persica.
Saxifragia lutea Fuchsii, id est Melilotus.
Saxifragia rubra, i. Philipendula.
Sagitta, i. Sagittaria.
Scammonea tenuis, i. Helxine Cissampelos.
Scandix, i. Pecten Veneris.
Scarlea, i. Horminum.
Scaunix Auerr. i. Nigella.

Serapias mas, i. Orchis fœmina Tragi.
Seygar, i. Nux moscata.
Sida Theoph. i. Althæa palustris.
Sidgritis tertia Matth. i. Ruta canina Monspelien sium.
Sideritis, i. Marrubium aquaticum.
Siciliania Camerarij, i. Androsæmum Dodonæi.
Siger Indi, id est Palma.
Stringa cærulea Dodon. id est Lilac Matthioli.
Siliqua dulcis, i. Ceratia siliqua.
Silicula Varronis, i. Fœnugrecum.
Siliquastrum Plinij, i. Capsicum.
Sigillum Mariæ, i. Bryonia nigra.
Sin, id est Ficus.
Sinasbarium, i. Mentha aquatica.
Sinapi Persicum, i. Thlaspi.
Siser, id est Sisarum.
Silaus Plin. i. Thisselium.
Sison Syriacum, i. Ammi.
Sissitiepteris Plin. i. Pimpinella.
Siler Plin. i. Alnus nigra.
Sithim, i. Larix.
Smilax levis, id est Convolvulus maior flo. albo.
Smyrhiza Plin. i. Myrrhis.
Sorbus aucuparia, id est Fraxinus bubula.
Sorbus Alpina Gesn. i. Aria Theophrasti.
Sorbus sylvestris, id est Fraxinus bubula.
Solanum rubrum, i. Capsicum.
Solanum lignosum Plinij, id est Amaradulcis.
Solanum tetraphyllum, id est Herba Paris.
Solanum vesicarium, i. Alkakengi.
Solatrum, i. Solanum hortense.
Solbastrella, i. Pimpinella.
Sosibio Theoph. i. Anemone.
Sparganion Matthioli, id est Platanaria.
Spina acuta, i. Oxyacanthus.
Spina acida, i. Oxyacantha.
Spina hirci, i. Tragacantha.
Spina infectoria, id est, Rhamnus solutivus.
Spina Iudaica, i. Paliurus.
Spirea Theoph. i. Viburnum.
[illegible]ponsa solis, id est Ros solis.
[illegible]phacelus Dodon. i. Scordium alterum Lobelii.
[illegible]yte, i. radix cava.
[illegible]icata, i. Potamogeiton.
Staphylodendron Plin. i. Nux vesicaria.
Statice Dalescamp. i. Caryophyllus marinus Lobelii.
Stataria, i. Peucedanum.
Stellaria Horat. Augerii, i. Cardnus stellatus.
Struthiopteris Cordi, i. Lonchitis.
Struthium, i. Saponaria.
Strumaria Galeni, i. Lappa minor.
Strangulatoria Avicennæ, id est Doronicum.
Sucaram, i. Cicuta.
Succisa, i. Morsus Diaboli.
Surum Avicennæ, i. Nigella.
Symphytum, i. Consolida maior.
Symphoniaca, i. Hyoscyamus.
Supercilium Veneris, i. Viola aquatilis.
Supercilium terræ, id est, Capillus Veneris.
Sus, i. Liquiritia.

T

Tagetes Indica, id est Flos Africanus.
Tahaleb, i. Lens palustris.
Tamecmmum Cordi, i. Vaccaria.
Tarifilon Avicennæ. i. Trifolium bituminosum.
Tatula Clusii, i. Stramenia.
Tatoula Turcis, i. Pomum spinosum.
Tamus. Dodon. i. Bryonia nigra.
Taraxacon, i. Dens Leonis.
Tarfa, i. Tamariscus.
Teda arbor, i. Pinus sylvestris.
Terzola, Baptistæ Sardi, i. Eupatorium cannabinum.
Tetrahit, i. herba Iudaica.
Terdina Paracelsi, i. Phu magnum.
Terpentaria, i. Betonica Aquatica.
Teliphano, i. Doronicum.
Thina, i. Larix.
Thut, i. Morus.
Thuia Theophrasti, i. Arbor vitæ.
Thysselium, i. Apium sylvestre.
Thymbra, i. Satureia.
Tornsol bobo, i. Heliotropium.
Topiaria, i. Acanthus.
Trapezuntica Dactylus, id est Laurocerasus.
Tragium, i. Fraxinella.
Tragium Germanicum, i. Atriplex alida.
Tremula, i. Populus Lybica.
Trifolium fibrinum, id est Trifolium palustre.
Trifolium cochleatum, i. Medica.
Trifolium frutisans, i. Polemonium.
Trifolium Asphaltites, i. Trifolium bituminosum
Tuber terræ, i. Cyclamen.
Turbith. i. Thapsia.
Turbith Avicennæ, i. Tripolium.
Typhium Theophrast. i. Tussilago.

V

Vesicaria peregrina, i. Pisum cordatum.
Veelguta, Dod. i. Petroselinum.
Veratrum, i. Helleborus.
Veratrum, vig. Dios. i. Astrantia nigra.
Verbascula, i. Primula veris.
Verdelhel Haliah, i. Ranunculus.
Victoriola, i. Hippoglossum.
Vitis alba, i. Bryonia.
Vitis Idæa, i. Vaccinia.
Virga sanguinea Matthioli, i. Cornus fœmina.
Virga pastoris, i. Dipsacus.
Vitalis, i. Crassula.
Vitalba, i. Viorna.
Viticella, i. Momordica.

Vincetoxicum,

Nominum quorundam interpretatio.

Vincetoxicum, i. Asclepias.
Viola nigra, i. Viola martia.
Viola flammea, i. Viola tricolor.
Viperaria, i. Scorzonera.
Visnaga, i. Gingidium.
Umbilicus Veneris, i. Cotyledon.
Unedo Plin. i. Arbutus.
Ungula caballina, i. Tussilago.
Ulticana, i. Solanum somniferum.
Ulpicum Columellæ, i. Allium.
Uriwaria, i. dens leonis.
Usnea, i. Muscus.
Una lupina Marcelli, i. Sambucus aquatica.
Una taminia, i. Bryonia nigra.
Una lupina, i. Herba Paris.
Una versa, i. Herba Paris.
Una vulpis, i. Solanum hortense.
Vvularia, i. Hippoglossum.
Vvularia, i. Laurus Alexandrina.
Vvularia Dodonæi, i. Trachelium.
Vulvaria, i. Atriplex olida.
Vulgago Macri, i. Asarum.
Vncata Caya, i. Stramonia.

X

Xaier, i. Alniriem Libanotis.
Xanium, i. Melanthium.
Xylon, i. Gossipium.
Xylocaracta, i. Ceratia siliqua.
Xyphium, i. Gladiolus.

Y

Yebet, i. Anetum.

Z

Zahara Auicennæ, id est Anthyllis Lobel.
Zaiton, i. Olea.
Zarund, i. Aristolochia.
Zarza parilla, i. Sarsa parilla.
Zerumbeth, i. Zedoaria.
Zizania, i. Lolium.
Zinziber caninum, i. Capsicum.
Ziziphus, i. Iuiuba.
Ziziphus alba, i. Elæagnus Matth.
Ziziphus alba Camerarii, i. Olea Bohemica.

A Table of such Englisth names as are attributed to the Herbes, *Shrubs, and Trees mentioned in this Historie.*

A

Aycocke 1449
Acatia 1331
Aconite 968.969
Ath, that is, Smallage.
Adams Apple 1464.1516
Adders Grasse, i. Dogs bollocks.
Adderwort, i. Snake weed.
Adders tongue 404
African Marigold 750
Ethiopian Apples 347
Agaricke 1365
Agrimonie 712
Bastard and water Agrimony 711
Agnus Castus 1387
Ague tree 1525
Alecost, i. Costmary.
All-good, i. faire Mercury.
All-good, i. Henry, or English Mercury.
All-heale 1003.1005
Alehooke, i. ground Ivy.
Alexanders, or Alixanders 1019
Alexanders foot, i. Pellitory of Spaine.
Aller or Alder, and his kindes, 1469 1477
All-seed, i. wilde Orach 324
Alleluya, i. wood Sorrel.
Almond tree 1445
Almond of Peru 1552
Almond Plum tree 1497
Aloes or Aygreen, and his kindes 507
Alkakengy, i. winter Cherry.
Alkanet, or wilde Bugloss 800
Ameos and his kindes 1036
Ambrosy, i. dimy gods food 1108
Amell corne 69
Anacardium, i. bean of Malaca 1544
Anemone and his kindes, from 374. to 386
Anise, or Anise seed 1035
Anet, i. Dill 1033
Angelica and his kindes 999
Anthyllis, or stinking ground pine 622
Anthora 969
Apple and his kindes. 1459
Apple of the earth 845
Apples of love, or golden Apples 346
prickly Apples, or of Peru, see Thorny 348
Apples of Jerusalem 363
mad Apples 345
Apycocke 1449
Arach and his kindes 324
Archangel and his kindes 702
blacke Archangell, i. stinking Hoxehound 702
Water Archer or Arrowhead 2 his kinds, 416
Arbute tree, or Strawberry tree 1496
Arched tree, looke vaulted Fig tree 1514
Argemony, i. bastard Poppy 9 his kinds 373.
Aristolochia 846
Aromaticall reed 63
Arom 834
Artichokes 1153
Arsmart, i. water Pepper 445
Asara bacca 836
Asparagus and his kindes 1110
Aspe tree, or Aspen tree 1487
Asphodil and his kinds, from 93 to 97
Ash tree 1472
Ash keyes ibid.
Wilde Ash, or Quicken tree 1473
Asses Wort tree 1332
Assyrian Apple tree 1474
Assyrian Plum 1499
Avens and his kindes 994, 995
Aslich 1233
Arsed ib.
Artwort ibid.
Aylwæd 1001
Aygreene 511

B

Backwort, or knit backe 807
Baldmoine, or Baldmony 532 533
Bastard Baldmony 1052
Ball thistle 1152
Balme 689.690
Balme Mint 684
Balsamint 684
Balme tree 1528.1530
Balme Apples, see Apples of Jerusalem, 363
Balsam Tree with the Fruit and wood, 1528
Ballocke grasse, i. Dogs Cullions, 207
triple Ballocke, (i.e.) triple Lady traces, 218
sweet Ballocks 218
Banswort, i. Sperwort 961
Bannanas 1516
S. Barbaraes herbe 243
Barberry bush and his kind 1326
Barley and his kindes 70
Barnacle tree 1587
Barnacles, or tree geese 1587
S. Barnabes thistle 1166
Barrenwort 480
Basil and his kindes 673
wilde Basil 675
red Cow Basil 678
cow Basil 492
Bastard dwarfe Box 1597
Batchelors buttons 472.957
Baume and his kindes 689.690
Bay tree and his kindes, 1407. 1409
Bay willow, or Bay willow herbs, 477
cherry Bay 1603
wilde Bay tree 1409
Orange Bay 1613
Beade tree 1492
Beane tree 1429
Beane Caper 897
Beane and his kindes 1209
flat Beane, i. Lupins 1217
Bearded Grasse 16
Beares breech 1147
Beares eare and his kindes 784, 785
Beares Garlicke 179
Bearewort 1052
Beerelwe 976
our Ladies Bedstraw 1126
Blew Bells 450,451
Indian Merrice bells 1545
Autumne Bell-flowre 438
Steeple Bell-flowre, or Peach bells, or Steeple bells 451
Sea bells 838
Bell flowres 450, 451
Wilde Bell flowres 455
Harteil Bells 438
Bent and his kindes 319
Beech tree 1444
Beech Mast 1444
Beet 1028
Betten seed 554
Beards Beards, i. Cats tailes.
white Bents 678
red 602
Bent 5
Bertram 758
Betle, or Betre, i. Bastard pepper 1542
Bauls Betony and his kinds 629
Betony 714
water Betony 715
Big, or big Barley 70
Bindeweed and his kindes, from 861 to 865
Sea Bindeweed, or withwæd 838
Rough Bindweed, or Bindeweed of Peru 859

Blew

Blew Bindeweed 865
purging Bindsweed 866
Bindweed, Inchanters Nightshade 352
Bishops weed 1036
Bishops leaues 715
Bilberries or Bulberries 1417
Birch tree 1478
Birds tongue 1565
Birds foot 1241
Birds eine 783
Birds nest 228
Birthwort and his kindes 846.847
Bistort and his kindes 399
Bitter sweet 350
Bitter worts 533
Biseke berries, loke Brample bush.
Bladder nut 1437
Blew ball, i. Blew bottle
Blessed thistle 1171
Blew bottle 732
Blites or Bliptes 320
Blodwort, i. Blody Docke 389
Blodstrange, i. Mouse taile 426
May Blossomes, i. Conual Lilly 410
Bolbonac, i. white satten 464
Bombast, or Bumbast 901
Borage and his kindes 797.807
Boots 818
Box thorne 1332
dwarfe Box, or ground Box 1410
bastard dwarfe Box 1597
Box tree 1410
Bramble bush 1272
Brake and his kindes, see Ferne
Branch pease 1221
Branke vrsine 1147
Bright wheat 66
Brimstonewort, i. Sow Fennel 1053
Bryonie and his kindes 869
Indian Bryony, i. Mechoacan.
Broome and his kindes 1311
Broome rape 1311
Sweet Briet bush, see Eglantine.
Briet bush, i. Hep tree 1271
Broomewort is Treacle mustard.
Brownewort 716
Bucke Broome 1316
bastard Spanish Broome, 1318
Brooke lime 621
Buglewort, i. Hoptwort 444
Bucks beanes 1194
Bucks horne and his kindes 427
Bucke wheat 89
Buckler thorne, i. Christs thorne 1336
Buckrames 179
Buckthorne 1338
Buckmast 1444
Bugloss and his kindes 798.799
Bugle 631
Bulfoot. see Coltsfoot.
Bullocks Langwort 773
Bullocks eye 746
Bull weed 728
Bulwort 1136
Bullsfoote 1497
Bullimong, i. Buckwheat 89
Bulmes 1045
Burgundy Trefoile 1189
Burre and his kindes 810
Burre reed 45
Water Burre docke 814
Burstwort 569
Butterfly Satyrion 211
Butterwort or Butter root 788
Butter burre 814
Butter flowres 951
Butchers broome 907
Butchers prickle tree 1468

C

Cabbage, i. Colewort 312
Calcous, or Calous 1544
Calathian violets 438,449
Calamint and his kindes 687
Water Caltrops 823.824
Calues foot 834
Caltrop 1166
Calues snout and his kindes 549
Calamus Aromaticus 63
Camels hay, see Schenanthum.
Cammocke, i. Rest harrow 1323
Camomil and his kindes 754, 755
red Cammomil i. Flos Idonis 387
wilde Cammomil 757
Campion and his kindes 467
Canaria grasse, seed or corne 86
Cane, Cane reed and his kindes 36
Canker wort, i. Pisse in bed.
Canker wort, i. Fluellin 625
Canker rose, i. red Poppy.
Candy Mustard, or Candy Thlaspi 265
Candy Alisanders 1024
Candy Carrots 1029
Canturbury bells 261.450
Capers and his kindes 895
Capons taile, i. great wilde Valerian. 1075
Card Teasell 1167
Carlocke or Charlocke, and his kindes 233
wilde Carline thistle 1159
Carobe tree 1429
white Carolina Thistle 1157
Carrot and his kindes 1028
wilde Carrot 1028
stinking and deadly Carrots 1030.1031
Carawa and Caraway seed 1034
Carles or Cares 1039
Carlidony 586
Castle Gilloflowres, i. stock Gilloflowres
Cast me downe 586
Cassia fistula 1431
Caterpillers, i. Scorpion grasse, and his kindes 337
Cat mint or nep 683
Catch fly 601
Cats foot 856
Cats taile, or Cats speare 46
Cats taile grasse 12
prickly or Juniper Cedar tree 1374
Cedar of Libanus 1352
Celandine 816.1069
Centory 546.547
Celars tree spurge 501
Ceterach 1140
Chameleon thistle 1157
Champion sea Holly 1164
Chadlocke, see Cadlocke.
white Chameleon grasse 26
Chaste tree and his kindes 1387
Chast wood, i. Cotton wood 644
Cherry and his kindes from 1590. to 1597
Cherry bay 1603
winter Cherries 342
long Cherry tree 1466
Cherusil 1038.1039
great or sweet Cherusil 1039
mocke-Cherusil, i. Shepheards Needle, 1040
water Chestnut 824
Cheese bowles 400
Cheese renning, i. Idaies Bedstraw, 1126
Chestnut tree 1442
earth Chestnut 1064
Chequered Daffodil 149. 150
Chickweed and his kindes from 611, to 617
bastard Chickweed 616.617
Childrens Mercury, i. Wilde Mercuris, 333
China root 1618
Choking Spurge, i. see Spurge 497
Christs wort, or Christs herbe, & Christmas herbe, i. blacke Ellebor 977
Christs thorne 1336
S. Christophers herbe 979.1131
Chichling and his kinds 1230.1231
Chithes and his kindes 1222.1223
wilde Chiches 1223
Etchory 281
Cinkfoile, or fine finger grasse. from 987 to 992
Cinamome root 790
of the Cinamome tree, the leafe and trunks 1532
Cicken Cicely 898
Cistus and his kindes, from 1275. to 1281
Cistus Ledon from 1285. to 1292
Citisus bush, i. milke Trefoile, or shrub Trefoile from 1304. to 1309
Citron Apple tree 1464
Citrul Cucumbers 913
the wilde Citrul 913
Cines or Chines 176
Strange Clary, i. Jupiters Distaffe, 769
Clary, or Cleary 770
wilde Clary 769.771
Clauer 1185.1186
horned or blacke Clauer 1191
Clauer gentle 1187
Marish Clauer 1194
garden Clauer 1195
snaile or sea Clauer 1199
Cleauers, or goose grasse 1122
biting Clematis 888
Clot burre 810
Cloud berries 1420.1630
Clone Gilloser and his kindes, from 588 to 597
Cluster of Grapes 875
Clownes Woodwort or All-heals 1005
Clownes Langwort 1585
the Clous tree 1535
the Clous berry tree 1610
Sea Cole 838
Clusius Hawkweeds 289.301.302
Cocks foot grasse 27
Cocks heads, i. medow Trefoile 1180
Cocks heads, i. red Fitchling 1243
Cockle 1087
Codded Trefoile 1190
Sweet Cods 218
Colewort and his kindes from 312, to 317
Coloquintida, or Coloquint, & his kinds. 915
Hares Colewort 295
Colesloy 314
Colts foot and his kindes 811, 812
Cone, i. Pine Apple 1355
Columbine and his kinds 1093,1094
Conyza, i. Fleabane Mullet from 461 to 485
Consound 806
middle and little. 634,637
Conuall Lilly 410
Contra-yerua 1621
Comfrey 806
spotted 808
Coral and his kindes 1575.1576
Coral tree 1614
Coral privet 1397
Coral worts 984.985
Coralline, or Coral mosse 1572,1573
Corke tree 1347
Coriander and his kindes 1912
Corne 65
Corne Flag and his kindes 104
Corne grasse 5
Corne Rose or Poppy 401
gilliflower or pinks 438
sallad 311
flowre 732
marigold 743
Cornel tree and his kinds 1466.1467
Cotula and his kindes 757
Cotton grasse 29
plant 901
thistle 1149
Sweet 644

Cowſlip and his kindes 781
Cowſlip of Jeruſalem, or Sage of Jeruſalem 808
mountaine Cowſlips 784
Cow Baſil 492
Cow wheat 90
wilde 91
Cozlars Sumach 1474
Coſtmary 649
Coſtus 1620
Couch graſſe 23 &c.
Couentry bells 385.448
Couentry Rapes 448
Cow parſneps 1009
Cocks combes, or Hens combes, i. yellow Rattle 1071
Crab graſſe 535
Crab tree 1461
Cjabs claw or freſh water Souldiour, 826
Crayfiſh 761
Cranes bill from 940 to 948
Craw or Rape Crowfoot 953
Creſſes and his kindes 243.250.253. 254.257.261
Creſtmarine 534
Crimſon Cedar 1374
Croſſe floure 564
Croſſewort and his kindes 433. 1123
Crowfoot and his kindes from 829 to 865.
yellow Crow bells, or yellow Narciſſus 133
Crow ſope, i. wilde Roſe Campian, 471
Crow toes, i. Hyacinths 107
Crow flowres 600
water Crowfoot 829
Crowfoot Cranes bill 943
double Crowfoot 957
white ib.
Crow garlicke 179
Cuckow pint or pintle, and his kindes, 834
Cuckow Gilloflowres 600
Cuckow Orchis 208
Cuckow flowres or Lady Smocks 259
Cuckowes meate, or Cuckowes ſorrell, i. wood Sorrell 1202
Cucumbers and his kindes 910
wilde 912
Cudweed, ſee Cottonweed.
Sweet Cullions 218
Cull me to you 855
Ladies Cuſhion 602
Culrage, i. Arſmart 445
Cullions and their kindes, from 205. to 228
Cumberland Hawthorne 1327
Cumin and his kindes 1066
wilde 1067
Curans or ſmall raiſons 874
red, white, and blacke 1393
garden Cypres, (i.) Lauander Cotton 1109
Cypreſſe tree 1367
Cypreſſe graſſe and his kindes 12.19. 21.22.29.30.
Cypres Wormewood, ſeeke Wormewood, 1098
Cypres ſpurge, ſee Spurge 498
field Cypres 525
Cypres wood Graſſe 19

D

Daffodill and his kindes from 123 to 137
Daffodowndilly 133
Day Lilly 99
Daiſies 634. &c.
Dalmatian Floure de luce 52
Dalmatian cap, i. Tulipa 137
Dandelion 291
Danewort 1426
Darnel 78
Darnel graſſe 730
Datetree 1517
drunken Date tree 1520
Daucus 1023,1028.1029
Dead nettle and his kindes 702.703
Dew graſſe 27
Diers weed 494
greening weed 1316.1317
Dill 1033
Diptame 797
Dittander 241
baſtard Dittany 797
Diuels bit 726
Docke 388.389
Dodder 577
Dogs graſſe 23 &c.
Dogs rib 422
Dogs tooth 204
violet 984.985
Dogs bane 903
cole 334
Cheries 1296
Roſe 1271
piſſe or tongue 804
Thorne 1274
Mercury 334
Cullions or ſtones 207
berry tree 1467
Camomil. 757
Leeke 106
Dozing his Woundwort 431
Downe thiſtle 1152
Dowes foot 938
Dzagons 831
Dzagons blood, i. Bloodwort 390
Dzagons blood, ſee Dzagons tree
biting Dzagon, i. Tarragon. 249
Dzagon tree 1523
Dzakes root 1621
Dzaucke or Dzake 76
Dzopwort 1058
Double leafe, i. Twayblade 403
Double tongue 909
Duck bill wheat 66
Ducks meat 829
Dug tree 1609
Dunce downe, i. Cats taile 46
Dwale. Nightſhade 339
Dwarfe graſſe red and white 3
Dwarfe Ciſtus 1284

E

Eaſterlin Pynet 1396
Eglantine, or ſweet Brier
Egrimonie, or Agrimony 712
Egyptian Wormwood 1101
Egyptian thorne 1330
Egyptians herbe, i. water Horehound 700
Egyptian Fig tree 1509
Egyptian Walberry tree ib.
Elder and his kindes 1424. &c.
mariſh 1425
dwarfe 1426
Elme and his kindes 1481.1482

Chaffeweed, Cottonweed.
Cheruell or Cheuerell was called (though vntruly) Apium riſus.
Churles Treacle, Allium.
Churchwort, Penny-royall.
Ciderage, Arſmart.
Clithe, the Burre docke.
Clitheren, Goſe graſſe or Cliuers.
Clite, Lappa.
Clone tongue, Elleborus niger.
Cocks foot, Columbine.
Cocke foot, Cheledonia maior.
Cow fat, Cow Basil.
Crisbalde, the leſſer Centory.
Croneberries, Vaccinia paluſtris.
Crowbell, yellow Daffodil.
Crow berries, Erica baccifera.
Crowfoot is Orchis, in Lincolneſhire and Yorkſhire.
Crow lope, Hopewort.
Crow leake, Hyacinthus Anglicus.
Cropweed, Iacea nigra.
Culuerwort, Columbine.
Culrage, Arſmart.
Cutberdole and Cutbertill is Wranke byſine.

D

Dinote, Cyclamen,
Donuinethel-wilde Hempe.
Dragons female, water Dragons.
Dropwort, Filipendula.
Duncedowne, Catſtaile.
Dwale is Nightſhade.

E

Edderwort, Dracontium,
Eilder, Alliaria.
Elfedocke, Enula Campana.
Earth gall, great Centory, or rather ſmall.
Euerferne is wall Ferne.
Exan, Crolwort, yet not our Cruciata.

F

Fine, white Floure delace.
Fauerell, Cepea.
Field Cypreſſe is Chamæpitys.
Fieldwort, Feilwort or Gentian.
Filewort, Filago minor.
Fleadocke, Petaſites.
Fleawort. Pſyllium.
Forget me not, Chamæpitys.
Forebitten more, Diuels bit.
Fauerole, water Dragons.
Franke, Spurry.
Freiler is the herbe that beareth Strawberries, Strawberrier.

G

Galingal meke is Ariſtot. rotunda.
Gaten træ or Gater træ is Dogs berry træ.
Gandergolles is Jockes.
Geckdor, Aparine.
God king Harry, Engliſh Mercury.
Goolechite, Agrimony.
Goolegraſſe was ſometime called Argentina.
Goole bill, Aparine.
Garden Ginger. Piperitis,
Glond, Cow Basil.
Grace of God, S. Johns wort,
Græne Muſtard, Dittander.
Ground will, Ground ſwell.
Ground nædle, Geranium muſcatum,
Ground Enel, Venus combe.

H

Hirtue, Cliuers.
Hammerwort, Pellitory of the wall.
Hardhow, Marygolds.
Hares eye, Lychnis ſyluestris.
Harebell, Crow leake.
Herbe Jup. Chamæpitys,
Henbell, Henbane.
Hethow. Hedera terreſtris.
Herbe Bennet. Hemlocke.
Herbe Peter, Cowſlip.
Herba martis, Martagon.
Hertelowe, Chamædryos.
Hertwort, Fraxinus.
Hillwort, Puliol mountaine.
Hippia maior. common Pimpernel,
Holy rope, wilde Pempt.
Hounddberry, Solanum.
Hozewort, Filago.
Hozlechire, Germander.
Hozleheale, Elecampane.
Hozle thiſtle, wilde Lettuce.
Honeſty, Bulborlack.
Hozlelder, Enula campana.
Hozlemint, Watermint,
Hullwort, Polium.
Hyndheale, Ambroſia.

I

Iacea alba, wilde or White Tanſy.
Imbzecke, Houſleake.
Ioane Giuer pin double Poppy.

K

Kindlegoſſe, Goſegraſſe.
Kings crowne Melilotus.
King cob or King cup is Crowfoot.
Kille me ere I riſe, Panſies.
Kidney wort, Nauelwort.

L

Langwort, Helleborus albus,
Little Wale is Gromell.
Lichwort is Pellitory of the wall.
Longwort, Pellitory of Spaine.
Lilly leake, Holy.
Lilly tiall, Pennyroyall.
Lodewort, water Crowfoot.
Louſewort, Staphiſacre.
Luſtwort is Dundew.
Lyngwort, Helleborus albus.

M

Mans Motherwort Palma Chriſti.
May bloſſomes, Connal Lillies.
Mawzoll, White Hozehound.
Mauthin or Mathes, Cotula fœtida.
March, Smallage.
March beetle, Cats taile.
Mædes Drage
Mercrop. Pimpernel.
Mozel Nightſhade
Mouſepeale, Orobus,
Mugwet, Woodroofe.

N

Nele, Lollium.
Nelpite, Calamint.
Nep, Cats mint.
Noſebleed, Yarrow.

O

Oxual, Oxpin.
Oxan, Cruciata,
Oxtongue, Lingua bouis.

P

Pagle, Stitchwort.
Palme de Dieu, *Palma Chriſti*,
Papwort, Mercury.
Paſtell, Woade.
Pedelion Helleborus niger,
Peters ſtaffe. Tapſus barbatus,
Pewterwort, Hozſetaile.
Pimentary, Bauline.
Powknædle, Storks bill.
Primrole, Ligustrum.
Pygle, Gramen Leucanthemum.

A Table of obſolete and leſſe vſed Engliſh Names.

R

Rams foot is Water Crowfoot.
Red knees is Hydropiper.
Robin in the hole is Lychnis ſylveſtris.
Rods gold is Marigold.

S

Cabwort is Enula Campana.
Sea Wocke is Wzanke vrſine.
Seggrom is Ragwort.
Selfe heale was ſometimes called Pimpernel.
Sheep killing is Cotyledon aquatica.
Sleepewort is Lettuce.
Staggerwort and Staverwort is Iacobea.
Stanmarch is Aliſander.
Standelwelks is Satyrion.
S. Maries ſeed is Sow thiſtle ſeed.
Small honeſty is Pinks.
Somerwort is Ariſtolochia.
Stike pile is Storks bill.
Stedfaſt is Palma Chriſti.
Stubwort is Oxys.
Sparrow tongue is Knot graſſe.
Stronnyd and Stonchorn is Stonecrop.
Stubwort is Wood Sorrell.
Swines graſſe is Knot graſſe.
Swine Carſe is Knot graſſe.
Swichen is Groundſwell.
Sowdwort is Columbine.

T

Talewort is wilde Wozage.
Tanke is wilde Parſnep.
Tetterwort is great Celandine.
Toothwort is Shepheards purſe.
Tutſane is Clymenum Italorum.

W

Walwort is Ebulus, which was ſometime called Filipendula.
Warences is Madder.
Warmot is Wormwood.
Waywort is Pimpernell.
Wayheed is Plantago.
Waywort is Hippia maior.
Waterwort is Maidenhaire.
Weyphernoy is Feuerfew.
White Bothen is great Daiſy.
Wilde Manager is Cockle.
Wilde Nardus is Aſarum.
White Golds is great Daiſy.
Wod march is Sanicle.
Wood ſower is Oxys.
Woodbroney is Fraxinus.
Woodnep is Ameos.
Wolfes thiſtle is Chamæleon.
Wynberry is Vaccinea.
Wymot is Ibiſcus.
Wit is Hyoſcyamus luteus.

Y

Yron head is Knapweed.

Z

Zeekes was counted Satyrion minor, and is that which Lobel calleth Scrapias formina pratenſis.

Saeds gwyllt, v. *Chwerwlys*.
Siwdrmwt. Sothernwood.
Siaccked y melyddd, v. *Cynffon Llwynog*.
Sirian. Cherries.
Snoden Fair. Engliſh Galingall.
Sowdl y Crydd. v. *Blaen yr yiwrch*.
Suran y góc. wood Sorrell.
Suran. Sorrell.
Syſi, v. *Meſys*.

T

Tafod y ki. Dogs tongue.
Tafod y neidr. Adders tongue.
Tafod yr hydd. Harts tongue.
Tafol. a Docke.
Tafol Mair. Biſtort.
Tagaradr, v. *Hwb yr ychen*.
Tafod yr edn. Birds tongue.
Tafod yr ych. Bugloſſe.
Telephin. Orpin.
Tormaen, Filipendula.
Tryw, v. *Caliwlyn y mêl*.
Troed y glomen. Columbine.
Triacl y tylodion. Tormentilla.
Troed y dryw. Parſley Breakſtone, or ſmal Saxifrage.
Triacl y Cymro. Germander.
Troed yr hedydd. Larke heele.

W

wilffraeu, v. *Llyſie yr gwaedlin*.
winiwn. Onions.

Y

Y Bewfelen. Fleabane.
Y benlas wenn, v. *Clafflys*.
Y bengaled. red Scabious.
Y benlas. Blewbottle, or Cornflowre.
Y bengoch. Horehound.
Y Clafflys. Scabious.
Y Dorfogl. medow three leafed graſſe.
Y Droedrydd. Herbe Robert.
Y Drwynſawr. Caliwlyn y mêl.
Y Ddwy geneloc. herb Twopeace, or Moneywort.
Y DorEwyd. wild tanſy or Siluerweed
Y dew bannoc, v. *Cynffon Llwynog*.
Y Dinboeth. Arſmart.
Y Ddayarlys. Peony.
Y Doddedigc wenn. Pilewort.
Y ſendigedi. Tutſan or Parke leaues.
Y Fabgoſ. Poppy.
Y fiolud. Violet.
Y ſylſen. Y ſronwys. ſmall Celandine.
Y ſeidiot lâs, v. *Llyſſie Ivan*.
Y ſyddarlys. Prickmadam.
Y ſyddygyn, v. *Craith vn nos*.
Y ſyw ſyth. Llyſſiev penth.
Y gauri goch. v. *Bvſil y Ddayar*.
Y gynga, v. *Llyſie yr bidl*.
Y gloria. wilde Roſe, or Spargwort.
Y gâs wenwyn. Diuels bit.
Y gyſog. a kinde of Spurge.
Y glaiarlys. Y grevlus. Groundſwell.
Y gyſgadvr. Nightſhade or Morell.
Y gingroen. Todeflax.
Y llew gwynn dôſ. Garden Orach.
Y llew gwynn gwyllt. wilde Orach.
Y llwlys, v. *Llyſiev llin*.
Y llwynbidydd. Ribwort.
Y llindro. Doder.
Y llyſiewyn bendigedic. Valerian.
Y lleůadlys. Lunaria.
Y Môr gelyn. Sea Holly.
Y Múrlys. Pellitory of the wall.
Y Papi coch, v. red Poppy, or corne Roſe.
Yr Eſcarlys *Hir* / *geon* / *bychan* — Ariſtolochia, or Birthwort, or Hartwort, — long, round, ſmall.
Yr Alaw. Water Lilly.
Yr bên lydan, i. ffordd. Waybread.
Yr Rhůt. Rue, or herbe Grace.
Yr vchelſa. Miſſeltoe.
Yr yſcallen Fraith. our Ladies thiſtle.
Yr yſcallen Fendigedic. Card. Benedict.
Yr holliach. Clownes wort.
Yſcall drain gwynn Carline Thiſtle.
Yſcall. wilde Thiſtles.
Yſcall y moch. Sow thiſtle.
Yſcol ſair. Peters wall or ſquare, S. Iohns wort.
Yſcaw. Elder trees.
Yſcaw Mair. Walwort.
Yſpaddaden. White thorne.
Yſniab. Muſtard.
Y wermod. Wormwood.
Y wermod wenn. Feuerfew.
Y winwydden wenn. white Bryonie.
Y winwydden ddů. blacke Bryony.
Y wilffrat. Llyſie yr gwaedlin.
Y wennwlydd. Great Thickweed.

A TABLE, WHEREIN IS CONTAINED THE NATVRE AND VERTVES OF ALL THE Herbes, Trees, and Plants, described in *this preſent Herbal.*
